OUTPUT SHAFT SUPPORT (Installation): With guide studs, Tool C-3283 in rear of transmission case,place output shaft support gasket over guide studs and into position on rear of case. Lubricate output shaft seal rings. Install support over shaft and guide studs, and position against transmission case *(CAUTION* - Use care when installing support so not to damage ring sealing surfaces). Install the one (short) output shaft support-to-transmission case screw and lockwasher, and tighten finger tight.

REAR OIL PUMP & GOVERNOR ASSEMBLIES (Installation): Place rear oil pump pinion ball in ball pocket in output shaft. Lubricate rear oul pump drive pinion. Place over output shaft and slide into position aligning key-way in pinion with ball in shaft. *(CAUTION - Pinion was marked at disassembly. Make sure it is installed correctly).* Lubricate rear oil pump gear and position in pump housing. Make sure gear is installed correctly; check marking. Slide rear oil pump and governor assemblies over output shaft and into position against support. *(CAUTION* - There are two extra holes in housing which are used for vents. Make sure no attempt is made to install screws in these holes. Check each threaded hole before installing screws). Install the five oil pump housing-to-output shaft support screws. Draw screws down evenly and tighten to 10-12 ft. lbs. After screws have been tightened, turn output shaft to make sure pump gears are free to rotate. If not, disassemble pump to determine cause.

CONTINUED ON NEXT PAGE

TORQUEFLITE (C nt.)

GOVERNOR WEIGHTS & VALVE ASSEMBLY (Installation): Align locating hole in output shaft to locating screw hole in governor support and install locating screw. Tighten to 5-7 ft. lbs. If governor body had been removed, and installed, tighten the four body screws to 6-8 ft. lbs. Dry governor weight assembly and valve with compressed air, but do not lubricate when assembling. Place governor weight assembly (secondary weight snap ring facing out) into governor body, and using pliers, Tool C-3229, install snap ring, making sure it is properly seated in groove. With the governor valve (small end up) on governor valve shaft, slide shaft into governor body through output shaft and governor weight assembly, at the same time position valve into body. Install governor valve shaft snap ring (from weight assembly end). Make sure it is properly locked to shaft. After snap ring installation, apply sufficient pressure to both ends of valve shaft to force snap rings to outer portion of snap ring grooves. Check operation of governor weight assembly and valve by turning output shaft. Both should fall free in governor body.

EXTENSION HOUSING (Installation): Install new extension housing gasket over guide studs and into position against output shaft support. *(CAUTION - Do not use sealing material on gasket).* Place extension over output shaft and guide studs and into position against support *(NOTE* - Propeller shaft flange and drum assembly can be used, if necessary, to draw extension output shaft support). Install extension housing-to-case screws and tighten to 25-30 ft. lbs. Tighten output shaft-to-case screw to 25-30 ft. lbs. (Check output shaft to make sure it turns freely). Install speedometer drive pinion and sleeve assembly in extension housing and tighten to 40-56 ft. lbs.

HAND BRAKE (Installati n): Make sure brake support spacer (neoprene) is in position on back of brake support and spacer sleeve is in center of support. Slide brake support assembly over rear of extension and anchor pin. Make sure spacer sleeve remains in center of support. Install brake support grease shield on extension housing (indent on shield is for correct positioning on extension, also, the shield must be located on extension far enough to permit installation of spring). Place both brake anchor washers on brake shoe anchor and install locking anchor washer. Place both shoe assemblies with adjusting sleeve nut and screw into position on anchor. Make sure brake shoes are between anchor washers. Use rubber bands around shoes to hold them in position. Install operating link. Note that link is marked for correct installation. Install the brake support grease shield spring (opening in spring toward adjusting sleeve). Make sure spring is properly seated in groove. Slide brake shoe return spring behind grease shield spring and hook into position. Install propeller shaft flange and drum assembly. Install shaft flange washer and nut. Tighten to 200 ft. lbs.

►*FRONT CLUTCH END CLEARANCE CAUTION:* Recheck end clearance *(See "Front Clutch End Clearance Check" under "Removal & Inspection of Transmission Units" above).* If clearance not correct (.020-.050"), input shaft washer of proper thickness can be installed by removing the seven screws and lockwashers from extension housing. Install guide studs, Tool C-3283. Remove the one output shaft support-to-transmission case screw and washer, and remove the hand brake assembly, extension, output shaft support, and No. 1 unit as an assembly.

BAND ADJUSTMENT: Rotate hand brake drum in both directions to center bands on retainers prior to making band adjustment. *See "Band Adjustment" above, for adjustment procedure.*

VALVE BODIES & TRANSFER PLATE ASSEMBLY (Installation): Clean mating surfaces of valve body assembly and place into position on transmission case. Install five (short) transfer plate screws, with Belleville washers. Draw down evenly and tighten to 14-16 ft. lbs. Install accumulator spring through transfer plate and position in piston. Install accumulator cover, three screws with Belleville washers and draw down evenly. Place oil strainer in position over rear pump suction tube in transfer plate assembly. Check position of front pump suction tube in elbow (opening in suction tube should be facing oil pan). Slide front pump suction tube into strainer and position elbow on transfer plate. Install the two screws (with Belleville washers), draw down evenly and tighten elbow and accumulator cover screws to 14-16 ft. lbs. Install neutral starter switch and visually check manual valve lever contact with switch.

OIL PAN (Installation): Install pan, using new gasket. Tighten screws evenly to 10-12 ft. lbs. Tighten oil drain plug.

MANUAL CONTROL VALVE LEVER AND CONTROL CABLE ADAPTOR HOUSING (Installati n): Install manual control lever (locking screw to rear) on manual valve lever shaft. Position lever so there is 7/32" clearance (without gasket) between bottom of lever and transmission case. Tighten locking screw securely. Place control cable adaptor (with spring lock in position) in lever and install pin. Place manual valve control lever in reverse position and install gasket, control cable housing, and three screws (with Belleville washers). Tighten evenly to 14-16 ft. lbs. Install felt washer, flat washer, and throttle valve lever assembly over shaft. Tighten clamp bolt.

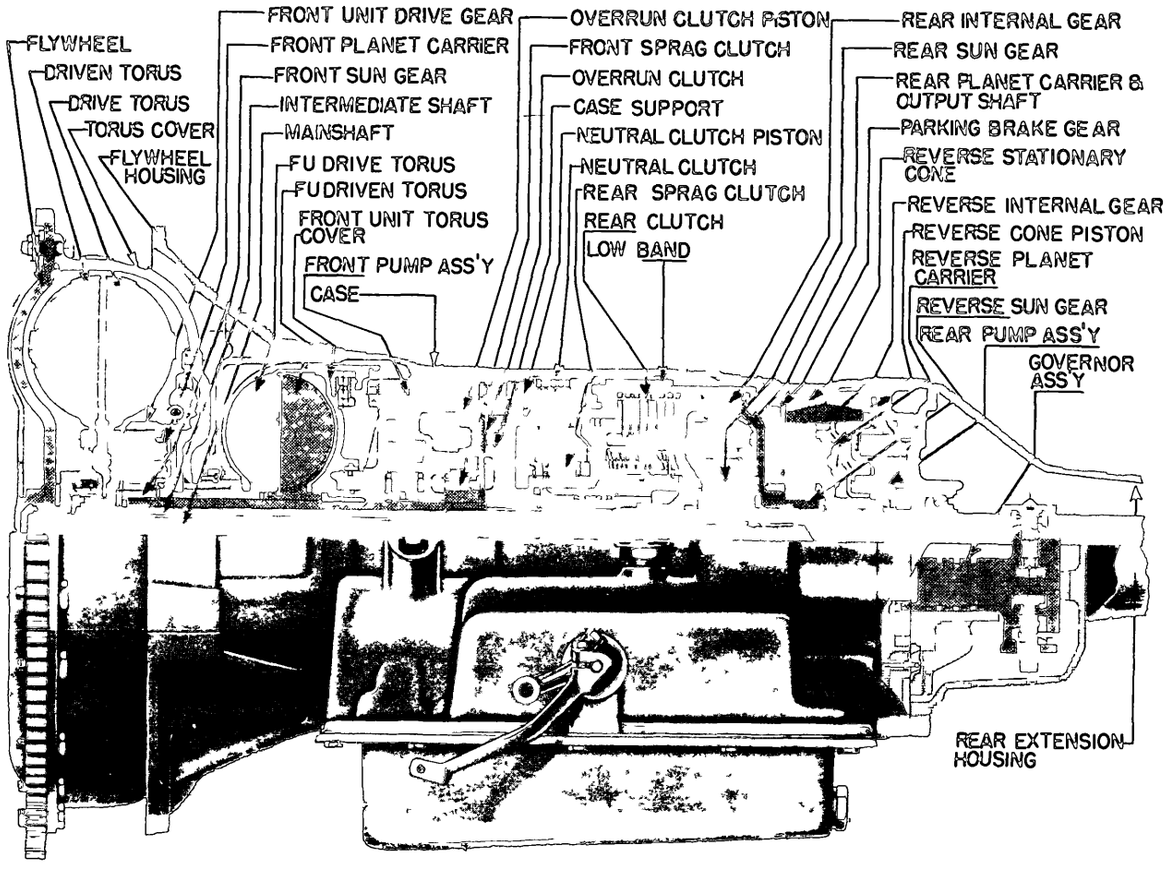
DUAL-COUPLING HYDRA-MATIC

Cadillac (1957)
Hudson (1957)
Nash (1957)
Oldsmobile (1957)
Pontiac (1957)
Rambler, 5720 Series (1957)

▷CHANGES, CAUTIONS, CORRECTIONS

▷*STARTING ENGINE BY PUSHING CAR:* Move selector lever to "N" (Neutral) position and turn on ignition switch. When car reaches speed of 25 MPH (Exc. Cadillac); 30-35 MPH (Cadillac), move selector lever to either "D" (Drive) position on Cadillac, Hudson, Nash & Pontiac; or to "D" or "S" position on Oldsmobile.

▷*TOWING HYDRA-MATIC DRIVE CARS:* Drive shaft must be removed or car must be towed with the rear wheels off the ground. Damage to transmission will result if these precautions not taken.



▷*TRANSMISSION OIL COOLER NOTE (ALL MODELS):* In the event of serious damage to transmission, the oil cooler should be replaced as it is not possible to properly clean cooler in the field.

▷*TRANSMISSION OIL FOAMING NOTE (ALL MODELS):* This condition may be caused by water leaking into transmission at the oil cooler. Check oil cooler for leaks as follows: Remove cooler and apply air pressure not exceeding 25 lbs., to either of the two cooler water pipes (plug other pipe). Submerge end of oil pipes in water and check for air bubbles in water. If bubbles appear, oil cooler is leaking and must be replaced. Before installing new cooler, remove transmission oil pan and clean thoroughly. Install clean transmission oil.

▷*1957 CADILLAC "WHISTLING" NOISE CORRECTION:* This condition, noticeable at shift points, is caused by wind action through a hole drilled in one side of external breather tube. If transmission is removed for other work, correct the above condition by drilling a hole through opposite side of tube. To make correction with transmission in car, collapse extreme lower end of tube with a pair of vise grip pliers, until outside narrow cross section of tube measures approximately ¼". Beginning with serial number C57-21596, CA57-2041, & CE57-2220, the condition was corrected in production.

▷*1957 CADILLAC "BUZZING" NOISE CORRECTION:* A buzzing noise occuring during 1-2 & 3-4 shifts may be caused by lower end of front pump intake pipe seating on bottom of the screen, causing restriction of intake oil and flutter of pressure regulator valve. Correct by cutting a 3/16" notch in forward end of opening in pipe and filing or grinding off pipe to increase size of opening toward rear end of pipe. Installation of the earlier type pipe, Part No. 8616283 will also correct the condition. Transmissions affected by the above condition are between serial numbers, C57-26807 & 28919; CA57-2234 & 2434; CE57-2767 & 3163. Earlier and later transmissions used a different intake pipe.

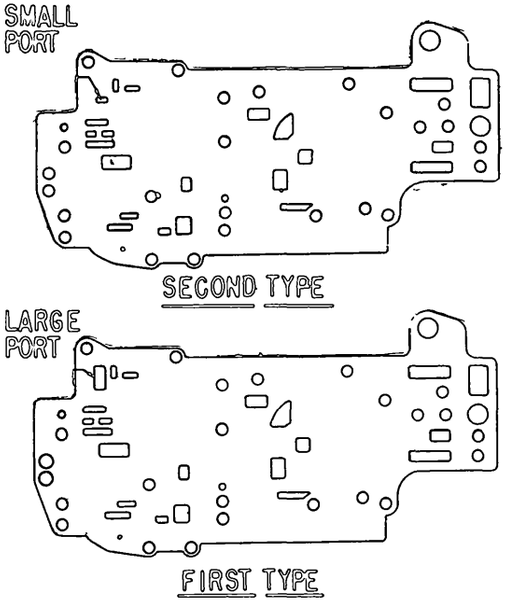
▷*1957 HUDSON, NASH & RAMBLER TRANSMISSION REMOVAL CAUTION:* If transmission is to be removed for correction of oil leakage at front of transmission, a special procedure must be performed to prevent recurrence of the leakage condition. *See TRANSMISSION REMOVAL below.*

DUAL-COUPLING HYDRA-MATIC TRANSMISSION (SECTIONAL VIEW)

▷*1957 HUDSON, NASH, RAMBLER & PONTIAC TORUS COVER OR FLYWHEEL REPLACEMENT NOTE:* Torus cover-to-flywheel dowels are located in the flywheel on 1957 models (in torus cover in 1956 models), and on service replacement flywheels. Two dowel pins will be serviced loose, as part of service replacement torus packages. When attaching 1957 service torus cover to 1956 flywheel, install both dowel pins (*NOTE - Be careful that dowels are placed in proper holes as the dimensions are different*). If a 1957 flywheel is attached to a 1956 cover, remove both dowel pins from original torus cover.

▷*1957 PONTIAC NOISE CORRECTION (Scraping Sound Heard When Operating in Reverse):* This noise may be caused by rear oil pump and can be corrected as follows: Install a Rear Pump Intake Pipe Kit, Part No. 8616978. Remove oil pan and remove rear pump intake pipe "0" ring seal and oil screen (*NOTE* - If the front pump intake pipe "0" ring seal is disturbed during oil screen removal, it should be replaced). Install bolt ½" into counterbored end of sleeve, then using bolt as driver, install sleeve into canted hole adjacent to rear pump intake hole, until sleeve is flush with or up to 1/16" below machined face of case. Remove bolt from sleeve and install steel retaining washer on pump end of pipe. Install new "0" ring seal next to retaining washer. Install check valve into pump end of pipe and install pipe assembly in case. Install retainer bolt and tighten to 5-6 ft. lbs. *NOTE* - Retainer must be installed with raised edge out and open end of retainer toward rear of transmission.

▷*1957 PONTIAC FRONT PUMP STARVATION CORRECTION (Results in a "buzzing" sound when selector lever is in "DR" range, car standing, and up to speeds of 8 MPH):* Correct by adding a notch in the inlet end of front pump inlet pipe (within the screen) in three or four places. Notch should be approximately 1/8" square. Re-



CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (Continued)

move burrs and clean pipe thoroughly. Install a new "O" ring seal.

▷ *1957 PONTIAC IMPROPER 2-3 SHIFT CORRECTION (EARLY CARS):* In some early 1957 transmissions, the transition valve check ball was not used (same as late 1956). If the 2-3 shift has a tendency to shift from second-to-low-to-direct (with cold oil), the 1/8" ball can be installed (to prevent the transition valve moving too fast). Later 1957 transmissions have this check ball installed.

▷ *1957 PONTIAC BIND OR DRAG DURING REVERSE OPERATION CAUTION & CORRECTION:* May be caused by interlock plate on gearshift lower lever (at lower end of steering column) not having sufficient travel. If this condition exists, serious damage can be done to transmission. *See LINKAGE ADJUSTMENT below.*

CHANNEL PLATE-TO-CASE SPACER (EXCEPT CADILLAC & OLDSMOBILE)

DESCRIPTION

The Dual-Coupling Hydra-Matic is a four speed hydraulically controlled planetary type transmission which is connected to the engine crankshaft through a fluid coupling, and is composed of the following control assembly, parking assembly, and drive units.

Control Valve Assembly—The control valve assembly consists of four individual assemblies connected to one main assembly: Coupling Valve Body Assembly, Shift Valve Body, Reverse Blocker Body, and Manual Control Valve Body Assembly.

Parking Assembly—A pawl actuated by linkage of manual control lever drops into teeth on outer diameter of the reverse planet carrier which is splined to output shaft of transmission and which prevents the output shaft from turning.

Front Unit—Drive parts of the front unit are the controlled fluid coupling, planetary gear set, and front sprag clutch.

Rear Unit—Drive parts of the rear unit are the planetary gear set, multiple disc rear clutch, rear sprag clutch, and the neutral clutch.

Reverse Unit—Drive parts of the reverse unit are the planetary gear set, reverse stationary cone, and reverse apply piston.

Overrun Clutch (Front Unit)—The overrun clutch is a single disc clutch connected to the front sprag clutch and is used to prevent the sun gear from rotating. This unit operates only when overrun braking is required in Dr. 3 range (1st & 3rd speed); Lo range (1st speed); and Reverse.

Lo Band (Rear Unit)—The Lo band is servo operated and is engaged only when transmission is in Lo range. Adjustment of this band is not required.

OPERATION

Transmission operation in each selector lever position is outlined below. In either "D" (Drive) position, operation varies with car speed and operating conditions.

Neutral Position: Front unit is in reduction (controlled coupling empty and sprag clutch holding). Rear unit is in neutral (neutral clutch released, rear clutch released and Lo band released). Reverse unit is in neutral (reverse cone clutch released).

Drive Left (Pointer to left of "D" on Cadillac & Pontiac. "Dr" on Oldsmobile. "D4" on Hudson, Nash, & Rambler):

First Speed—Front unit is in reduction (controlled coupling empty, sprag clutch holding). Rear unit is in reduction (neutral clutch applied, rear clutch released, sprag clutch holding and Lo band released). Reverse unit is in neutral (reverse cone clutch released). Total reduction is 3.97-1.

Second Speed—Front unit is in direct drive (controlled coupling is filled and sprag clutch released). Rear unit is in reduction (neutral clutch applied, rear clutch released, sprag clutch holding and Lo band released). Reverse unit is in neutral (reverse cone clutch released). Total reduction is 2.55-1.

Third Speed—Front unit is in reduction (controlled coupling empty, sprag clutch holding). Rear unit is in direct drive (neutral clutch applied, rear clutch applied, sprag clutch released and Lo band released). Reverse unit is in neutral (cone clutch released). Total reduction is 1.55-1.

Fourth Speed—Front unit is in direct drive (controlled coupling is filled, sprag clutch released). Rear unit is in direct drive (neutral clutch applied, rear clutch applied, sprag clutch released and Lo band released). Reverse unit is in neutral (cone clutch released). No reduction 1.00-1.(Direct Drive).

Drive Right (Pointer to right of "D" on Cadillac & Pontiac. "S" on Oldsmobile. "D3" on Hudson, Nash, & Rambler):

First Speed—Front unit is in reduction (controlled coupling empty, sprag clutch holding, overrun clutch applied). Rear unit is in reduction (neutral clutch applied, rear clutch released, sprag clutch holding and Lo band released). Reverse unit is in neutral (reverse cone clutch released). Total reduction is 3.97-1.

Second Speed—Front unit is in direct drive (controlled coupling filled, sprag clutch released, overrun clutch released). Rear unit is in reduction (neutral clutch applied, rear clutch released, sprag clutch holding and Lo band released). Reverse unit is in neutral (reverse cone clutch released). Total reduction is 2.55-1.

Third Speed—Front unit is in reduction (controlled coupling empty, sprag clutch holding, overrun clutch applied). Rear unit is in direct drive (neutral clutch applied, rear clutch applied, sprag clutch released and Lo band released). Reverse unit is in neutral (reverse cone clutch released). Total reduction is 1.55-1.

Lo Range (All Models):

First Speed—Front unit is in reduction (controlled coupling empty, sprag clutch holding, overrun clutch applied). Rear unit is in reduction (neutral clutch applied, rear clutch released, sprag clutch holding and Lo band applied). Reverse unit is in neutral (reverse cone clutch released). Total reduction is 3.97-1.

Second Speed—Front unit is in direct drive (controlled coupling filled, sprag clutch released, overrun clutch released). Rear unit is in reduction (neutral clutch applied, rear clutch released, sprag clutch holding and Lo band applied). Reverse unit is in neutral (reverse cone clutch released). Total reduction is 2.55-1.

Reverse Range: Front unit is in reduction (controlled coupling empty, sprag clutch holding, overrun clutch applied). Rear unit is acting as reverse idler (neutral clutch released, rear clutch released, sprag clutch released). Reverse unit is in reduction (reverse cone clutch applied). Total reduction is 4.31-1.

LUBRICATION

LUBRICATION INTERVALS: Check fluid level every 1000 miles (Hudson, Nash, Oldsmobile, & Rambler), every 2000 miles (Cadillac & Pontiac). Drain and refill every 25,000 miles (except Cadillac), every 12,000 miles (Cadillac, normal driving), 6000 miles (Cadillac, heavy duty driving).

▷ *CADILLAC DRAIN & REFILL INTERVAL CHANGE: The above fluid change intervals supersede previous instructions on all 1956-57 models.*

Recommended Lubricant: Use only GM Hydra-Matic Fluid or an Automatic Transmission Fluid Type "A" with "AQ-ATF" embossed on top of fluid container.

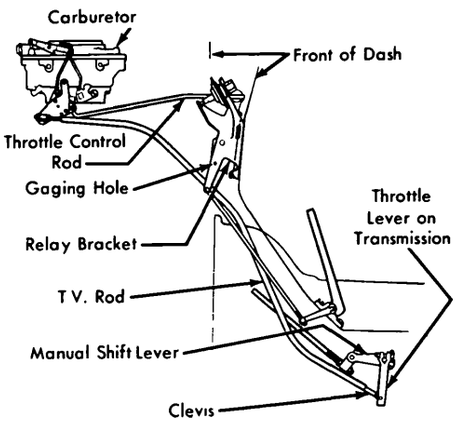
CHECKING FLUID LEVEL: With selector lever in "N" or "P" position, run engine at normal idle speed (except Cadillac); approx. 20 MPH (Cadillac), for 1½ minutes and check fluid level on dipstick. With engine still running, add fluid to bring level up to within ¼" of "F" (full) mark on dipstick. *CAUTION—do not fill above "F" mark on dipstick as this will cause foaming when transmission oil is hot.*

▷ *NOTE: Fluid level should be ¼" below "F" mark when cold and at the "F" mark when h t.*

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (C ntinu d)

DRAINING & REFILLING: Remove transmission oil pan drain plug and drain plug from flywheel or torus cover *(NOTE* - To gain access to flywheel or torus cover drain plug, remove flywheel housing front cover (Cadillac, Hudson, Nash, & Rambler), flywheel inspection plate (Oldsmobile), flywheel housing lower plate (Pontiac). Allow old fluid to drain completely and then reinstall plugs. *(CAUTION - Care must be taken not to damage flywheel or torus drain plug).* Pour 11 qts. (Oldsmobile), 8 qts. (all others) of Automatic Transmission Fluid Type "A" into transmission through filler tube on right side of transmission (tube is located under hood and also houses the dipstick). Run engine at 800 RPM (Cadillac), normal idle speed (all others) for 1½ minutes with selector lever in "N" (neutral). Add fluid as required to bring level to within ¼" of "F" (full) mark on dipstick. On Cadillac, reduce engine to idle speed before adding fluid.



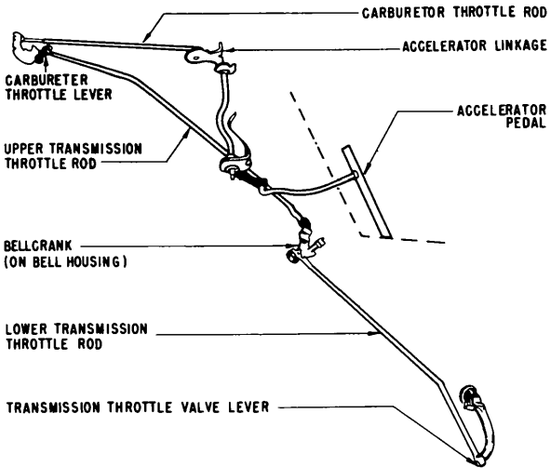
►*NOTE:-* Transmission oil capacity is approximately 12 qts. (Cadillac), 11½ qts. (Hudson, Nash, & Rambler), 11 qts. (Oldsmobile), 9½ qts. (Pontiac).

LINKAGE ADJUSTMENT

►*THROTTLE VALVE LINKAGE ADJUSTMENT NOTE: See "Carburetor" on individual car model pages for throttle valve linkage adjustment.*

CADILLAC

MANUAL LEVER LINKAGE ADJUSTMENT: Loosen the adjusting nuts on transmission manual rod and back off approximately 1". Place manual lever on transmission fully forward to "P" (Park) position. Place selector lever on steering column in "P" (Park) position. Slide clevis of manual lever along manual rod in direction of steering column until all slack in linkage is taken up *(NOTE*–If clevis contacts upper adjusting nut before all slack is taken up, nut should be backed off an additional amount). Tighten lower adjusting nut with fingers against clevis to further remove slack. Bring upper adjusting nut down to contact clevis and tighten with wrench. Check manual selector lever in car. It should be free to enter the "P" (Park) position and the "DR4" stop in the steering column should correspond to the "DR4" detent position in the transmission. Readjust if necessary. Check indicator pointer to see that it indexes to the "DR4" position when selector lever is at the "DR4" stop.

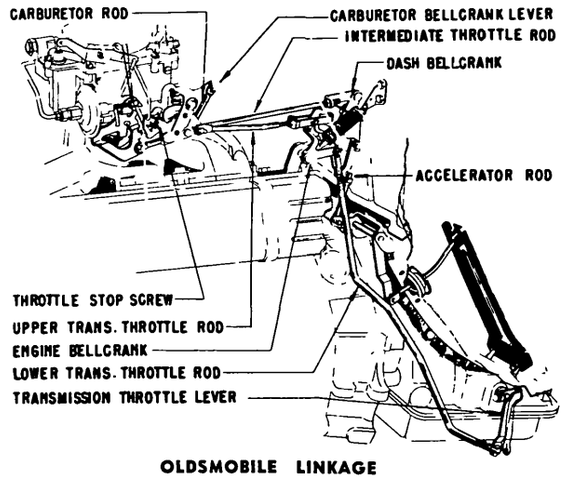


CADILLAC LINKAGE

Neutral Safety Switch Adjustment (Combination Neutral Safety Switch, Back-up Light Switch): Located on steering column forward of instrument panel. Loosen attaching screw on switch and position it on jacket so starter is not operative in any position except "N" (Neutral) or "P" (Park).

NASH, HUDSON & RAMBLER

MANUAL LEVER LINKAGE ADJUSTMENT: Place selector lever in the "D-3" position and set operating lever against stop on starter switch bracket. Remove clevis pin from gear shift control rod at side of transmission case and remove clevis from shift lever.



HUDSON, NASH & RAMBLER LINKAGE

Place transmission outer shift lever in "D-3" position. Adjust clevis so that clevis pin passes freely through hole in lever with the operating lever against stop on starter switch bracket, then remove clevis and **lengthen the control rod two full turns** and replace clevis and pin.

OLDSMOBILE

MANUAL LEVER LINKAGE ADJUSTMENT: Place transmission manual lever in neutral detent position. Disconnect manual rod from lower shift lever. Hold lower shift lever upward so selector lever is positioned against stop in upper steering column. Install pin in clevis and rotate clevis until pin enters bushing freely in lower shift lever. Install clevis and pin and tighten locknut. Move selector lever to "P" (Park) position and rock car to check for parking pawl engagement.

N utral Saf ty Switch Adjustment: Located on steering column forward of instrument panel. Loosen attaching screws on mast jacket, and with selector lever in

OLDSMOBILE LINKAGE

"N" (neutral) position, position the switch so that a .090" pin can be inserted through hole in switch arm and into hole in face of switch. Tighten switch attaching screws and remove pins. Check to see that starter will operate only in "P" (Park) and "N" (Neutral) positions, and that transmission is not in gear.

PONTIAC

►*1957 PONTIAC BIND OR DRAG DURING REVERSE OPERATION CORRECTION:* This condition may be caused by improper travel of gearshift interlock plate in slot at lower end of steering column. If sufficient overtravel of lower shift lever beyond the reverse detent position is not allowed, and shift lever is not fully into the reverse detent, the neutral clutch exhaust will be blocked, preventing release and possible burning of neutral clutch plates. Check interlock plate for length of shift lever slot on reverse end of travel. Slot in plate should extend inside of jacket opening (jacket opening should limit the travel). If slot is not correct, check linkage for correct travel of steering column lower shaft lever as follows: Place upper shift control lever and transmission lever in "P" (Park) position. With outer transmission shift lever trunnion nuts backed off clear of trunnion, pull shift rod down toward transmission as far as possible; and, while holding in this position, run trunnion upper nut down to just contact trunnion. Hold shift rod and shift transmission into "R" (Reverse) using upper shift lever. Observe position of upper trunnion nut. If nut is short of trunnion, rework interlock and adjust linkage as indicated below. If upper nut is contacting trunnion, count the number of turns upper nut can be backed off and still contact trunnion. If less than two turns, rework interlock and adjust linkage as indicated below. If more than two turns, screw nut down from "just contact" position to original or starting position and tighten lower nut (linkage will be correct).

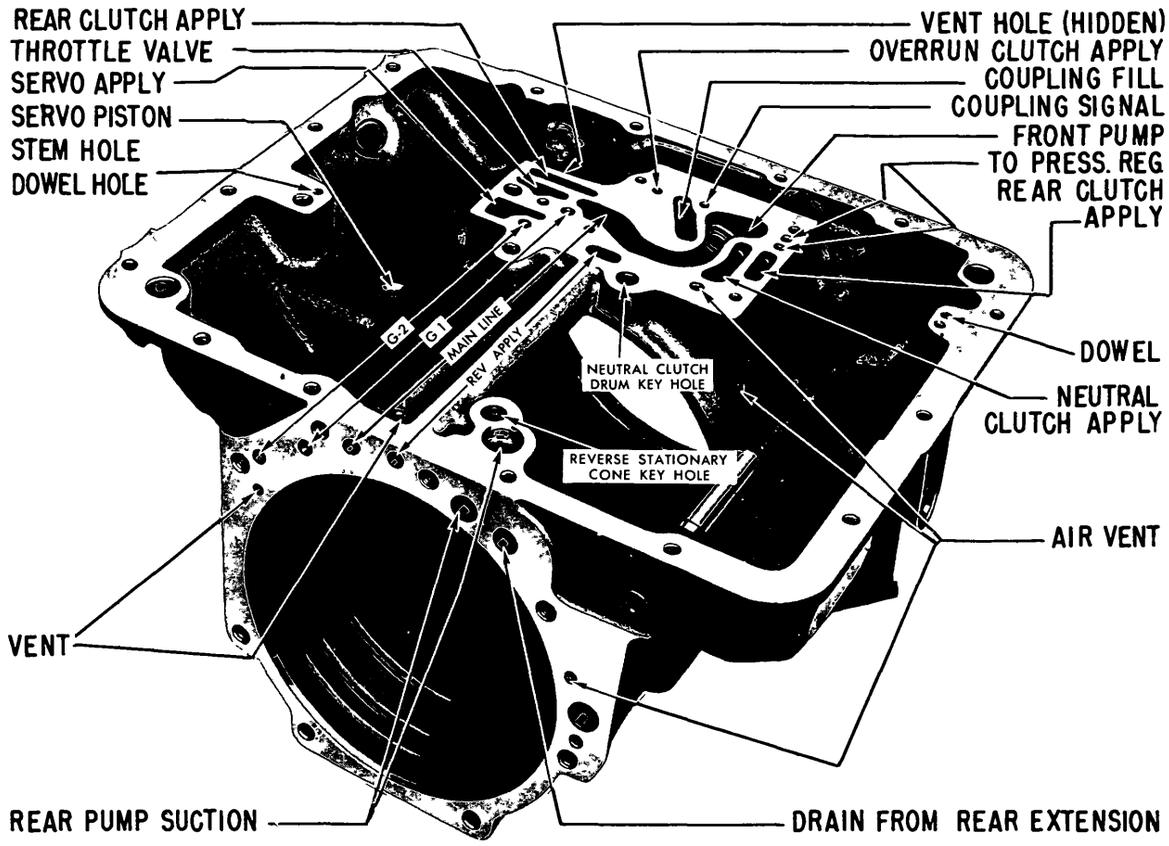
►*INTERLOCK REWORK FOR PROPER TRAVEL OF SHIFT LEVER: (See "Bind or Drag During Reverse Operation Correction" above).* Remove interlock plate

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (Continued)

from steering column jacket and lengthen slot to within at least ¼" (3/16" allowable) from end of plate. Reinstall interlock plate.

MANUAL LEVER LINKAGE ADJUSTMENT: Place selector lever and transmission manual lever in "P" (Park) position; and with outer transmission shift lever trunnion nuts backed off clear of trunnion, pull shift rod down toward transmission as far as possible. While holding in this position, run the upper trunnion nut down to just contact trunnion. Hold the shift rod and shift transmission into "R" (Reverse), and observe position of upper trunnion nut **(This is important).** If upper nut is short of trunnion, screw upper nut down to just contact trunnion, then turn down **two additional turns.** Tighten lower nut. If upper nut is contacting the trunnion, count number of turns nut can be backed off and still contact trunnion. If less than two turns, turn nut down **two turns** against trunnion from the "just contact" position, and lock lower nut. If more than two turns, turn upper nut down against trunnion from the "just contact" position to the original or starting position and lock lower nut. Check transmission parking lock with car on a grade or ramp for positive lock. *NOTE* - The shift indicator must not be off index more than .080" after linkage adjustment is completed.



Neutral Safety Switch Adjustment: Located at lower end of steering column in engine compartment. Loosen switch mounting screw and adjust switch bracket to a position where starter will not operate when ignition key is turned to start position. Place manual control lever in "P" (Park) position. Make certain that switch arm does not touch stop on switch bracket. Check to see that engine starts when selector lever is in "P" (Park), or "N" (Neutral) positions. Tighten mounting screw securely.

TESTING

ROAD TEST: Operate car over a test route and note performance and shift speeds. Select a test route that will provide for all types of operation. *See "Dual-Coupling Hydra-Matic" Shift Point Table for correct shift speeds.*

►*1ST SPEED & REVERSE TEST NOTE: See "Stall Test" below.*

2nd Speed Test: With selector lever in "Lo" range, make a full throttle start from a complete stop. The shift to 2nd speed should occur as indicated in "Shift Table" below, accompanied by a drop in engine RPM which then increases in second speed as full throttle opening is maintained. If a definite change from first to second speed is not noticed and engine speed does not drop but increases steadily, a malfunctioning front unit coupling is indicated. When the car is in second speed, permit the car to coast at zero throttle opening. If a definite engine braking effort is noticed, a malfunctioning overrun band is indicated. If transmission slips in second or misses second speed, the front unit coupling is not operating properly. If transmission slips in first and second on coast in "Lo" range, the overrun band is not operating properly.

TRANSMISSION AIR TEST POINTS

3rd & 4th Speed Test: Using the "Dr4" (Drive Left) range to obtain 40 MPH, move the selector lever to "Dr3" (Drive Right) range, forcing a downshift to third speed. Decrease car speed by use of the brakes while throttle is maintained in the open position and car speed is above 25 MPH. If engine RPM increases and the transmission has been satisfactory in reverse, first & second speeds, the rear unit clutch is slipping. If no excessive slip is felt, the rear unit clutch is operating correctly. The operation of the front unit clutch can be checked by bringing the car speed up to 30 MPH in "Dr4" range. With the car coasting in "Dr4" range, manually shift to "Dr3" range. If an immediate shift is felt which results in more braking effect on the car, then the overrun clutch is operating properly. If the manual lever is shifted from "Dr3" to "Dr4" range above 22 MPH with the car coasting and an immediate reduction of braking effort is obtained, then the clutch is releasing properly.

STALL TEST (EXC. OLDS. & PONTIAC): Use this test to check engine and transmission performance. Connect a tachometer to engine, then bring engine and transmission to normal operating temperature. Apply foot brake and set hand brake tightly. Place selector lever in "D" (Drive) position. Depress accelerator to floor and note engine speed. This should be 2100 RPM (Cadillac with single carb.), 2500 RPM (Cadillac with dual carbs.), 1760-1860 RPM (Hudson & Nash), 1675-1775 RPM (Rambler). *(CAUTION - Use extreme care when making this test and DO NOT HOLD THROTTLE OPEN MORE THAN ONE MINUTE, 15-20 SECONDS PREFERABLY. If engine speed exceeds maximum RPM, CLOSE THROTTLE IMMEDIATELY to avoid damage to transmission).* If engine speed not correct, make further tests as indicated below.

If Engine Speed Above Maximum: If engine speed continues above maximum speed as indicated above, it indicates that sprags are not holding properly, or there is slippage in the fluid coupling, damaged torus member, or defective front pump.

Check to Determine Which is Slipping - After above test, place selector lever in "R" position and test again. If slippage still occurs, fault is with front unit (or both front and rear units). If slippage does not occur, then all slippage (above) is in rear unit.

OIL PRESSURE TEST: Connect Oil Pressure Gauge

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (C ntinued)

J-2540 (Cadillac), J-2540-A (Hudson, Nash, & Rambler), J-4268-1 (Pontiac) to take off hole at bottom of rear pump using a hose and fitting. Drive car until transmission oil has reached normal operating temperature.

Zer Thrott Pressur (Hudson, Nash, Pontiac, & Rambl r): Check pressure in all ranges. Pressure should be 50 lbs. minimum in all ranges with a maximum variation of 10 lbs., (may be higher in reverse).

Z r Thrott Pr ssure (Cadillac): With transmission in 4th speed, and car above 20 MPH, oil line pressure should be 60-70 lbs.

Driv Right Pressure (Hudson, Nash, Pontiac, & Rambler): With transmission selector lever in "Drive Right" position and car speed at approximately 25 MPH, pressure should be 90-100 lbs. *NOTE* - Pressure at any speed is constant regardless of throttle pressure as throttle valve pressure is not used to modulate line pressure.

Drive Left Pressure (Hudson, Nash, Pontiac, & Rambler): While driving at 25 MPH, move selector lever to "Drive Left" position so that transmission will shift into 4th speed. Oil pressure should drop to 60-70 lbs. in 4th.

Full Throttle Pressure Test (Cadillac): In any drive range, pressure should be at least 20 lbs. higher than zero throttle pressure test reading (see above).

Rear Pump Pressure Test (Cadillac): Drive car at 40-45 MPH in 4th speed, then shift to neutral and turn engine off. Pressure should be at least 60 lbs.

Reverse Pressure Test (Cadillac, Hudson, Nash, Pontiac, & Rambler): Place selector lever in "R" (Reverse) position and apply foot brake. Increase engine speed to half throttle. The pressure range under these conditions should be 160-200 lbs. (Cadillac), 145-190 lbs. (Hudson, Nash, Pontiac, & Rambler).

DUAL-COUPLING HYDRA-MATIC (Continued)

TROUBLE SHOOTING & DIAGNOSIS

FORWARD DRIVE IN NEUTRAL: Manual linkage not adjusted correctly. Neutral clutch not releasing properly. Rear unit clutch not releasing properly. Overrun band not fully released.

REVERSE DRIVE IN NEUTRAL: Stationary cone sticking. Reverse piston not fully released.

NO DRIVE (Resulting in Neutral Condition): Front sprag clutch slipping. Front sprag clutch incorrectly installed. Rear sprag clutch slipping. Rear sprag clutch incorrectly installed. Neutral clutch apply restricted or leaking. Manual linkage incorrectly installed. Manual valve not engaged with valve pin. Low oil pressure.

NO DRIVE (Resulting in Stall Condition): Stationary cone sticking. Reverse piston not fully released. Front sprag clutch broken. Rear sprag clutch broken.

LOCKED-UP CONDITION IN REVERSE RANGE: Neutral clutch not releasing properly. Rear unit clutch not releasing properly. Overrun band not fully released. Rear sprag clutch incorrectly installed.

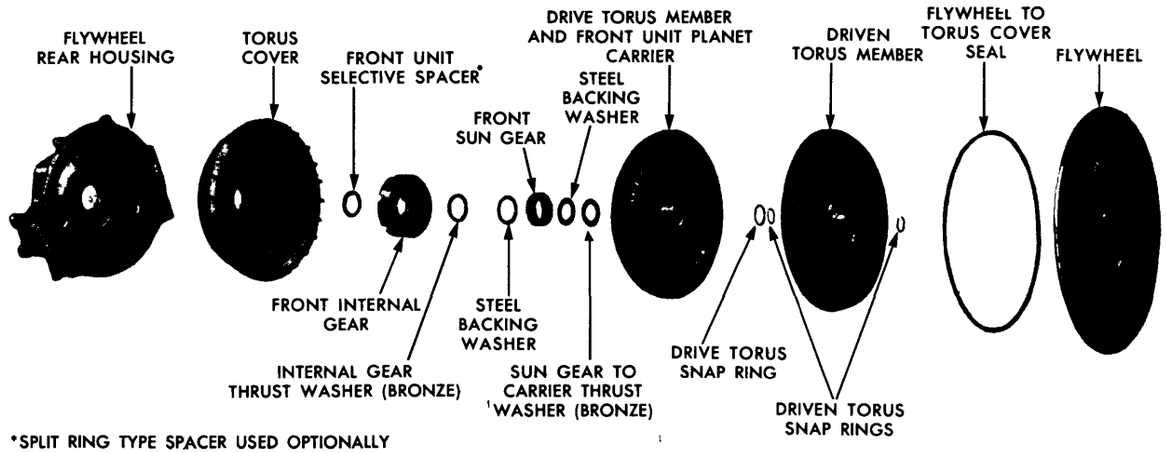
NEUTRAL CONDITION IN REVERSE RANGE: Reverse piston apply restricted or leakage. Stationary cone key missing.

NO REVERSE (Drive Slips): Reverse piston apply restricted or leaking. Low oil pressure. Manual linkage not adjusted correctly. Manual valve not engaged with valve pin. Front sprag clutch slipping or broken.

SELECTOR LEVER WILL NOT GO INTO REVERSE RANGE: Governor valves sticking or broken govenor oil seal rings. Reverse blocker piston stuck open.

SLIPS IN 1ST & 3RD IN "DR4" RANGE: Front sprag clutch slipping or broken.

SLIPS IN OR MISSES 2ND & 4TH: Front unit coupling cover seals leaking. Front unit coupling cover exhaust valves sticking or missing. Front unit coupling cover feed restriction or leak. Front unit coupling cover signal restriction or leak. Low oil pressure. Coupling valve sticking. Sticking valve or dirt in valve body.



SLIPS IN 1ST & 2ND (All Drive Ranges): Neutral clutch slipping or burned. Neutral clutch apply restricted or leaking. Incorrect number of clutch plates. Rear sprag clutch slipping or broken. Low oil pressure.

SLIPS IN 3RD & 4TH (In Both "Dr4" & "Dr3"): Rear clutch unit slipping or burned. Rear unit clutch apply restricted or leaking. Incorrect number of clutch plates.

SLIPS IN 3RD (In "Dr3" on Coast): Overrun clutch slipping or burned. Overrun clutch apply restricted or leaking. Sticking valve or dirt in valve body.

SLIPS IN 1ST & 2ND (In "Lo" on Coast): Servo apply restricted or leaking. Overrun clutch not anchored to case or broken. Servo piston binding in case or in servo and accumulator body. Overrun band facing worn or loose.

SLIPS IN 1ST (In all Driv Rang s): Front sprag clutch slipping or broken. Front sprag clutch incorrectly installed. Rear sprag clutch slipping or broken. Rear sprag clutch incorrectly installed. Neutral clutch slipping or burned. Neutral clutch apply restricted or leaking. Incorrect number of neutral clutch plates.

*SPLIT RING TYPE SPACER USED OPTIONALLY

DUAL-COUPLING HYDRA-MATIC FLYWHEEL REAR HOUSING & TORUS ASSEMBLY

NO UPSHIFTS: Governor valves sticking. Broken governor oil seal rings. Sticking valve or dirt in valve body.

MISSES 2ND SPEED: Amplifier valve sticking. Transition valve sticking. Sticking valve or dirt in valve body.

MISSES 3RD SPEED: Transition valve sticking. Sticking valve or dirt in valve body.

ROUGH 2-3 UPSHIFT: Trimmer valve stuck. Accumulator piston stuck. Accumulator gasket broken or leaking. Restricted or leaking oil passages. Broken accumulator spring. Broken or leaking accumulator piston oil seal ring.

LOCKS UP IN 3RD & 4TH: Rear sprag clutch broken.

LOCKS UP IN 2ND & 4TH: Front sprag clutch broken.

UPSHIFTS HIGH: Governor valves sticking. Leaking or restricted main line feed to governor. Broken governor oil seal rings.

UPSHIFTS LOW: Governor valves sticking. Broken governor oil seal rings. Sticking valve or dirt in valve body.

REMOVAL & INSTALLATION

CADILLAC

REMOVAL: 1) Place car on hoist or jack stands and drain cooling system. Disconnect battery and remove transmission filler pipe bracket from right cylinder head. Remove starter motor and slush deflector. Clean dirt away from pipe flange and slide filler pipe out of sleeve in transmission case. Remove lower flywheel front cover. Drain transmission at oil pan and flywheel.

2) Remove propeller shaft assembly. Remove intermediate frame crossmember below flywheel housing. Disconnect hoses at cooler and speedometer cable from extension housing. Remove throttle valve and manual levers from shafts.

3) Remove nuts from flywheel-to-drive plate screws. Place a jack under rear of engine oil pan, using a wood block to prevent damage to oil pan. Place transmission jack under transmission and raise it just enough to take strain off rear engine support.

4) Disconnect engine rear support at transmission extension housing, and remove crossmember that carries support. Lower transmission and engine below normal position and use a 5/8" universal socket and a 2½ ft. long, 3/8" drive extension to reach the upper flywheel housing to cylinder block bolts.

►*NOTE:* The above engine removal procedure supersedes previous instructions requiring the removal of upper flywheel housing-to-block by removing the access holes in floor pan. These floor pan holes are provided for use only when a damaged bolt may not be accessible.

5) Remove four remaining screws holding flywheel housing to engine. Remove flywheel housing and transmission as a unit by moving assembly toward rear of car, disengaging flywheel housing from locating dowels on engine, then tilting front of unit downward to lower it from car. Remove washer from pilot hole in crankshaft and four spacer washers from flywheel-to-drive plate screws.

INSTALLATION: 1) Install spacer washer in pilot hole in crankshaft and install spacer washers on flywheel-to-drive plate screws. Raise transmission into position carefully with transmission jack. Align drive plate with four torus cover screws, and dowel holes in flywheel housing with dowels on engine.

2) Install four lower flywheel housing-to-crankcase screws (be sure that flywheel is as far forward as possible). Install four nuts attaching drive plate to flywheel and tighten to 15-20 ft. lbs. Be sure drain plugs in flywheel and oil pan are tight.

3) With transmission and engine in a lower than normal position (same position used for removal), install and tighten upper flywheel-to-cylinder block bolts. Raise engine and transmission about one inch above normal

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (C ntinued)

height and install engine rear support bracket on frame. Lower transmission carefully and install support screws. Remove jack and block from engine pan.

4) Install flywheel housing front cover and starter motor. Install transmission filler tube with support bracket properly positioned on cylinder head. Install manual and throttle valve levers making sure that serrations on levers lineup with serrations on their respective shafts. Tighten securely. Install slush deflector and install speedometer cable. Connect hoses to cooler and tighten securely.

5) Install frame crossmember below flywheel housing. Install propeller shaft assembly, then lower car to floor. Connect battery and install filler pipe bracket to cylinder head screw. Fill cooling system. Fill transmission *(see "Draining & Refilling" above)*. Adjust manual and throttle valve linkage *(see "Linkage Adjustments" above)*.

HUDSON, NASH, & RAMBLER

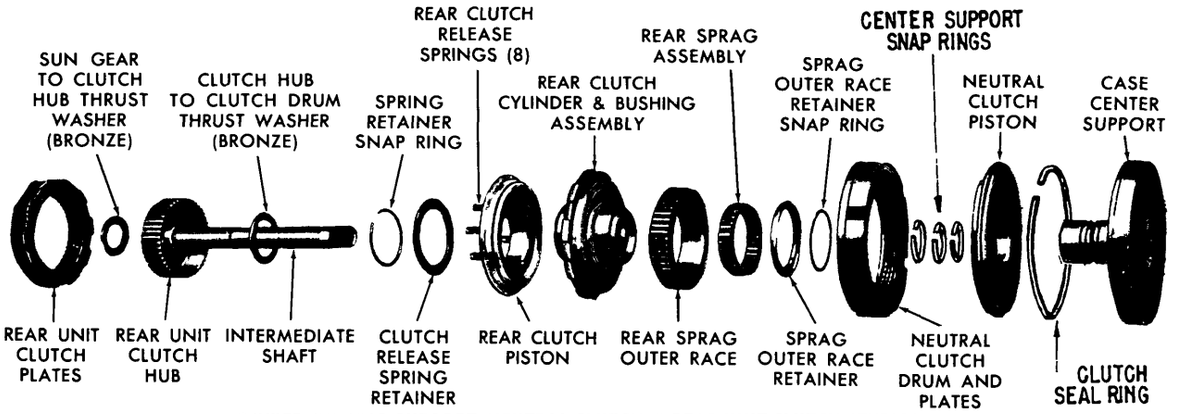
REMOVAL: Raise car sufficiently on car stands, supporting rear of car at side sills. Support rear axle with a hydraulic jack.

1) Drain flywheel and transmission oil pan *(see "Draining & Refilling"* above). Remove oil filler tube from oil pan. Disconnect oil cooler tubes at right side of transmission.

2) Disconnect hand brake cable at bell crank brake cable housing at bell crank bracket. Remove brake hose bracket from floor pan to prevent damage to hose. Disconnect speedometer cable and housing at transmission adapter.

3) Disconnect throttle rod assembly from throttle lever at transmission and bellcrank at bell housing. Disconnect manual control rod from lever at transmission.

4) Disconnect torque tube from rear bearing retainer, then move rear axle and torque tube assembly to the rear and separate by sliding universal joint to rear off splines of output shaft.



5) Support rear of engine to remove weight from rear engine support cross member. Remove plate from flywheel housing and remove six nuts retaining flywheel and torus assembly to engine flex plate, Place a hydraulic jack. with Tool J-6130 under transmission. Disconnect flywheel housing-to-engine attaching bolts.

6) Disconnect the cross member from rear engine supports and from body side sills. With jack handle toward rear of car, raise the jack slightly to remove strain or bind from bolts fastened to flex plate. Move transmission assembly to rear and lower assembly after six bolts have been withdrawn from engine flex plate.

INSTALLATION: Reverse removal procedure and note the following:

1) Coat torus pilot with lubriplate. Exercise caution when entering torus pilot into flywheel.

2) Line up the two torus covers with clearance holes in flywheel or flex plate when retaining nuts are tightened. *CAUTION* - If these dowels are not lined up, they can be forced out and damage the bell housing.

CENTER BEARING SUPPORT, NEUTRAL CLUTCH, & REAR UNIT CLUTCH (TYPICAL)

OLDSMOBILE

REMOVAL: 1) Disconnect battery and remove transmission oil filler tube. Raise car with all four wheels off floor. Drain transmission *(see "Draining & Refilling" above)*. Disconnect speedometer cable at transmission.

2) Disconnect manual and throttle valve linkage and remove throttle lever. Remove crankcase lever outlet tube. Scribe a line from one propeller shaft center bearing support-to-frame bolts on frame member to aid in aligning center bearing support at installation.

3) Remove propeller shaft center bearing support bolts and shims (mark shims for installation at the same location). Disconnect front universal joint at transmission. Raise center bearing so it will clear frame member and, slide front propeller shaft and bearing assembly approximately 2" to rear on slip joint (bearing mounting plate will rest on frame and keep propeller shaft from dropping down).

4) Remove starter and lower flywheel housing. Support transmission with a transmission hoist and adapter. Raise engine enough to relieve weight from rear engine mounts and remove engine mount-to-crossmember bolts. Remove crossbar to frame attaching bolts and remove crossmember.

5) Remove torus oil plug and drain torus, reinstall plug and tighten to 6-7 ft. lbs. Install engine support bar (Tool 30-13), with support screw pilots seated into lower flywheel housing front attaching screw holes. *NOTE* - Locate support bar forward on frame so transmission will clear when it is lowered.

6) Lower transmission hoist until it is free of transmissions, then lower engine (using support bar adjusting screws), NOT TO EXCEED 1½", to permit removal of the two upper bell housing-to-block bolts. Disconnect oil cooler hoses at lines and cap lines immediately.

7) Raise transmission hoist to contact transmission, supporting it slightly. Remove the four flex plate-to-flywheel nuts (note position of flywheel dowels in relation to the flex plate). Remove remaining flywheel housing-to-block bolts. Move transmission to rear approximately ¾" to clear dowels (standard thread holes adjacent to dowels are provided for installing bolts to push flywheel housing off dowels). Lower transmission from car.

INSTALLATION: Reverse removal procedure and note the following:

1) Lubricate crankshaft pilot bore and wick in pilot bore with Synthetic Oil Seal Lubricant, Part No. 567196.

2) To assemble flex plate to flywheel, align one dowel in flywheel with the small recess adjacent to small ear in flexplate, then cross tighten flex plate-to-flywheel attaching nuts to 17-22 ft. lbs. Tighten oil pan drain plug.

3) Use a 4" "C" clamp to hold bearing against spider journals and obtain clearance of bearing snap rings when installing front propeller shaft to companion flange on transmission. Tighten "U" bolt nuts to 18-22 ft. lbs.

4) Refill transmission. *See "Draining & Refilling" above.*

PONTIAC

REMOVAL: 1) Drain cooling system and remove transmission oil level indicator. Drain transmission oil pan (torus assembly can be drained at same time or it can be drained after transmission removed).

2) Disconnect rear universal joint from differential companion flange and slide propeller shaft from transmission output shaft. Disconnect speedometer cable from driven gear.

3) Remove flywheel housing bottom cover and crankcase ventilator outlet filter. If car is equipped with dual exhaust system, the right hand exhaust pipe must be removed (it is not necessary to disturb the exhaust system on cars with single exhaust).

4) Disconnect rear engine insulators from rear engine support cross member. Using Engine Fixture J-4732, raise rear of engine until insulators are about 1/2" above cross member *(CAUTION–Do not raise engine more than necessary to remove cross member).*

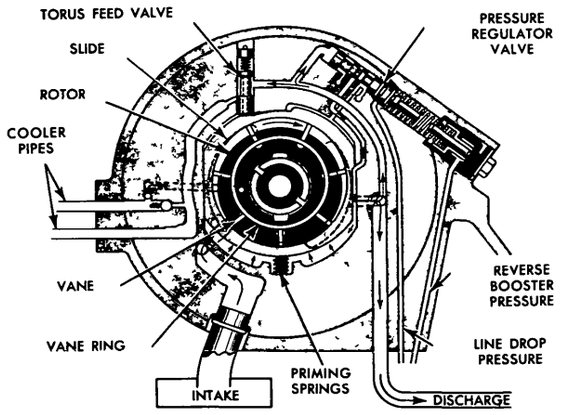
5) Loosen transmission filler pipe to cylinder head clamp. Remove transmission throttle control lever and disconnect manual control rod from transmission lever. Remove engine rear support cross member.

6) Remove nuts from six torus cover and flywheel-to-flex plate attaching bolts. Disconnect water hoses from oil cooler. Push transmission filler pipe upward out of transmission.

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (Continued)

7) Lower engine about 1½" below its normal position and position special automatic transmission jack under transmission and raise transmission slightly to take load off rear flywheel housing attaching screws. Using 18" to 22" socket extension, remove screws attaching flywheel housing. Work transmission rearward to disengage dowels from front flywheel housing, then lower transmission from car.



INSTALLATION: 1) With transmission on special automatic transmission jack, raise it under car until engine flex plate and transmission flywheel and torus cover are at the same level. Rotate torus cover until dowels in cover and flywheel are aligned with holes in flex plate (torus cover and flex plate can be fastened at either of two positions). Move transmission into position engaging flywheel dowels into flex plate and rear flywheel housing dowels into front flywheel housing.

2) Install and tighten two rear flywheel housing attaching screws (*NOTE* - Check to see that flywheel and torus cover are free to move back and forth slightly. If pilot on flywheel has entered end of crankshaft properly, some movement should be possible).

3) Rotate flywheel to position one flex plate mounting pad down. Push forward slightly on flywheel to seat it against crankshaft. Measure clearance between pad on flex plate and flywheel, using feeler gauges. Clearance should be .013-.024". If clearance is outside these limits, install shims as follows:

If Clearance Less Than .013" - Move transmission away from engine and install a special spacer, Part No. 522975 over flywheel pilot which fits into crankshaft. Move transmission back into place, install and tighten flywheel housing attaching bolts. Recheck clearance (which will be greater than .024") and install correct shims as indicated below.

If Clearance More Than .024" - Insert shims, Part No. 523087 (.011"), and Part No. 523088 (.030") to reduce clearance between pad and flex plate to .013-.024", at each of the six pads. Coat shims with petrolatum so they will remain in position. Do not install nuts until shims have been installed at each attaching pad as it will cock the assembly giving a false measurement of clearance at the other pads.

FR NT PUMP & REGULATOR VALVE (TYPICAL)

4) Remove plugs from oil cooler adapter and fasten adapter to transmission case. Remove special transmission jack. Raise engine until transmission touches floor pan (using Support Fixture J-4732). Install engine support rear crossmember. Install bolts, washers, and nuts and tighten securely. Lower engine into position and fasten insulators to crossmember.

5) Install nuts which retain flex plate to flywheel and torus cover and tighten to 15 ft. lbs. using torque wrench with adapter J-6498. Install crankcase ventilator outlet filter and flywheel housing bottom cover. Slide filler pipe into place in transmission, making sure shoulder on filler pipe is seated against sleeve which extends out of transmission case. On cars with dual exhaust, replace right hand exhaust pipe.

6) Replace outer shift lever and outer throttle lever. Connect speedometer cable to driven gear. Install propeller shaft, then lower car to floor. Fasten transmission filler pipe clamp to cylinder head after making sure pipe is fully seated in transmission. Fill transmission with automatic transmission fluid (*see "Draining & Refilling" above*). Adjust throttle valve linkage and manual control linkage (*see "Linkage Adjustment" above*).

TRANSMISSION OVERHAUL

►CHANGES, CAUTIONS, CORRECTIONS

►*1957 MANUAL VALVE BODY PRODUCTION CHANGE (EXCEPT CADILLAC & OLDSMOBILE):* The manual valve body and channel plate-to-case spacer has been changed to decrease neutral clutch apply oil in "Reverse". Only the later type parts will be available for service replacement. When installing a new manual valve body, the later type spacer plate must be used. The later type spacer plate can be used with either early or later manual valve bodies. See illustration for identification of channel plate-to-case spacer.

TRANSMISSION UNIT REMOVAL (TRANSMISSION IN CAR)

►*REMOVAL OF TRANSMISSION UNITS NOTE: The following transmission units may be removed without removing transmission assembly fron car. Note the following points and see "Disassembly" below, for removal procedure.*

MAIN CONTROL VALVE BODY (ALL MODELS): Remove in usual manner after removal of oil pan.

EXTENSION HOUSING (HUDSON, NASH & PONTIAC): *OLDSMOBILE NOTE*–While the extension housing cannot be removed from transmission, it can be moved rearward far enough to gain access to the following indicated units that would normally require extension housing removal.

GOVERNOR ASSEMBLY (EXCEPT CADILLAC): Remove extension housing. See Oldsmobile Note above.

REAR OIL PUMP (HUDSON, NASH & PONTIAC): On Oldsmobile, the rear oil pump can be moved rearward and rotated sufficiently to remove parking brake pawl bolt.

REVERSE PARTS (HUDSON, NASH & PONTIAC): After removing rear extension housing, reverse parts can be removed.

PARKING BRAKE LINKAGE (ALL MODELS): On Oldsmobile, see "Rear Oil Pump" above.

INSIDE DETENT & THROTTLE LEVERS: Requires removal of outside throttle control and manual levers and also of oil pan, oil screen and intake pipes.

REAR SEAL IN EXTENSION HOUSING (EXCEPT CADILLAC): On Pontiac, the slide hammer used for seal removal must be inserted through shaft tunnel in frame. When installing the seal, use an extension on the installing tool so it can be used through frame shaft tunnel.

ACCUMULATOR & SERVO (ALL MODELS): Can be removed without disturbing the main control valve assembly.

TRANSMISSION DISASSEMBLY

►*TRANSMISSION DISASSEMBLY NOTE: Instructions below cover removal of sub-assemblies from transmission case. See "OVERHAUL OF UNITS" for disassembly, inspection, and reassembly of these sub-assemblies.*

OIL COOLER, TORUS ASSEMBLY & FLYWHEEL REAR HOUSING: Disconnect oil cooler pipes from transmission cooler adapter plate, remove two bottom extension housing attaching screws and remove oil cooler.

1) Mark flywheel and torus cover so flywheel can be reinstalled in same position and remove torus cover to flywheel attaching nuts and remove flywheel. Remove and discard the "O" ring seal from flywheel.

2) Remove snap ring retaining driven torus to mainshaft, and remove driven torus member with check valve and spring. *NOTE*–If torus member sticks, tap end of mainshaft with soft hammer and at same time pull out torus member.

3) Remove inner snap ring locating driven torus member to mainshaft. Remove snap ring retaining drive torus member to intermediate shaft, and remove drive torus member. *CAUTION–Do not attempt to remove torus cover and driving torus member together.*

4) Remove front unit sun gear to drive torus hub bronze thrust washer and steel backing washer. Remove front unit sun gear from shaft of front unit coupling driven torus member. Remove sun gear to internal gear steel backing washer. Leave staked bronze thrust washer in internal gear. Remove internal gear.

5) Remove torus cover assembly (*CAUTION*–Do not attempt to remove torus cover by pulling or pushing in a rough manner as this may result in a damaged oil seal. Work hub of torus cover back through oil seal, pulling torus cover out with even pressure).

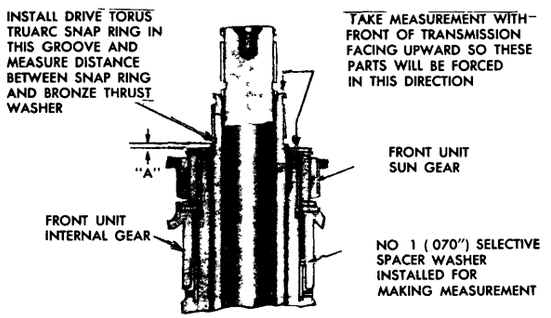
6) Remove selective spacer washer from front unit drive torus hub (spacer may have remained in internal gear). Spacer may be either a solid or split ring.

7) Install Front Seal Protector J-6119 to protect front oil seal and bushing when removing flywheel

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (Continued)

housing. Remove flywheel housing from front of transmission case. *NOTE*–On Pontiac models, leave engine insulators attached to flywheel housing.



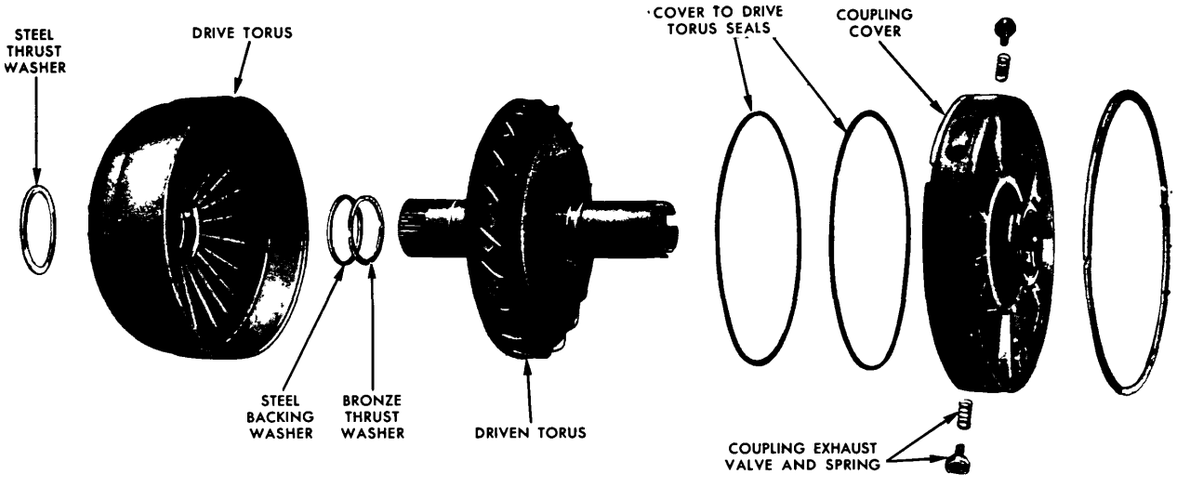
8) Remove Front Seal Protector and remove housing-to-case "O" ring seal.

MAINSHAFT ENDPLAY CHECK: *NOTE–Check and record the mainshaft endplay as it is necessary for the selection of proper selective washer at reassembly.* 1) Install collar of Endplay Checking Fixture J-6127 on intermediate shaft and secure in position by installing snap ring on mainshaft. Install Dial Indicator Support J-6126 and a dial indicator.

2) Move mainshaft back and forth th check endplay of mainshaft. Record the amount of endplay.

►*NOTE:* In order to find the actual endplay of the rear unit, it will be necessary to measure endplay of sun gear on mainshaft after transmission has been disassembled. This dimension must then be subtracted from mainshaft endplay to determine proper selective washer to be used.

3) Remove dial indicator and endplay checking fixture.



MAINSHAFT ENDPLAY CHECK PROCEDURE

FRONT UNIT ENDPLAY CLEARANCE: *(NOTE–This measurement must be made with transmission in vertical position with front end upward).* 1) Install a No. 1 (.0695–.0705") selective spacer washer over front unit driven torus hub in place of the washer removed at disassembly *(NOTE–The No. 1 washer must be used for gauging purposes).* Install front unit internal gear over front unit driven torus shaft against spacer washer.

2) Install bronze thrust washer and steel backing washer in front unit internal gear (steel washer has splines which engage splines of driven torus shaft). Install front unit sun gear and install steel and bronze thrust washers over intermediate shaft against sun gear. Install drive torus Truarc snap ring in groove on intermediate shaft nearest to bronze thrust washer.

3) Push intermediate shaft and sun gear firmly to rear of transmission to make sure all end play is taken up. Push snap ring down against bottom of groove and very carefully measure clearance between snap ring and bronze thrust washer using a set of feeler gauges. *CAUTION–Feeler gauge must be flat against the thrust washer to obtain an accurate reading.*

DUAL-COUPLING HYDRA-MATIC FRONT UNIT COUPLING (TYPICAL)

4) Compare measurement with feeler gauge with spacer washer chart (below) to determine the correct selective spacer washer to use. (For example: If measurement is found to be .067", a number "6" selective spacer washer should be used when transmission is reassembled). Check number on original spacer which was removed from transmission. It should be the same as the number found on the chart. If not, a new spacer washer must be used at reassembly. Record identification number of required spacer for use at reassembly.

Selective Spacer Washer Chart

Spacer No.	Dimension "A" ①	Thickness
1	.024-.031"	.0695-.0705"
2	.032-.039"	.077-.079"
3	.040-.047"	.085-.087"
4	.048-.055"	.093-.095"
5	.056-.063"	.101-.103"
6	.064-.071"	.109-.111"
7	.072-.079"	.117-.119"
8	.080-.087"	.125-.127"
9	.088-.095"	.133-.135"
10	.096-.103"	.141-.143"
11	.104-.111"	.149-.151"
12	.112-.119"	.157-.159"
13	.120-.127"	.165-.167"
14	.128-.135"	.173-.175"

① - See feeler gauge (Dim. "A") in illustration.

5) Remove Truarc snap ring, sun gear with bronze and steel thrust washers, internal gear with bronze and steel thrust washers, and .070" selective space washer.

FRONT UNIT COUPLING, PRESSURE REGULATOR & COOLER ADAPTER: 1) Rotate transmission to horizontal position with oil pan upward. Remove front coupling assembly from transmission case. Remove pressure regulator assembly from side of transmission.

2) Remove oil cooler adapter, with gasket, from side of transmission case. Remove two oil cooler sleeves and seals by pulling from case.

OIL PAN, OIL SCREWS & INTAKE PIPES: Remove oil pan and gasket. Remove screw holding front pump intake pipe clamp and remove pipe and clamp from pump screen. Remove "O" ring seal from pump. Remove oil screen and rear pump intake pipe and "O" ring seal.

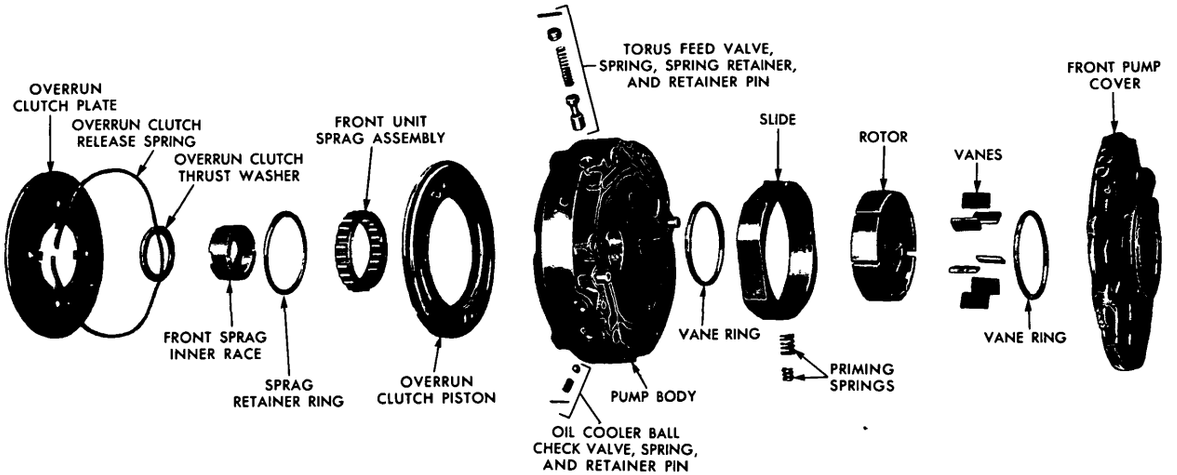
CONTROL VALVE, SERVO & ACCUMULATOR: Remove screws holding servo and accumulator assembly to case *(NOTE–Servo piston is spring loaded),* and remove servo and accumulator assembly and servo spring. Remove five remaining control valve assembly screws and remove control valve assembly. *CAUTION –Do not drop manual control valve.*

FRONT PUMP & OVERRUN CLUTCH: 1) Remove front pump locking screw and lockwasher located under control valve assembly.

►*FRONT PUMP CLEARANCE CAUTION:* When front pump is removed, check clearance between pump bushing and front unit driven torus shaft. This clearance must not exceed .003", using a 1/2" wide feeler. If a .004" feeler can be inserted, the front unit driven torus member and the front pump should be replaced. If the inner sprag race is not the late type which can be identified by an "O" or "S" in the recess in tang end, it should be replaced.

2) Remove the two front pump cover-to-body screws and the three front pump-to-case support attaching screws. Install two Slide Hammers J-6125 into two opposite cover-to-body screw holes in front pump and remove front pump assembly from case. *NOTE*–Front sprag inner race may stick in pump. Be careful not to drop it when pump is removed

3) Remove overrun clutch release spring and front sprag inner race if it did not come out with pump. Remove clutch overrun plate and clutch thrust washer. Install Rear Unit Clutch Retainer J-6135 with set screw end toward front and lock securely.



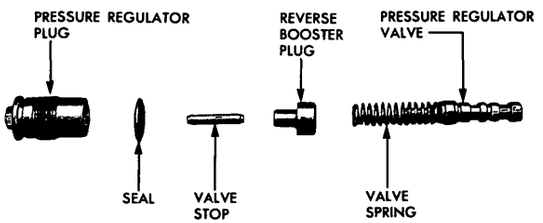
CENTER BEARING SUPPORT, NEUTRAL CLUTCH & REAR UNIT ASSEMBLY: 1) Remove speedometer driven gear from rear extension housing. Remove large snap ring retaining center bearing support. Position transmission horizontally, bottom side up.

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC C ntinu d)

2) Remove extension housing and gasket. If housing sticks, tap lightly with a soft hammer. Remove governor assembly by pulling governor out of rear housing (Governor drive key may not remain with governor).
3) Remove breather pipe clamp screw from rear of transmission case and carefully pry breather pipe out of pump body. Remove rear pump locating screw (located to right of pump cover, facing pump, and is inset into pump body). Remove pump attaching screw (This screw is located to left of governor bore and is the center screw of the three in that area).
4) Remove rear bearing snap ring from output shaft. If necessary, remove two opposite rear pump cover screws and install Slide Hammers J-6125 and remove rear pump, and reverse clutch piston assembly and gasket. Remove special tools.
5) Remove large wave-type reverse piston release spring, reverse internal gear and tang-type reverse clutch release spring (*NOTE*–Tangs on reverse clutch release spring point outward toward rear of transmission.
6) Remove reserse planet carrier outer snap ring from output shaft. Remove reverse stationary cone (take care to prevent binding), and remove cone key from case. Remove reverse planet carrier while lifting up on output shaft.
7) Remove center bearing support locking screw from side of transmission case. Remove center bearing support, neutral clutch and rear unit as an assembly by sliding complete assembly toward front of transmission. If assembly is tight in case, use Slide Hammers J-6125 with adapters, to insert into center bearing support and pull entire assembly forward. Remove entire assembly and position into Clutch Unit Holding Fixture J-6116, with output shaft down.

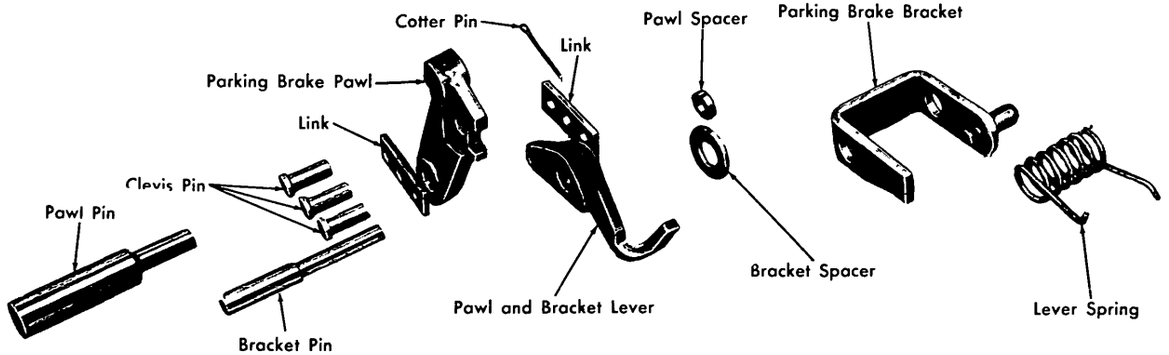
PARKING BRAKE ASSEMBLY, OVERRUN BAND, NEUTRAL CLUTCH DRUM STATIONARY STOP KEY AND INSIDE DETENT AND THROTTLE CONTROL ASSEMBLY: **1)** Remove stationary stop key from case. Unhook overrun band end from anchor inside of case and rotate band to horizontal position with band ends facing rear of case. Remove band through front of case.
2) Remove inside detent control and inside throttle control lever assembly as follows: Remove snap ring retaining detent control lever to case. Remove lever assembly and outer and inner washers. Remove "O" ring seal from case counterbore.
3) Disconnect parking brake lever spring and remove bracket and spring. Install 3/8" bolt into parking brake pawl pin and remove pin and spacer. Remove spacer, lever and pawl as an assembly.



FRONT PUMP AND OVERRUN CLUTCH ASSEMBLY (TYPICAL)

OVERHAUL OF UNITS

PRESSURE REGULATOR: Disassembly–Remove pressure regulator valve stop pin from reverse booster plug and remove booster plug from regulator plug. Remove "O" ring seal from pressure regulator plug.
Inspection: Inspect all passages for dirt or metal chips and all parts for burrs or other damage. Burrs can be removed with crocus cloth and oil. Replace all damaged parts.
Reassembly: Install new "O" ring seal and reverse disassembly procedure.

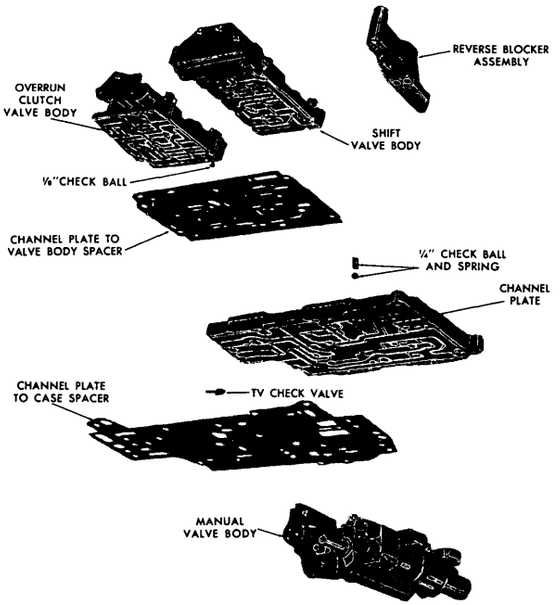


FRONT PUMP: Disassembly–1) Remove front sprag inner race if still in pump and remove pump cover from body. Remove retaining pin, torus feed valve, spring and retainer.
2) Remove front pump rotor along with top vane ring. Remove 7 vanes and bottom vane ring (vanes may remain in rotor). Remove slide by pushing slide toward priming springs, then lift out of body at opposite end. Note position. Remove inner and outer priming springs.
3) Turn pump body over and remove spiral type snap ring retaining front sprag to pump body and remove sprag assembly. (*NOTE*–If outer sprag is damaged, the oil pump assembly must be replaced). Mark overrun clutch piston and pump body for proper reassembly, and remove clutch piston from pump body. If piston sticks, use a soft hammer and tap around outer rear edge of pump body.
4) Remove interlocking oil seal ring from front pump cover.

PRESSURE REGULAT R VALVE

Inspection: Using a small diameter wire, inspect all passages for dirt or restrictions. Check slide for excessive wear or scoring and make sure that it moves freely in pump body. Check freeness of vanes in rotor slots (pump vanes will have a tendency to show a polished surface on the side bearing against the front pump slide, if not excessive, this is a normal condition). Check torus slide valve priming springs for free movement in bores. Check bushing for scores or flaking (a normal wear can be noticed on bushing surface which if not excessive is a normal condition). Examine pump body and pump cover slide surface contacts for smoothness. Clean all parts thoroughly before assembly.

CONTINUED ON NEXT PAGE

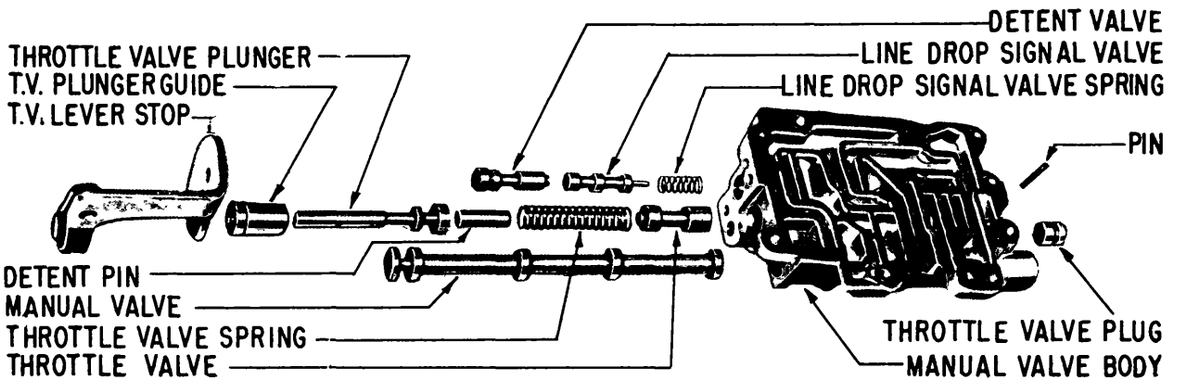


DUAL-COUPLING HYDRA-MATIC PARKING BRAKE ASSEMBLY

DUAL-COUPLING HYDRA-MATIC (Continu d)

►*FRONT SPRAG CLUTCH FAILURE CORRECTION:* In the event of front sprag clutch failure it is recommended that in all cases the following parts should be replaced: Front Pump, Front Sprag Assembly, Front Sprag Inner Race, Front Unit Driven Torus Member Assembly. Inspect all other adjacent parts and replace where needed.

R ass mbly: 1) Check location mark on pump body and overrun clutch piston, align and install piston into pump body (insert one side of oil seal ring and position in cavity). At same time, work around ring, compressing and seating it in pump cavity. Do not force clutch piston into cavity. If sticking occurs, dowels and holes are not correctly aligned.



CONTROL VALVE ASSEMBLY (TYPICAL)

2) Install sprag assembly into rear body with rim of sprag facing up, and check rotation of sprag by inserting inner race. Then remove inner race. Install spiral type snap ring retaining sprag assembly to body. Install interlocking oil seal ring on front pump cover.

3) Insert inner and outer priming springs in pump body. Position pump slide into pump body toward priming spring. Compress priming springs with slide and drop slide into cavity of pump.

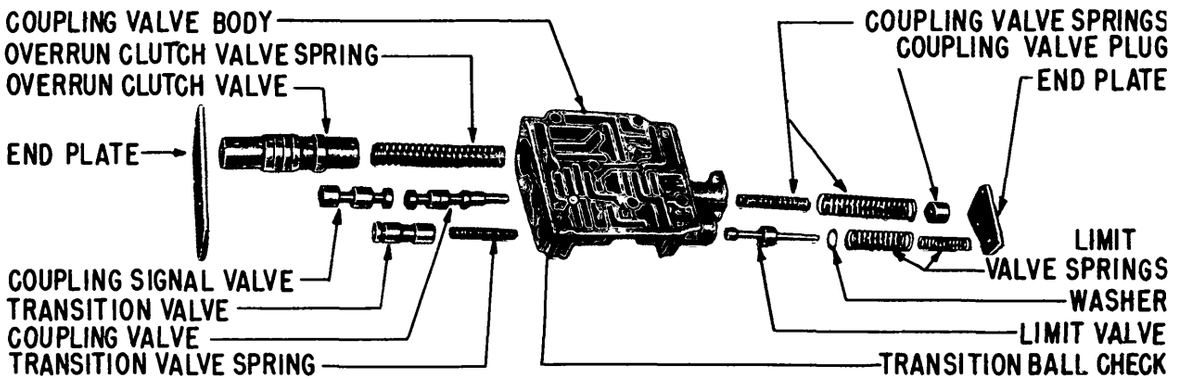
4) Insert bottom vane ring, locating it concentrically with slide bore. Install rotor with drive slots up and install 7 vanes in rotor slots (make certain vanes fit between bottom vane ring and slide). *NOTE*–Check edges of vanes for wear pattern. One edge of vane will be polished full length. This edge should face the slide.

5) Install top vane ring on rotor, centering it between vanes. Install torus feed valve, spring, retainer and retainer pin. Make sure that valve moves freely. Check for free rotation of rotor and that all parts in pump are positioned correctly. Install check valve ball, spring and retaining pin and install cover to pump body. *NOTE* –Leave two opposite cover screws out for later insertion of slide hammers.

MANUAL VALVE ASSEMBLY (TYPICAL)

CONTROL VALVE: The control valve assembly consists of four individual assemblies connected to one main channel plate. Each individual part of the control valve assembly should be disassembled and reassembled separately to avoid confusion of component parts.

►*CONTROL VALVE DISASSEMBLY & REASSEMBLY CAUTION: The number of individual valves and springs in each of the control valve bodies may vary with the make of car. Following illustrations are typical of all makes and care should be exercised when disassembling to identify all parts in relation to their location in the valve body.*



Coupling Valve Body: Removal & Disassembly - Remove coupling valve body making sure not to lose transition check ball (*NOTE* - Support valve assembly to prevent damage to channel plate case spacer). Remove coupling valve rear end plate being careful of limit valve spring tension. Remove inner and outer limit valve springs, coupling valve spring and plug, and limit valve and washer. Remove coupling valve front plate and remove transition valve and spring, coupling valve (some assemblies may have two separate valves within the one bore) and overrun control valve and spring (some assemblies may not contain the spring).

►*INSPECTION NOTE: See "Control Valve Inspection" below.*

Reassembly & Installation - Insert overrun control valve (and spring if used) into large bore in body. Insert transition valve and spring into valve body. Install coupling valve (two valves and additional valve springs may be be used on some cars). Install coupling valve front end plate and install coupling valve spring (or springs). Install limit valve and washer and inner and outer limit valve springs. Position coupling valve plug on spring and install coupling valve rear end plate (*NOTE* - Make certain limit valve springs are aligned properly after tightening screws). Install coupling valve assembly to channel plate using petrolatum to hold transition ball check in place.

Shift Valve Body: Removal & Disassembly - Remove shift valve body. If coupling valve body has been removed, remove spacer plate (*NOTE* - When removing spacer plate be sure not to lose check ball and spring).

CONTINUED ON NEXT PAGE

COUPLING VALVE ASSEMBLY (TYPICAL)

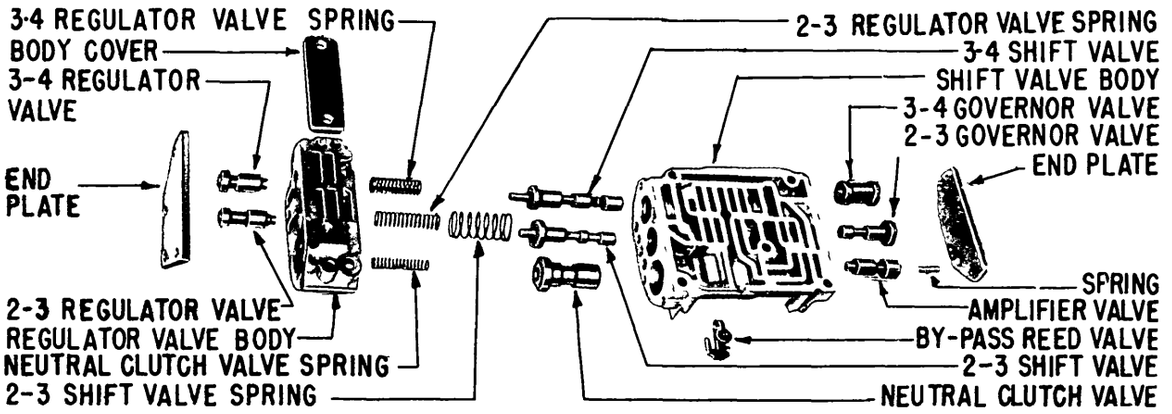
DUAL-COUPLING HYDRA-MATIC (C ntinu d)

Remove shift valve body end plate, 3-4 governor valve, 2-3 governor valve, amplifier valve spring and valve. Remove regulator valve body plate and body. Remove 3-4 throttle valve regulator valve, and 2-3 throttle valve regulator valve, then remove regulator valve body cover. Remove neutral clutch valve and spring 2-3 throttle valve (inner) and shift valve (outer) springs. Remove 3-4 throttle valve regulator spring. Remove 2-3 and 3-4 shift valves.

►*INSPECTION NOTE: See "Control Valve Inspection" below.*

Reassembly & Installation - Install 2-3 and 3-4 shift valves, neutral clutch valve, then install 3-4 throttle valve regulator valve spring, 2-3 throttle valve (inner) and shift valve (outer) springs. Install neutral clutch spring. Install 3-4 throttle valve regulator valve in regulator body and install 2-3 throttle valve regulator valve. Install regulator valve body plate on regulator valve body. Install assembly on shift valve body and install attaching screws. Install regulator valve body cover. Install 3-4 governor valve with large end inward. Install 2-3 governor valve, amplifier valve and spring, and shift body end plate. Install by-pass reed valve, then install shift valve body to control valve assembly.

R v rse Blocker Body: Removal & Installation - Remove reverse blocker body from manual valve body. Remove hairpin clip retaining detent plunger and remove detent plunger and spring from body. Remove reverse blocker retaining pin (pin is peened and requires filing to remove). Remove reverse blocker spring and piston.



►*INSPECTION NOTE: See "Control Valve Inspection" below.*

R assembly & Installation - Install reverse blocker piston and spring into body. Install reverse blocker retaining pin and peen in place. Install detent plunger and spring. Install hairpin clip to retain detent plunger and install reverse blocker body to manual valve body.

Manual Valve Body: Removal & Disassembly - Remove reverse blocker body from manual valve body if not already done. Remove manual valve body from channel plate. Remove manual valve. Remove throttle valve lever stop from body and remove throttle valve plunger and guide. Remove detent valve and line drop signal valve (these two valves may be combined) and spring. Remove detent pin (if used), throttle valve and spring. Remove throttle valve plug retainer pin and throttle valve plug.

►*INSPECTION NOTE: See "Control Valve Inspection" below.*

R assembly & Installation–Install throttle valve plug and retainer pin. Swedge over edge of retainer pin hole to keep pin in place. Install throttle valve, making sure valve is seated against plug and install throttle valve spring. Install throttle valve plunger guide on throttle valve plunger and install unit. Install pressure drop signal valve spring and valve, lining up spring to be sure it is fully positioned on bottom of bore. Install detent valve. Install throttle valve lever stop on manual valve body and install manual valve body to channel body. Install reverse blocker to manual valve body and install manual valve.

SHIFT VALVE ASSEMBLY (TYPICAL)

Control Valve Inspection: Clean all parts thoroughly and do not allow valves to bump together, as this may cause nicks and burrs. Inspect all valves carefully to make sure they are free from dirt and are not damaged in any respect. If burrs are present, they should be removed with a fine stone or crocus cloth and light oil. All valves and plugs should be tested in their individual bores to make certain that free movement can be obtained. All valves should fall free of their own weight with a slight tapping action on the body. The manual valve is the only valve which may be serviced separately. If other valves are defective or damaged beyond repair, an individual assembly should be installed.

►*CONTROL VALVE ASSEMBLY NOTE:* If all the individual assemblies were removed at one time, proceed as follows: Position channel body separator plate on channel body. Install manual valve to channel body and install reverse blocker body to manual valve body, positioning one dowel pin. Install ball check and and spring in channel body (ball first, then spring). Install and align separator plate on channel body. Install shift valve body on channel body. Install coupling valve on channel body using petrolatum to hold transition ball check in place. Install manual valve in manual valve body.

FRONT UNIT COUPLING: Disassembly–*(CAUTION–The front unit coupling is balanced at the factory and any change in positioning of the cover will affect the balance. On early transmissions without an indexing point on driving torus shell, punch marks should be made on both cover and shell in line with the snap ring gap (using a very fine punch). On later transmissions the No. 1 exhaust valve is lined up with the snap ring gap and mark on driving torus cover).*

1) Remove steel thrust washer from recess at front of front unit drive torus if it did not come off with flywheel housing. Install front unit coupling assembly into Clutch Holding Fixture J-6116 with splined shaft down.

2) Remove large snap ring retaining coupling cover to drive torus shell (make sure that all parts are marked for correct reassembly). Install two Coupling Valve Retainers J-6122 to hold exhaust valve in position when removing cover.

3) Remove coupling cover from coupling using Front Unit Coupling Cover Remover J-6121 as follows: Place cross piece of remover on end of torus shaft with end of shaft indexed in counterbore on underside of tool. Screw stud at end of each leg into holes in coupling cover until they bottom (nuts on studs should be backed off so they will not contact cross piece). Insert long stud of tool J-6121 through coupling and cross piece. Index bottom end with hole in holding fixture so it cannot turn. Install washer and nut on upper end and tighten securely. Tighten nuts on four studs evenly and only a small amount at a time to pull cover out of unit.

4) Remove tool J-6121 and remove coupling cover from unit. Hold fingers over valve so they will not be ejected and remove Coupling Valve Retainers and exhaust valves and springs from cover. Remove rubber seal rings from outer diameter of cover.

5) Remove driven torus member by pulling up on shaft, and remove steel and bronze thrust washers *(NOTE-* It may be necessary to cut the bronze thrust washer). Remove drive torus member from holding fixture.

Inspection: Check for burrs and scratches. Remove burrs with crocus cloth and oil.

Reassembly: 1) Install driving torus into Rear Unit Holding Fixture J-6116. Install interlocking oil seal rings to hub and shaft of driven torus member. Install bronze and steel thrust washers into driving torus member, install one interlocking oil seal ring on driven torus member and install driven torus member into driving torus member.

2) Install two springs and exhaust valves in coupling cover and hold in place, using Front Unit Coupling Valve Retainers J-6122. Install two oil seal rings on cover hub. Install two square rubber ring seals on coupling cover, making sure that seals are square in their respective grooves and apply petrolatum to circumference of seals.

3) Install studs from Front Unit Coupling Cover Re-

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (C ntinu d)

mover J-6121, into coupling cover and position cover in driving torus member, lining up marks made during disassembly (*CAUTION*–Cover must be inserted evenly to prevent cocking in drive torus member and damaging seals).

4) Install large snap ring retaining coupling cover to driving torus member. Remove studs from coupling cover and remove coupling assembly from fixture.

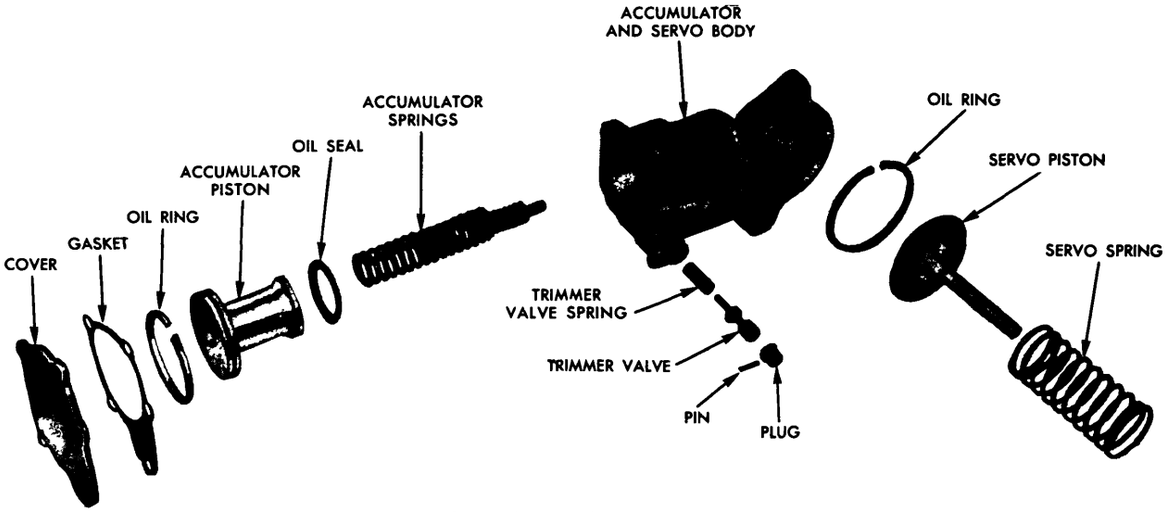
ACCUMULATOR & SERVO ASSEMBLY: Disassembly–Remove servo apply piston from assembly. Remove two opposite accumulator cover screws and install Accumulator Cover Remover & Installer J-6124. Remove remaining three cover to accumulator body attaching screws. Using extreme care remove cover, gasket and special tool. Discard gasket and remove accumulator piston assembly. Remove accumulator spring (more than one spring may be found at this location. See Production Changes & Corrections above). Remove pin retaining trimmer valve assembly in accumulator body. Remove plug, trimmer valve and spring.

Inspecti n: Inspect servo piston assembly for damaged oil seal ring, scores or burrs in ring land grooves. Inspect accumulator spring for collapsed or distorted coils. (*NOTE*–Slight wear "bright spots" on side of spring are permissable). Inspect accumulator body for restricted passages, scores or burrs. Inspect servo piston assembly for distorted pin, damaged oil seal ring lands or broken oil seal ring.

R assembly: Install trimmer valve spring, valve and plug in accumulator body. Install pin retaining trimmer valve assembly. Install accumulator spring (or springs) in accumulator body and install piston on outer accumulator spring. Align new gasket to accumulator cover and install Accumulator Cover Remover & Installer J-6124. Compress accumulator spring and install piston into body, making certain that aluminum piston ring is not binding. Install three screws retaining accumulator cover to body. Remove special tool and install the remaining two screws. Tighten all attaching screws and install servo piston into body.

REAR PUMP: Disass mbly–**1)** Remove vent pipe from rear pump body by carefully prying out of bore with screwdriver. Remove reverse piston from back of rear pump and remove oil seal ring. Remove rear pump cover by tapping pump body with plastic hammer.

2) Remove governor drive key from driven gear in rear pump. Mark top of drive and driven gears to insure correct reassembly, and then remove gears. Remove snap ring retaining rear bearing to rear pump body and remove rear bearing.



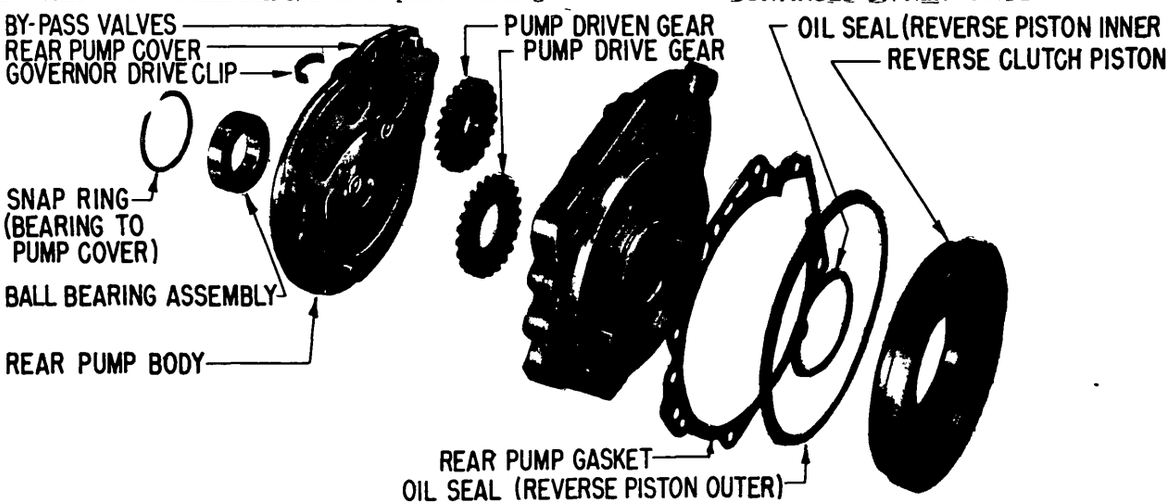
3) Remove reverse piston inner oil seal ring from pump body hub.

Insp cti n: Inspect all parts to make sure they are free of dirt, burrs, scoring or other damage. Remove burrs with crocus cloth and oil. Check oil seal ring grooves. Make sure vent pipe is not damaged and is free from restrictions.

Reassembly: 1) Install rear pump bearing into pump body and install snap ring retaining rear bearing. Install pump gears, noting the locating marks made at disassembly.

2) Install governor drive key into driven gear, making certain key is properly seated. Install pump cover to body, positioning governor hole over drive gear in pump, indexing properly with dowels.

3) Install reverse servo piston in back of rear pump as follows: Install oil seal rings on pump body hub and on reverse piston. Insert piston into bore of rear pump, positioning on top of dowels. Compress large oil seal ring on piston with fingers at one end of gap. After the end is seated in the cavity, gradually work oil seal around, at the same time applying light pressure, forcing piston into cavity.



SERVO & ACCUMULATOR ASSEMBLY (TYPICAL)

GOVERNOR: Disassembly–Remove four oil seal rings and remove cover. Remove end cover plate retaining G-2 valve assembly. Remove valve and bushing assembly and remove valve from bushing.

Inspection: Inspect all parts to make sure they are free from dirt, burrs and other damage. Remove burrs with crocus cloth and oil. Test all valves in their respective bores for free movement. Inspect governor ring lands and oil seal rings for freedom in grooves. If lands are damaged or worn, replace complete governor assembly.

Reassembly: Insert G-2 governor valve into bushing and install assembly in governor body. Install cover plate retaining G-2 valve assembly, making sure dowel in cover plate enters recess in governor body and governor valve bushing. Install governor cover to body. Install four oil seal rings in grooves which do not contain oil holes.

CONTINUED ON NEXT PAGE

DUAL-C UPLING HYDRA-MATIC REAR PUMP ASSEMBLY

DUAL-COUPLING HYDRA-MATIC (C ntinu d)

TORUS CHECK VALVE (Main Drive): Disassembly—Remove cotter key retaining check valve in fluid coupling driven torus member, and remove torus check valve and spring.

Insp ction: Inspect parts for nicks, burrs and for collapsed spring.

R ass mbly: Install spring into check valve and install check valve and spring into driven torus member. Make sure spring seats properly and valve fits evenly. Install cotter key retaining check valve and spring. Make sure check valve can move freely.

PARKING BRAKE: Disassembly—Remove cotter pin retaining three clevis pins and parking brake links and separate pins, links, parking pawl and pawl lever.

Inspection: Inspect parking pawl for cracks or signs of unusual wear. Check pawl pivot pin and linkage for wear.

R ass mbly: Assemble parking brake links, clevis pins, pawl and pawl lever and insert cotter pin.

INSIDE CONTROL LEVER: Disassembly—Remove pin retaining throttle control shaft to inside detent control shaft and separate levers, washers and "O" ring oil seal.

Insp ction: Check fit of inside throttle control shaft in shaft of inside detent control shaft. If shaft binds, is excessively worn, or if splines are damaged, replace the defective parts.

R ass mbly: Install new "O" ring seal, washers, and throttle control shaft in manual control hub and insert retaining pin.

CENTER BEARING SUPPORT, NEUTRAL CLUTCH & REAR UNIT: Disassembly—1) Remove Rear Unit Clutch Retainer J-6135 *(CAUTION—Be sure to back off screw far nough to prevent damage to machined surface at front of intermediate shaft).* Remove hook-type oil seal ring from intermediate shaft by pushing one end toward center of shaft and other way from shaft. Remove case support and neutral clutch piston assembly.

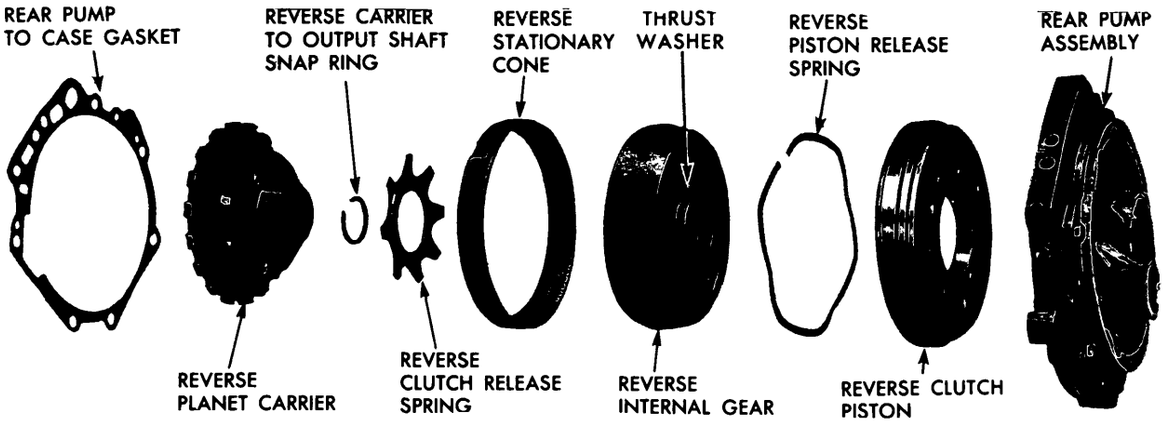
2) Remove oil seal rings from support hub and remove neutral clutch piston. Turn support over and bump on bench to remove piston *(NOTE—On late type assemblies with rubber lip seals, remove seals from piston hub and hub of support. Leave rings in place on piston and support of early type.*

3) Remove neutral clutch drum assembly which contains five composition clutch plates, four steel clutch plates and five release springs. Remove large snap ring from rear drum assembly with screwdriver.

4) Remove rear clutch cylinder and sprag assembly by lifting over intermediate shaft. Remove intermediate shaft and clutch hub, along with front clutch hub washer from rear unit assembly. *(NOTE—Intermediate shaft and clutch hub may be disassembled if parts replacement necessary).* Remove clutch hub front thrust washer from clutch hub.

5) Remove mainshaft assembly and rear unit sun gear from rear unit. Remove clutch hub thrust washer from sun gear.

►*REAR UNIT SUN GEAR CAUTION: Make sure the sun gear is marked properly for reassembly. On later type units, a drill mark is made on rear side of gear. Early type gears were not marked and it is very important that a mark be placed on the rear side to indicate side of gear facing rear of transmission.*



6) Remove seven steel clutch plates and seven composition plates. Remove bronze thrust washer from rear unit carrier. Remove rear unit drum and output shaft assembly from holding fixture and set on bench with output shaft end up.

7) Remove large snap ring holding reverse drive flange to rear unit drum. Lift output shaft and reverse drive flange assembly out of rear unit drum.

8) If parts replacement is necessary, mark internal gear so it can be installed with the same side up. Remove internal gear and rear unit clutch backing plate from rear unit drum assembly together by tapping backing plate with soft hammer. Remove reverse planet carrier locating snap ring from output shaft and remove reverse drive flange and sun gear assembly from output shaft. Remove selective washer from reverse drive flange assembly or output shaft.

9) Remove spiral snap ring from rear unit sprag outer race, using small needle nose pliers or small screw driver. Insert tool into small hole in end of spiral ring and pull upward. Remove outer race, sprag and retainer by rotating counterclockwise and pulling upward *(NOTE—Do not attempt to disassemble sprag assembly).* Remove rear unit sprag retainer and sprag from neutral clutch hub.

10) Disassemble rear unit clutch piston assembly as follows: Place cylinder and piston assembly over tool J-6129 with spring end up. Set spring compressor J-4670 on top of spring retainer and start nut on stud of J-6129. *(NOTE—On models of J-4670 without hole in center, drill at 7/16" hole so J-6129 can be inserted through it).* Turn nut down to compress clutch springs until snap ring is free. Remove snap ring and compressor tool and release spring retainer from rear clutch springs. Remove eight clutch release springs. Remove rear clutch piston from cylinder by rapping piston end of cylinder assembly on wood block. Remove seals from piston and hub.

DUAL-COUPLING HYDRA-MATIC REVERSE ASSEMBLY

Inspecti n: 1) Inspect center bearing support for burrs, damaged oil seal ring grooves, worn or damaged bushing or damaged threads. Check to see that all passages are open and not interconnected, using either a fine wire or air pressure.

2) Inspect neutral clutch piston for scoring, burrs, or damaged oil seal groove. Check ring gap with feeler gauge (gap should be .002-.007"). If a new ring is installed, gap must be checked and ends of ring must be filed, if necessary, to provide proper gap.

3) Inspect neutral clutch drive plates for damaged surfaces or worn teeth. Plates must be flat. If flakes of facing material can be removed by scratching surface with thumb nail, plate should be replaced. Discoloration is not an indication of failure. Inspect release springs for distortion (springs have 5 waves).

4) Inspect neutral clutch driven plates (steel) for scored surfaces or damaged lugs. Also make sure they have six equally spaced waves .008-.012" high when measured on a surface plate. Inspect clutch drum for scored or damaged surfaces. Inspect spiral snap ring for distortion or damage. Inspect rear unit sprag assembly for damaged shoulder, broken springs, or scored sprags. Inspect rear unit sprag outer race for damaged splines or scored sprag race.

5) Inspect rear clutch cylinder and bushing assembly for scoring, burrs, or damaged lugs. Inspect eight rear clutch springs for distortion or collapsed coils *(NOTE - Slight wear "bright spots" on sides of release springs indicating slight contact with the piston assembly is permissible).* Inspect rear clutch release spring retainer for cracks or damage. Inspect rear unit clutch cover-to-rear clutch hub bronze thrust washer.

6) Inspect intermediate shaft and rear unit clutch hub. Clutch hub and shaft can be separated if either needs replacement. Inspect rear unit sun gear-to-clutch hub bronze thrust washer. Inspect seven rear unit composition faced clutch drive plates for damaged surfaces. Plates should be flat. Check in same manner as for neutral clutch plates. Inspect seven driven plates (steel) for scored surfaces or damaged lugs. Driven plates must have six equally spaced waves (approx. .010" deep).

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (C ntinued)

7) Inspect main shaft and rear unit sun gear for damaged splines, teeth or bearing surfaces. Gear and shaft can be separated for replacement if necessary. If shaft only is to be replaced, put old gear on new shaft with same side toward front.

8) Measure endplay of rear unit sun gear on mainshaft and determine correct selective washer to use in rear unit as follows: Clamp sun gear and mainshaft assembly in Holding Fixture J-6116 using "C" clamp and dial indicator. Be sure gear is firmly clamped on both sides so it cannot give. Set dial indicator to contact end of mainshaft. Move mainshaft straight up and down to measure endplay and record endplay. Subtract this endplay from the mainshaft endplay recorded before transmission was disassembled. The difference will be the actual endplay of the rear unit and should be .004-.018". If endplay is outside the limits of .004-.018", select the reverse drive flange-to-rear unit planet carrier thrust washer which will give the proper endplay. Selective washers are furnished in the following nine sizes and are stamped with an identification number:

Id ntificati n N .	Siz	Identification No.	Size
1	.055-.059"	6	.080-.084"
2	.060-.064"	7	.085-.089"
3	.065-.069"	8	.090-.094"
4	.070-.074"	9	.095-.099"
5	.075-.079"		

9) Inspect rear unit internal gear for tooth damage *(NOTE*–Internal gear and clutch backing plate can be separated from drum if replacement is necessary). If drum or backing plate is replaced, the gear should be reinstalled with the same side toward the front (the edges of the gear teeth are chamfered on the side which goes against the backing plate). Inspect output shaft to rear unit sun gear bronze thrust washer. Inspect output shaft for damaged pinions, splines, bearing surfaces or speedometer gear teeth.

10) Inspect reverse drive flange and sun gear assembly *(NOTE*–Reverse drive flange and sun gear are serviced as an assembly and should not be separated). Inspect rear unit selective washer for wear and damage.

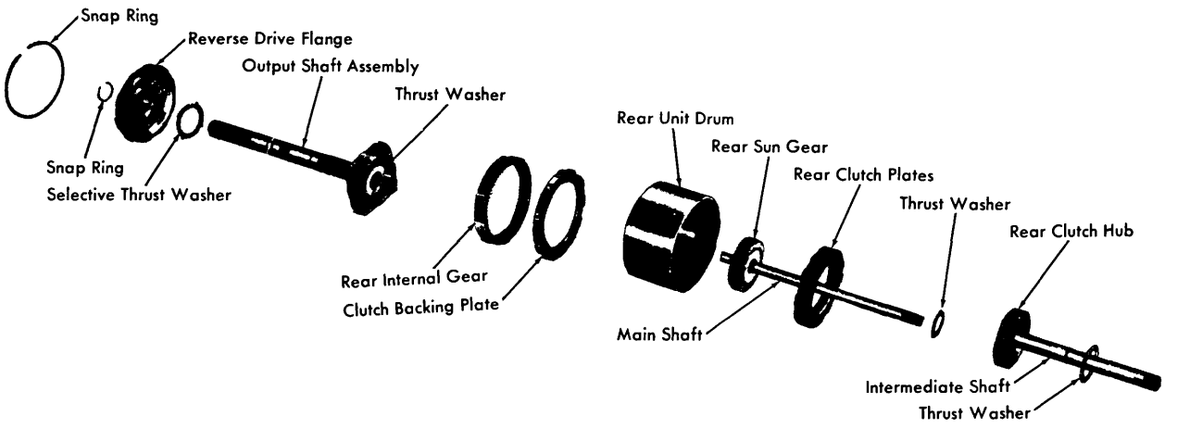
R ass mbly: 1) Holding reverse drive flange and sun gear in left hand with drive flange up, install proper selective washer *(as determined by rear unit endplay check, see "Inspection" above)* in recess of drive flange with locating lugs indexed in flange. Use petrolatum to hold washer in place. Still holding reverse drive flange and sun gear in left hand, insert output shaft through the assembly until carrier bottoms on selective thrust washer. Hold unit tightly together and place on bench on carrier end. Install reverse planet carrier front ring on output shaft.

2) Insert Reverse Drive Flange Retainer J-6120 between snap ring and flange snug against rear unit carrier to prevent selective washer from dropping out of position *(NOTE*–When the selective washer used between reverse drive flange and planet carrier is at or near the upper limit of thickness, Retainer Tool J-6120 cannot be inserted between snap ring and flange. In this case, it is not necessary to use the retainer since there is not enough clearance to allow the thrust washer to drop out of place. Set rear unit drum on bench with long undercuts on lugs upward (or with internal gear up if it was not removed). Install clutch backing plate with flat surface down if it was removed (it may be necessary to tap plate into place with a soft hammer).

3) Install rear unit internal gear with mark upward (drill mark in rear face of gear or mark made at disassembly) if it was removed (gear teeth are beveled on side which goes against backing plate). Position gear against clutch backing plate. Install output shaft and reverse drive flange assembly into rear unit drum and secure with large snap ring. Set rear unit assembly into Holding Fixture J-6116 with shaft end down. As unit is lowered into fixture, lift up on drum and remove Drive Flange Retainer *(CAUTION–Do not lift on output shaft after retainer is removed).* Position thrust washer in counterbore of output shaft and retain with petrolatum.

4) Apply Hydra-Matic Oil to faces of seven drive and seven driven plates and alternately install them in rear unit drum. Start with a drive (composition) plate and finish with a driven (steel) plate. Install all drive plates with same side upward. Assemble driven plates with lugs in rear unit drum slots so notches in lugs are all in line *(NOTE*–Indexing the notches will nest the plates together so waves are all in the same direction, and with no gaps between plates). Install mainshaft and sun gear assembly into output shaft in rear unit, meshing sun gear with planet pinions of output shaft.

5) Assemble rear unit clutch hub to rear end of intermediate shaft if it was removed (open side of hub toward front of shaft. End with longest spline and longest machined surface will be toward rear). Install two bronze thrust washers on rear unit clutch hub, one on each side and retain with petrolatum. Install intermediate shaft and rear unit clutch hub and thrust washers into rear drum *(NOTE*–Pick up clutch drive plates by rotating intermediate shaft). Do not drive or force rear unit clutch hub into rear unit drum.



6) Assemble rear clutch piston into rear clutch cylinder as follows: Install new inner seal on hub of clutch cylinder with lip down. Install new outer seal on piston with lip facing away from spring bore side. Install piston into cylinder using flat edge of screwdriver to start seal into cylinder. Install eight clutch release springs into bores in piston. Place spring retainers on springs with tangs facing upward. Compress springs using tool J-4670-B and J-6129. Install snap ring which holds release spring retainer. Remove compressor tools.

7) Install rear unit sprag assembly in rear unit outer race with shoulder side of sprag on counterbored side of outer race. Install sprag and outer race of rear unit inner race (push sprag part way down through outer race then rotate sprag counterclockwise to assemble). Install rear unit sprag retainer in outer race with large outer diameter upward. Push retainer down to expose snap ring groove. Install spiral snap ring on rear unit clutch hub. Install rear unit cylinder and sprag assembly into rear clutch drum with sprag side up. Secure cylinder and sprag assembly into rear clutch drum with large snap ring.

8) Install neutral clutch drum on rear unit with driven clutch plate lug slots upward. Apply Hydra-Matic Oil to five clutch drive plates (composition) and four driven plates (steel). Install plates alternately using a release spring between steel plates (start with a composition plate, release spring, then steel plate, and end up with composition plate and spring).

9) Install seal on second type neutral clutch piston with lip side facing side with dowel holes, or install ring on first type. Install seal on hub of second type center bearing support with lip facing bottom of piston cavity, or install oil ring on first type center bearing support. Install neutral clutch piston into center bearing support aligning notch in edge of piston with lockscrew hole in side of center bearing support. This alignment assures that dowels will enter dowel holes (seal or piston ring can be installed by compressing with fingers). Install two oil rings in grooves of center bearing support hub. Center rings around hub and install center bearing support assembly into neutral clutch drum in rear unit using care not to damage bushing when lowering support over intermediate shaft. If properly centered, oil rings

REAR UNIT DRUM, MAINSHAFT, & OUTPUT SHAFT ASSEMBLY (TYPICAL)

DUAL-COUPLING HYDRA-MATIC (Continued)

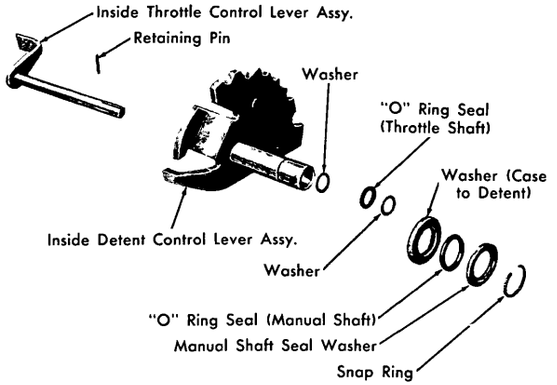
on support hub will be compressed by taper on hub of rear clutch cylinder. Install hook type oil seal ring on intermediate shaft.

FLYWHEEL HOUSING SEAL INSTALLATION: Start seal into bore in flywheel housing with lip facing toward bushing *(NOTE–Do not use sealer).* Drive seal into place using Flywheel Housing Oil Seal Installer J-6118. Stake housing against seal in three places.

TRANSMISSION REASSEMBLY

PARKING BRAKE ASSEMBLY, OVERRUN BAND, NEUTRAL CLUTCH DRUM STATIONARY STOP KEY AND INSIDE DETENT AND THROTTLE CONTROL ASSEMBLY: 1) Install overrun band through front of case with the band ends facing rearward in a horizontal position (anchor support hole should face right hand side). When band is approximately halfway through transmission case, with band still horizontal, rotate band so that ends are in cavity in case above anchor pin and rotate band into position. Position band end on anchor in case.

2) Place parking brake pivot shaft spacer in recess in case. Position parking brake pawl and lever assembly in case with upper lever on pivot in case. Locate parking pawl at pivot shaft hole and insert parking pawl pivot shaft through case, pawl and spacer until end of shaft is flush with rear of case. Slide spacer washer onto pivot shaft against parking brake lever. Position parking brake lever spring in bracket with long end toward rear. Slide bracket and spring assembly onto pivot shaft with end of spring under parking brake lever. Hook other end of spring over pin at front of bracket.



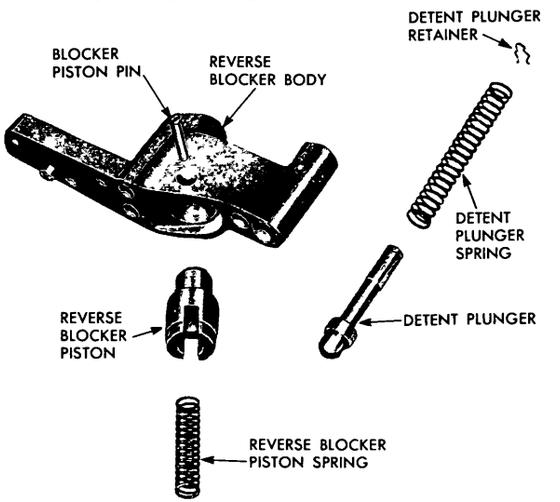
3) With throttle and detent levers assembled, place spacer washer over detent shaft against detent lever. Insert lever and shaft assembly through hole in case from inside with parking brake tang below pin in parking brake bracket. Install "O" ring seal and special washer which fits into bore on outside of case over detent lever shaft. Install snap ring to retain seal and washer.

4) Install neutral clutch stop key in case using petrolatum to hold it in place. Position rounded side toward front to provide lead for guiding neutral clutch drum over key.

CENTER BEARING SUPPORT, NEUTRAL CLUTCH & REAR UNIT ASSEMBLY: 1) Install rear unit, neutral clutch, and center bearing support assembly into case as follows: Insert output shaft end of assembly part way into front of case and then rest rear unit drum on case, while holding intermediate shaft. Rotate neutral clutch drum until groove for neutral clutch key is up.

2) Holding neutral clutch drum in this position, rotate center bearing support so that set screw hole in support is aligned with the second clutch plate slot counterclockwise from key slot in neutral clutch drum.

3) With parts aligned, slide assembly into case, engaging neutral clutch drum key with slot in clutch drum. Alignment can be checked by looking through lockscrew hole in side of case and observing that clutch plate slot in neutral clutch drum is aligned with set screw hole. This will properly align both the setscrew hole



INNER CONTROL LEVER ASSEMBLY

in support and locking key groove in neutral clutch drum. When properly installed, snap ring groove in case will be visible at front edge of case support. *NOTE–* If unit fits tightly in case, assembly may be aided by pulling on output shaft. Also make sure low band does not cock on rear unit drum and hold unit.

4) Make sure case support locking screw hole is aligned and install snap ring which positions center bearing support in case. Tap snap ring as necessary with screwdriver and hammer to make sure it seats fully in groove. *(NOTE–*If necessary to align center bearing support after installation, install Slide Hammers J-6125 to act as handles). Install center bearing support locking screw from outside of transmission case.

REVERSE ASSEMBLY, REAR PUMP & GOVERNOR: 1) Install reverse planet carrier on output shaft, aligning splines and pinions. Install reverse planet carrier to to output shaft snap ring. Install reverse stationary cone key in case with rounded side toward rear and retain with petrolatum. Install stationary cone key making certain that cone aligns with key. If cone sticks, tap gently with plastic hammer until seated.

REVERSE BLOCKER ASSEMBLY

2) Install reverse clutch release spring on carrier. Tangs should be positioned away from carrier. Install reverse internal gear on carrier. Position reverse internal gear-to-pump hub thrust washer against internal gear. Install reverse clutch piston release spring over internal gear against shoulder in case and stationary cone.

3) Install new gasket on rear pump, and install the reverse piston and rear pump as an assembly into case aligning splines of pump drive gear and output shaft by rotating shaft. Install locking screw and rear pump-to-case attaching screw. Tighten attaching screw to 25 ft. lbs. and locating screw to approximately 6-8 ft. lbs.

4) Remove Rear Unit Clutch Retainer J-6135 from intermediate shaft. Install rear bearing over output shaft into pump cover. *(NOTE–*If rear bearing is tight on shaft, it will be necessary to tap bearing into place using Rear Bearing Installer J-6133. While tapping bearing into place hold a block of wood aginst front of the mainshaft to hold output shaft to rear until groove for snap ring can be seen behind the rear bearing). If bearing is a slip fit on output shaft install snap ring on shaft against bearing, then pull shaft rearward and push snap ring into groove.

5) Install rear bearing snap rings on output shaft, if not previously installed, and in rear pump cover. Check mainshaft endplay as follows: Install Dial Indicator Support J-6126. Install collar of Endplay Checking Fixture J-6127 and secure in position by installing Truarc snap ring on mainshaft. Attach fixture to collar by threading collar securely into fixture. Install dial indicator. Move mainshaft back and forth to check endplay of mainshaft. Be sure to get free mainshaft endplay. Forcing mainshaft will not give accurate reading. Subtract endplay of rear unit sun gear on mainshaft from mainshaft endplay. Difference will be actual endplay of rear unit and should be .004-.018". If outside these limits it will be necessary to remove and disassemble the clutch unit so that correct selective washer can be installed between rear unit planet carrier and the reverse drive flange. *See "Center Bearing Support, Neutral Clutch & Rear Unit" under "Disassembly & Reassembly of Units" above.*

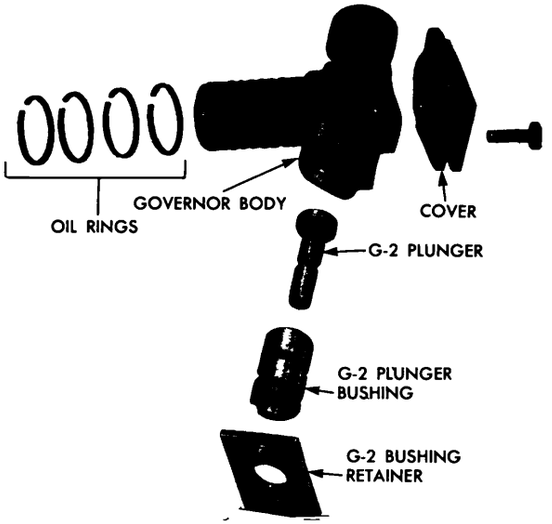
6) Remove endplay checking tool. Install governor into rear pump as follows: Align snap rings so gaps will be upward when governor sleeve is aligned with drive key. Compress rings by hand and work governor into bore in rear pump. Rock governor back and forth to engage drive key. Check to see that governor turns when output shaft is turned.

7) Install new extension housing gasket on rear pump with petrolatum, and install extension housing on case with six attaching screws and washers. Tighten to 25 ft. lbs. torque. Leave out bottom two screws which are used to fasten oil cooler. Install speedometer driven gear in extension housing. Insert vent pipe into hole in top of rear pump and clamp pipe to case.

8) If rear oil seal was removed, coat new seal with Permatex and drive seal into housing using seal Installer J-5154-A. Felt portion of seal must be toward rear. Seal should be driven in until it bottoms in housing.

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (Continued)



FRONT PUMP & OVERRUN CLUTCH: 1) Install front pump and overrun clutch plate assembly over intermediate shaft and at the same time align intake pipe holes in front pump and case. These should be indexed properly before any attempt is made to install pump into transmission.

2) Install front pump into transmission case and tighten the three front pump-to-center bearing support bolts, then back off 1/4 turn. Apply air in the neutral clutch hole of transmission case to position center bearing support against snap ring. With air still applied, tighten case to front pump lock screw to 22-27 ft. lbs. Tighten pump-to-center bearing support screws to 25-30 ft. lbs.

FRONT UNIT COUPLING, PRESSURE REGULATOR & COOLER ADAPTER: 1) Make sure seals are in place on ends of oil cooler sleeves and insert sleeves in case with seal end first. Place oil cooler adapter with gasket on case over oil cooler sleeves, install two attaching screws with copper washers, and tighten securely.

2) With spring in place on regulator valve install valve and spring into case. Install pressure regulator plug assembly and tighten to 5 ft. lbs. *CAUTION–Overtightening of pressure regulator may push pump away from side of case causing an oil leak between passages in pump and case.*

3) Install front unit coupling cover first (with transmission vertical, and front end up), into transmission case. Rock drive torus shell to make sure drive hub engages front pump rotor and rock driven torus shaft to make sure lugs on shaft engages front unit sprag inner race. Driven torus shaft should turn clockwise freely, but should not turn counterclockwise as viewed from front.

GOVERNOR ASSEMBLY

CONTROL VALVE, SERVO & ACCUMULATOR: 1) Rotate transmission to horizontal position. Attach control valve assembly to transmission with five attaching screws, leaving out screw which will position front pump intake pipe retainer. *(NOTE–*The four outer screws have star washers and the center two have flat washers). Position detent lever so it will engage detent plunger and manual valve.

2) Install new front pump "O" ring seal in intake pipe at front of case. Install servo and accumulator assembly and servo spring. Install front intake pipe into case and secure with clip and valve body attaching screw.

3) Install rear pump "O" ring seal on rear pump intake pipe. Install oil screen on front pump intake pipe. Install rear pump intake pipe into screen and case. Install oil pan with new gasket and tighten attaching screws securely.

FLYWHEEL REAR HOUSING, TORUS ASSEMBLY & OIL COOLER: 1) Remove transmission from holding fixture and position on bench in a horizontal position, with pan down. Install steel thrust washer in recess in front unit drive torus shell. Position Flywheel Housing Bushing and Seal Protector J-6119 over intermediate shaft.

2) Install rear flywheel housing-to-case "O" ring seal on flywheel housing. Install rear flywheel housing on case and attach with six screws. Tighten securely. Remove Bushing and Seal Protector.

3) Install proper selective washer on drive shaft of front unit as determined when checking front unit end clearance at disassembly. Install torus cover and push cover on evenly, without rocking, to prevent damage to seal and bushing.

4) Install internal gear assembly into cover, indexing with torus cover and front unit drive torus hub. Install bronze thrust washer then steel backing washer in internal gear. Steel backing washer must be indexed with splines of front unit drive torus shaft.

5) Install sun gear over front unit driven torus shaft, chamfered side first. Install steel backing washer and bronze thrust washer against sun gear. Install drive torus member on intermediate shaft indexing front unit planet carrier with sun gear and internal gear. Secure drive torus to intermediate shaft with Truarc snap ring.

6) Install driven torus rear Truarc snap ring on mainshaft. Install driven torus front Truarc snap ring on mainshaft to secure torus member.

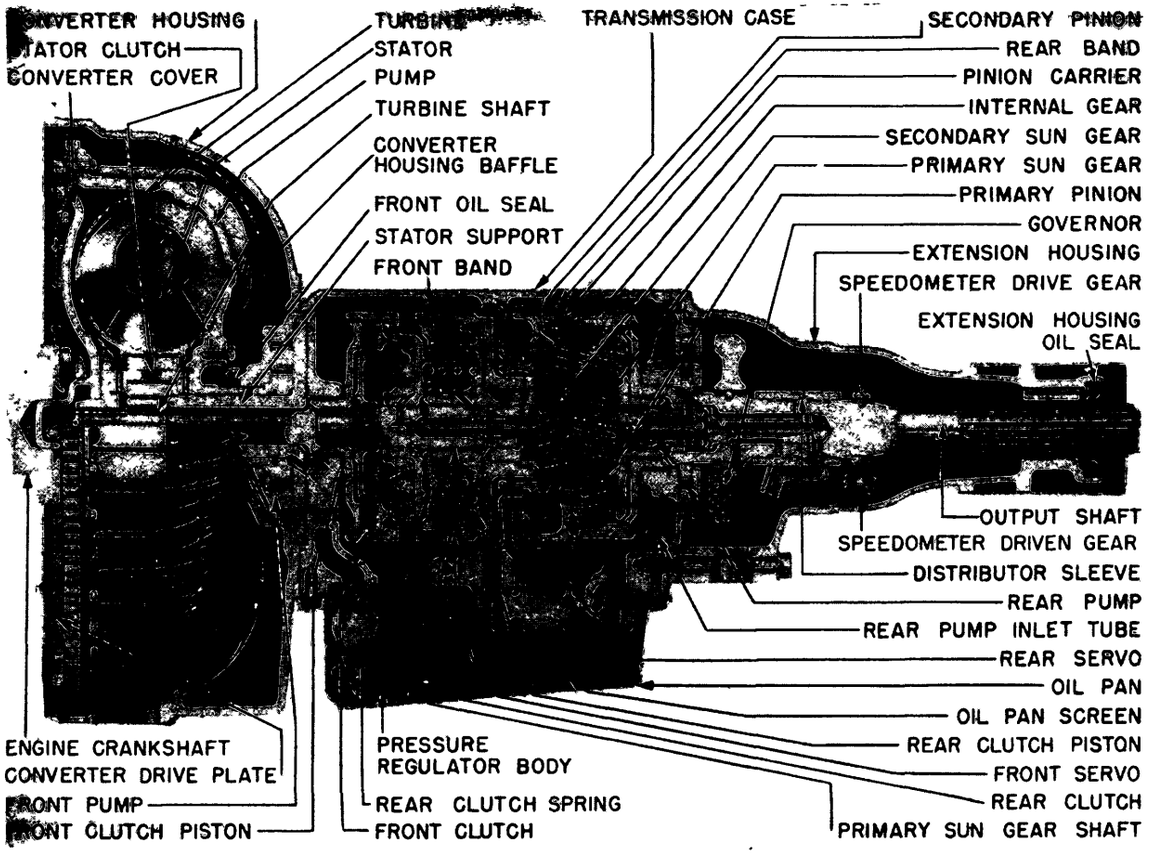
7) Install flywheel "O" ring seal on flywheel and position flywheel against torus cover, indexing with dowels (flywheel can be installed in only one position since dowels are of different sizes). Install and tighten flywheel-to-torus cover nuts, leaving nuts off bolts required for attaching flywheel and torus cover to flex plate. Tighten nuts to 20 ft. lbs.

8) Place oil cooler in position against bottom of rear extension housing and install attaching screws. Connect oil cooler pipes to adapter on side of transmission case.

FORDOMATIC, MERCOMATIC & TURBO-DRIVE TRANSMISSION

Ford Pass. Cars, All Models (1957)
Ford Trucks F-100, F-250, F-350, P-350, P-400, P-500 (1957)
Lincoln & Continental (1957)
Mercury (1957)

►CHANGES, CAUTIONS, CORRECTIONS



►*POOR ACCELERATION OR LACK OF POWER ON HILLS NOTE:* This condition may be caused by converter clutch slippage due to improperly installed clutch sprags. To determine if converter clutch is at fault, perform a stall test *(see "Stall Test" below).* A slipping converter clutch will cause a decrease of 300-400 RPM in specified stall speeds. Inspect sprags as one or more may be turned 180° which would prevent clutch locking up. See "Torque Converter Overhaul" below.

►*AUTOMATIC TRANSMISSION FLUID COLOR CHANGE:* Fluid having a red dye in it may be found in 1957 transmissions. This color is being added to aid in detecting oil leakage. Uncolored fluid may be mixed with colored fluid.

►*1957 FORDOMATIC, MERCOMATIC & TURBO-DRIVE TORQUE CONVERTER STATOR CLUTCH PRODUCTION CHANGE:* A new converter stator clutch assembly Part No B7A-7940-B having two brass drag strips replacing the "T" bar on the inner cage insures positive engagement of the sprags The new clutch assembly which replaces Part No B7A-7940-A & PAR-7940-B has fourteen sprags compared to 16 sprags in the earlier assemblies When installing the new assembly inner race into stator clutch, care must be taken to prevent bending the drag strips. The stator clutch sprag assembly must be assembled into outer race so that the flange on the cages will face toward the front of car and drag strips face toward rear. *CAUTION- To prevent repeat failures in service, DO NOT race engine in neutral, or stall test immediately after an overhaul. DO NOT operate car at full throttle until car has been driven 5-10 miles after overhaul.*

►*1957 FORD V8 FLYWHEEL PRODUCTION CHANGE:* A new one-piece flywheel, Part No. B7A-6375-A is being used on all Fordomatic Cars. When installing converter to flywheel, align converter drain plugs with flywheel drain plug slots A reinforcing plate, Part No. B7A-6383-A is used between crankshaft bolts and the new flywheel

►*1957 MERCURY REVERSE AND PARK INHIBITOR SWITCH PRODUCTION CHANGE:* On later cars, the switch mechanism formerly mounted on the transmission is now mounted in the drivers compartment. A two-piece speedometer cable provides the drive for the switch and for the speedometer. When replacing the early type switch, use Kit, Part No. MHK-15824-A. Installation instructions are included with the kit. *NOTE* - When replacing the switch on air conditioned cars, it should be mounted to the left of steering column to prevent interference with air conditioner plenum chamber.

FORDOMATIC, MERC-O-MATIC & TURBO-DRIVE TRANSMISSION SECTIONAL VIEW

►*1957 FORD "DOWNSHIFT CLUNK" CORRECTION:* If a 3-2 downshift "clunk" is evident when coasting to a stop, with no throttle applied, and a linkage adjustment will not correct the condition, rear clutch plates, Part No. B6A-77519-A, should be installed. These plates can be identified by eight oil grooves on each side of plate.

►*1957 FORD SPEEDOMETER DRIVEN GEAR CORRECTION (GEAR FALLS INTO TRANSMISSION):* Remove drive gear and retainer and bend retainer so that distance between legs at center is .330-.350". Position driven gear on the cable to its full depth, making certain that inner core is fully seated in square hole of gear. Insert retainer clip through slots of driven gear to secure gear to cable with closed end of clip riding against gear.

►*1955-57 LINCOLN & CONTINENTAL MANUAL DETENT LEVER & SPRING CHANGE (To minimiz ffort in shifting s l ctor quadrant l v r):* A new manual valve detent lever, Part No. PAN-77280-A, and lever spring, Part No. PAN-77276-A, are available for service replacement. These parts are interchangeable individually with the parts formerly used.

►*1957 MERCURY CONVERTER HOUSING LOWER COVER SERVICE REPLACEMENT NOTE:* Converter housing lower cover, Part No. 77979-A, may be used to service either the cast iron or aluminum converter housing. When used on aluminum housing, the retaining tang must be bent down toward cover to provide a tight fit.

►*1957 MERCURY "NO DOWNSHIFT" CORRECTION (EARLY CARS):* If kickdown cannot be obtained with properly adjusted linkage, install a new adjustable type accelerator rod, Part No. MG-9784-B, as follows: Set new rod to shortest overall length and install it in position. Adjust rod 2 or 3 turns until proper kickdown obtained. When rod is properly adjusted, distance between accelerator pedal and bare floor pan will be about 4" *(CAUTION* - Excessive adjustment will cause accelerator shaft to ride on engine block).

►*1957 LINCOLN & MERCURY (WITH 368" ENGINE) CONVERTER STATOR REAR THRUST WASHER CHANGE:* A new steel backed bronze thrust washer, Part No. PAN-7937-D has been added between the stator and impeller because of the increased thrust. A new aluminum thrust washer PAN-7937-C is used

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (Cont.)

in conjunction with PAN-7937-D, replacing the former washer When wear is found on rear converter stator thrust washer in early production cars the new washers should be installed

►*1957 MERCURY PARK HANDLE LOOSE ROLL PIN CORRECTION* Install a new longer roll pin Part No 353660-S2 in park slide handle Spread the slot in the new pin slightly to insure a good fit and then install with slot facing rear of car

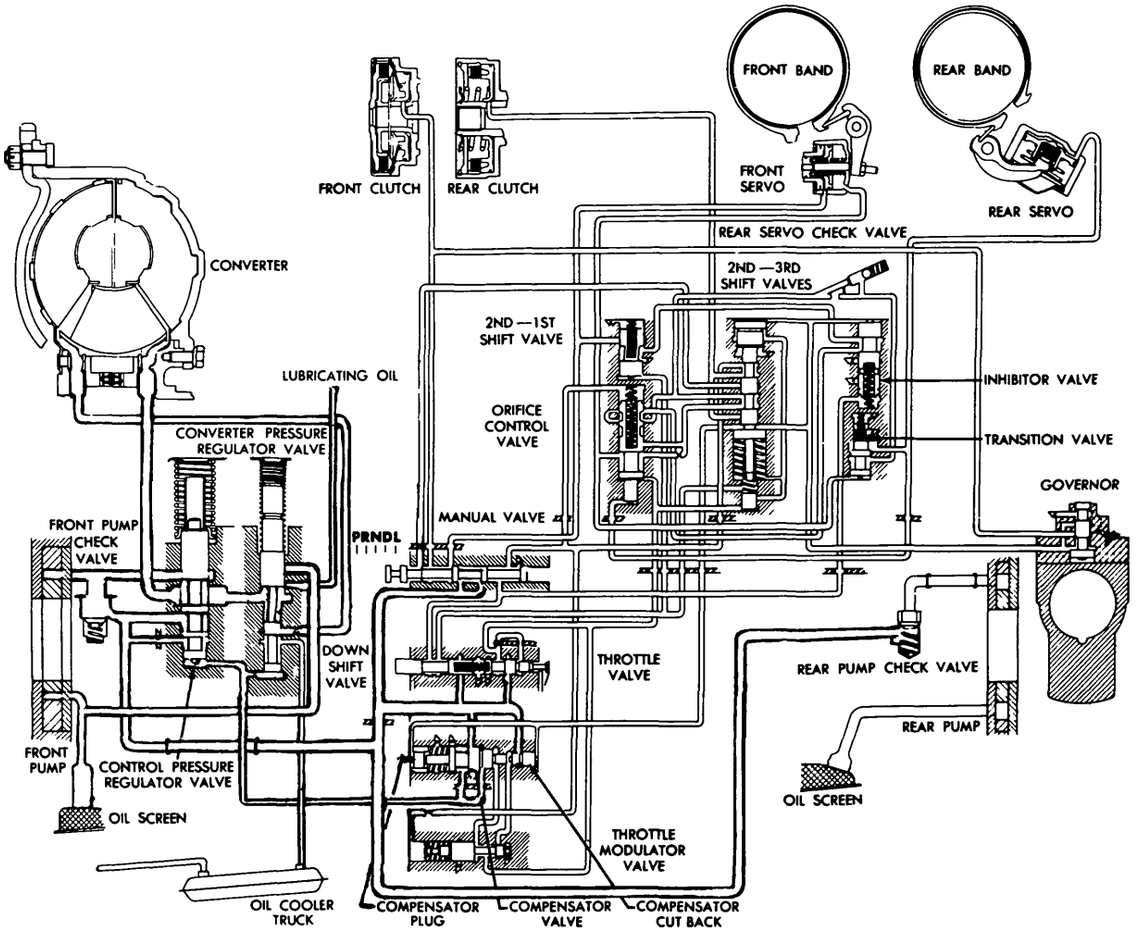
►*1957 MERCURY ERRATIC OR IMPROPER SHIFT PATTERN* This condition may be caused by improper installation of transmission main control assembly *See "Transmission Reassembly" below*

►*1951-57 MERCURY MANUAL CONTROL LEVER REPLACEMENT NOTE* Two types of manual control lever assemblies are furnished for service replacement and both have the same part number On one type the lever is "staked" to shaft, and on the other, the lever is brazed to shaft When using the staked type, spacer Part No PAR-77351-A must also be used

►*1957 MERCURY PARKING PAWL LINKAGE PRODUCTION CHANGE* The following parking pawl parts are being used in production Do not intermix these parts with previous parts as the later type parts must be used together Brake Pawl, Part No PBA-77311-B, Toggle Lever Link Pin Part No PBA-77317-B, Toggle Link Pin Part No PBA-77318-B, Toggle Link, Part No PBA-77316-C

►*TRANSMISSION IDENTIFICATION NOTE:* Transmission Model No and Serial No on name plate on left side of transmission case must be used to identify individual units for parts replacement etc

►*STARTING ENGINE BY TOWING OR PUSHING CAR:* Pushing is recommended Place selector lever in Neutral "N" position When car reaches 20 MPH speed, turn on ignition, move selector lever to "LO", depress accelerator pedal to half throttle position until engine begins to run *NOTE–On ice or snow where traction not good, move selector lever to "DR" position to crank engine*



►*TOWING CAR CAUTIONS: Do not tow at speed greater than 40 MPH and observe following precautions*

If Transmission Operating Properly–Place selector lever in Neutral "N" position Car can be towed normally for distances not to exceed 12 miles **For greater distanc s, use sam procedure as for inoperative transmission.**

If Transmission Inoperative–Tow car with rear wheels lifted off road, or disconnect and remove propeller shaft and protect rear end of transmission from entry of dirt (U-joint Knuckle, Part No 1M-4841 can be installed and wired in place for this purpose)

DESCRIPTION

Fordomatic Merc-O-Matic & Turbo-Drive Automatic Transmissions consist of a hydraulic torque converter and a three speed planetary type transmission which provides automatic operation in "DR" range, "LO" 'R" & "P' ranges are controlled manually Transmission oil coolers are provided on all models except Ford 6 Cyl Pass Cars A new 'Key Board" type transmission range selector is used on all Mercury models The selector head contains a "push-pull" lever for applying and releasing the transmission parking pawl a parking brake release bar (to release foot operated parking brake) and four transmission control buttons A combination neutral safety, back-up light and starter switch is attached to rear of the selector assembly Depressing the "N" (Neutral button past the neutral position engages the starter switch A reverse inhibitor switch located on back of selector assembly is controlled by a speedometer cable driven centrifugal switch mounted on the transmission (early cars) in drivers compartment (later cars) and prevents shifting transmission into "Park" or "Reverse" when car speed is greater than 5 MPH

FORDOMATIC, MERC-O-MATIC & TURBO-DRIVE TRANSMISSION HYDRAULIC CIRCUITS

OPERATION

Torque converter automatically provides a torque multiplication ranging from 2 1-1 (maximum for starting and acceleration) to 1.0-1 (normal driving range with torque converter acting as a fluid coupling) This torque multiplication is supplemented by the planetary gears when selector lever placed in "DR", "LO", and "R" ranges.

Drive Range–Car starts in Intermediate Gear (except when accelerator pedal depressed to floor when car will start in Low Gear) with a gear ratio of 1 467-1 (Ford), 1 46-1 (Lincoln & Mercury), with Front Clutch applied locking the Primary Gear to the Turbine Shaft, and the Front Band applied, holding Secondary Sun Gear stationary The power flow at this point is from Turbine Shaft through Front Clutch to Primary Pinion, to Secondary Pinion, to Internal Gear, to Output Shaft As car speed increases (depending on throttle pressure) to a certain point, the Front Band is released and the Rear Clutch is applied, automatically causing transmission to change to direct (1.0-1) drive The power flow in "High" gear is from the Turbine Shaft through the Front and Rear Clutches to the Planetary Gears

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (Cont.)

which are locked together and rotate as a unit, causing the Output Shaft to rotate at engine speed

Low Range—Front Clutch applied, locking the Turbine Shaft to Primary Sun Gear, and the Rear Band applied, holding Pinion Carrier stationary The flow of power is from the Turbine Shaft through the Front Clutch, to Primary Pinions to Secondary Pinions, to Internal Gear and out the Output Shaft at a ratio of 2 40-1 *See "Fordomatic, Mercomatic & Turbo-Drive Transmissions" in 1955 Annual Data or later Manual dition.*

LUBRICATION

►*OIL COOLER HOSE CONNECTION CAUTION. When reconnecting oil cooler hoses after installation of radiator, care must be taken to connect hoses to correct fitting on radiator When removing hoses, connections should be marked for correct assembly*

►*AUTOMATIC TRANSMISSION FLUID COLOR CHANGE* Fluid having a red color may be found in 1957 transmissions This color is being added to aid in detecting oil leaks Uncolored fluid may be mixed with colored fluid Be sure and use Automatic Transmission Fluid Type "A"

►*CAUTION· Transmission oil level should be checked at 1000 mile intervals (Ford Pass Cars & Trucks), 2000 mile intervals (Lincoln, Continental, & Mercury) Drain and refill every 25,000 miles (Ford Pass Cars), 15,000 miles (Ford Trucks), 16,000 miles (Lincoln, Continental, & Mercury)*

R commended Oil - Automatic Transmission Fluid Type 'A"

Capacity - Approximate capacities as follows

Ford 6 & 8 (Pass Cars & Trucks, except Thunderbird & Police Interceptor) - 9½ qts

F rd Thunderbird & Police Interceptor - 10½ qts

Mercury - 10½ qts

Lincoln & Continental - 11.3 qts

Ch cking Fluid Level—Apply hand brake, place selector lever in Neutral "N" position, run engine at idle speed for approximately four minutes, then move selector lever to Park "P" position When engine and transmission have reached normal operating temperature, move selector lever through all positions to assure fluid distribution throughout transmission, return lever to "P" position Raise engine hood, clean all dirt from around filler cap at right rear corner of engine. Check fluid level on dipstick in filler tube *(CAUTION—* make certain dipstick pushed all the way down in the filler tube when checking fluid level) Add fluid as necessary to bring level up to "F" full mark on dipstick

Drainage and Refilling—Remove converter housing lower plate and drain converter by removing one drain plug, then rotate the engine 180° and remove the second drain plug Disconnect filler tube from transmission oil pan to drain fluid from transmission Tighten converter drain plugs to 7-10 ft lbs Tighten filler tube connection Install 5 quarts of automatic transmission fluid, start engine and allow to idle four minutes Add 4 qts, of fluid and bring transmission to operating temperature Place selector lever in parking (P) position and check oil level If level is not up to dip stick level mark, add additional fluid as required

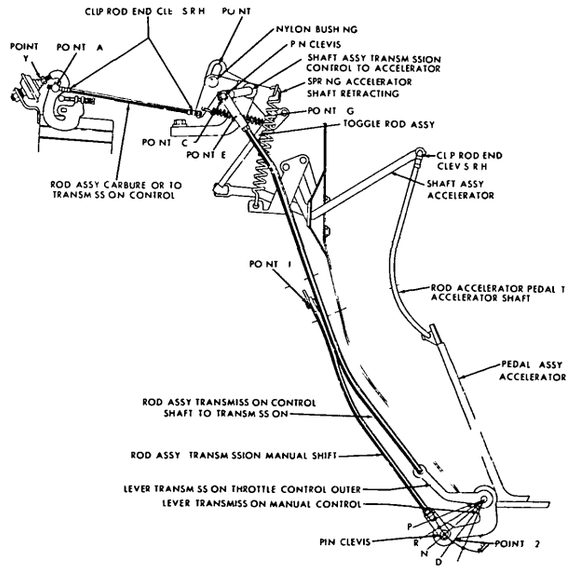
►*CAUTION—Correct fluid level should be determined by dipstick reading rather than actual number of qts. installed*

LINKAGE ADJUSTMENT

Throttle Linkage Adjustment (Pressure Method): *NOTE This method should be used in addition to regular throttle linkage adjustment procedures (see Car Model pages), after transmission overhaul* With transmission at normal operating temperature, adjust engine idle speed, anti-stall dashpot, manual linkage, neutral safety switch and throttle linkage (see Car Model pages), then proceed as follows Set hand brake securely Raise car on hoist and install pressure gauge (300 lbs) in 1/8" pipe plug hole on transmission case Lower the car to floor and install a tachometer on engine Position pressure gauge so it can be read from driver's seat Place selector lever in "DR" (Drive) range and increase engine speed to 1000 RPM. Note pressure reading on gauge which should be the same as specifications in Line Pressure Range Table *(see "Testing" below)* If pressure is less than specified, rotate throttle rod clevis to lengthen rod If more than specified, shorten rod as necessary to bring pressure within limits Check pressures at idle and stall speeds Pressures should be as indicated If idle pressure is above specifications and linkage cannot be shortened further, the throttle lever internal stop must be bent away from valve body If idle pressure or stall speed is not within specifications perform Shift Test & Stall Test and refer to "Trouble Shooting and Diagnosis"

►*CAUTION Do not operate car for long periods under stall or partial stall conditions*

FORD, LINCOLN, CONTINENTAL



Manual Linkage Adjustment (Except Mercury): Disconnect upper end of manual shift rod from selector arm Position selector lever with indicator in the quadrant down against its stop in 'DR" position Place manual lever at transmission in the "DR" detent (second from bottom) Rotate manual shift rod clevis until clevis pin fits freely into holes in clevis and selector arm Length-rod assembly 2 complete turns (Ford Pass Cars & Trucks except Thunderbird), 1 complete turn (Thunderbird, Lincoln, & Continental), counterclockwise Install clevis pin and check pointer alignment in all positions

MERCURY KEYBOARD CONTROL ADJUSTMENT

Manual Selector Cable Adjustment (Mercury): Raise car remove splash shield and remove pipe plug from left side of transmission case Remove park release cable from lever and clamp *(NOTE - Park release cable must not be connected to adjusting bracket or park release lever while making manual selector lever adjustment)* Loosen control cable mounting bracket retaining screw and washer leaving it finger tight Hold "D" button on transmission keyboard selector in the FULLY DEPRESSED position, then move adjusting bracket downward to limit of travel Install Tool 77270-F in place of pipe plug in transmission case Pull upward on selector cable and housing assembly until pin in gauge seats in the locating slot of selector cable connector sleeve Leaving Tool 77270 F in place torque control cable mounting screw to 18-22 ft lbs Remove tool and replace pipe plug Check for correct keyboard control operation of all buttons before proceeding with park cable adjustment

Park Cable Adjustment (Mercury): *(NOTE - Manual selector cable must be adjusted before park cable adjustment is made)* Install park cable on the pin of park release lever and install clamp and screw on adjusting bracket Fully depress park bar on keyboard selector Install gauge Tool 77270-E over torsion lever support pin in transmission case and the pin on park release lever Remove cable slack by pulling cable housing toward rear of car then while holding cable in this position tighten cable clamp screw *(NOTE-* No external park release lever retracting spring is used on later transmissions) Remove Tool 77270-E Install washer and retaining pin in park release lever pin Check operation of all control buttons and park bar

STARTER NEUTRAL SAFETY SWITCH: *(NOTE - Neutral Safety Switch is located at lower end of steering column (Ford, all models), on steering column, inside passenger compartment (Lincoln & Continental), at back of "key-board" control (Mercury)*

TURBO-DRIVE THROTTLE LINKAGE

BAND ADJUSTMENT

►*Band Adjustment is recommended to be made at 15000 mile intervals when transmission fluid is changed (pan should be removed and cleaned at this time)*

FRONT BAND ADJUSTMENT· Drain fluid from pan using a drain can with a fine mesh screen, remove pan Remove fluid screen from transmission and loosen

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (C nt.)

the front servo adjusting screw locknut TWO FULL TURNS, using a 9/16" wrench. Using front band adjusting tool No. 7225, insert gauge block between servo piston and adjusting screw and tighten adjusting screw until wrench overruns. Back off adjusting screw exactly ONE COMPLETE TURN and remove gauge block. While holding adjusting screw stationary, tighten locknut clockwise (20-25 ft. lbs.). Install fluid screen and install pan using new gasket. Install the drain plug and refill transmission to "Full" mark using fluid drained from transmission unless fluid being changed. Check fluid level (see LUBRICATION).

►*CAUTION–Severe damage may result if adjusting screw not backed off exactly 1 full turn.*

REAR BAND ADJUSTMENT: Fold back floor mat to expose right side of floor pan and remove access cover on right side of transmission floor pan. Using rear band adjusting tool No. 7195 or 7195-B *(NOTE* - See note below for adjusting rear band on air conditioned cars), loosen rear band adjusting screw locknut. Using "T" handle of tool No. 7195, tighten rear band adjusting screw until wrench overruns (if screw found to be tighter than wrench capacity (10 ft. lbs.) loosen screw several turns and retighten until wrench overruns). Back off adjusting screw exactly 1½ COMPLETE TURNS. While holding adjusting screw stationary, tighten adjusting screw locknut to 35-40 ft. lbs.

►*CAUTION: Severe damag may result if adjusting screw not backed off exactly 1½ turns.*

►*REAR BAND ADJUSTMENT NOTE (AIR CONDITIONED CARS):* To avoid interference on air conditioned cars when using band adjusting tool No. 7195, substitute a sliding handle for the stationary type handle of tool Using a piece of steel rod 7/16" x 6½", (with threads on each end of rod), slide rod into the original handle hole of tool and install nuts on ends of rod. The later tool No. 7195-B can be used by loosening the handle attaching screw and sliding the handle as required to clear air conditioning unit.

TESTING

►*CAUTION: While making the Stall Test never hold the throttle open longer than 5 seconds.*

STALL TEST: The stall test is made in "D", "LO" & "R" ranges to determine if bands or clutches are slipping. Connect a tachometer to engine and set it to read on the "high" scale. Make sure engine is idling properly at normal operating temperatures. Start engine, then firmly apply parking brake and service brake. Place selector lever in "D" range, then press accelerator slowly all the way to the floor without going into "low gear" kickdown. The engine speed should be as indicated in the "Stall Speed Table" below. If engine speed is below minimum limit, tune the engine and repeat test. If engine speed exceeds maximum limit, release accelerator immediately because front band or clutch slippage is evident. To determine whether the front band or front clutch is causing slippage, move lever to "LO" range and repeat the test. If slippage is evident in "LO" range also, the front clutch is slipping. If slippage is found in "DR" range, but not in "LO" or "R" ranges, the front band is causing the the slippage. If engine exceeds the maximum limit with selector lever in "R" range, the rear band or rear clutch is slipping. To determine which of the two is faulty, move selector lever to "LO" range. If slippage is evident in "LO" and "R" ranges, but not in "D" range, the rear band is slipping. When slipping is noted in "R" range but not in "LO" or "D", the rear clutch is causing the slippage.

TRANSMISSION SHIFT SPEEDS

	AXLE RATIO	SHIFT SPEED (MPH)						MAN. SHIFT

Ford Truck, F-500, P-500	6.80-1	6-11	29-35	8-5	34	17-22	10-8	14-10
Lincoln	All	15-20	60-70	16-10	28-78	41-48	16-21	24-30
Continental	All	16-20	60-70	16-10	26-70	41-48	15-19	24-30
Mercury	All	16-20	59-76	15-9	24-75	36-47	0-21	23-30

① - If manual shift made above speed indicated, transmission will shift from High to Intermediate; if made below these speeds, transmission will shift from Intermediate to Low (Ford); High to Low (Lincoln, Continental & Mercury).

ENGINE STALL SPEEDS

Car & Model	Low Limit – Engine RPM – High Limit
Ford 6 Cyl. (223" Eng.)	1380 – 1580
Ford V8 (272" Eng.)	1460 – 1660
Ford V8 (292" Eng.)	1550 – 1750
Ford V8 (312" Eng.)	1620 – 1820
Lincoln & Continental	1820 – 2020
Mercury (312" Eng.)	1620 – 1820
Mercury (368" Eng.)	1820 – 2020

SHIFT TESTS: Select a smooth road for the tests. Make test as outlined below and see "Shift Point Table" for correct speed where shifts should occur.

2-3 Upshift (Minimum Throttl): Place selector lever in "DR" range, and starting from a standstill, apply accelerator lightly but steadily.

3-2 D wnshift (Minimum Throttl): Permit car to decelerate (from speed attained in above test) until downshift occurs from high to intermediate.

3-2 Downshift (Forced): Reduce car speed below 45 MPH (Ford), 50 MPH (Mercury & Lincoln). Press accelerator pedal to floor. Transmission should shift from high to intermediate. This shift should occur only with car in high gear.

2-3 Upshift (Maximum Throttle): Place selector lever in "DR" range, and starting from a standstill, press accelerator to the floor. Full throttle upshift should occur as indicated.

2-1 Downshift (Forced): With selector lever in "DR" range and car speed below 18 MPH (Ford), 19 MPH (Mercury & Lincoln), quickly press accelerator fully to the floor. This action shifts transmission from high, to intermediate, or low.

1-2 Upshift (Maximum Throttle): With accelerator fully pressed to floor for above test (2-1 Downshift, Forced), transmission should upshift from low to intermediate when car speed indicated in table is reached. The 2-3 Upshift will occur at same speed as for 2-3 Upshift (Maximum Throttle).

"DR" to "LO" Manual Shift: With car speed between 40-45 MPH (Ford), 45-50 MPH (Mercury & Lincoln), Manually shift selector lever from "DR" to "LO". Instead of shifting to low gear, the transmission should shift from high to intermediate. When car speed is reduced within the range indicated in table, the trans-

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (Cont.)

mission should shift into low range.

"R" Shift: Bring car to a stop and place selector lever in "R" range. The car should move in reverse direction smoothly, upon light throttle pressure.

CONTROL PRESSURE TESTS: *(NOTE - The Throttle Lever Protractor Gauge formerly used in testing the transmission is no longer required).* Install Pressure Gauge No. 77820-A (300 lbs.) in pressure take-off hole in transmission (located either near throttle lever or at rear of transmission case), and position it so it may be read from the driver's seat. Install tachometer to engine and adjust engine to correct idle speed. Set hand brake and allow engine and transmission to reach normal operating temperature. Proceed as follows *(NOTE - See "Line Pressure Range" table below for pressure specifications):*

1) With selector lever in "DR" (Drive) range, check idle pressure which should be within specifications.

2) Increase engine speed to 1000 RPM and note control pressure. If pressure is not within specifications, adjust throttle rod *(see "Throttle Linkage Adjustment" above).*

3) With selector lever in "DR" (Drive) range, increase engine speed to a stall condition. Pressure must be within specifications.

4) Move selector lever to "R" (Reverse) range and repeat the pressure tests at idle speed, 1000 RPM, and stall. Pressures should be within specifications.

► *CONTROL PRESSURE DIAGNOSIS NOTE: If pressures for the above tests are not within specification as outlines in "Line Pressure Range" table below, perform Shift Test & Stall Test as indicated above. Refer to "Trouble Shooting & Diagnosis".*

LINE PRESSURE RANGE TABLE
Ford Pass. Cars & Trucks

Engine Speed	Lever Position	223" Engine ①	272" & 292" Engine ①	312" Engine ①
Idle	DR	49-63	51-69	50-70
1000 RPM	DR	80-85	80-85	80-85
Stall	DR	124-155	133-165	147-180
Stall	R	173-195	181-205	194-216

① - Lbs. Pressure.

Lincoln, Continental, & Mercury

Engine Speed	Lever Position	Pressure
Idle	All	56-70 lbs.
1000 RPM	D	80-85 lbs.
Stall ①	R	197-215 lbs.
Stall ①	D-L	152-180 lbs.
Stall ②	D	152-180 lbs.

① - To detent. ② - Through detent.

AIR PRESSURE TESTS (WITH TRANSMISSION IN CAR): Raise car on hoist and remove transmission oil pan, and control valve assembly. Proceed as follows:

Front Clutch: Apply pressure to front clutch and governor input passage (see illustration). Listen for dull thud which indicates that clutch is operating. Keep air pressure in passage for several seconds to check for leaks in this part of system.

Governor Valve: Remove governor inspection cover. Apply air pressure to the same passage as for front clutch (above). Listen for a click and also watch valve snap inward.

Rear Clutch: Apply air pressure to rear clutch oil passage (see illustration). Listen for a dull thud to indicate clutch is operating. Check for leaks in same manner as for front clutch (above).

Rear Band & Servo: Apply pressure to rear servo oil passage (see illustration), and observe band application.

Front Band & Servo: Apply pressure to front servo apply tube (rear tube), and observe band application.

► *TESTING NOTE: If servos, bands, clutches, and governor operate with air pressure, then the no drive problems, erratic shift, or no upshift conditions indicate that the control valve assembly is the cause of the trouble. See "Control Valve" in OVERHAUL BELOW.*

TROUBLE SHOOTING & DIAGNOSIS

► *TROUBLE SHOOTING & DIAGNOSIS NOTE: Make corrections in sequence shown, testing operation of transmission after each correction.*

SEVERE ENGAGEMENT ("Lo", "Dr", or "R" Ranges): Check engine idle speed and throttle linkage adjustments. Adjust rear band. Perform a control pressure test. Remove and clean main control valve assembly and pressure regulator valve.

2-3 SHIFT IS LOW, HIGH, OR ERRATIC: Check fluid level. Adjust throttle and manual linkage. Check governor operation. Perform a pressure control test. Remove and clean main control valve assembly and pressure regulator valve.

SEVERE 2-3 SHIFT: Adjust throttle linkage. Adjust front band. Remove and clean main control valve assembly and pressure regulator valve. Remove and inspect front servo.

ENGINE OVERSPEEDS (2-3 SHIFT): Adjust front band. Remove and clean main control valve assembly.

NO 2-3 SHIFT: Remove and inspect governor. Remove and clean main control valve assembly. Rear clutch slipping. Leakage in hydraulic system. Fluid distributor sleeve in output shaft is faulty.

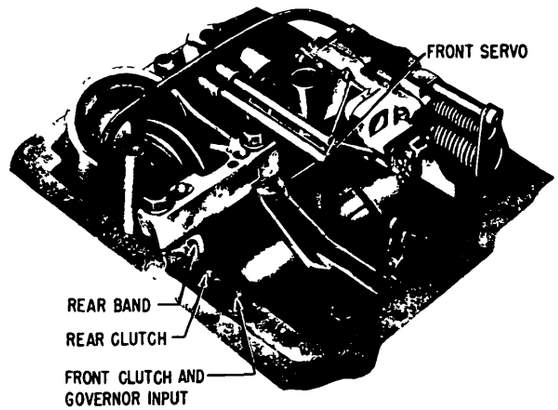
NO FORCED DOWNSHIFT (3-2 SHIFT): Adjust throttle linkage. Perform control pressure check. Remove and clean main control valve assembly. Check operation of inner and outer throttle levers.

SEVERE 3-2 DOWNSHIFT (CLOSED THROTTLE): Check engine idle speed and throttle linkage. Remove and clean main control valve assembly.

SLIPPAGE OR CHATTER IN 2ND SPEED: Check fluid level. Adjust throttle linkage. Adjust front band. Check control pressure. Clean main control valve and pressure regulator assemblies. Front servo not performing properly. Front clutch slipping. Leakage in hydraulic system.

SLIPPAGE OR CHATTER IN 1ST SPEED: Check fluid level. Adjust throttle linkage. Adjust rear band. Clean main control valve and pressure regulator assemblies. Check inner and outer throttle levers. Front clutch slipping. Leakage in hydraulic system. Fluid distributor sleeve in output shaft is faulty.

SLIPPAGE OR CHATTER IN REVERSE: Check fluid level. Adjust throttle linkage. Adjust rear band. Check control pressure. Clean main control valve and pressure regulator assemblies. Front clutch slipping. Leakage in hydraulic system. Fluid distributor sleeve in output shaft faulty



NO DRIVE IN "DR" RANGE: Adjust front band. Clean main control valve assembly. Make an air pressure check. Front clutch slipping. Leakage in hydraulic system. Fluid distributor in output shaft faulty.

NO DRIVE IN "R" RANGE: Adjust rear band. Rear servo not operating properly. Clean main control valve assembly. Make an air pressure check. Rear clutch not operating. Leakage in hydraulic system. Fluid distributor sleeve in output shaft faulty.

NO DRIVE IN "LO" RANGE: Adjust manual linkage. Adjust rear band. Rear servo not operating properly. Clean main control valve assembly. Leakage in hydraulic system. Fluid distributor sleeve in output shaft faulty.

NO DRIVE IN ANY RANGE: Check fluid level. Adjust manual linkage. Check control pressure. Clean main control valve and pressure regulator assemblies. Make an air pressure check. Leakage in hydraulic system.

LOCKUP IN "DR" RANGE: Adjust manual linkage. Adjust rear band. Rear servo not operating properly. Front servo not operating properly. Rear clutch slipping. Check parking linkage. Leakage in hydraulic system.

TRANSMISSION TEST POINTS

LOCKUP IN "R" RANGE: Adjust front band. Front servo not operating properly. Front clutch slipping. Check parking linkage. Leakage in hydraulic system.

LOCKUP IN "LO" RANGE: Adjust front band. Front servo not operating properly. Clean main control valve assembly. Rear clutch slipping. Check parking linkage. Leakage in hydraulic system.

PARKING LOCK BINDS OR WILL NOT HOLD: Adjust manual linkage. Check parking linkage.

UNABLE TO START ENGINE BY PUSHING: Check fluid level. Adjust manual linkage. Clean main control and pressure regulator valve assemblies. Rear pump not operating. Leakage in hydraulic system.

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (Con..)

TRANSMISSION OVERHEATING: Converter cooling air passages blocked. Oil cooler and connections faulty. Clean pressure regulator assembly. Converter one-way clutch slipping or faulty.

ENGINE RUNAWAY ON FORCED DOWNSHIFT: Adjust front band. Clean main control valve and regulator valve assembly. Front servo not operating properly. Leakage in hydraulic system.

MAXIMUM SPEED BELOW NORMAL (POOR ACCELERATION): Converter one-way clutch not operating properly.

NO 2-1 DOWNSHIFT: Adjust throttle linkage. Clean main control valve assembly. Rear servo not operating properly.

NOISE IN NEUTRAL: Clean and inspect pressure regulator. Engine rear oil seal faulty. Front clutch not releasing properly. Front pump faulty.

NOISE IN 1ST, 2ND OR REVERSE SPEEDS: Clean and inspect pressure regulator. Fault in planetary assembly. Front or rear clutch faulty. Front pump faulty.

NOISE IN PARK RANGE: Clean and inspect pressure regulator. Front pump faulty.

NOISE WHEN COASTING IN NEUTRAL (20-30 MPH) WITH ENGINE OFF: Rear pump faulty.

MINOR REPAIRS (TRANSMISSION IN CAR)

The following transmission units can be removed for repair without removing transmission assembly from car. Raise car on hoist for these operations, then drain fluid from transmission and remove oil pan.

►*NOTE: For Disassembly & Overhaul of the following units, see OVERHAUL (TRANSMISSION UNITS) below.*

Govern r Removal: Remove governor inspection cover from extension housing. Rotate the drive shaft to bring governor body in line with inspection hole. Remove the two screws that secure governor body to sleeve. Remove governor.

►*CAUTION: Use care not to drop bolts or governor valve into housing.*

Installation–Lubricate governor valve with transmission fluid and install valve in governor body (*CAUTION*–valve must move freely in body). Install governor body on counterweight with the **side plate forward** (*CAUTION*–fluid passages in governor body and counterweight must be aligned), install governor body attaching screws. Install inspection cover with NEW gasket, tighten cover screws to 4-6 ft. lbs. torque.

►**NOTE:** For the following operations, remove transmission fluid level indicator. Remove transmission filler tube and drain the fluid into clean container using a fine mesh wire screen for straining. (Fluid may be re-used). Then remove transmission oil pan and screen.

Front S rv Removal: Loosen lubrication tube from pressure regulator and rear pump and remove. (NOTE–If necessary, tap tube with soft hammer to remove. *CAUTION*–Do not bend or distort tube). Loosen control valve body attaching bolts. Remove servo attaching bolt and while holding servo strut with fingers, remove servo assembly.

Installation–Position servo band forward in case with band ends down. Position servo strut with large end indexing with servo actuating lever and small end indexing with band end. Rotate band, strut and servo into position, indexing tubes from valve body to servo, and anchor end of band with anchor in case. Install attaching bolt, tightening to 30-35 ft. lbs. Tighten control valve attaching bolts to 8-10 ft. lbs. Install lubrication tube and adjust servo band. See "Front Band Adjustment". Install screen, install oil pan using NEW gasket, tighten oil pan screws to 10-13 ft. lbs. Connect filler tube. Fill transmission to correct level (old fluid can be re-used), recheck fluid level with transmission at operating temperature.

Rear Servo Removal: Remove lubrication tube from rear pump and regulator. (*NOTE*–If necessary tap tube with soft hammer to remove). Remove rear pump intake tube. Remove front servo (see above). Take out rear servo attaching bolts, hold actuating and anchor struts with the fingers, remove rear servo assembly.

Installation–Position servo anchor strut and rotate servo band to engage strut. Hold in position with fingers. Position actuating lever strut and install servo, install servo attaching bolts (*CAUTION*–Longer attaching bolt must be installed in forward bolt hole), tighten attaching bolts to 40-45 ft. lbs. torque. Install front servo (see above). Install rear pump intake tube and lubrication tube. Adjust rear band (see BAND ADJUSTMENT). Install oil pan with NEW gasket, tighten oil pan screws to 10-13 ft. lbs. Connect filler tube. Fill transmission to correct level (old fluid can be re-used), recheck fluid level with transmission at operating temperature.

Control Valve Body Removal: Remove two "U" tubes from pressure regulator and control valve body. Loosen front servo attaching bolt three turns. Take out three valve body attaching bolts, lower the valve body and pull it off the servo tubes.

►*CAUTION–Use extreme care when removing valve body to prevent damage to body and attached parts.*

Installation–Align servo tubes with holes in control valve body, position manual lever in neutral, position inner throttle lever between stop and downshift valve and at the same time push the throttle valve in to clear the transmission case **making certain that manual valve engages actuating pin manual detent lever.** Install control valve body attaching bolts but do not tighten the bolts. Install two "U" tubes in pressure regulator and control valve body. Tighten control valve body attaching bolts to 8-10 ft. lbs. torque. Tighten front servo attaching bolt to 35-40 ft. lbs. torque. Adjust front and rear bands (see BAND ADJUSTMENT). Install oil screen, install oil pan using NEW gaskets, tighten oil pan screws to 10-13 ft. lbs. Connect filler tube. Fill transmission to correct level (old fluid may be re-used) recheck fluid level with transmission at normal operating temperature.

Pressur Regulat r Rem val: Remove lubrication tube. Remove control pressure tube and compensator tube from valve body and regulator. Remove pressure regulator spring retainer. (*CAUTION*–Maintain pressure on retainer to prevent springs flying out). Remove the control pressure and converter pressure valves. Take out pressure regulator attaching bolts and washers, remove regulator.

►*MAIN OIL PRESSURE REGULATOR VALVE INSTALLATION CAUTION:* If regulator removed to correct transmission "buzzing" noise, examine valve for undersize bleed flats and rotate valve 90° in bore from original position when re-installing it. This should correct the noise.

Installation–Install regulator body and attaching bolts and tighten to 17-22 ft. lbs. Install converter pressure and control pressure valves and make certain valves operate freely in bore, then install valve springs and retainer. Install large control pressure tube, small compensator tube, and lubrication tube. Install oil screen, install oil pan using NEW gaskets, tighten pan screws to 10-13 ft. lbs. Connect filler tube. Fill transmission to correct level (old fluid may be re-used), recheck fluid level with transmission at normal operating temperature.

Manual & Throttle Lever Seal Replacement: Remove control valve body (see above), disconnect manual and throttle linkage rods at transmission levers. Remove nut on inner throttle lever shaft and remove inner throttle lever. Remove outer throttle lever and shaft, remove throttle shaft seal from counterbore in manual lever shaft. Take out cotter pin in each end of parking pawl torsion lever rod and remove the rod, rotate manual lever shaft until detent lever clears detent ball (*CAUTION*–do not allow detent ball to fly out), remove detent ball and spring. Remove manual lever shaft nut, remove detent lever, remove outer manual lever and shaft assembly. Remove manual shaft seal.

Installation–Coat outer diameter of new seal with Permatex No. 3, install seal in case using tool No. 77288. Install outer manual lever and shaft, rotate shaft until manual lever points downward, place detent lever on inner end of shaft, install attaching nut and tighten nut to 35-40 ft. lbs. torque. Place detent spring and ball in hole in case (use piece of thin wall tubing to depress ball and spring), rotate detent lever until detent ball is held in place. Install parking pawl torsion lever rod and cotter pins. Install new throttle shaft seal, outer throttle lever and shaft, inner throttle lever and attaching nut, tighten nut to 25-28 ft. lbs. Connect manual and throttle rods to outer levers. Check linkage for free movement. Install control valve assembly and other parts. *See Control Valve Assembly Installation (above).*

TRANSMISSION & CONVERTER REMOVAL
FORD PASS. CARS & TRUCKS (EXCEPT THUNDERBIRD)

►*TRANSMISSION OR CONVERTER REMOVAL NOTE: Transmission and converter can be removed as an assembly, or transmission can be removed separately (without disturbing converter) as follows:*

1) Place car on hoist. On truck models, drain radiator, fold front of floor mat back and remove covers from converter housing access bolt holes. Loosen water inlet and outlet hose clamps at oil cooler and pull hoses off cooler. On all cars and trucks, remove the two upper converter-to-engine bolts and lockwashers then raise vehicle with the hoist.

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (C nt.)

2) Disconnect oil filler tube at oil pan and drain transmission Remove converter housing front plates (8 Cyl.) or the access plate (6 Cyl.). Remove one of the converter housing drain plugs Rotate converter 180°, then remove second drain plug Drain converter.

►*NOTE: Converter may be drained after it is removed from car.*

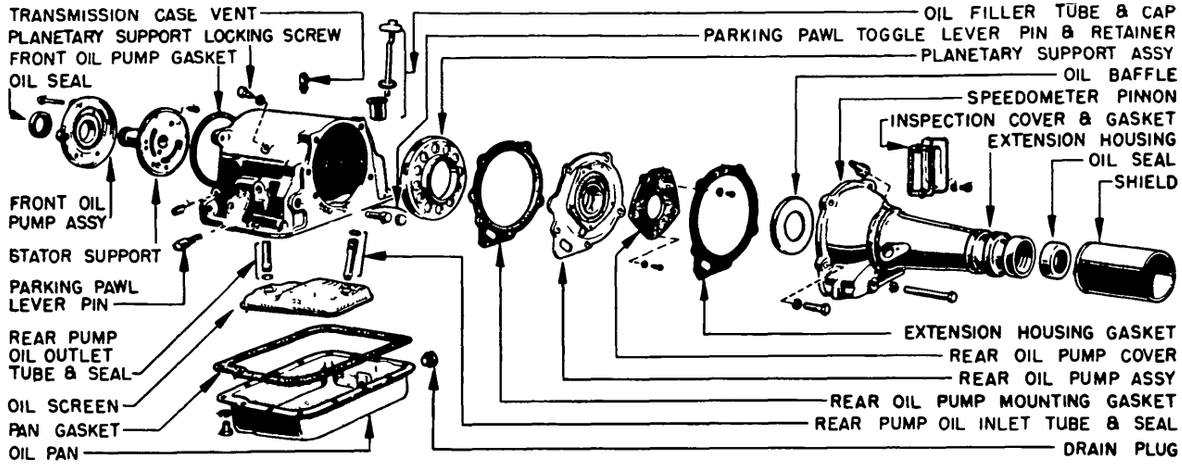
3) Disconnect drive shaft at rear axle and remove shaft On F-250, F-350, P-350, P-400 or P-500 trucks, remove the four bolts attaching drive shaft coupling yoke at parking brake assembly

4) Remove flywheel-to-converter bolts Install the lower converter housing front plate (V8) or wedge the converter in place (6-Cyl) to prevent converter from sliding out of housing when transmission is removed

5) Disconnect starter cable at starter, then disconnect transmission-to-frame ground cable at transmission remove starter. On truck models, remove bolts attaching oil cooler to support brackets, on all models with oil cooler, disconnect oil cooler inlet and outlet hoses at transmission. On truck models, remove oil cooler On air cooled models, remove converter air duct and linkage dust shield, (cars), or the exhaust duct shield (trucks).

6) Disconnect manual and throttle linkages at transmission Disconnect speedometer cable at transmission On Pass. Cars, remove the two engine rear support-to-transmission bolts Position a transmission jack under transmission and raise it slightly to take weight off crossmember. On trucks, with the transmission jack in place remove the converter housing crossmember bolts. On all vehicles, then remove the two lower converter housing-to-engine bolts

7) Tilt rear of converter and transmission assembly upward slightly, then move assembly toward rear of vehicle sufficiently to remove the six engine crankshaft flange-to-flywheel attaching bolts Remove flywheel to provide sufficient clearance, then lower converter and transmission assembly



Torque Converter Removal (from Transmission): *See "Torque Converter Overhaul" below.*

THUNDERBIRD

►*NOTE The converter and transmission assembly cannot be removed with engine in the car. Either the engine can be removed first, or transmission, converter and engine can be removed as an assembly*

1) Remove engine *(see "Engine Removal" in Ford Special Data)* If converter and transmission have been removed with the engine, they can be removed from the engine by removing the six converter-to-flywheel drive plate bolts, then removing the four converter housing to engine attaching bolts

2) To remove converter and transmission after the engine has been removed separately, remove the two transmission extension housing-to-rear engine support attaching bolts Remove speedometer cable at transmission Disconnect the manual shift control lever at transmission Move transmission forward and remove forward drive shaft, then remove converter and transmission from car

TRANSMISSION CASE & EXTENSION HOUSING ASSEMBLY

Torque Converter Removal (from Transmission): *See "Torque Converter Overhaul" below.*

LINCOLN & MERCURY

1) Remove ground strap from battery Remove bolts and nuts securing throttle linkage bar bracket to engine and body Place car on support stands with all four wheels approximately 12' off ground On Mercury models with single exhaust pipe, remove nuts securing muffler inlet and cross over pipe to exhaust manifolds Remove manifold outlet pipe from mounting bracket at rear of manifold and move exhaust system away from working area.

2) Disconnect manual linkage and throttle linkage at transmission Disconnect speedometer cable at extension housing Disconnect drive shaft at rear universal joint and remove drive shaft from transmission output shaft. On models with water cooled torque converter, remove inlet and outlet hoses at transmission. On models with air cooled torque converter, remove air duct from torque converter housing.

3) Remove splash deflector, and converter housing lower plate Drain converter by removing one drain plug, then rotate engine 180° and remove second drain plug Drain fluid from transmission

4) Remove engine rear mount-to-frame crossmember bolts Position transmission lift under transmission and raise engine and transmission sufficiently to install support tool Remove rear engine mount from transmission On Lincoln, remove the detachable frame crossmember from frame "X' member (the Mercury models have a tubular crossmember with brackets welded to the crossmember). Lower lift under transmission to allow engine to rest on support tool Reposition transmission lift under transmission assembly and raise lift just enough to relieve weight of transmission on engine.

5) Remove starter and upper converter housing plate with seal Remove six bolts securing converter to flexible drive plate. Remove the bolts securing converter housing to engine block

6) Remove transmission and converter assembly by sliding assembly toward rear of car sufficiently to disengage converter housing dowels and converter cover pilot Secure converter to converter housing to prevent damage to converter. Lower the assembly and remove from under car

Torque Converter Removal (from Transmission): *See "Torque Converter Overhaul" below*

TRANSMISSION REMOVAL (WITHOUT CONVERTER)

FORD PASS. CARS & TRUCKS

►*NOTE: On most cars and trucks, the transmission can be removed without removing the converter assembly.*

1) Raise vehicle with a hoist and drain fluid from transmission Disconnect drive shaft at rear axle and remove drive shaft

2) On trucks, disconnect oil cooler-to-transmission fluid inlet and outlet lines at transmission Remove bolts holding oil cooler on support brackets, then move cooler to one side

3) Remove converter air duct from pass cars, and remove exhaust duct splash shield from trucks

4) Disconnect manual control and throttle linkage at transmission Disconnect speedometer cable at extension housing. On pass. cars, remove the two rear support-to-transmission bolts Position a transmission jack under transmission and raise it slightly to take weight off crossmember Remove crossmember bolts and crossmember

5) On all vehicles, with transmission jack in place, remove the four transmission-to-converter housing attaching bolts On trucks, remove oil cooler from front support bracket Tilt rear of transmission slightly upward and move assembly toward rear, with a jack, until clear of turbine shaft Lower assembly and move it from under vehicle

LINCOLN & MERCURY

1) Place car on support stands with all four wheels approximately 12" off floor On Mercury models with

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (Cont.)

single exhaust pipe, disconnect muffler pipes at exhaust manifold and the outlet pipe at support bracket, and move complete exhaust system away from work area

2) Drain fluid from transmission and disconnect manual and throttle linkage at transmission Disconnect speedometer cable at extension housing Disconnect drive shaft at rear universal joint and remove drive drive shaft from transmission output shaft

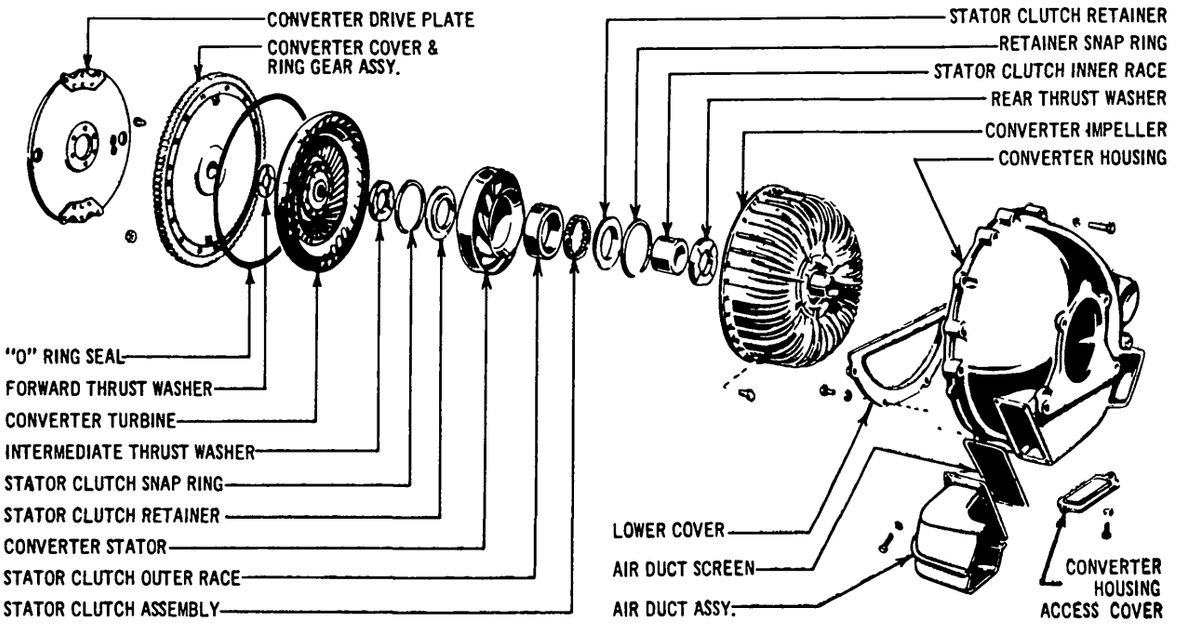
3) Remove rear engine mount to frame crossmember bolts (Mercury models have a tubular crossmember with brackets welded to crossmember) Position lift under transmission and raise engine and transmission and raise engine and transmission sufficiently to install engine support tool Remove rear engine mount from transmission On Lincoln, remove the detachable crossmember from frame "X" member

4) Lower lift under transmission and allow engine to rest on support tool Reposition transmission lift to relieve the weight of transmission Remove four bolts securing transmission to converter housing.

5) Remove transmission by sliding assembly toward rear of car sufficiently to disengage the turbine shaft. Lower the assembly and remove from under car.

TORQUE CONVERTER OVERHAUL

►*DISASSEMBLY & REASSEMBLY CAUTION. CLEANLINESS IS EXTREMELY IMPORTANT WHEN OPENING UP TRANSMISSION. Thoroughly clean outside of case first, clean ach part as removed*



TORQUE CONVERTER REMOVAL (From Transmission): Grasp converter cover with both hands and pull straight out *(CAUTION–To prevent damage to front seals, do not rock assembly from side to side)* Remove converter housing attaching bolts and remove housing from transmission

DISASSEMBLY: Remove converter cover attaching bolts and nuts Remove cover and "O" ring seal Remove bronze thrust washer from turbine and remove turbine Remove stator from pump housing *(CAUTION–Check and locate the balancing marks on cover and stator so they may be replaced in the exact same position)* Remove thrust washer from pump hub and from turbine hub. Remove sprag clutch inner race and remove snap ring retaining outer hub to stator *(CAUTION–Do not burr snap ring groove)* Remove outer hub, sprag assembly, outer race and inner hub as an assembly Separate hubs and sprag assembly from outer race Remove snap ring retaining inner hub to stator

INSPECTION: Inspect converter blades for looseness, and check thrust surfaces for scores and splines for burrs and wear Inspect seal surfaces and front pump driving lugs for wear Inspect sprag assembly for worn or broken sprags or broken or distorted spring Inspect bushings for wear or scoring (if bushings worn, polish bearing surface of journal with crocus cloth to eliminate possibility of wear having been caused by rough bearing surface)

REASSEMBLY: Install stator inner hub and snap ring Turn assembly over, install outer race in stator Install sprag assembly in outer race making sure that sprags are pointed in the right direction Install outer hub and outer hub snap ring Insert Tool No 7946, tapered side first, into sprag assembly while rotating tool counter-clockwise to position sprags Install inner race with spline section up Guide tool No. 7946 with hand while pushing inner race into position. Check stator for clockwise rotation while holding the inner race Install new seal in pump hub and install hub in pump Tighten hub capscrews to 8-10 ft lbs Install thrust washer into hub of converter pump and install stator with the word "front" (stamped into face of stator) upward Install thrust washer in hub of turbine and install turbine Install bronze thrust washer on turbine hub. Position converter cover on pump housing with new "O" ring seal and properly align balance marks on cover and housing *(CAUTION–Cover and housing must be installed in the same position noted when these parts disassembled)* Install all converter bolts and tighten to 25-28 ft lbs in the sequence indicated below Install converter housing on transmission case and tighten attaching bolts to 40-45 ft lbs Install converter assembly and press it firmly into position on turbine shaft *(CAUTION–Do not "rock" converter assembly while installing it on shaft (will damage oil seals)*

►*COVER BOLT TIGHTENING SEQUENCE (To prevent leaks)* Tighten two nuts directly opposite each other just snug, tighten two nuts 90° from first two similarly, tighten two nuts 45° from first four nuts similarly, Continue this sequence until all nuts have been tightened **just snug,** then torque all nuts in same sequence to 25-28 ft lbs torque

TORQUE CONVERTER ASSEMBLY

TRANSMISSION DISASSEMBLY

►*DISASSEMBLY & REASSEMBLY CAUTION: CLEANLINESS IS EXTREMELY IMPORTANT WHEN OPENING UP TRANSMISSION. Thoroughly clean outside of case first. CLEAN each part as removed with cleaning fluid or gasoline and dry with air–wiping cloths will leave lint on parts.*

DISASSEMBLY OF TRANSMISSION (Into Major Units): With transmission on bench fixture, (tool No. 7000-C-D recommended for holding transmission), remove all transmission units as follows:

1) Remove pan and gasket and take out fluid screen.

2) Remove pressure regulator spring retainer, regulator springs, control pressure and converter pressure regulator valves.

►*CAUTION: Maintain pressure on retainer to pr vent valve springs from flying out.*

3) Loosen pressure regulator and valve body attaching bolts, and remove lubrication tube from pressure regulator and rear pump. NOTE– If necessary tap tube with soft hammer. *CAUTION–do not bend or distort tube.*

4) Remove rear pump intake tube, being careful not to bend or distort it

5) Remove compensator pressure tube (small) and control pressure tube (large) from pressure regulator and valve body. NOTE–If necessary, tap tube with a soft hammer. *CAUTION–do not bend or distort tube.*

6) Remove pressure regulator spring retainer, pressing it inward toward regulator to release Remove pressure regulator springs, control pressure and con-

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (Cont.)

verter pressure regulator valve. Remove regulator body attaching bolts and washers and remove body from case. NOTE—After removing regulator body from case, replace valve in body to protect them.

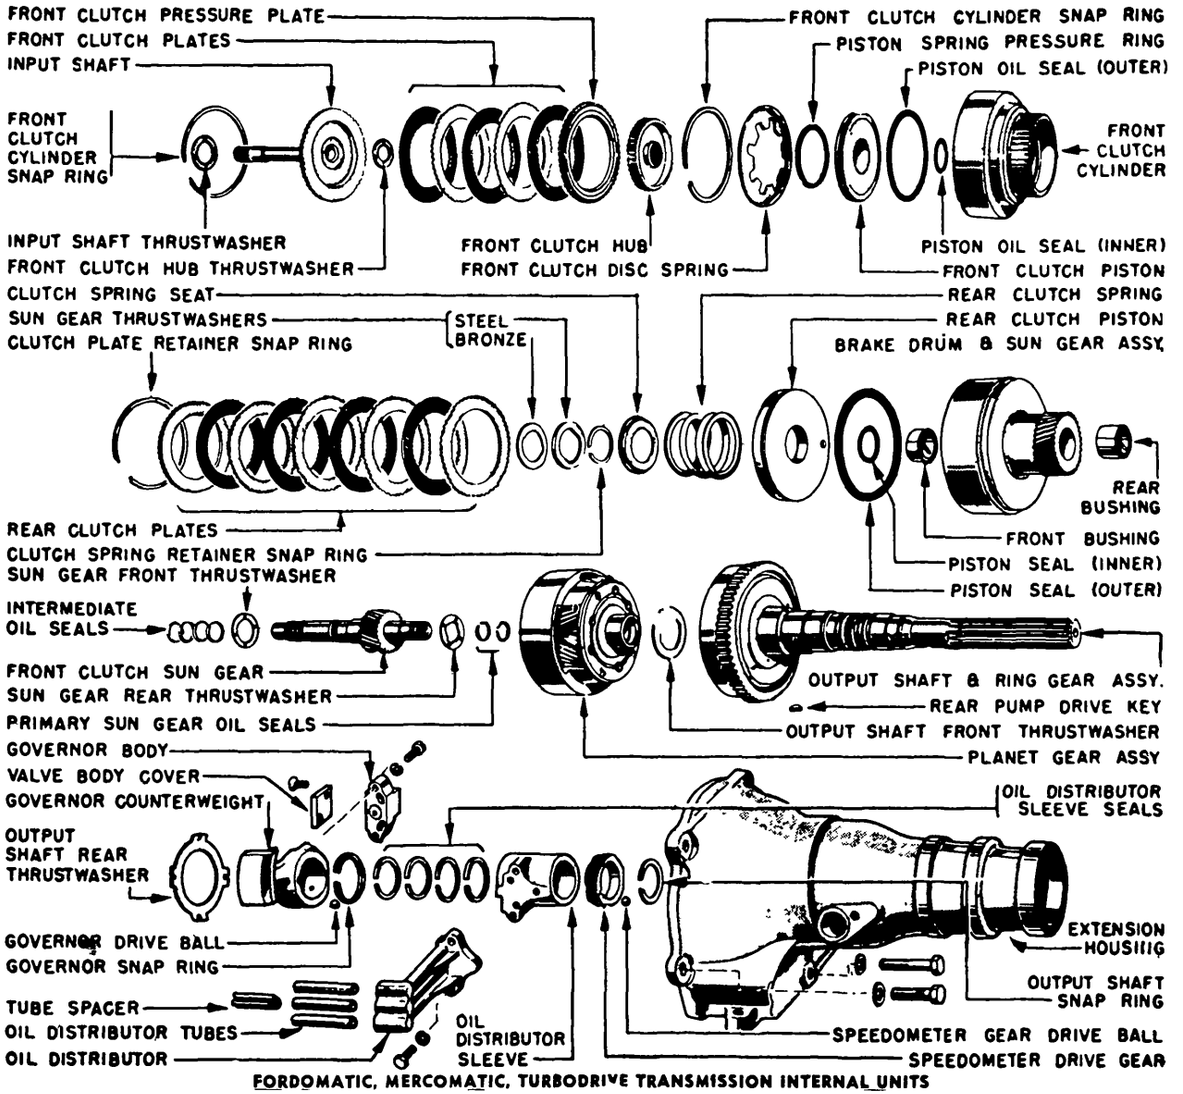
7) Loosen front and rear servo band adjusting screws five turns and loosen front servo attaching bolts three turns. Remove valve body attaching bolts and raise valve body to clear case and disengage valve body to clear case and disengage valve body to servo tubes and remove valve body.

8) Remove front servo apply and release tubes by twisting and pulling tubes. Take out front servo attaching bolt, hold front servo strut with fingers, lift servo out.

9) Remove rear servo attaching bolts and while holding actuating and anchor struts with fingers, lift servo from case *(CAUTION—Do not allow struts to drop into cas).*

10) *CHECK TRANSMISSION ENDPLAY before proceeding with disassembly, as follows:* Remove one front pump attaching bolt and mount Dial Indicator & Support Tool No. 77067 in this bolt hole so that contact button rests on end of turbine shaft. Install Extension Housing Seal Replacer Tool No. 7657-D on output shaft to provide support for shaft. Pry front clutch cylinder toward rear of transmission using a large screwdriver, and set dial indicator to zero while maintaining a slight pressure on clutch cylinder. Remove screwdriver and pry units forward (toward front of transmission) by inserting screwdriver between large internal gear and case. Record indicator reading (endplay) for use in step 17 (below). This endplay should be .010-.029". Remove dial indicator and support and remove tool from output shaft.

11) Remove front pump attaching bolts and remove front pump assembly. (NOTE—If pump is tight in case, use soft hammer to loosen pump). Remove pump to case gasket. *CAUTION—Pull pump off shaft carefully to avoid damaging oil seal.*



12) Remove five extension housing-to-transmission bolts (these bolts also hold rear oil pump on case), withdraw extension housing carefully while holding rear pump in place. *CAUTION—Pull housing off output shaft carefully to avoid damaging rear oil seal.*

13) Remove speedometer drive gear snap ring from output shaft and take off the speedometer drive gear. *(CAUTION—*Do not lose drive ball).

14) Remove fluid distributor attaching bolts and slide distributor and tube from transmission. Remove distributor sleeve from output shaft. Carefully remove the four seal rings from the output shaft with the fingers *(CAUTION—*use care not to damage these rings).

15) Remove governor snap ring from shaft and slide governor assembly from output shaft. *(CAUTION—*Use care so as not to damage seal rings on output shaft. Do not lose governor drive ball).

16) Remove rear pump discharge tube using tool 77869 and remove pump from case. Remove extension housing and pump gaskets. Remove rear pump drive key from output shaft. Remove bronze thrust washer from output shaft. (NOTE—Washer may come off with pump). Hold rear drum forward and remove the output shaft.

FORDOMATIC, MERCOMATIC, TURBODRIVE TRANSMISSION INTERNAL UNITS

17) Remove selective thrust washer from rear of pinion carrier. If endplay as recorded in step 10 (above) was not within limits of .010-.029", replace this washer with one of proper thickness to give desired endplay. This washer furnished in following sizes: .063-.061", .069-.067", .076-.074", .083-.081".

18) Remove two seal rings from primary sun gear shaft. *CAUTION—use care not to distort rings.*

19) Remove pinion carrier from case and remove bronze thrust washer.

20) Mark rear band position so that it can be assembled in the same position. Remove band by squeezing ends together and tilting band forward.

21) Remove two center support bolts (on outside of case-one on each side). Press on end of turbine shaft to force clutch units toward rear of transmission and remove center support from case.

22) Remove rear and front clutch assemblies from transmission case as a unit. Install clutch assembly into bench fixture, tool No. IP-77530 and remove thrust washer from front of turbine shaft. Remove the front band from case. Lift front clutch assembly from

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (Con..)

primary gear shaft. (*CAUTION*–Do not rock assembly while lifting to prevent damage to seal rings)

23) Remove bronze and steel thrust washers from primary sun gear shaft and then remove the front clutch seal rings from primary sun gear shaft. Lift rear clutch assembly from shaft. (*CAUTION*–Do not rock assembly while lifting to prevent damage to seal rings). Remove rear clutch seal rings and thrust washers from shaft.

TRANSMISSION OVERHAUL (TRANSMISSION UNITS)

►*DISASSEMBLY & CLEANING CAUTION:* Handle all parts with care to avoid nicking or burring bearing surfaces and mounting faces. Clean all parts with clean solvent and dry with air. DO NOT use wiping cloths which might deposit lint and interfere with proper operation of transmission. Minor scores or burrs may be removed with crocus cloth. *CAUTION–When polishing valves use extreme care not to round edges of valve lands.*

►*REASSEMBLY CAUTION: Use all new gaskets when assembling or installing units in transmission. Lubricate all internal parts with Automatic Transmission Fluid Typ "A" (vaseline may be used to retain gaskets and thrust washers). Tighten all bolts, nuts, and screws to correct torqu .*

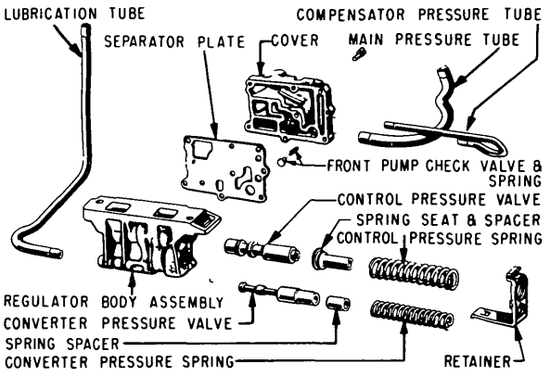
PRIMARY SUN GEAR SHAFT (Disassembly): Remove rear clutch seal rings by applying pressure on one end and at back of ring forcing ring into groove at these two points. Other end will spring out and free the hook. Remove thrust washer from thrust face of primary gear.

Inspecti n: Inspect all thrust surfaces and journals for wear or scores. Inspect sun gear for broken, chipped, or worn teeth. Inspect shaft splines and ring grooves for wear or burrs. Check all fluid passages for evidence of leakage and make certain passages are clean and free from obstructions. Check seal rings for wear by installing rings in bore and measuring end gap which should be .002-.009", check rings for free fit in groove (must not bind) If front clutch lubrication valve not operating properly, repair it by installing a new kit.

Reassembly: Install bronze thrust washer against thrust face of primary sun gear, install seal rings in shaft grooves. Seals can be installed in the same manner in which they were removed (see Disassembly above)

REAR CLUTCH (Disassembly): Using arbor press and tool No. 77515, remove clutch release spring snap ring (*CAUTION*–Guide spring retainer while releasing press to prevent retainer interfering with snap ring groove. Remove retainer, release spring, pressure plate snap ring, and pressure plate. Remove the four bronze and four steel clutch plates (Ford & Mercury), Five bronze and Five steel plates (Lincoln), from the drum. Place splined end of primary sun gear shaft in clutch piston bore, entering it as far as it will go, apply air pressure to hole in end of shaft which will force clutch piston out of cylinder (*CAUTION*–Hold hand over piston to prevent it flying out and being damaged) Remove outer seal ring from groove in piston and inner seal ring from clutch drum. Discard these seals (do not re-use).

Inspection: Inspect drum band surface, the bushing, and thrust surfaces for scores. Remove minor scores with crocus cloth. Replace badly scored parts. Inspect needle bearings for worn or loose rollers. Inspect gear teeth for burrs or wear. Inspect clutch piston bore and piston inner and outer bearing surfaces for scores. Check fluid passages for obstructions, making sure that they are free and clear. Inspect clutch plates for scores, and check plates for fit on clutch hub serrations. Replace all plates that are worn or do not fit properly (*CAUTION*–Front clutch plates differ from rear clutch plates and are not interchangeable). Check coning of the steel plates. Position plates on a flat surface, then check coning with a feeler gauge. Plates are coned to .010" clearance and should be checked on the inside diameter. Inspect clutch pressure plate for scores on clutch plate bearing surface. Replace plate if deeply scored. Check clutch release spring for distortion and discard if badly bent.



Reassembly: Lubricate all parts with Automatic Transmission Fluid Type "A". Install clutch piston inner seal ring in groove in drum. Install a new outer seal ring on piston and install piston in clutch drum. Install four steel and four bronze clutch plates (Ford & Mercury), five steel and five bronze (Lincoln), alternately, starting with a steel plate, convex side up (Ford), concave side up (Lincoln & Mercury). Install clutch pressure plate with bearing surface down, and install snap ring. Make sure snap ring is fully seated in groove. Install clutch release spring, then position retainer on spring. Position the clutch assembly in an arbor press using tool No. 77515 positioned on spring retainer, and compress clutch spring. Install snap ring (*CAUTION–While compressing the spring, guide retainer to avoid interference of retainer with snap ring groove. Make sure snap ring is fully seated in groove).*

FRONT CLUTCH: Disassembly–Remove clutch cover snap ring and remove turbine shaft (input shaft) from clutch drum. Remove thrust washer and clutch hub. Remove four bronze and three steel clutch plates and pressure plates. Using arbor press and tool No. 77565 depress clutch release spring and remove snap ring. Release spring pressure, remove clutch release disc spring from drum. Using air pressure and a piece of 3/16" tubing (bend at the end for entry into hole in clutch bore) force clutch piston out of cylinder. (*CAUTION–Hold hand over piston to prevent damage).* Remove piston inner seal from clutch cylinder and remove piston outer seal from groove in piston.

Inspection: See "Rear Clutch Inspection" above and follow the same procedure except that all front clutch plates are flat. *CAUTION–Front and rear clutch plates are not interchangeable.*

►*FRONT CLUTCH ASSEMBLY PRODUCTION CHANGE (ALL TRANSMISSION):* To prevent gear noise or clutch "roll over" during manual shift from "D" to "N", Front Clutch Plate (bronze). Part No. B5A-77519-A is used to replace two of the original four bronze plates. Install one later type plate identified by additional parallel grooves on both sides, next to clutch pressure plate, and the other installed on top of the balance of the plates. These later type plates can be used to correct the above condition in early 1955 transmissions

Reassembly: Install a new piston inner seal ring in clutch cylinder and a new outer seal ring in piston groove. Install piston in clutch housing. (*CAUTION–Make certain that steel bearing ring is in place on piston).* Position release spring in cylinder with **c n-**

PRESSURE REGULATOR ASSEMBLY

cave side up, place spring compressor tool on spring and compress spring in an arbor press to enable installation of snap ring, make sure that snap ring is fully seated in groove. *NOTE–Complete reassembly of front clutch after rear clutch assembly has been installed on primary sun gear shaft as indicated below.*

PRIMARY SUN GEAR SHAFT & CLUTCH (Reassembly): After individual units assembled (Shaft and Front & Rear Clutches), place primary sun gear shaft assembly in bench fixture and install rear clutch assembly on sun gear shaft (*CAUTION–Center seal rings on shaft to prevent breakage as clutch assembly installed).* Install steel and bronze thrust washers on shaft in that order. Install two seal rings in shaft grooves. Install two seal rings in shaft grooves. Install front clutch housing on primary gear shaft while rotating clutch units to mesh rear clutch plates with serrations on clutch hub being careful not to damage seal rings as clutch assembly being installed. Install clutch hub in clutch cylinder with deep counterbore down. Install bronze thrust washer on clutch hub. Install pressure plate in clutch cylinder with bearing surface up then install four bronze and three steel clutch plates alternately, starting with a bronze plate, (*CAUTION–*Lubricate all plates with Automatic Transmission Fluid Type "A" as they are installed. Install turbine shaft in clutch cylinder and install snap ring in groove, making sure that it is fully seated. Install bronze thrust washer on turbine shaft. Assembly is now ready for installation in transmission case. *See "Transmission Reassembly" below.*

FRONT PUMP (Disassembly): Remove pump cover attaching screws and remove cover with stator support. Mark the driven gear with Prussian Blue to assure correct assembly and remove drive and driven gears

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (Con..)

from pump body. To remove seal from pump body, mount the pump body on transmission case, use tool No. 1175-AB to remove seal

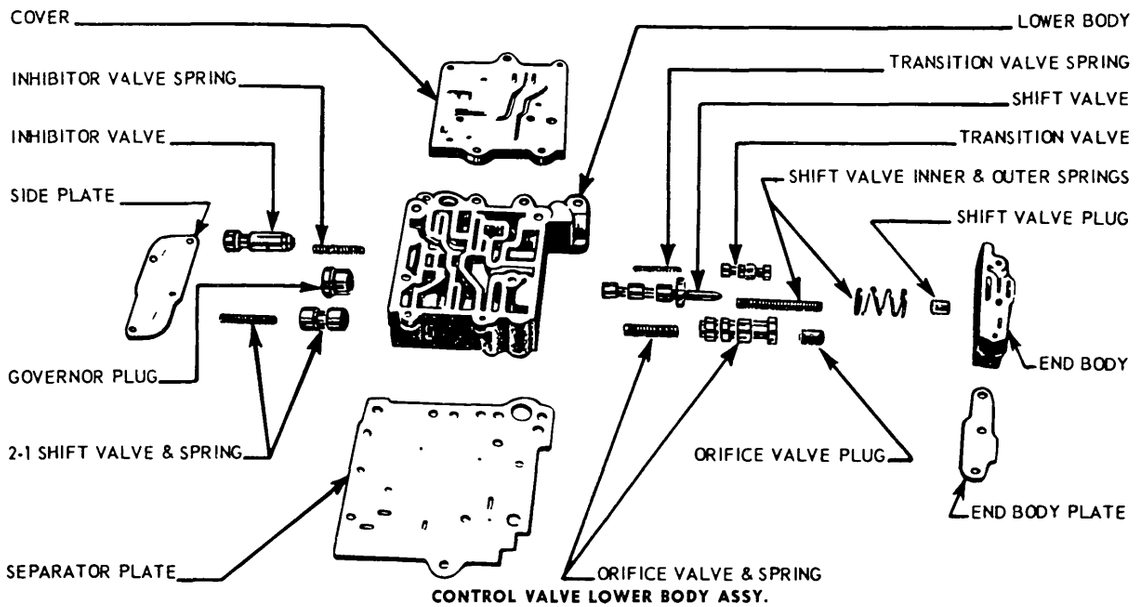
►*CAUTION: Extreme care must be taken not to scratch or mar pump gears or bearing surfaces*

Inspection: Inspect bushing, gear pockets and crescent for scores. Inspect front cover, pump body, gear teeth and stator support splines for burrs. Check pump for evidence of contact between outside diameter of drive gear and crescent. REPLACE PUMP if such contact noted. Check bushing for wear and scoring

Reassembly: Use tool No. 77837 to install new seal in pump body (*CAUTION*—coat outside diameter of seal with Permatex No. 3 before installation to prevent fluid seepage). Install pump driven gear in pump body in accordance with marks made before disassembly, install drive gear. Install pump cover, attaching screws, lockwashers, and tighten cover screws evenly to 1-3 ft. lbs. Check pump for free movement.

REAR PUMP: (Disassembly): Remove screws and lockwashers securing pump cover to pump body and remove cover. Using Prussian Blue, mark pump drive and driven gears to assure correct assembly, and remove gears from body.

►*CAUTION—Handle pump parts with care to avoid scratching or marring*

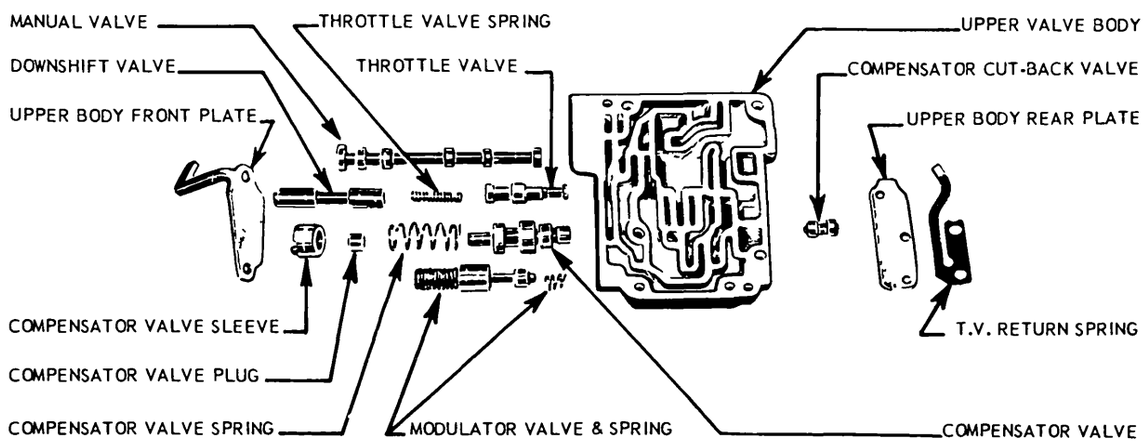


Inspection: Inspect all pump parts for excessive wear, score, or burrs. Check fluid passages for obstructions. Check pump for evidence of contact between outside diameter of drive gear and crescent. REPLACE PUMP if such contact noted. Check bushing for wear or scoring.

Reassembly: Install pump driven gear into pump body, positioning gears as marked on disassembly. Install drive gear into position as marked. Install pump cover, install cover screws with lockwashers, tighten screws evenly to 50-60 inch lbs. (¼"), 20-30 inch lbs.,(10-24 screws). Check pump for free movement of gears.

PRESSURE REGULATOR BODY (Disassembly): Remove valves from body Take out cover attaching screws, remove cover and separator plate

Inspection: Inspect regulator body and cover mating surfaces. Check fluid passages in body and fluid passages in separator plate for obstructions Inspect valves and valve bores for scoring and check freedom of valves in valve bores. Check regulator valve springs for distortion. Wash thoroughly in clean solvent and blow dry with air.

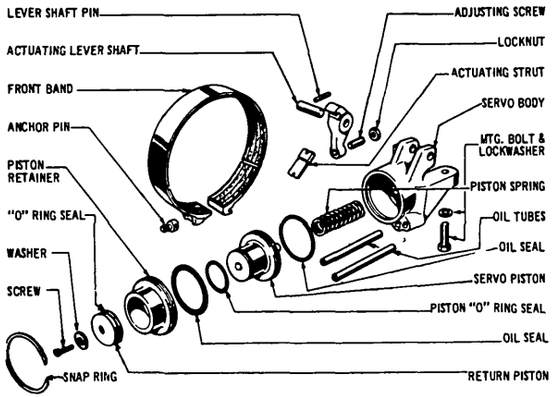


Reassembly: Install check valve spring in regulator cover and position valve on spring (*see "Pressure Valve Installation Caution" below*) Position separator plate on regulator cover Hold regulator and cover together and check for free movement of valve. Place regulator body in position on separator plate and install attaching screws. *NOTE—Do not install valves at this time as they should be installed after regulator assembly is installed in transmission. See "Transmission Reassembly" below.*

CONTROL VALVE LOWER BODY ASSY.

►*MERCOMATIC & TURBO-DRIVE PRESSURE REGULATOR VALVE SPRING & SPACER INSTALLATION CAUTION.* It is extremely important that the spring seat and spacer be installed so that the cupped end fits over the end of the control pressure valve, and the stem fits down through the control pressure spring. Two types of spacers are used in production, one having the small diameter end closed, and the other with the end open. Install either spacer as indicated above.

CONTROL VALVE (Disass mbly): During disassembly of the control valve avoid damage to valve parts and keep valve parts clean. Place valve assembly on a clean cloth while performing the disassembly operation. *(NOTE—Do not separate th valve bodies until after valves have been removed).* Remove manual valve and remove one screw attaching separator plate to lower valve body. Remove upper body front plate *(NOTE—The plate is spring loaded. Apply pressure to plate while removing the attaching screws).* Remove compensator spring and plug, remove valve spring and valve. Remove modulator valve retainer, both large and small springs and valve. Remove downshift valve and spring. Remove two screws attaching throttle valve return spring to upper body, then remove spring. Remove the remaining screw attaching upper valve body rear plate to valve body, then remove plate. Remove throttle valve, then the compensator cut back valve. Remove lower body side plate *(apply pressure to plate while removing as it is spring loaded).* Remove the 2-1 shift valve spring and valve, low inhib-



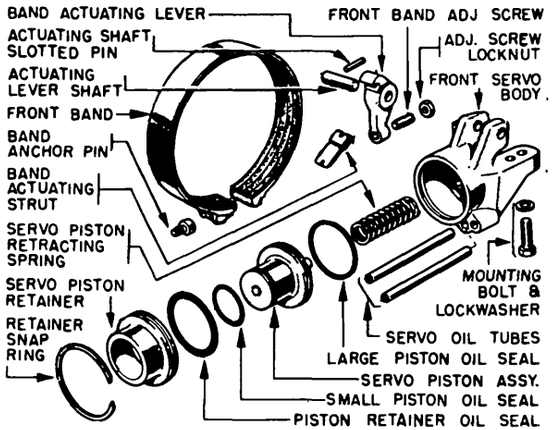
CONTROL VALVE UPPER BODY ASSY.

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (Cont.)

itor valve and spring, then remove the 2-3 shift valve and governor plug. Remove the end body *(End body is spring loaded. Apply pressure while removing attaching screws).* Remove orifice control valve plug and 2-3 shift valve plug from end body and remove end body plate. Remove 2-3 shift valve outer and inner springs, then remove shift valve. Remove orifice control valve and transition valve and spring. Remove attaching bolts and screws and separate bodies. Remove separator plate from upper body and remove check valve seat, valve and spring from lower body.

Inspection: *(CAUTION–Handle all parts carefully to avoid scoring, burrs and distortion).* Clean all parts



TURBODRIVE FRONT SERVO & BAND ASSY.

thoroughly in clean solvent and blow dry with air. DO NOT USE CLOTH FOR WIPING PARTS (lint left by a cloth may cause poor valve operation). Inspect all mating surfaces for burrs, scratches, and flatness. Check all passages for obstructions. Inspect all valves and valve bores for scoring and check valves for free movement in bores (valves should slide in bore of own weight). Valves can be polished with crocus cloth.

►*CAUTION–Do not round the sharp edges of valves and plugs.*

Reassembly: *(NOTE–Arrange all parts in their correct position. Rotate valves and plugs when inserting them in their bores, to avoid shearing of soft body castings).* Install separator plate on upper body (do not tighten screws). Install check valve spring, valve, and seat in lower body. Position lower body on upper body. Install lower body cover and tighten attaching bolts finger tight. Align the valve body attaching bolt holes in the separator plate and lower body. Tighten the four valve body bolts to 4-6 ft. lbs. *(CAUTION–Excessive tightening of these bolts may distort valve bodies, causing valves or plugs to stick).* Install the three lower cover to lower body screws and tighten to 20-30 inch lbs. Install the plate on lower end body and tighten attaching screws. Install orifice control and shift valve plugs in end body. Install transition valve and spring, the orifice control valve and spring, 2-3 shift valve in lower body. Install shift valve inner and outer springs, and install end body on lower body, *(CAUTION–Make sure that inner spring is piloted on shift valve regulator plug).* Install governor plug in lower body. Install low inhibitor valve spring in valve, and install spring and valve. Install 2-1 shift valve spring in valve, and install valve and spring. Install lower body side plate. Install compensator cut-back valve in upper body. Install throttle valve and position upper body rear plate on upper body with the plate between end lands of throttle valve. Install one plate to body screw in hole next to throttle valve. Position throttle valve return spring on plate, and secure plate in place with the remaining plate to valve body screws. Install compensator valve and spring and downshift spring and valve. Install modulator small spring, valve, spring, and retainer as an assembly. Install the plug in the compensator valve sleeve, castellated end out, and install assembly in body, with smooth end toward body. Install upper body front plate. Install separator plate to lower body screw and install manual valve.

FORDOMATIC & MERCOMATIC FRONT SERVO & BAND ASSEMBLY

GOVERNOR (Disassembly): Remove governor body side plate attaching screws, remove plate. Remove governor body attaching screws and remove body from counterweight. Remove governor valve from body.

Inspection: Inspect valve and valve bore for scores and check free movement of valve in bore. Inspect all fluid passages for obstructions. Inspect mating surfaces for burrs and distortion.

Reassembly: Install governor valve in bore of governor body and install body cover plate and attaching screws. Mount governor body on counterweight, making sure that fluid passages line up with passages in counterweight. Install body attaching screws. Tighten body-to-counterweight screws.

FRONT SERVO (Disassembly–Ford & Mercury): Remove piston retainer snap ring *(CAUTION–Servo piston is spring loaded. Apply pressure to piston when removing snap ring).* Remove servo piston and retainer from servo body (NOTE–If necessary, tap servo piston guide lightly with soft hammer to remove from servo body). Remove servo spring, and remove retainer from piston and seal from retainer.

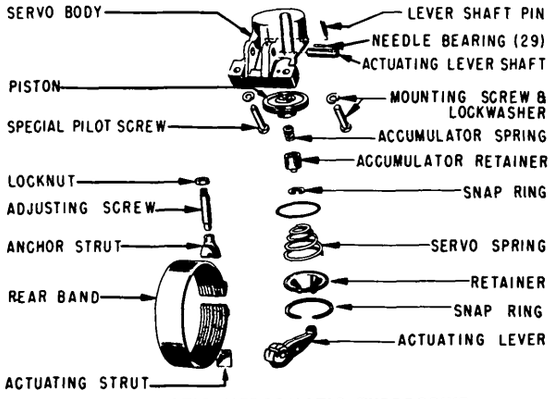
Disassembly (Lincoln): Proceed as with Ford & Mercury (above), then loosen to one half its length the screw that secures servo piston release piston to servo piston stem. Tap screw head with soft hammer until stem is forced from release piston. Separate release piston, piston retainer and piston. Remove seal from release piston. Remove "O" ring seals from piston.

Inspection: Inspect servo body for cracks. Inspect piston and piston bore for scores. Check fluid passages for obstructions. Check actuating lever for free movement and inspect for wear. (NOTE–If necessary to replace actuating lever or shaft, remove retaining pin and push shaft out of bracket). Inspect threads in lever and on adjusting screw. Check servo spring and servo band for distortion. Inspect servo band lining for excessive wear and bond to metal band. (NOTE–Band should be replaced if worn to a point where grooves are not evident). Inspect bands for cracks and distortion.

Reassembly (Ford & Mercury): Install new "O" ring seals on piston, and new oil seal on piston retainer. Lubricate seals and install retainer on piston. Position servo spring in servo body. Lubricate and install piston and retainer assembly in servo body. Press retainer into servo body and install snap ring. *(CAUTION–Make sure snap ring is fully seated in groove).* Install adjusting screw and locknut in actuating lever if previously removed. Check operation by applying air pressure to apply hole.

Reassembly (Lincoln): Install new "O" ring seals on piston, and install new seal on piston retainer. Lubricate seals and install retainer on piston. Install new oil seal on release piston and retainer piston and piston retainer. Install new "O" ring seals on piston. Install piston in retainer and move piston to full release position in retainer. Place piston release piston in position, concave side toward stem and press into place. Install screw retaining release piston to piston stem. Complete reassembly in same manner as for Ford & Mercury (above).

REAR SERVO (Disassembly): *(NOTE–Ford & Mercury Rear Servo is smaller in diameter than that used on Lincoln).* With a 1/8" pin punch, remove servo actuating lever shaft retaining pin, and remove shaft and operating lever *(CAUTION–Use care when removing actuating lever to avoid losing needle bearings).* While pressing down on servo spring retainer, remove snap ring (release pressure on retainer slowly). Remove retainer and servo spring. Hold hand over piston to prevent damage and force piston from servo body with air pressure. Press down on accumulator piston and hold in this position while removing "cir-clip" type lock ring with lock ring pliers. With lock ring removed, gradually release accumulator piston until all tension has gone from spring. Remove piston seal ring from servo piston.



Inspection: Inspect servo body for cracks, and piston bore for scores. Inspect servo body-to-transmission case mating surface for burrs. Check fluid passages

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (Cont.)

for obstruction and passage plugs for tightness in body. Inspect piston stem for scores. Inspect accumulator bore and piston for scores and wear, and accumulator spring for distortion. Inspect actuating lever, socket, and shaft for scores and wear. Check needle bearings for wear and distortion. Inspect servo spring for distortion. Inspect servo band lining for excessive wear and bond to metal band. (Band should be replaced if worn to point where grooves are not clearly evident). Inspect band and struts for distortion and band ends for wear

R assembly: Install new seal ring in servo piston. Install accumulator spring and piston in servo piston and retain with lock ring. Install piston in servo body (lubricate parts to facilitate assembly). Install servo

FORDOMATIC, MERCOMATIC, TURBODRIVE REAR SERVO & BAND ASSEMBLY

spring with small end against servo piston and install retainer. Compress spring and install snap ring, making sure that snap ring is fully seated in groove. Place needle bearings in actuating lever shaft hole. With a pencil, position needle bearings around hole Lock bearings in place by placing thumb over bearings and rotating clockwise. Install actuating lever with socket in lever bearing on piston stem. Needle bearing retainers at each side of actuating lever shaft hole must be installed with actuating lever. Install actuating lever, aligning the retaining pin holes and bearing retainers, and install pin. Check lever for free movement and then check operation of servo by applying air pressure to apply hole.

DISTRIBUTOR SLEEVE (Inspection): Inspect all passages for obstructions. Inspect sleeve bore for scores or excessive ring wear. Inspect mating surfaces for burrs and flatness. Check fit of fluid tubes. *NOTE*–Make sure spacer is on center tube.

PINION CARRIER (Inspecti n): Inspect servo band surfaces for scores. Inspect inner bushing for scores. Check free movement of pinions on pins and inspect for worn or broken teeth. Check pinion endplay (.010-.020"). Pinion pins must be a tight fit in carrier. Check all fluid passages. Check journal bushing for scores. *NOTE*–Planet carrier is serviced only as an assembly.

OUTPUT SHAFT (Inspection): Inspect thrust surfaces and journals for scores. Inspect internal gear for broken or worn teeth. Inspect aluminum sleeve for scores and check ring grooves for burrs. Inspect keyway and drive ball socket for wear. Inspect splines for burrs or wear. Inspect external parking gear teeth for damage and speedometer drive gear for burrs

EXTENSION HOUSING (Inspection): Inspect housing for cracks and drive shaft slip yoke bearing surface for scores. Inspect gasket surface for burrs. If inspection reveals it necessary to remove rear seal, use tool No. 1175-AB. (NOTE–Rear seal may be replaced without removing transmission from car). Use tool No. 7657-D and install new seal in extension housing. Remove inspection cover and gasket and check fluid baffle for tight fit in housing.

TRANSMISSION CASE LINKAGE (Disassembly): Remove throttle lever nut and take off inner and outer throttle levers. Remove throttle lever shaft seal from counterbore in manual lever shaft. Remove parking mechanism actuating rod, detent ball and spring. Remove manual lever shaft nut, detent and outer manual lever and shaft. Remove torsion lever retainer clip and take off torsion lever assembly. Disassemble torsion lever assembly by rotating lever while holding spring. Disengage pawl return spring from toggle link pin and remove pin. Remove pawl pin by working pawl fore and aft until pin protrudes from case. Remove toggle pin retainer clip, toggle pin, pawl return spring, spring retainer and link. Remove toggle lever pin by tapping lever toward rear of case, then remove plug, toggle lever pin and lever (NOTE–toggle lever pin is held in place by the plug). Remove manual shaft seal and transmission vent from case.

Inspection: Inspect each part of parking mechanism for wear, distortion or other damage.

Reassembly: Assemble toggle lever, link, pawl return spring and pawl and install assembly in transmission case. Install toggle lever and pawl pins. Install torsion lever assembly. (NOTE–Use screwdriver to position spring on torsion lever). Install washer and retainer clip. Coat outer diameter of new manual shaft seal with Permatex No. 3 and use Tool 77288 to install seal in case. Install manual lever and shaft in case, mount detent lever and tighten attaching nut to 35-40 ft. lbs. torque. Install detent spring and ball *(NOTE*–use a piece of thin tubing to depress ball and spring while rotating detent). Position ends of parking pawl torsion lever rod in detent lever and torsion lever and secure with cotter pins. Install new seal on throttle lever shaft, install outer throttle lever and shaft in case, install lever on inner end of shaft and tighten attaching nut to 35-40 ft. lbs. Check linkage for free operation without binding.

TRANSMISSION CASE (Insp ction): Inspect case for cracks and stripped threads Inspect all gasket and mating surfaces for burrs. Inspect all bearing surfaces for wear, scores, and burrs.

TRANSMISSION REASSEMBLY

►*REASSEMBLY CAUTION: Use Automatic Transmission Fluid Type "A" only to lubricate parts for assembly. DO NOT use any other form of lubricant. Use all new gaskets and tighten all bolts and screws to correct torque specifications. DO NOT USE FORCE WHEN ASSEMBLING PARTS. If parts do not assemble freely, examine parts for cause of difficulty*

CLUTCH ASSEMBLIES: Install front band in transmission case so that anchor end aligned with anchor in case. Install clutch assemblies into transmission case from the rear *(CAUTION–Do not allow clutches to separate)*, while positioning servo band on drum. Hold units together while making installation. Position center support in case, aligning hole in center support with hole in right hand side of case. Install right and left hand center support outer bolts and external tooth lockwashers *(CAUTION–Lockwashers must be installed with the rolled edg toward transmission case to insure tight seal).*

PINION CARRIER & OUTPUT SHAFT: Position rear servo band in transmission case, with the strut ends up. Place anchor end (identified by a depression in center of strut retainer), toward adjusting screw. Install a bronze thrust washer on thrust face inside pinion carrier. To install pinion carrier assembly, position rear band over drum while meshing the planet pinions. Install two seal rings on primary sun gear shaft, and check rings for free movement in grooves. Install selective thrust washer on rear of planet carrier, retaining it in place with the transmission fluid. *(NOTE–If endplay was not within specifications, when checked prior to disassembly, replace washer with one of proper thickness).* Install output shaft, carefully meshing internal gear with pinions.

REAR PUMP: Position rear pump drive key in keyway on output shaft. Position new front and rear gaskets on pump body, retaining gaskets with transmission fluid. Install thrust washer on pump body with the bronze side up. Align thrust washer tangs with bosses on pump body, then install the rear pump *(CAUTION–*Be sure drive key is aligned with keyway in pump drive gear).

GOVERNOR: Position governor drive ball in the pocket in output shaft. Retain ball with transmission fluid Install governor assembly aligning groove with ball in output shaft. Install governor snap ring. *NOTE–Install governor with the governor body plate toward front of transmission.*

DISTRIBUTOR: Place the four seal rings in distributor sleeve, and check ring gap. Check fit of seal rings in grooves of output shaft. Install distributor sleeve on output shaft, chamfer forward (lubricate parts to aid assembly) Install distributor and tubes on sleeve, making sure passages in sleeve and distributor are aligned. Install attaching bolts and lockwashers. Tighten bolts finger tight. Insert distributor tubes in transmission case, until spacer on center tube is against case, then tighten distributor attaching bolts to 8-10 ft. lbs. Install a new seal on rear pump outlet tube and install tube in transmission case and rear pump body.

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (Cont.)

EXTENSION HOUSING: Position speedometer drive gear ball in pocket in output shaft, retaining it with fluid. Install speedometer drive gear, and gear snap ring. Insert extension housing oil seal replacer and pilot in housing, then install extension housing on transmission case. Install attaching bolts and external tooth washers. *(CAUTION–Washers must be installed with rolled edge toward transmission case to insure a tight seal).* Tighten extension housing attaching bolts to 28-30 ft. lbs. Install governor inspection cover and a new gasket on housing.

FRONT PUMP: Position a new front pump gasket in counterbore of transmission case. Install front pump, aligning pump bolt holes with holes in case. Install three of the pump attaching bolts and tighten them to 17-22 ft. lbs.

TRANSMISSION ENDPLAY (Checking): Mount a dial indicator support on front pump bolt hole Mount dial indicator on support so that contact rests on end of turbine shaft. Use a large screw driver to pry front clutch drum toward rear of transmission. Set dial indicator to zero. Remove screw driver and pry units toward front of transmission case by inserting the screw driver between large internal gear and transmission case. Note indicator reading. Endplay should be .010-.029". Remove indicator and remove tool from extension housing. Install the one remaining front pump attaching bolt and tighten it to 17-22 ft. lbs

FRONT SERVO: Position front band forward in case with band ends up. Position servo strut with the slotted end aligned with servo actuating lever and the small end aligned with band end. Rotate band, strut, and servo into position engaging anchor end of band with anchor end in case. Locate servo on dowel in case, then install attaching bolt (or bolts), tightening them only two or three turns. Install servo tubes

REAR SERVO: Position servo anchor strut, then rotate rear band to engage the strut. Position servo actuating lever strut with a finger, then install servo and attaching bolts. Tighten bolts to 40-45 ft. lbs

PRESSURE REGULATOR BODY: Install pressure regulator body and attaching bolts and tighten bolts to 17-22 ft. lbs. Install control and converter valve guides and springs and install spring retainer. Install a new seal ring on rear pump intake tube, then install tube in case. *NOTE–When installing spring retainer be sure that both tangs attach at the same time*

►*1957 MERCURY ERRATIC OR IMPROPER SHIFT PATTERN·* This condition may be caused by main control valve being installed in such a way that only a slight contact exists between detent pin and lands of manual valve This can cause excessive wear and result in binding, distortion, or disengagement of the pin from manual valve To prevent this condition the following procedure should be used to install main control valve Check for bent manual valve by rolling valve on a true flat surface Install main control assembly, engaging detent pin between the correct lands on manual valve Loosely install bolts securing main control assembly to transmission case Move main control assembly as far as possible toward left side of car then tighten mounting bolts Check for binding between detent pin and manual valve by rotating manual valve while the detent is in each position If manual valve binds in any position, loosen mounting bolts and move main control assembly slightly toward right side of car *CAUTION* - Move it only enough to eliminate binding

CONTROL VALVE BODY: Install control valve assembly, using care to align servo tubes with control valve Align the inner throttle lever between throttle lever stop and downshift valve, and at the same time push the throttle valve in to clear transmission case. *(CAUTION–Align manual valve with actuating pin in the manual detent lever. Do not tighten attaching bolts).* Install the large control pressure tube in valve body and regulator. Install small control pressure compensator tube in valve body and regulator. Install lubrication tube in rear pump and regulator body. Tighten control valve body attaching bolts to 8-10 ft. lbs. Tighten front servo attaching bolts or bolt to 30-35 ft. lbs.

ADJUSTMENT (Front Servo): Loosen front servo adjusting screw locknut, then back nut off three turns. Loosen adjusting screw five complete turns Using the front band adjusting wrench, tool No. 7225, insert a ¼" spacer between lever and stem, then tighten the screw until ratchet overruns. **Back the adjusting screw one complete turn,** then tighten locknut to 20-25 ft. lbs.

ADJUSTMENT (Rear Servo): Loosen adjusting screw locknut three turns with a ¾" socket of the rear band adjusting wrench. Back off the adjusting screw until free travel is obtained. Using tool No. 7195, tighten adjusting screw until ratchet overruns, then back off the adjusting screw 1½ turns. Hold rear servo adjusting screw stationary, and tighten the locknut to approximately 40 ft. lbs.

FLUID SCREEN & PAN: Position fluid screen over rear pump inlet tube then over front pump inlet tube. Press screen down firmly and install screen retaining clip. In trucks, position the oil cooler to sump discharge tube in case. Place a new gasket on transmission case, then install the pan. Install attaching bolts and lockwashers and tighten to 10-13 ft. lbs.

TRANSMISSION & CONVERTER INSTALLATION

FORD PASS. CARS & TRUCKS (EXCEPT THUNDERBIRD & SUNLINER)

1) If converter has been removed from converter housing, position converter in housing, then install converter housing lower cover plate (8 Cyl.), or wedge converter in places (6 Cyl) to prevent converter slipping out of housing. Rotate converter until drive plate bolt holes are in horizontal position (8 Cyl), or in the vertical position (6 Cyl). Position flywheel on crankshaft flange, then install attaching bolts

2) Move converter and transmission assembly forward into position, using care not to damage converter drive plate and converter pilot Install lower converter housing to engine bolts and tighten them to 40-45 ft lbs. Install crossmember on pass. cars. Lower transmission until extension housing rests on crossmember and install extension housing to crossmember bolts

3) On trucks, install converter housing to crossmember bolts. On all vehicles position flywheel drive plates, and install drive plate attaching bolts. Tighten drive plate bolts to 28 ft. lbs. Install converter drain plugs and access plates. On trucks, position the oil cooler on support brackets, then install cooler. Connect oil inlet and outlet lines to transmission.

4) Coat universal joint knuckle with transmission fluid, then install drive shaft. Connect speedometer cable at transmission. Connect manual linkage at transmission manual lever. Install converter air duct and the linkage splash shield (pass. cars), exhaust duct shield (trucks).

5) Install starter motor and connect transmission-to-frame ground strap at transmission. Connect fluid filler tube to oil pan. Lower hoist, on trucks, position water inlet and outlet lines on oil cooler. Tighten hose clamps securely. Install the two upper converter housing-to-engine bolts and tighten to 40-45 ft. lbs. Replace covers on converter housing access holes, and floor mat. Fill radiator with water.

6) Fill transmission with Automatic Transmission Fluid Type "A" *(see "Lubrication" above).* Check transmission and converter assembly for fluid leaks, adjust manual and throttle linkages *(see "Linkage Adjustment" above)*

THUNDERBIRD

►*INSTALLATION NOTE: Converter and transmission assembly must be installed before engine installed in chassis. The converter and transmission assembly can be installed in the chassis separately before engine is installed, or converter, transmission, and engine may be installed together as a unit*

1) To attach converter and transmission to engine before assembly into chassis as a unit, first align converter pilot, housing dowel holes, and drive plate holes Remove all foreign material from converter pilot bore in crankshaft. Apply a heavy film of lubricant evenly on converter pilot bearing surface. *(CAUTION–Excessive lubricant in pilot bore will prevent proper entry of converter pilot into bore, forcing converter rearward and scoring front pump)*

2) Install pilot studs in two of the converter housing to engine bolt holes Remove converter housing lower front cover plate Move converter and transmission forward into position using care not to damage converter drive plate and converter pilot. Install four converter housing to engine bolts, remove pilot studs, then tighten bolts to 40-45 ft. lbs

3) If engine has been removed separate from converter and transmission assembly, mount transmission on a transmission floor jack and position assembly in car. Connect drive shaft to transmission output shaft. Install the two extension housing to rear engine support bolts. Connect speedometer cable and manual linkage at transmission. Install engine lifting sling and lower engine carefully into engine compartment, starting converter pilot into crankshaft. Make sure studs on manifold are aligned with holes in muffler inlet pipe, and dowels in block engage holes in converter housing. Raise car and position jack stands. Install engine

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (Cont.)

front insulator bolt, and right and left hand insulator support bolts. Connect exhaust pipe to manifold and lower car to floor

4) Install two lower converter housing to engine bolts and tighten them to 40-45 ft. lbs. (Tighten bolts slowly and evenly to avoid binding on dowel pins). Install converter housing to engine bolts, and tighten them to 40-45 ft lbs. Align flywheel and drive plate bolts with converter Install the six bolts and tighten them to 25-28 ft lbs. Complete engine installation

LINCOLN & MERCURY

1) Position transmission and converter assembly under car, raise it into position and move it forward to engage converter pilot with hole in crankshaft *(CAUTION*–Guide assembly carefully to avoid damage to flexible drive plate and converter pilot).

2) Install converter housing attaching bolts and tighten to 40-45 ft. lbs. Install six bolts securing converter to drive plate and tighten to 25-28 ft. lbs. (On Lincoln, install detachable frame crossmember to "X" member). Install engine rear mount to transmission. Remove engine support tool, lower engine and install rear engine mount to crossmember bolts and remove lift. Connect speedometer cable at extension housing.

3) Connect throttle and transmission manual linkage to transmission levers. Adjust linkage (see "Linkage Adjustment" above). Install converter housing upper plate with new seal. Install starter, converter drain plugs, and place fluid filler tube on pan and tighten filler hex nut to 40-50 ft. lbs.

4) Install converter housing lower plate. On air cooled torque converters install duct on converter housing and deflector between frame and housing. On water cooled torque converters, install inlet and outlet hoses. Install drive shaft (lubricate front universal slip yoke to aid installation). On Mercury models with single exhaust, install exhaust system. Check operation of neutral switch. Install throttle linkage brackets to engine and body using original nuts and bolts. Install battery ground cable. Fill transmission with Automatic Transmission Fluid Type "A" (see "Lubrication" above).

TRANSMISSION INSTALLATION (WITHOUT CONVERTER)

FORD PASS. CARS & TRUCKS

►*NOTE: On Thunderbird and Sunliner it is not possible to remove the transmission (without converter) due to limited clearance.*

1) Install guide pins in the two top transmission to converter housing bolt holes. Mount transmission on jack and position it under vehicle. Rotate engine to position the front pump drive lugs on converter impeller housing in a vertical position. Rotate front pump to position slots in front pump drive gear in a vertical position. Apply lubriplate to seal the surface on the converter impeller cover hub. (If a new transmission is being installed, position a new rubber extension housing duct shield over end of housing)

2) Raise transmission and move it toward front of vehicle *(CAUTION*–Be sure to align the turbine shaft splines with turbine hub splines and the converter impeller lugs with slots in front pump drive gear)

3) On trucks, position the oil cooler front support bracket on case. On all vehicles, install the lower transmission to converter housing attaching bolts. Remove the two guide pins and install the two upper attaching bolts. Tighten bolts to 40-45 ft. lbs.

4) On cars, install the frame crossmember and bolts. Lower transmission onto crossmember and then install engine rear support to transmission bolts On trucks, position the oil cooler on the support bracket and install attaching bolts. Connect oil cooler to transmission oil lines at transmission. Tighten fittings securely. Install universal joint yoke onto transmission output shaft and connect drive shaft

5) On F-250, F-350 & P-350 trucks, coat universal joint knuckle with transmission fluid. Install the four bolts attaching drive shaft coupling yoke at the parking brake assembly, then connect drive shaft at rear axle Connect speedometer cable at extension housing.

6) Connect manual linkage and throttle linkage to transmission levers and adjust the linkage (see "Linkage Adjustment" above). Connect fluid filler tube to oil pan and tighten fitting securely. Lower vehicle to floor and fill transmission with Automatic Transmission Fluid Type "A" (see "Lubrication" above).

LINCOLN & MERCURY

1) Install guide pins, tool No. ST-0711 into top transmission to converter housing attaching bolt holes. Mount transmission on lift and position under car. Rotate engine to position front pump drive lugs on converter pump housing in a vertical position. Rotate transmission front pump to position slots in pump drive gear in a vertical position. Apply lubriplate to seal surface on converter pump cover hub.

2) Raise transmission and move toward front of car *(CAUTION*–Use care to index turbine shaft splines with turbine hub, and lugs on converter pump with slots in front pump drive gear). Install two lower transmission to converter housing attaching bolts. Remove the two guide pins and install two upper attaching bolts and tighten to 40-45 ft. lbs.

3) Install rear engine mount to transmission

4) Raise engine and transmission sufficiently to remove engine support fixture. Lower unit to crossmember and install rear engine mount to crossmember bolts. Install drive shaft. (Lubricate front universal joint yoke with transmission fluid to aid assembly).

5) Connect speedometer cable at extension housing Connect manual and throttle linkage to transmission levers. Adjust linkage (see "Linkage Adjustment")

6) Place fluid filler tube in position on pan and tighten filler hex nut to 40-50 ft lbs Remove support stands and lower car to floor Fill transmission with Automatic Transmission Fluid Type "A" (see "Lubrication" above) Road test car

FLASH-O-MATIC TRANSMISSION

Rambler 5710 Series (1957)

►CHANGES, CAUTIONS, CORRECTIONS

►*FLASH-O-MATIC TRANSMISSION NOTE:* This transmission used as Optl. Equipment on 1957 Rambler beginning Serial No. D-367711 (supersedes Dual-Range Hydra-Matic Drive used on earlier cars).

►*STARTING THE ENGINE BY PUSHING CAR: NOTE -* Pushing rather than towing is recommended (to avoid possibility of car ramming towing vehicle). Place selector lever in Neutral "N" position. When speed of 15-20 MPH is reached, turn ignition "on" and move selector lever to "D-1" or "D-2" position.

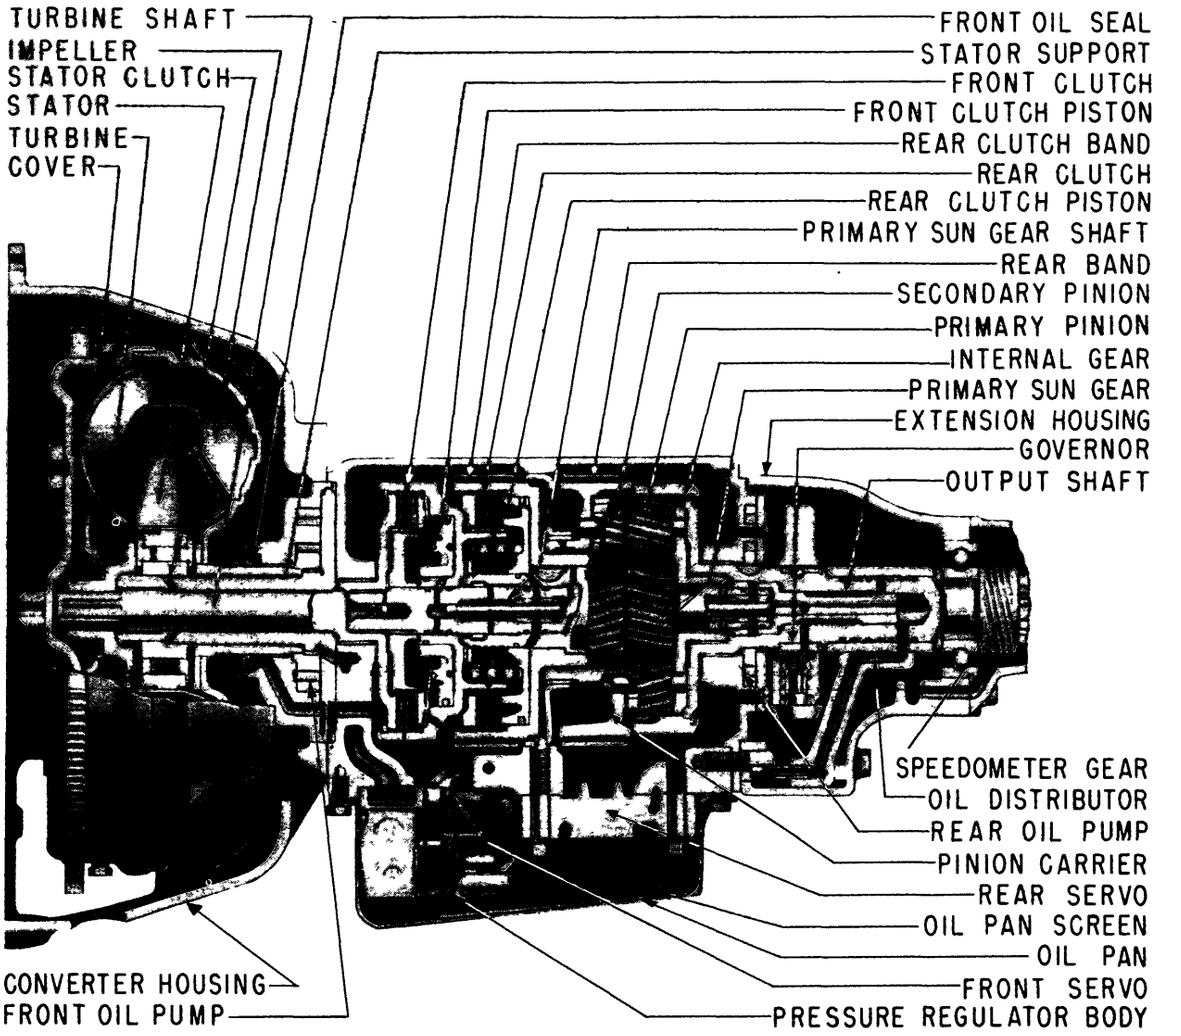
►*TOWING THE CAR:* If transmission inoperative, always tow car with rear wheels raised or with propeller shaft disconnected. If transmission operating properly car can be towed for **short distance** with selector lever in Neutral "N". Prolonged towing may cause damage to transmission.

►*1-2 SLIPPAGE OR 2-3 "PILE-UP" WITH LIGHT THROTTLE IN "D1" RANGE CORRECTION:* This condition may be caused by an unbalanced vacuum condition due to clogged vacuum ports or vacuum leakage at carburetor *(See "Carter (AS) Carburetor" in Carburetor Section)*. Check adjustment of Vacuum & Solenoid Control Unit on transmission *(See "Throttle Control Adjustment" below)*.

DESCRIPTION

Flash-O-Matic transmission consists of a hydraulic torque converter and a hydraulically controlled automatic 3-speed planetary transmission which provides automatic operation in "D1" & "D2" ranges. Additional "L" (Low), "R" (Reverse), and "P" (Park) ranges are controlled manually. In "D1" range, the car starts in low and upshifts to intermediate and then to direct. In "D2", the car starts in intermediate, then shifts to direct. Downshifts follow the same pattern (in reverse) in relation to car speed and throttle position. Throttle valve pressure is controlled by a vacuum and solenoid unit located at left rear of transmission. This unit is calibrated with carburetor throttle valve opening to control transmission shift pattern, and is operated by a vacuum line from the carburetor. A forced downshift (kickdown) from direct to intermediate can be made by fully depressing the accelerator pedal.

►*THROTTLE CONTROL NOTE:* The above Vacuum & Solenoid Unit performs the same function as the conventional Throttle Control Linkage used with other automatic transmissions.



LUBRICATION

►*CAUTION: Check fluid at 1000 mile intervals. Drain and refill at 15,000 mile intervals, using Automatic Transmission Fluid Type "A". The dipstick is located at right rear of engine under the hood.*

Capacity - 8½ quarts (approximately).

Checking Fluid Level - Bring engine and transmission to operating temperature with transmission in "P" (Park) position. Move selector lever from "P" to "R", then to "D2" position. Check oil level on dipstick and add fluid as required to bring level to "F" mark. *NOTE - Approximately 1½ qts. of fluid are required to raise fluid level from "L" to "F" mark.*

Draining & Refilling - With transmission at normal operating temperature, rotate converter until one of the drain plugs is visible through square opening in converter bell housing. Remove plug and then turn converter 180° and remove second drain plug. Remove drain plug at rear of transmission oil pan. After draining, replace the drain plugs and tighten converter plugs to 7-10 ft. lbs. Install 5 qts. of Automatic Transmission Fluid Type "A". Set hand brake and run engine with transmission selector lever in "N" position. Add 3½ qts. of fluid and move selector lever through all ranges. Check oil level, and if necessary, add sufficient fluid to brain level to "F" mark on dipstick. *CAUTION - Do not overfill transmission as this will cause foaming when transmission is warm.*

FLASH-O-MATIC TRANSMISSION SECTIONAL VIEW

LINKAGE ADJUSTMENT

►*THROTTLE CONTROL NOTE:* Throttle control pressure should be 85 lbs. ± 5 lbs. at 1000 RPM, and is controlled by the Vacuum & Solenoid Control Unit on the transmission case. The control unit ordinarily requires adjustment only when it has been reinstalled on the transmission. *See "Throttle Control Adjustment" following.*

CONTINUED ON NEXT PAGE

FLASH-O-MATIC TRANSMISSION (Continued)

Manual Linkage Adjustment: Place transmission selector lever in "D-1" (Drive) position. Disconnect clevis at transmission manual lever and place the lever in "D-1" (Drive) position. Adjust clevis to transmission manual lever so that clevis pin enters hole in lever freely. Check selector lever pointer in all positions to be sure pointer is set correctly. *NOTE* - If pointer does not line up properly, remove bottom half of jacket tube and adjust pointer to line up with center of "N".

Vacuum & Solenoid Control Unit: *(NOTE - After installation, initially adjust the control unit by screwing it in or out of case for a distance of 5/16-13/32" between front edge of unit and transmission case).* Connect a tachometer to engine. Remove the 1/8" pipe plug located at left front lower side of transmission case and install a pressure gauge. Start engine and move transmission selector lever to "D" (Drive) position. Apply hand brake and service brakes and accelerate engine to 1000 RPM. Pressure gauge should read 85 lbs. ± 5 lbs. If reading not correct, adjust by rotating the vacuum solenoid unit clockwise to increase pressure and counterclockwise to decrease pressure. If control pressure cannot be adjusted by setting control unit, check vacuum supply from carburetor which should be 5½-6½" at 1000 RPM using the stall test procedure above.

▷ *VACUUM READING NOTE:* Above vacuum reading (5½-6½") is normal. Vacuum varies with altitude and the following vacuum readings are considered normal at the altitudes indicated: 6.2" (650 ft.), 6.1" (1860 ft.), 5.3" (3140 ft.), 5.0" (4040 ft.), 4.3" (5100 ft.), 4.0" (6250 ft.). 3.5" (6920 ft.), 3.1" (8050 ft.), 2.5" (8980 ft.).

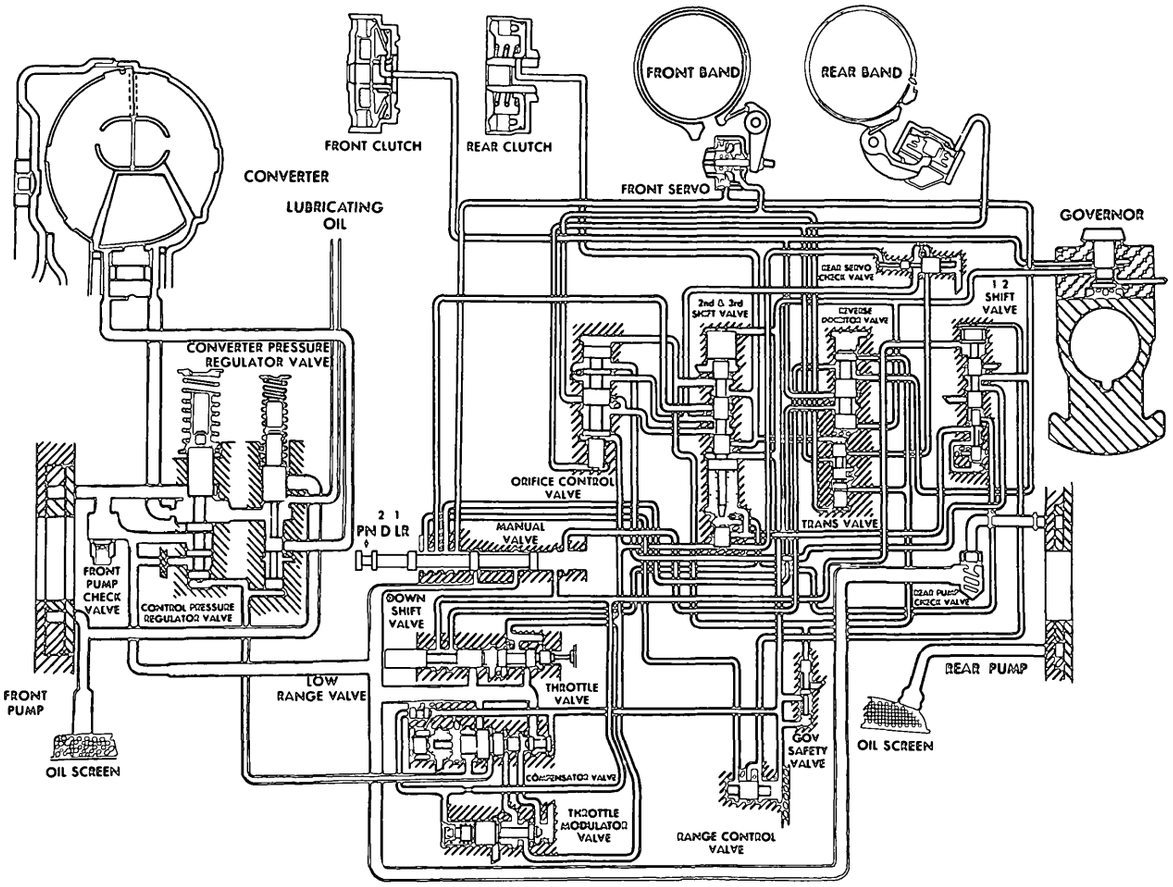
BAND ADJUSTMENT

Front Band: Remove transmission oil pan, gasket, and screen. Using Tool J-5880, loosen adjusting screw and insert .250" gauge block (part of Tool J-5880) between end of adjusting screw and servo piston rod. Turn tool in until tool "overruns", then back off tool one complete turn and tighten the locknut to 20-25 ft. lbs. Install screen, gasket, and transmission oil pan. Refill transmission.

Rear Band: Loosen locknut on adjusting screw located on left side of transmission case and install Tool J-6655 on adjusting screw. Tighten screw with a torque wrench to 7 ft. lbs. Mark adjusting screw with a reference point, then back screw off 1½ turns. Tighten locknut securely.

TESTING

FLASH-O-MATIC SHIFT SPEEDS



Upshifts

Shift	Light Throttle	Full Throttle	Kickdown
1-2	7-9 MPH	22-26 MPH	①36-38 MPH
2-3	15-19 MPH	46-50 MPH	②57-59 MPH

① - 3700 RPM. ② - 3650 RPM.

Downshifts

Shift	Closed Throttle	Full Throttle	Kickdown
3-2	10-12 MPH	24 MPH Max.	53 MPH Max.
2-1	5-7 MPH	8 MPH Max.	18 MPH Max.

FLASH-O-MATIC TRANSMISSION HYDRAULIC CIRCUITS

STALL TEST: Connect tachometer to engine and place it where it can be easily read from driver's seat. Set hand brake and start engine. Place selector lever in "D1" position, apply service brakes and operate engine at full throttle. Note tachometer reading. *(CAUTION - Do not operate engine at high speed while selector lever is in one of the driving ranges, with rear wheels held stationary, for more than 10 seconds at a time to prevent overheating transmission).* Normal stall speeds are 1400-1475 RPM. If stall speed is greater than normal, slippage in transmission is indicated. If stall speed is below normal, poor engine performance is indicated.

VACUUM & OIL PRESSURE TEST: With engine and transmission at normal operating temperature, connect a tachometer to engine and a vacuum gauge to carburetor, then remove the 1/8" pipe plug on left front side of transmission case and install an oil pressure test gauge. Move selector lever to "D1" or "D2", apply hand and service brakes and operate engine at 1000 RPM. Vacuum reading should be 5.5-6.5" (at sea level). Transmission oil pressure should be 80-90 lbs. If transmission vacuum is in excess of 6.5" at 1000 RPM, vacuum leakage, obstructions, or improper carburetor vacuum calibrations are indicated. *NOTE - Altitude will reduce vacuum reading slightly (see "Throttle Control Adjustment" above.*

AIR PRESSURE TEST (Transmission in Car): Raise car on hoist and remove transmission oil pan and control valve assembly. The front servo tubes should remain in front servo and the servo attaching screw must be tight. *NOTE - When making air pressure tests, hold a clean towel over transmission pening to prevent excessive oil spray.*

Front Clutch: Apply air pressure to front clutch passage (on transmission case rear flange). Listen for a dull thud indicating clutch is operating. Retain air pressure in this passage for several seconds to check for leaks in this circuit.

Governor Valve: Remove governor inspection hole cover and apply air pressure to front clutch passage (see

CONTINUED ON NEXT PAGE

FLASH-O-MATIC TRANSMISSION (C ntinued)

above). Listen for a click and watch valve snap inward. Replace inspection hole cover.

Rear Clutch: Apply air pressure to rear clutch passage (on transmission case rear flange). Listen for a dull thud indicating clutch is operating. Retain air pressure in this passage for several seconds to check for leaks in this circuit.

Front Band & Servo: Apply air pressure to front servo apply tube (rear tube) and observe band application.

Rear Band & Servo: Apply pressure to rear clutch oil passage (transmission case rear flange), and observe band application.

► *TESTING NOTE· If servos, bands, clutches, and governor operate with air pressure, then the no-drive problems, erratic shift, or no-upshift conditions indicate that the control valve ass mbly and pressure regulator valve ass mbly is the cause of the trouble. See "Control Valve" and "Pressure R gulator Valve" below.*

TROUBLE SHOOTING & DIAGNOSIS

INITIAL ENGAGEMENT TOO ROUGH: Idle speed may be too high. Control pressure may be too high caused by improper adjustment of throttle control vacuum unit. Regulator control valve may be dirty.

INITIAL ENGAGEMENT DELAYED: Check fluid level. Adjust rear band as it may be loose. Control pressure may be too low at idle speed. Clean control valve assembly and pressure regulator assembly. Check front pump for wear. Check fluid circuits for leaks and correct as necessary.

INOPERATIVE IN ALL RANGES: Check fluid level. Manual linkage may be disconnected. No control pressure, which may be caused by trouble at front pump Check rear band adjustment Check rear servo action with air pressure. Inspect and clean control valve assembly. Check engine stall speed, as converter may not be operating properly.

NO DRIVE IN "D" OR "L" POSITION: Check fluid level. Manual linkage may be disconnected. Control pressure may be low. Adjust vacuum control unit. Clean control valve and pressure regulator valve assemblies Check front clutch action with air pressure. Check rear servo and band with air pressure. Check transition valve in control valve assembly as it may be stuck.

NO DRIVE IN "R" POSITION: Check fluid level. Check and adjust manual linkage. Control pressure may be too low. Adjust vacuum control unit. Clean control valve and pressure regulator valve assemblies. Check rear clutch action with air pressure. Check rear servo and band with air pressure. Check transition valve in control valve assembly.

LOCKS UP IN "D" POSITION: Rear clutch or front band may be applied. Clean control valve and governor valve assemblies. Check rear clutch and front band and servo for mechanical failure.

LOCKS UP IN "D" POSITION (2ND GEAR): Check rear band and servo and rear clutch for mechanical failure.

LOCKS UP IN "D" POSITION (3RD GEAR): Front or rear band may be applied. Check bands and servos for mechanical failure. Clean control valve assembly.

LOCKS UP IN "R" POSITION: Check front clutch and band and front servo for mechanical failure. Clean control valve assembly.

SLIPS IN "D" OR "L" POSITION: Check fluid level. Control pressure may be low. Adjust vacuum control unit. Clean control valve and pressure regulator valve assemblies. Rear servo travel may be limited, check for mechanical failure of band or servo. Check front clutch for mechanical failure. Rear pump check valve may be stuck open.

1-2 UPSHIFT ROUGH: Control pressure may be too high. Check and correct vacuum and solenoid adjustment. Check and adjust bands. Clean governor valve assembly.

1-2 UPSHIFT SLIPPAGE (LIGHT THROTTLE): This condition may be caused by an unbalanced vacuum condition due to clogged vacuum ports or vacuum leakage at carburetor *(See "Carter (AS) Carburetor" in Carburetor Section)* Check adjustment of Vacuum & Solenoid Control Unit on transmission *(See "Throttle Control Aduustment" above)*

1-2 UPSHIFT SLIPS: Adjust vacuum and solenoid unit. Adjust bands. Check for stuck governor valve. Check front servo piston for limited travel with air pressure. Check for fluid leakage.

NO 1-2 UPSHIFT: Check for stuck governor valve or 1-2 shift valve.

1-2 UPSHIFT TOO EARLY: Check for stuck governor valve.

1-2 UPSHIFT TOO LATE: Check for stuck governor valve or leak in governor circuit. Adjust vacuum solenoid unit.

2-3 UPSHIFT ROUGH: Control pressure may be too high, adjust vacuum solenoid unit. Clean control valve assembly and adjust front band. Check for stuck governor valve.

2-3 UPSHIFT "PILE-UP" (LIGHT THROTTLE): *See "1-2 Upshift Slippage (Light Throttle)" above*

2-3 UPSHIFT SLIPS: Control pressure may be too low, adjust vacuum solenoid unit. Clean control valve assembly and adjust front band. Check for internal leaks and stuck governor valve.

NO 2-3 UPSHIFT: Governor valve or 2-3 shift valve may be stuck.

2-3 UPSHIFT EARLY: Check for stuck governor valve.

2-3 UPSHIFT LATE: Check for stuck governor valve or leak in governor circuit. Adjust vacuum solenoid unit.

3-2 DOWNSHIFT ROUGH (CLOSED THROTTLE): Adjust vacuum solenoid unit. Orifice control valve may be stuck.

3-2 KICKDOWN (EARLY): Check for stuck governor valve.

2-1 DOWNSHIFT ROUGH (CLOSED THROTTLE): Adjust vacuum solenoid unit. Rear servo check valve may be stuck

WILL NOT START BY PUSHING: Rear pump not operating. Pressure regulator valve may be stuck.

NO PARK POSITION: Adjust vacuum solenoid unit. Check for damaged internal linkage or pawl.

TRANSMISSION REMOVAL & INSTALLATION

REMOVAL: Disconnect battery cable. Raise car on hoist and place jack stands under rear of car at body sills. Disconnect oil filler tube at oil pan and drain transmission. Disconnect vacuum line and wire terminal at vacuum unit on rear of transmission. Disconnect speedometer cable at transmission. Disconnect rear brake hose bracket from floor panel. Disconnect manual shift linkage at transmission lever. Disconnect rear shock absorbers from rear axle. Disconnect torque tube, propeller shaft and hand brake cable. Lower rear axle and move rearward to separate torque tube and propeller shaft from transmission. Place a hydraulic hoist with suitable cradle in position under transmission oil pan. Remove transmission case-to-converter housing upper capscrews and lockwashers. With hydraulic hoist and cradle adjusted so transmission is in alignment with converter housing, pull transmission to rear with the hydraulic hoist to disengage transmission from housing and converter assembly. Remove transmission from car.

► *TRANSMISSION, BELL HOUSING & CONVERTER ASSEMBLY REMOVAL NOTE:* These parts may be removed as an assembly as follows In addition to transmission removal procedure (see above), remove the starter attaching bolts and remove starter. Support transmission and remove crossmember at side sill bolts. Lower engine and block engine on both sides from the top ledges of oil pan to side sill crossmember (these blocks should be 5" long and 2" square) Remove bell housing-to-engine bolts and bell housing lower mud pan Remove six capscrews attaching torque converter to drive plate. Complete removal as outlined above.

INSTALLATION: Reverse the removal procedure and note the following If transmission removed separately, position front pump drive tangs on converter in a horizontal position and position the front pump external tooth gear drive lugs in a vertical position. Tighten transmission-to-bell housing attaching bolts to 40-45 ft. lbs If converter has been removed, converter-to-drive plate attaching capscrews must be tightened to 23-28 ft. lbs.

TRANSMISSION OVERHAUL

► *CONVERTER OVERHAUL NOTE:* Torque converter is a sealed assembly (case is welded together during manufacture) and cannot be disassembled for service

CONTINUED ON NEXT PAGE

FLASH-O-MATIC TRANSMISSION (Continued)

TRANSMISSION OVERHAUL: Overhaul procedures are the same as for Fordomatic, Mercomatic, and Turbo-Drive Transmissions. *See "Fordomatic, Mercomatic, & Turbo-Drive Transmission" for all data except the following:*

VACUUM & SOLENOID CONTROL UNIT

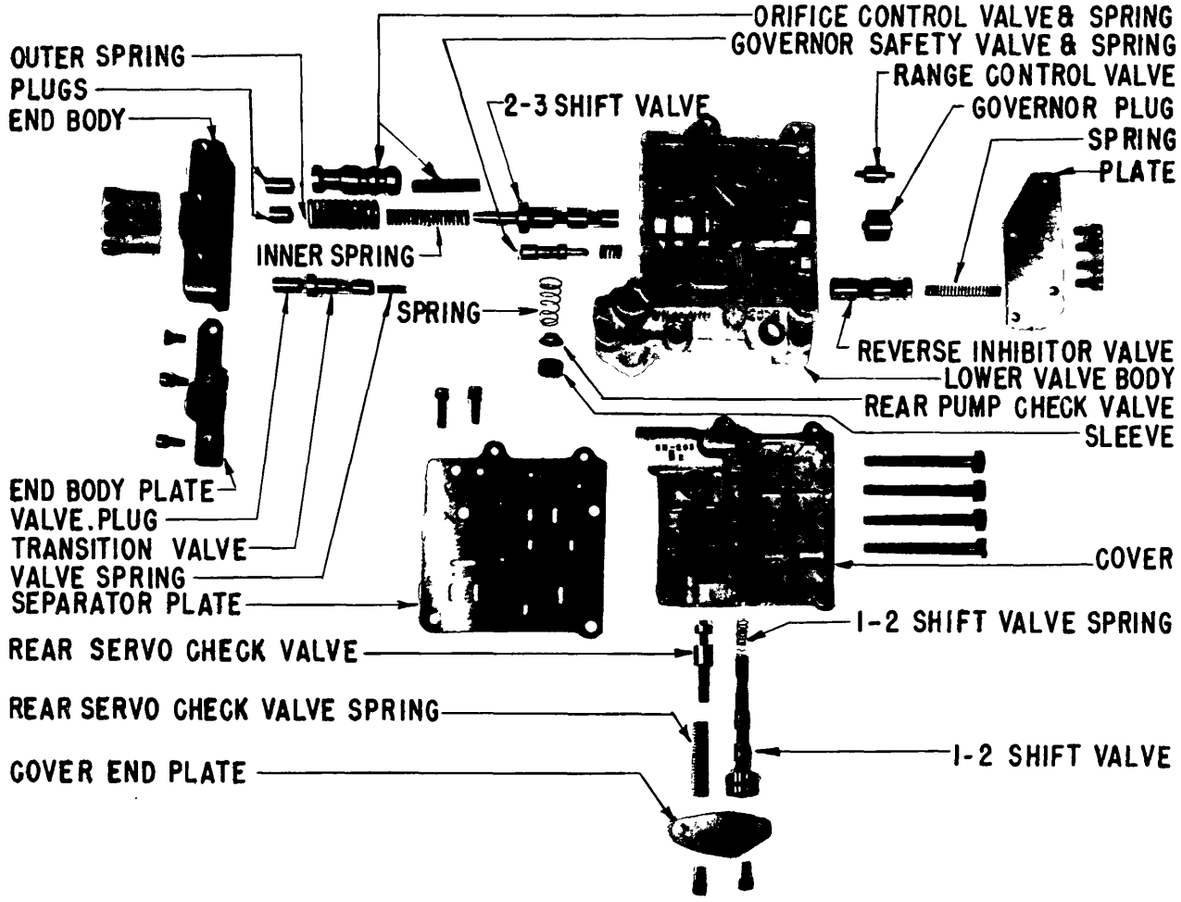
►*NOTE:* Control unit cannot be disassembled and is serviced by replacement.

REMOVAL: Disconnect vacuum line and solenoid wire. Loosen locknut and unscrew unit from transmission case.

INSTALLATION: Screw unit into transmission case until distance from front edge of unit to face of transmission case is 11/32", tighten locknut. *This is a preliminary setting only. See "Throttle Control Adjustment" for final setting after transmission installed in car.*

CONTROL VALVE

►*CONTROL VALVE CAUTION: Do not separate valve bodies until valves have been removed. Keep all parts clean and avoid damage to all valve parts.*



DISASSEMBLY: 1) Remove manual valve, then remove upper body front plate by removing one screw attaching separator plate to lower body (apply pressure to plate while removing, as it is spring loaded). Remove compensator sleeve and plug, then remove compensator valve inner and outer springs and valve. Remove low range valve, modulator valve retainer, outer spring, valve and inner spring (modulator outer spring retainer may be removed from valve by pressing outward on the three retainer flanges). Push downshift valve into bore to remove vacuum control lever hook (control lever may be removed, if necessary, by pulling out retainer and pin). Remove downshift valve and spring.

2) Remove two screws attaching throttle valve return spring to upper body and remove the spring. Remove remaining screw attaching upper valve body rear plate to body and remove plate. Remove throttle valve and compensator cut-off valve. Remove lower body side plate (spring loaded). Remove reverse inhibitor valve spring and valve, governor plug, and range control valve. Remove end body (spring loaded).

3) Remove orifice control valve plug, 2-3 shift valve plug and transmission valve plug from end body. Remove end body plate. Remove 2-3 shift valve outer spring, inner springs and shift valve. Remove orifice control valve and spring, transition valve and spring, and the governor safety valve and spring. Remove cover end plate, 1-2 shift valve and spring and rear servo check valve spring and valve. Remove attaching bolts, then separate the bodies.

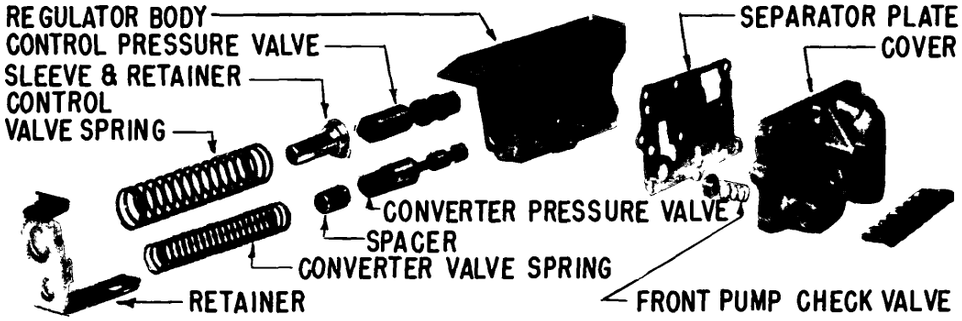
4) Remove valve body plate and separator plate from upper and lower bodies. Remove rear pump check valve sleeve, check valve and spring from lower body. *(NOTE -* Check valve sleeve can be removed with snap ring pliers).

INSPECTION: Clean all parts in solvent and blow dry with air. Inspect all valves and plug bores for scores. Check all fluid passages for obstructions. Inspect check valves for free movement. Inspect all mating surfaces for burrs and distortion. Inspect all plugs and valves for burrs or scores. *(NOTE - Crocus cloth can be used to polish plugs and valves. Be careful not to round off sharp edges of valves and plugs).* Inspect all springs for distortion. Check valves and plugs for free movement in their bores (valves and plugs, when dry, must fall of their own weight, in their respective bores).

FLASH-O-MATIC TRANSMISSION CONTROL VALVE LOWER BODY

REASSEMBLY: *NOTE - Arrange all parts in their correct position. When installing valves and plugs, rotate them into their bores to avoid sheering of soft body castings.* 1) Install valve body plate on upper body (do not tighten screws). Install rear pump check valve spring, valve, and sleeve into lower body. Position lower body on upper body. Place the separator plate on lower body, and install the lower body cover. Tighten attaching bolts finger tight. Align valve body attaching bolt holes in valve body plate and lower body. Tighten the four bolts to 4-6 ft. lbs. *(CAUTION - Excessiv tightening of th se bolts may distort valve bodies, causing the valves r plugs to stick).*

2) Install the two lower cover-to-body screws, then tighten all cover and body screws to 20-30 **Inch** lbs. (2 ft. lbs.). Install plate on lower end body and tighten attaching screws.



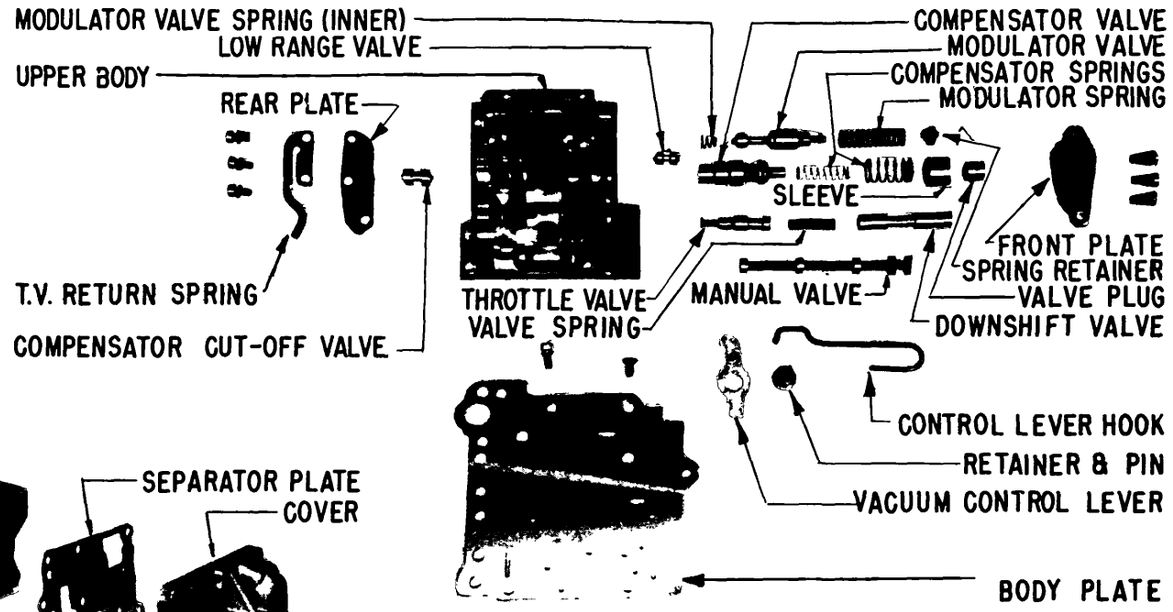
3) *(NOTE - Lubricate all valv s and plugs with Automatic Transmission Fluid Type "A" b for installing them).* Install orifice control valve plug, 2-3 shift valve plug, and the transition valve plug in end body. Install transition valve spring and valve, orifice control valve spring and valve, governor safety valve spring and valve, and 2-3 shift valve in lower body. Install shift valve inner and outer springs, install end body on lower body *(CAUTION - Make sure the inner spring is piloted on the 2-3 shift valve plug).* Install range control valve and

CONTINUED ON NEXT PAGE

FLASH-O-MATIC TRANSMISSION (C ntinued)

governor plug in lower body. Install reverse inhibitor valve spring in the valve and install valve. Install lower body side plate. Install 1-2 shift valve and spring in cover, then install rear servo check valve and spring. Install cover end plate.

4) Install compensator cut-off valve in upper body and install throttle valve. Position the upper body rear plate on upper body with the plate between end bands of the throttle valve. Install one plate-to-body screw in hole next to throttle valve. Position throttle valve return spring on plate and secure plate in place with the remaining plate-to-valve body screws. Install compensator valve and springs, throttle valve spring and downshift valve. Install low range valve, then the modulator spring, valve, outer spring, and retainer as an assembly. Be sure both springs are fastened into position on valve before installation in upper body.



FLASH-O-MATIC TRANSMISSION PRESSURE REGULATOR

5) Install plug in compensator valve sleeve, castellated end out, and install the assembly in body with smooth end toward body. Install upper body front plate and the screw attaching the separator plate to lower valve body. If vacuum control lever was removed, reinstall lever with retainer and pin. While pressing the downshift valve into its bore, insert the vacuum control lever hook into downshift lever and control lever. Install manual valve.

PRESSURE REGULATOR VALVE OVERHAUL

DISASSEMBLY: Remove valves from regulator body and remove body cover. Remove check valve and spring from separator plate, then remove separator plate from regulator body.

FLASH-O-MATIC TRANSMISSION CONTROL VALVE UPPER BODY

INSPECTION: Wash all parts in solvent and blow dry with air. Inspect regulator cover and body mating surfaces for burrs. Check all fluid passages for obstructions. Inspect control pressure and converter pressure valves and bores for burrs and scores. Remove all burrs carefully with crocus cloth. Check free movement of valves in bore (with both parts dry, valves should fall freely of their own weight). Check springs for distortion.

REASSEMBLY: Position check valve spring and valve in regulator cover. Position separator plate on regulator and place this assembly on regulator body and install attaching screws. Tighten screws to 20-30 **Inch** lbs. (2 ft. lbs.). Insert valve in regulator body.

STUDEBAKER FLIGHTOMATIC

Studebaker, All Models (1957)
Packard Clipper (1957)

►CHANGES, CAUTIONS, CORRECTIONS

►*STARTING ENGINE BY PUSHING CAR:* Move selector lever to "N" (Neutral) position. When car speed reaches 20 MPH, turn the ignition switch on and move transmission selector lever to the "L" (Low) position. It is recommended that the car be pushed to start it rather than be towed.

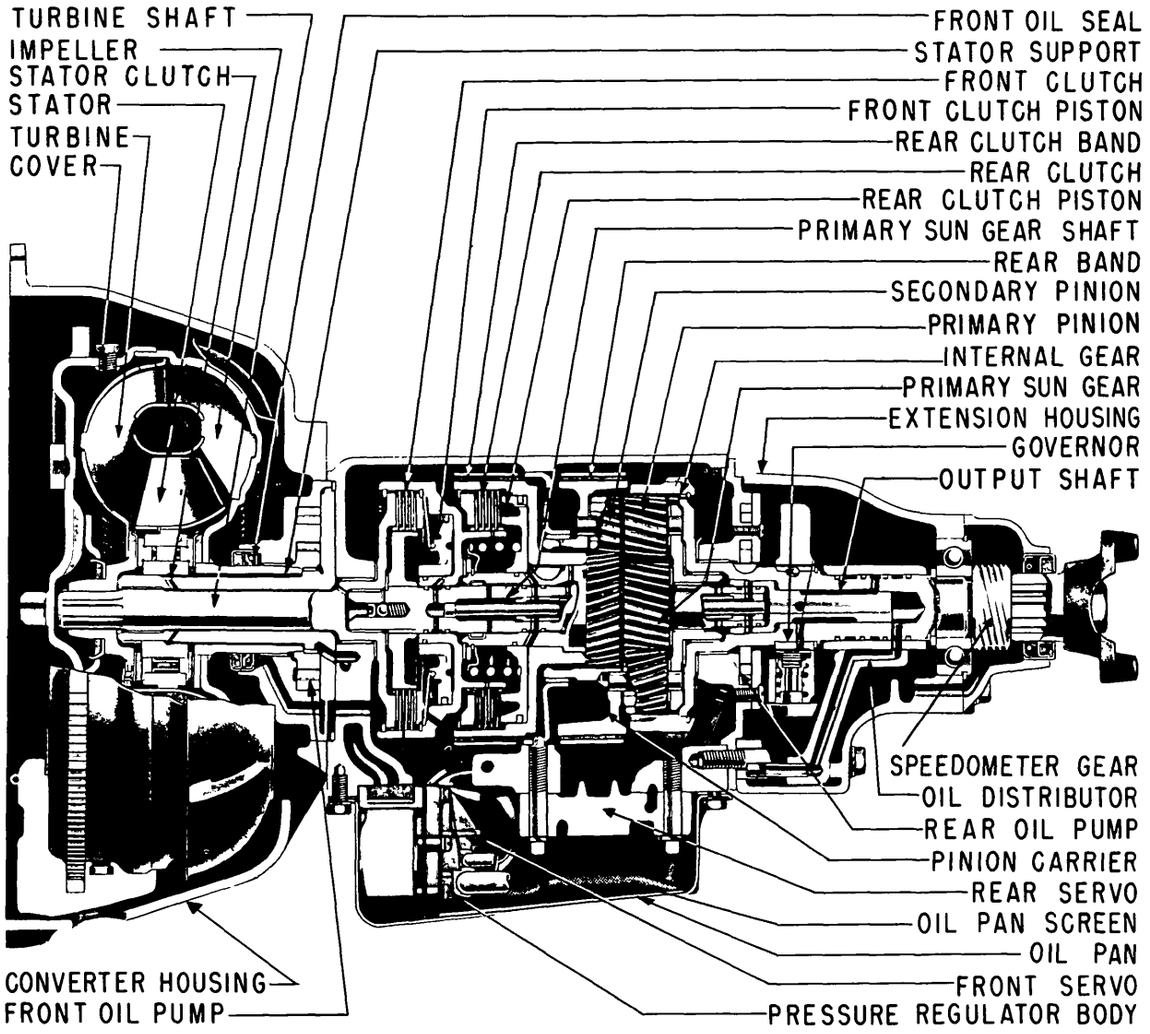
►*TOWING CAR CAUTION:* Car can be towed for very short distances with the transmission selector lever in the "N" position. Prolonged towing will result in damage to the transmission unless the drive shaft is disconnected or the rear wheels are off the ground.

►*1957 FLIGHTOMATIC OVERHEATING (HEAVY DUTY OPERATION) NOTE:* The following procedures should be observed for service on cars used for heavy duty operation such as police cars, taxi cabs, etc.

Band Adjustment - Adjust bands at 5000 mile intervals.

Control Pressure Check & Adjustment - Check control pressure and adjust to 85 lbs. at 1000 RPM in "D" (Drive) range every 5000 miles.

Pressure Regulator Change (to speed up oil flow) - Remove pressure regulator valve assembly and note if converter return passage is restricted to approximately 3/32" in valve body (converter return passage is the restricted opening in center of pressure regulator valve body attaching surface). If this passage has a restriction, disassemble unit and carefully enlarge orifice to 9/32" with a drill.



►*CONTROL VALVE ASSEMBLY IDENTIFICATION:* Different control valve assemblies are used on Packard Clipper and Goldenhawk than on the other models. A figure "1" stamped on lower body cover near front servo apply and release tubes identifies Part No. 1543076 used on Packard and Goldenhawk. The figure "2" identifies Part No. 1542992 used on other models.

►*GOVERNOR ASSEMBLY IDENTIFICATION:* A narrow groove machined into smallest diameter of governor valve (sleeve) identifies the assembly used on Packard and Goldenhawk models. The valves used on other models do not have the groove.

►*BAND SLIPPAGE & ERRATIC SHIFT PATTERN CORRECTION NOTE:* This condition may be caused by a loose control valve or regulator valve assembly moving off its seat enough to allow escape of oil. Make sure that these parts are properly tightened to specified torque.

►*TRANSMISSION REMOVAL & OIL PAN DAMAGE CAUTION:* When removing transmission assembly, use the proper factory recommended jack and cradle. A conventional floor jack may bend and distort oil pan and cause weight of transmission to be taken on the control valve body. Damage and sticking of control valves may result.

►*1956-57 COMMANDER & PRESIDENT MAIN CONTROL VALVE SEPARATOR PLATE CHANGE (To correct a condition of "No Reverse When Hot"):* This condition may be caused by sluggishness and inoperation of the 1-2 shift valve due to decreased and escaping pressure when oil is hot. If all other operations of transmission are normal, install a new separator plate, Part No. 1542984, having a relocated passage to the 1-2 shift valve. This later plate is identified by a notch adjacent to one of the capscrew holes.

STUDEBAKER FLIGHTOMATIC TRANSMISSION (SECTIONAL VIEW)

DESCRIPTION

Flightomatic transmission consists of a hydraulic torque converter and a hydraulically controlled 3-speed planetary type transmission which provides automatic operation in "D" (Drive) range. Additional "Lo" (Low), "R" (Reverse), and "P" (Park) ranges are controlled manually. In "D" (Drive) range, the car starts in "1st" speed (Champion) "2nd" speed (Other Models). Design is similar to that used for late 1956 Studebaker models.

LUBRICATION

►*CAUTION: Check fluid level at 1000 mile intervals. Drain and refill at 15,000 mile intervals, using Automatic Transmission Fluid Type "A".*

Capacity—9 qts. (approximately).

Checking Fluid Level—Place transmission selector lever in "P" (Park) position and operate engine for approximately four minutes, or until engine and transmission have reached normal operating temperature. Roll up the floor mat from right side until oil level inspection hole cover in floor pan is accessible, and remove cover. Clean all dirt and foreign material from around transmission fluid dipstick. Apply the parking

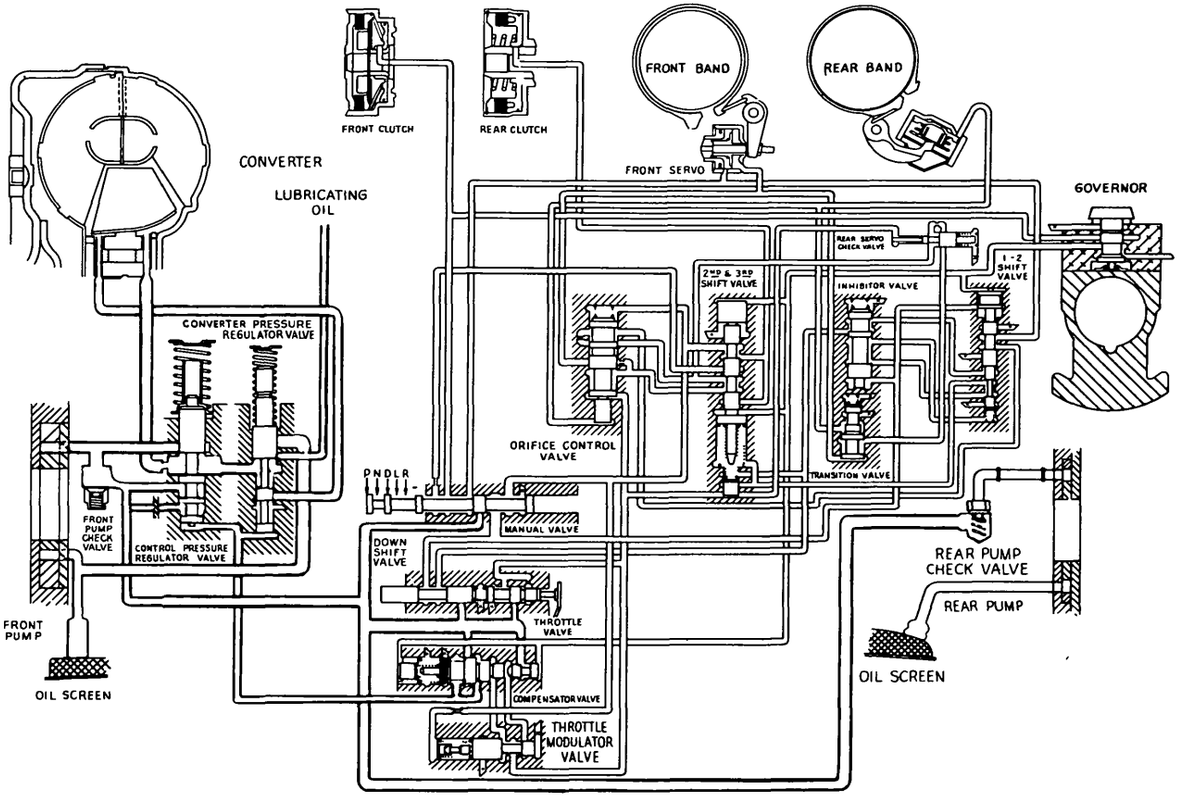
CONTINUED ON NEXT PAGE

STUDEBAKER FLIGHTOMATIC (C ntinu d)

brake and foot brake and move selector lever slowly from "P" position to "R" position and then back to "D" position. Remove dipstick and wipe clean, then install it in transmission and **turn clockwise to the l ck position.** Remove dipstick and check fluid level. Add fluid through dipstick hole to raise level to the "F" mark on dipstick. *NOTE*–The amount of fluid required to raise the level from "L" mark on dipstick to "F" mark is approximately 1½ pints.

Draining & Refilling–Place transmission selector lever in "P" (Park) position and operate engine for approximately four minutes, or until engine and transmission are at normal operating temperature. Stop engine and raise car on hoist. Remove transmission dipstick *(see "Checking Fluid Level" above).* Remove transmission drain plug. Rotate the converter until one of the drain plugs is visible through hole in converter housing, remove drain plug and quickly rotate converter 180°, and remove the other converter drain plug. After fluid has drained from transmission and converter, install transmission drain plug using a new gasket, and the two converter drain plugs. Lower the car to floor and install three quarts of Automatic Transmission Fluid Type "A" through dipstick hole. Apply parking brake and foot brake; start the engine and operate it with the selector lever in "N" (Neutral) position. Slowly pour four additional quarts of fluid into transmission. Move selector lever through all ranges. Check oil level on dipstick *(see "Checking Fluid Level" above).* Add sufficient oil to bring level up to "F" mark on dipstick.

LINKAGE ADJUSTMENT



Throttle Linkage Adjustm nt: *See CARBURETOR on Car Mod l Pag s.*

Manual Linkage Adjustment: Disconnect shift lever-to-transmission manual valve lever rod at transmission manual valve lever by removing the ball joint assembly. Place selector lever in "D" (Drive) position and place the manual lever on transmission in the "D" (Drive) position (this is center of manual valve lever travel). Adjust the shift lever-to-manual valve lever rod until the ball joint stud will slip freely through the hole in the manual valve lever. Install ball joint stud locknut and lock to rod.

BAND ADJUSTMENT

► *1957 FLIGHTOMATIC OVERHEATING (HEAVY DUTY OPERATION) NOTE: See "Changes, Cautions, Corrections" (abov) for service recommendations.*

Fr nt Band: Remove transmission oil pan, gasket and screen. Loosen the front servo adjusting screw locknut two full turns with a 9/16" wrench. Check the adjusting nut for free rotation in the actuating lever and free the adjusting screw if necessary. Install the gauge block of the adjusting tool (J-5880) between the servo piston rod and the adjusting screw. Place the Front Band Adjusting Tool J-5880, on the adjusting screw and tighten until the tool overruns. **Back ff th adjusting scr w on full turn,** and tighten locknut to 20-25 ft. lbs. Place the screen over the rear pump inlet first then over the front pump inlet, and install the screen retaining clip. Position a new oil pan gasket on transmission oil pan flange and hold it in place with petroleum jelly. Align oil pan on transmission flange and install capscrews and lockwashers. Tighten to 10-13 ft. lbs. Install drain plug and fill transmission *(see "Lubrication" above).*

FLIGHTOMATIC TRANSMISSION HYDRAULIC CIRCUITS

Rear Band: Roll up floor mat from the right side until the oil level inspection hole cover in the floor is visible, and remove the cover. Clean dirt and all foreign material from around rear band adjusting screw and locknut, and oil the adjusting screw threads. Using Rear Band Adjusting Tool J-5883, tighten the screw until wrench overruns, **back off adjusting screw 1½ turns,** and tighten the locknut to approximately 35-40 ft. lbs. torque. *CAUTION–It is very important the adjusting screw be backed off 1½ turns to avoid damage to band and servo.*

TESTING

STALL TEST: Connect tachometer to the engine and place it where it can be easily read from the drivers seat. Set the hand brake and start the engine. Place selector lever in "D" (Drive) position, apply service brakes and operate the engine at full throttle. Note tachometer reading. Repeat this procedure with selector lever in "L" and "R" positions. *(CAUTION–Do not operate the engine at high speed while the selector lever is in one of the driving ranges, with the r ar wheels held stationary, for more than 10 seconds at a time or for a total time greater than one minute in any half-hour period).* Normal stall speeds are 1400-1500 RPM (Champion); 1550-1650 RPM (Commander); 1750-1850 RPM (President, Golden Hawk, & Packard Clipper). If stall speed is greater than normal, slippage in transmission is indicated. If stall speed is between 900-1000 RPM (if engine is normal), slippage is indicated in torque converter stator free wheel unit.

ROAD TEST: A thorough test must be made to determine the shift speed and transmission performance. The initial application of the various bands and clutches should be checked in all driving ranges by stopping the car and moving the selector lever to "D", "Lo", & "R" ranges. A driving test should be made in the "D" range to check the shift speeds. *See "Shift Sp ds" below.*

STUDEBAKER FLIGHTOMATIC (Continued)

FLIGHTOMATIC SHIFT SPEED (MPH)

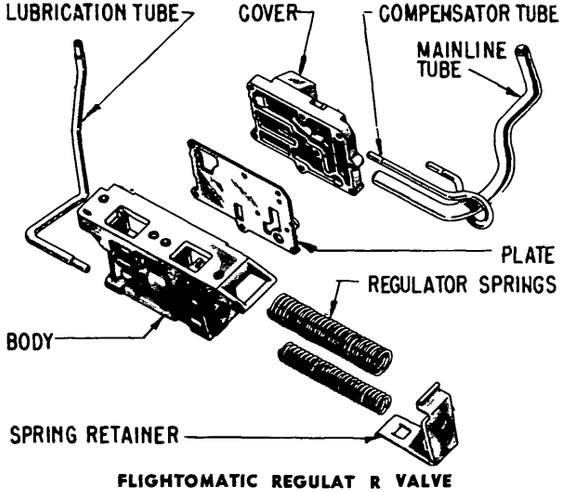
Light Throttle Upshift

Shift	Champion	Comm. & Pres.	Packard & Gold. Hawk
1-2	5-11		
2-3	16-22	14-19	11-16

Maximum Throttle Upshift

Shift	Champion	Comm. & Pres.	Packard & Gold. Hawk
1-2	30-40	35-41	36-43
2-3	53-63	56-69	65-74

Maximum Kickdown



Shift	Champion	Comm. & Pres.	Packard & Gold. Hawk
3-2	48-58	56-63	58-65
2-1	16-24	8-12	6-10

Closed Throttle Downshift

Shift	Champion	Comm. & Pres.	Packard & Gold. Hawk
3-2	8-17	8-12	6-10
2-1	4-7		

FLUID PRESSURE TESTS: Fluid pressure tests should be made to ascertain whether or not the pressure regulator system is functioning correctly and to determine if there is fluid leakage in the clutch circuits. Remove the 1/8" pipe plug located near throttle lever and manual lever, and install pressure gauge hose (pressure gauge should be in drivers compartment). Connect a tachometer to engine and position it so it can be read from drivers compartment. Make the following tests:

1) Idle Pressure Test - With engine and transmission at normal operating temperature, and with engine at normal idle speed, move selector lever to "D", "L", & "R" positions. The pressure gauge should read approximately 50-80 lbs. (Champion, Commander, & President), 52-95 lbs. (Golden Hawk & Packard Clipper), in all ranges. If pressure is low in any one range, a fluid leak in that range circuit is indicated. If pressure is high, the throttle linkage should be checked and adjusted *(see CARBURETOR on Car Model pages).*

FLIGHTOMATIC REGULAT R VALVE

2) Pressure Regulation Check - Move selector lever to "D" range and firmly set hand brake and foot brake. Run engine at 1000 RPM and read pressure gauge. Pressure should be approximately 80-85 lbs. (Champion, Commander, & President), 95-100 lbs. (Golden Hawk & Packard Clipper). If the pressure is less, it indicates the throttle valve linkage is too long and must be adjusted. If pressure is greater, it indicates throttle valve linkage is too short and must be readjusted.

3) Stall Pressure Test - Firmly set hand brake and foot brake and operate engine at full kickdown position. Move selector lever to "D", "L", & "R" ranges and read gauge pressure. The pressure in "D" & "L" positions should be 130-175 lbs. (Champion, Commander, & President), 132-184 lbs. (Golden Hawk & Packard Clipper). In the "R" range, the pressure should be 170-190 lbs. (Champion, Commander, & President), 184-203 lbs. (Golden Hawk & Packard Clipper). If pressure is less or greater than the above pressures, malfunctioning of throttle valve, modulator valve, compensator valve, or pressure regulator assembly is indicated and it will be necessary to remove and clean the control valve assembly and pressure regulator valve assembly.

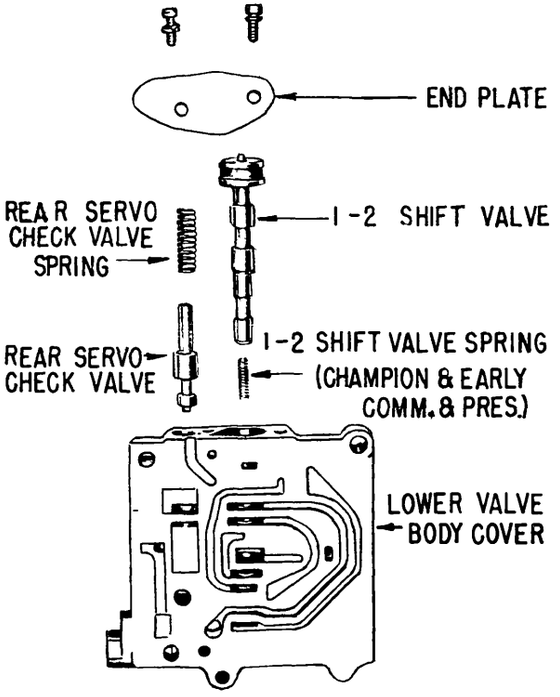
AIR PRESSURE TEST (With Transmission in Car): Raise car on hoist and remove transmission oil pan and control valve assembly. Proceed as follows:

Front Clutch: Apply pressure to front clutch and governor input passage (case rear flange). Listen for dull thud which indicates that clutch is operating. Keep air pressure in passage for several seconds to check for leaks in this part of the system.

Governor Valve: Remove governor inspection cover. Apply air pressure to the same passage as for front clutch (above). Listen for a click and also watch valve snap inward.

Rear Clutch; Apply air pressure to rear clutch oil passage (case rear flange). Listen for a dull thud to indicate clutch is operating. Check for leaks in same manner as for front clutch (above).

Rear Band & Servo: Apply pressure to rear servo oil passage (case rear flange), observe band application.



Front Band & Servo: Apply pressure to front servo apply tube (rear tube), and observe band application.

►*TESTING NOTE: If servos, bands, clutches and governor operate with air pressure, then the no drive problems, erratic shift, or no upshift conditions indicate that the control valve assembly is the cause of the trouble. See "Control Valve" below.*

TROUBLE SHOOTING

►*FLIGHTOMATIC TRANSMISSION FAILURE TO OBTAIN AUTOMATIC UPSHIFT OR REAR CLUTCH APPLICATION CORRECTION:* If control pressure and all other transmission adjustments are normal, this condition may be caused by shifting of distributor tube in output shaft. Dependent on how the distributor tube shifted, the following conditions may occur:

1) No governor action, in which case the transmission would not upshift automatically.

FLIGHTOMATIC LOWER VALVE B DY COVER

2) Obstructed rear clutch passage, in which case transmission would not provide third gear or reverse.

3) Allowing a common passage to supply pressure to both front and rear clutches simultaneously, in which case a locking (or partial locking) condition would exist in "D", "L", or "R" ranges.

To determine correct position of tube within output shaft, remove output shaft and locate governor drive ball pocket in shaft (at approximate center of shaft). Then, looking at front of output shaft assembly, locate elongation of oil passage in center of distributor tube (visible from gear end of output shaft). Using governor drive ball pocket as a reference point, elongated portion of passage should be located 180° from (or relatively opposite) the governor drive ball pocket.

INITIAL ENGAGEMENT TOO ROUGH: Idle speed may be too high. Control pressure may be too high caused by improper throttle valve linkage or dirt in control valve assembly or regulator valve assembly. Check throttle valve stop and reset if necessary.

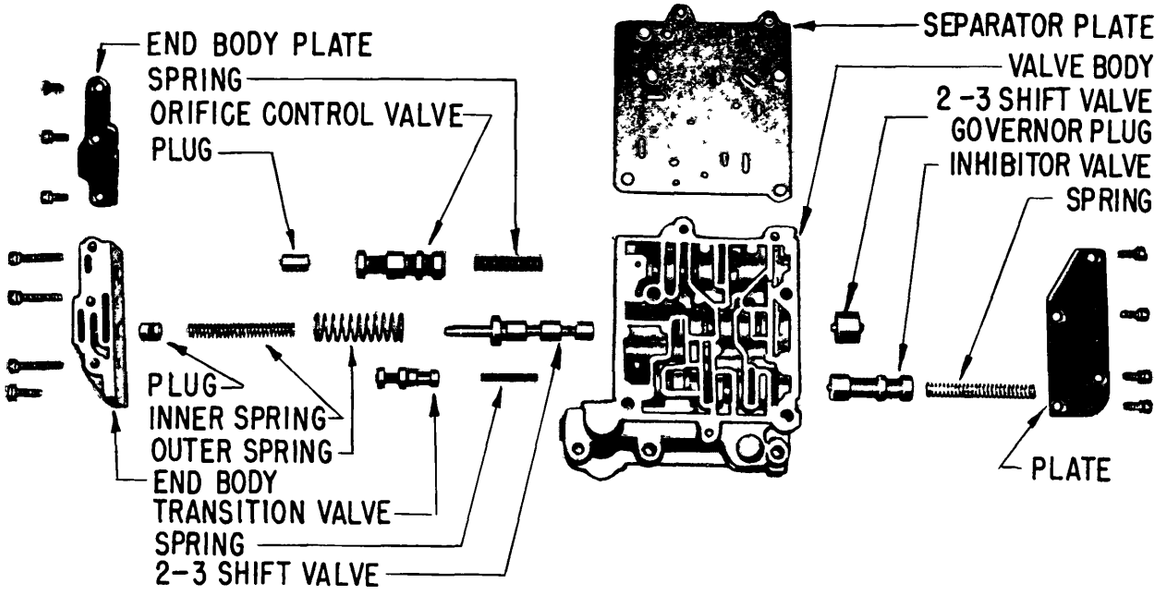
INITIAL ENGAGEMENT DELAYED: Check fluid level. Adjust rear band as it may be loose. Control pressure may be too low at idle speed. Clean control valve assembly and pressure regulator assembly. Check front pump for wear. Check fluid circuits for leaks and correct as necessary.

INOPERATIVE IN ALL RANGES: Check fluid level. Manual linkage may be disconnected. No control pressure

CONTINUED ON NEXT PAGE

STUDEBAKER FLIGHTOMATIC (C n.inued)

which may be caused by trouble at front pump. Check rear band adjustment. Check rear servo action with air pressure. Inspect and clean control valve assembly. Check engine stall speed, as converter may not be operating properly.



NO DRIVE IN "D" OR "L" POSITION: Check fluid level. Manual linkage may be disconnected. Control pressure may be low. Adjust throttle valve linkage. Clean control valve and pressure regulator valve assemblies. Check front clutch action with air pressure. Check rear servo and band with air pressure. Check transition valve in control valve assembly as it may be stuck.

NO DRIVE IN "R" POSITION: Check fluid level. Check and adjust manual linkage. Control pressure may be low. Check and adjust throttle valve linkage, and clean control valve and regulator valve assemblies. Check rear clutch action with air pressure. Check rear servo action with air pressure. Check transition valve in control valve assembly.

LOCKS UP IN "D" POSITION: Rear clutch or front band may be applied. Clean control valve and governor valve assemblies. Check rear clutch and front band and servo for mechanical failures.

LOCKS UP IN "D" POSITION (2ND GEAR): Check rear band and servo, and rear clutch for mechanical failure.

LOCKS UP IN "D" POSITION (3RD GEAR): Front or rear band may be applied. Check bands and servo for mechanical failure. Clean control valve assembly.

FLIGHTOMATIC LOWER VALVE BODY

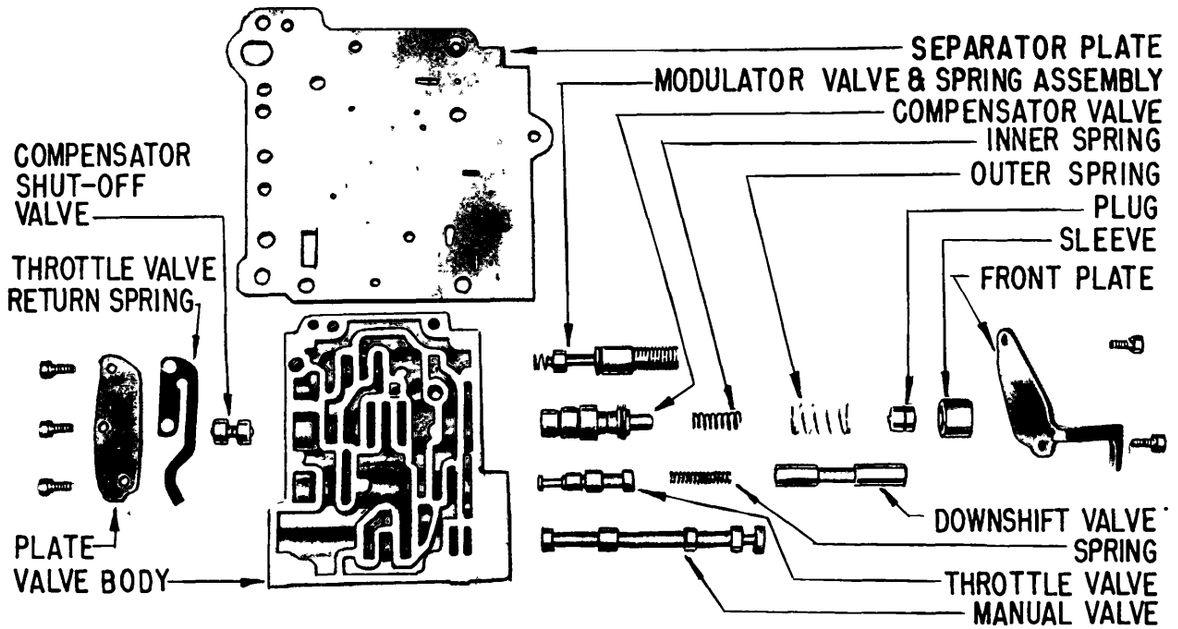
LOCKS UP IN "R" POSITION: Check front clutch and band and front band servo for mechanical failure. Clean control valve assembly.

SLIPS IN "D" OR "L" POSITION: Check fluid level. Control pressure may be low. Check throttle valve linkage. Clean control valve and pressure regulator valve assemblies. Rear servo travel may be limited; check for mechanical failure of band or servo. Check front clutch for mechanical failure. Rear pump check valve may be stuck open.

SLIPS IN "R" POSITION: Check fluid level. Check and adjust throttle control linkage. Clean control valve and regulator valve assemblies. Check rear servo for limited travel. Check front clutch for mechanical failure as it may be slipping. Rear pump check valve may be stuck open.

1-2 UPSHIFT ROUGH: Check and correct throttle control linkage as control pressure may be too high. Clean and adjust bands. Governor valve may be stuck.

1-2 UPSHIFT SLIPS: Check and adjust throttle control as control pressure may be too high. Adjust bands. Check for stuck governor valve. Check front servo piston for limited travel with air pressure. Check for fluid leakage.



NO 1-2 UPSHIFT: Check for stuck governor valve or 1-2 shift valve.

1-2 UPSHIFT TOO EARLY: Check for stuck governor valve.

1-2 UPSHIFT TOO LATE: Check for stuck governor valve or leak in governor circuit. Check and adjust throttle control linkage. Clean control valve assembly.

2-3 UPSHIFT ROUGH: Control pressure may be too high; adjust throttle control linkage and clean control valve assembly. Adjust front band. Check for stuck governor valve.

2-3 UPSHIFT SLIPS: Control pressure may be too low; adjust throttle control linkage and clean control valve

FLIGHTOMATIC UPPER VALVE BODY

CONTINUED ON NEXT PAGE

STUDEBAKER FLIGHTOMATIC (Continued)

assembly. Adjust front band. Check for internal leaks and for stuck governor valve.

NO UPSHIFT 2-3: Governor valve or 2-3 shift valve may be stuck.

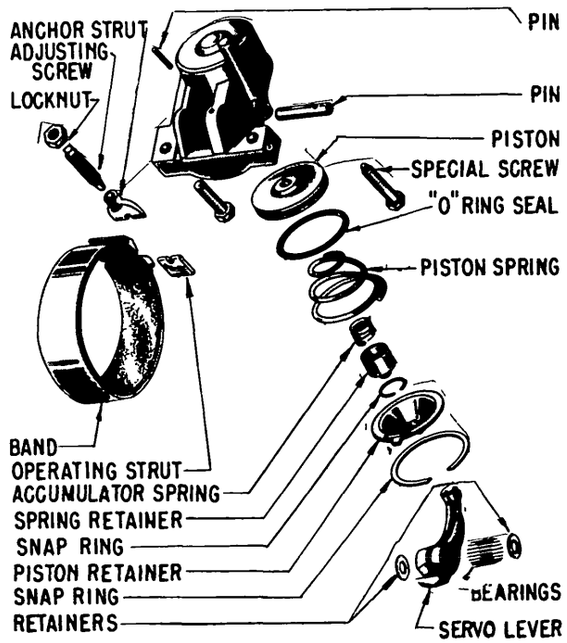
2-3 UPSHIFT EARLY: Check for stuck governor valve.

2-3 UPSHIFT LATE: Check for stuck governor valve or leak in governor circuit. Adjust throttle control linkage.

3-2 DOWNSHIFT ROUGH (CLOSED THROTTLE): Adjust throttle control linkage. Orifice control valve stuck.

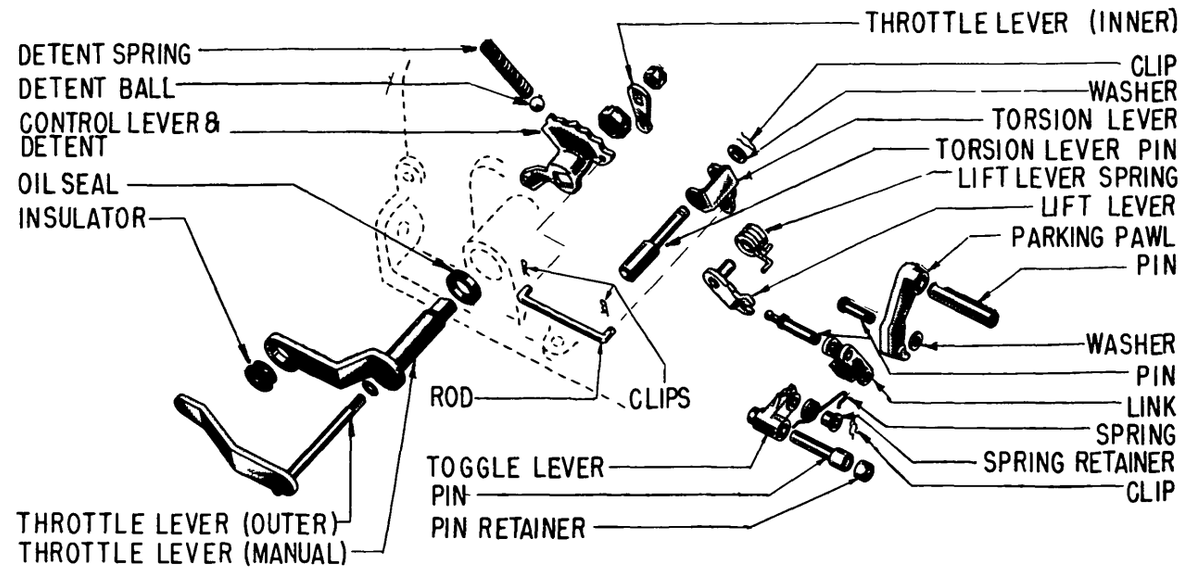
3-2 KICKDOWN (EARLY): Adjust throttle control linkage.

NO KICKDOWN: Adjust throttle control linkage.



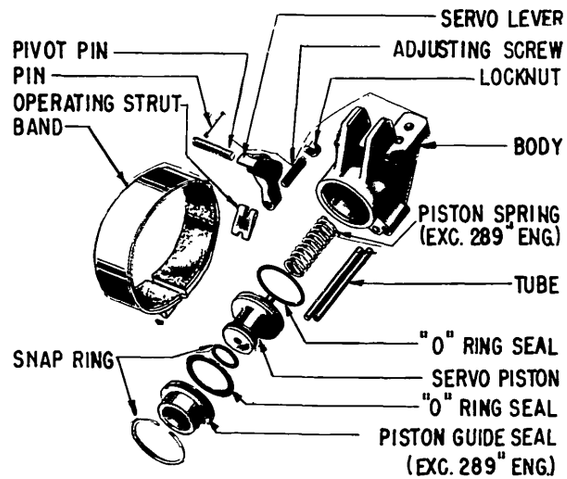
2-1 DOWNSHIFT ROUGH (CLOSED THROTTLE): Adjust throttle control linkage. Rear servo check valve may be stuck.

WILL NOT START BY PUSHING: Rear pump not operating. Pressure regulator valve may be stuck.



NO PARK POSITION: Adjust throttle control linkage. Check for damaged internal linkage or pawl.

TRANSMISSION REMOVAL & INSTALLATION



REMOVAL: Raise car on hoist, and remove transmission drain plug and converter drain plug. On coupe and hardtop models, remove body front pillar support crossmember. On cars with dual exhaust system, remove the left hand exhaust system. Remove complete propeller shaft assembly. Disconnect shift lever-to-transmission manual valve lever rod from manual valve lever. Disconnect bellcrank-to-throttle valve lever rod at throttle valve lever. Remove speedometer cable retaining screw and remove pinion and cable. Place transmission lift with the saddle as far forward in the tracks as possible, in position on transmission oil pan flange and align saddle on oil pan flange. Remove the four transmission-to-converter bell housing capscrews. Install transmission-to-converter housing guide pins, Tool J-4284, into upper capscrew holes. Remove transmission assembly by sliding it rearward on saddle out of converter bell housing and converter.

FLIGHTOMATIC REAR SERVO & BAND ASSEMBLY

FLIGHTOMATIC TRANSMISSION INNER CONTROL LEVER ASSEMBLY

FLIGHT MATIC FRONT SERV & BAND ASSEMBLY

INSTALLATION: Position front pump drive tangs on converter hub in horizontal position. Using a thin screwdriver, position the front pump external tooth gear drive lugs in vertical position. Install transmission-to-converter housing guide pins, Tool J-4284 (if they were removed). Raise transmission to proper height and angle and carefully slide transmission assembly into torque converter and bell housing, using the pilot studs as guides. Do not force transmission into converter by using transmission retaining screws to draw transmission into position, as this may damage converter or front pump. Make sure transmission fits snugly against converter bell housing. When transmission is in contact with bell housing, install the two lower transmission-to-bell housing retainer capscrew and lockwashers. Remove guide pins and install remaining capscrews and lockwashers. Tighten capscrews to 40-45 ft. lbs. Remove transmission hoist and saddle. Install speedometer pinion and cable and install retaining screw. Install shift lever-to-transmission manual valve lever rod. Install bellcrank-to-transmission throttle valve lever rod. On coupes and hardtops, install the body front pillar support cross-member. On cars with dual exhaust, install left exhaust pipe. Install propeller shaft assembly. Fill transmission to proper level (see "Draining & Refilling" above).

TORQUE CONVERTER REMOVAL & INSTALLATION

REMOVAL: Remove transmission (see above), and starter. Disconnect tail pipe support and remove the "U" bolt from exhaust pipe support at converter housing. Disconnect rear exhaust pipe from front exhaust pipe and pull muffler and pipe assembly rearward. Move assembly

CONTINUED ON NEXT PAGE

STUDEBAKER FLIGHTOMATIC (C ntinued)

to one side out of the way. Using a suitable support for engine (support must be shaped to support weight of engine at oil pan flanges and not under oil pan) and a hydraulic jack, remove rear insulator studs and raise engine just enough to have a separation between insulators and crossmember. Remove rear engine support crossmember. Remove converter bell housing-to-engine capscrews and remove bell housing, being careful not to damage dowels or distort converter blower. Lower rear of engine, being careful not to pull off water outlet hose (if additional clearance is required) drain cooling system and disconnect water outlet hose). Remove capscrews and washer holding converter assembly to the crankshaft-to-converter drive plate, and remove converter assembly.

INSTALLATION: Install converter assembly on the crankshaft-to-converter drive plate and loosely install retaining screws and lockwashers. Clean engine rear plate and mating surface on bell housing and install bell housing, taking care not to damage dowels or converter blower. Be sure bell housing is installed on dowels. Install bell housing retaining capscrews and tighten to 23-28 ft. lbs. If engine has been lowered, raise it to normal position. Position converter aligning tool, J-6310, into bore of bell housing and over pump drive fingers on torque converter assembly. Install the two upper transmission capscrews to hold aligning flange in position, and rotate converter assembly through two complete revolutions to center the torque converter assembly. Tighten converter-to-drive plate capscrews to 23-28 ft. lbs. Remove aligning tool. Install rear engine support crossmember. Install exhaust pipe, muffler and tail pipe assembly, making sure that proper alignment exists between assembly and the supports. Install transmission (see above), and starter.

TRANSMISSION OVERHAUL

CONVERTER OVERHAUL: Converter assembly is welded together and cannot be disassembled for servicing or overhaul.

TRANSMISSION OVERHAUL: Transmission overhaul procedures are the same as for Fordomatic, Merc-O-Matic, & Turbo-Drive Transmissions. *See "Fordomatic, Merc-O-Matic, & Turbo-Drive Transmissions" in 1956 Annual Data and note the following:*

CONTROL VALVE DISASSEMBLY & REASSEMBLY

►*CONTROL VALVE DISASSEMBLY NOTE:* Each valve body of the assembly should be disassembled, cleaned and inspected, and reassembled at one time to reduce the possibility of interchanging springs in the assembly. Clean all parts in solvent and dry with compressed air. Inspect all valves for burrs, scores or scratches. Check fluid passages for obstructions. Inspect mating surfaces for nicks and burrs. Check springs for distortion.

DISASSEMBLY: (Upper Valve Body)–Remove four capscrews and lockwashers that attach lower valve body cover to control valve assembly. Invert assembly and remove the screw attaching separator plate to lower valve body. Remove upper valve body and separator plate. Remove the two separator plate attaching screws and remove separator plate (note that one of the screws is countersunk). Remove throttle valve return spring screws and remove spring. Remove the remaining screw and rear plate. Remove compensator cut-off valve and remove manual valve. Remove front plate retaining screws and lockwashers, and remove plate. Remove downshift valve, throttle valve spring and throttle valve. Remove compensator valve sleeve, valve plug. valve inner and outer springs and the compensator valve. Remove modulator valve and spring assembly. *NOTE*–Do not separate modulator valve and spring assembly.

Reassembly: After cleaning and inspection install modulator valve and spring assembly, compensator valve, inner and outer springs, valve plug and sleeve; throttle valve, valve spring, and downshift valve in their respective bores and install front plate and attaching screws. Tighten screws to 20-30 inch lbs. Install compensator cut-off valve in its bore and install rear plate and screw. *NOTE*–When installing rear plate the throttle valve must protrude from the valve body to provide clearance for the stop on the rear plate. Position throttle valve return spring on rear plate and install screws. Tighten screws to 20-30 inch lbs. Position separator plate on upper valve body and install the screw. Tighten screws to 20-30 inch lbs. Install manual valve in its bore.

DISASSEMBLY: (Lower Valve Body)–Remove rear pump check valve seat, valve and spring. Remove screws and washers attaching cover to lower valve body and remove cover. Remove separator plate. Remove retainer facer screws and lock washers and remove the side plate. Remove inhibitor valve spring and valve, and 2-3 shift valve governor plug from their respective bores. Remove the four remaining screws and lockwashers and remove the end body. Remove transition valve and spring, 2-3 shift valve inner and outer springs and 2-3 shift valve, and orifice control valve and spring. Remove the 2-3 shift valve plug and the orifice control valve plug from the end body. Remove retaining screws and remove end body plates.

Reassembly: Position end body plate on end body and install retaining screws and lockwashers. Tighten screws 20-30 inch lbs. Install orifice control valve plug and the 2-3 shift valve plug in their respective bores. Install orifice control valve spring and valve; the 2-3 shift valve and inner and outer springs, the transition valve spring and valve in their respective bores. Position the end body on lower valve body and install retaining screws and lockwashers. Tighten screws to 20-30 inch lbs. Install the 2-3 shift valve governor plug, and the inhibitor valve and spring in their respective bores. Position side plate on lower valve body and install retaining screws and lockwashers. Tighten to 20-30 inch lbs. Install rear pump check valve spring, valve, and seat.

DISASSEMBLY: (Lower Valve Body Cover)–Remove end plate retaining screws and lockwashers and remove end plate. Remove rear servo check valve spring and check valve from its bore. Remove the 1-2 shift valve and spring from its bore. *NOTE*–Models with "intermediate gear start" (later Commander & President models, and early Commander & President having a modified control valve assembly) have the 1-2 shift valve spring, which is conical, installed between end plate and valve. All Champion models, and early Commander & President models have the spring located at opposite end of valve.

Reassembly: After cleaning and inspection, install the 1-2 shift valve and spring (see "Disassembly" above for spring location), and the rear servo check valve and spring in their respective bores. Position end plate on lower valve body cover and install retaining screws and lockwashers. Tighten screws to 20-30 inch lbs.

►*CONTROL VALVE REASSEMBLY NOTE:* Position the upper valve body and separator plate on lower valve body and install retaining screw and lockwasher, do not tighten screw. Position separator plate and lower valve body cover on lower valve body and install retaining screws and lockwashers, do not tighten screws. Install four capscrews and lockwashers that attach lower valve cover to control valve assembly. Tighten capscrew to 4-6 ft. lbs. Tighten all retaining screws to 20-30 inch lbs.

AIR CONDITIONING SERVICE CAUTIONS

DISCONNECTING LINES OR UNITS FOR SERVICING ENGINE: *See Individual Air Conditioning Car Data.*

HANDLING FREON: Though considered the safest and best refrigerant for use in Air Conditioning systems the following precautions must be observed to avoid serious accidents or damage to the system

Drum: 1) Do not leave drum uncapped (metal cap furnished with drum is for protection of valve and safety plug) It should be replaced after each use of drum

2) Do not carry drum in passenger compartment of car Place drum in luggage compartment or if in an open truck cover drum to protect it from radiant sun heat If precaution not taken resultant increase in pressure may cause safety plug to release or drum to burst

3) When charging system do not subject drum to high heat Use water no warmer than 125°F (Hot rags will suffice) *Never place drum on radiator, stove, or use torches for heating during charging* Keep drums upright

4) Never permit a drum to be dropped or strike another drum violently

5) Do not fill drum completely (when filling one drum from another) Leave space above liquid for expansion

P rsonal: 1) Do not discharge Freon into room with exposed flame because concentrations of this gas in contact with open flame will produce a toxic gas

2) Do not expose eyes to liquid *USE GLASSES OR GOGGLES Liquid Freon will freeze anything with which it comes in contact* If Freon should strike eyeballs splash water to area of eye to gradually get temperature above freezing point apply a few drops of sterile mineral oil to eyes as an irrigator If irritation continues wash eyes with a weak solution of boric acid *DO NOT RUB EYES See an eye specialist at once*

3) Do not inhale large quantities of Freon vapor as it will act an an anesthetic

4) If Freon comes in contact with skin injury should be treated for frostbite

HANDLING REFRIGERANT LINES. 1) Keep refrigerant lines dry and clean Whenever a connection or joint is broken clean all dirt from joint or connection

2) Parts from stock are capped and dehydrated Caps should only be removed just prior to installation Lines removed from system to be used again should be capped immediately, to prevent dirt and moisture from entering lines

3) Lines should be free of kinks, and should be carefully stored to avoid crushing or bending

4) Proper size wrenches should be used when tightening fittings Always use two wrenches to prevent twisting copper tubing

5) Tubing that is left free to vibrate will harden and crystallize the area of the tubing at flare sections so that it may become brittle and break

6) When using paint drying lamps, ovens steam cleaners, or other heat producing devices avoid heating any part of system If sufficient heat applied, pressure will increase to a point where system will rupture

7) When undercoating, use care to see that undercoating does not plug evaporator drain Do not coat air conditioning joints and connections

8) Keep gauge set and lines free of moisture

9) Compressor lubricant container must not be left open longer than necessary as the special oil is moisture free and will absorb moisture from air if left uncapped

AIR CONDITIONING LEAK TESTS

LEAK TESTING CONFINED AREAS For leak testing confined areas such as sections of evaporator and condenser a torch or flame type detector must be used Two types are available One type uses anhydrous methyl alcohol under pressure for producing the testing flame The cylinder is refillable and must be pre heated to pressurize cylinder The other type uses propane gas under pressure to produce the testing flame The cylinder is replaceable and comes already pressurized making it unnecessary to pre-heat cylinder in order to produce testing flame Instructions for use of the detectors are furnished with the detector

Leak Testing With flame adjusted explore for leaks by moving end of hose or sampling tube around all points where a leak may be Especially check around bottom of connections since Freon is heavier than air and will be more apparent at bottom of fitting Color of flame will turn to a yellow-green when a small leak is detected Large leaks will be indicated by a change in color to bright or brilliant blue or purple When hose or tube is moved away from leak flame will clear to an almost colorless pale-blue or green *CAUTION*–Do not use lighted detector in any place where combustible or explosive gases dust or vapors may be present Do not breathe fumes and black smoke that are produced if leak is a big one Before leak testing be sure car is thoroughly aired (particularly if Freon tank used or if system opened for any reason) and moved to a Freon-free area in order that false readings may be prevented

PIN-POINTING LEAKS There are a number of fittings and places throughout the air conditioning unit where a leak detector solution or detergent may be used to pin-point leaks Apply solution to suspected area with with swab that is attached to bottle cap Bubbles will will form within seconds if there is a leak

AIR CONDITIONING TROUBLE SHOOTING

►*CAUTION Do not disconnect refrigerant lines, replace parts, or attempt adjustments without complete instructions See "Air Conditioning Service Cautions"*

POOR COOLING: 1) Blowers Not Operating–Fuse blown or faulty circuit breaker, switch in "Off" position, defective switch, switch resistors or blower rheostats inoperative, broken wire or loose connections, blower motor defective, blower fans or motor improperly installed

2) Restricted Air Flow–Filters clogged, dirt or other obstructions in air ducts, evaporator fins or coils clogged or restricted with frost or ice

3) Refrigerant Flow to Cooling Coils or Fins Incorrect–Expansion valve improperly adjusted or defective, power element or temperature bulb does not contact pressure line properly, restriction in liquid line between receiver and cooling coils or fins, power element or temperature bulb discharged, insufficient refrigerant, by pass valve thermostatic switch or solenoid (if so equipped) not properly set or inoperative, modulator valve (if so equipped) defective, break in any part of closed refrigeration system

4) Refrigerant Not Condensing Properly–Air flow through condenser restricted high engine operating temperatures, air or excess refrigerant in system, restriction in high pressure side of compressor and condenser

5) Clutch (If So Equipped) Does Not Engage–Defective coil or relay, clutch plate lining worn or saturated with oil causing slippage, air conditioning "On" switch defective, thermostat inoperative, clutch adjustment incorrect

6) C mpr ssor - Belts not adjusted properly worn or broken operating above normal pressures valves faulty service valves not fully open

7) El ctrical–Loose connections or broken wires between electrical units blown fuses or faulty circuit breakers

TOO COLD· 1) Clutch (If S Equipp d) Do s Not Disengage–Thermostat inoperative, relay stuck closed, air conditioning "On" switch inoperative

2) Blower Speed Cannot be R duced–Defective blower switch

VIBRATION–NOISE 1) Blow rs–Loose on shaft, striking housing foreign material, motor bearings or mounts loose or worn

2) Compressor–Mounting brackets loose, loose internal parts, insufficient oil, too much refrigerant

3) Air Flow–Foreign material in air system, small slits or openings in ducts

INCORRECT OPERATING PRESSURE: 1) Exc ssiv Pressure on High Pressure Sid–Air or excess refrigerant in system, air flow through condenser core restricted, kinks or restrictions in line on high pressure side, high engine temperature, shut-off valve on high pressure side of compressor not fully open, insufficient air flow through cooling coil, defective expansion valve or incorrect adjustment

2) Insufficient Pressure on High Pr ssure Side–Shortage of refrigerant, defective expansion valve or incorrect adjustment, leaky or broken compressor valves

3) Excessive Pressure on L w Pr ssur Side–Power element or temperature bulb not making correct contact with pressure line expansion valve needle stuck open or leaking

4) Insufficient Pressure on L w Pressur Side–Restriction in lines shortage of refrigerant, expansion valve needle stuck shut expansion valve not open far enough plugged or defective, dehydrator-filter (strainer-drier) plugged, power element or temperature bulb charge lost or line plugged compressor valves faulty, blower fans inoperative, temperature control thermostat does not cut out, moisture or freeze-up

CHRYSLER, DE SOTO, DODGE, PLYMOUTH

Chrysler, DeSoto, Dodge, Plymouth & Imperial (1957)

▷CHANGES, CAUTIONS, CORRECTIONS

▷*1957 "V2" COMPRESSOR NOISE (WHISTLING – PULSATING) CORRECTION:* This condition can be corrected by installing a new compressor oil pump relief valve ball (MoPar Service Package, Part No. 1843474). See *"Compressor" below for installation procedures.*

▷*1957 AIR CONDITIONER OPERATING CAUTION: Engine cooling system must be protected to a temperature of 20°F. above zero for summer operation.*

DESCRIPTION: This new unit is a combined heater-air conditioner system with all components located on dash panel and in engine compartment. Temperature control is obtained through a reheating process. During the cooling cycle, air is cooled as it passes through the evaporator coil and then is reheated to the desired temperature by the heater core. Air for this cycle may be brought from outside the car or it may be recirculated. During the heating cycle, outside air is introduced into the system through a permanently open vent in top of cowl section, and is drawn through both the cooling and heating coils by a centrifugal blower. The heated air is then forced into the duct for distribution. The air conditioner compressor is a two cylinder reciprocating type located on right side of engine and driven by a belt. A magnetic clutch on the compressor is actuated by a thermal switch and controls operation of the compressor in relation to requirements of the system. The Recirculating Door is operated by engine oil pressure through a power piston and is controlled by the main operating control lever on instrument panel.

SERVICE CAUTIONS: *Before disconnecting any part of air conditioning system or lines, see "Air Conditioning Service Cautions" at beginning of Air Conditioning Section.*

LEAK TESTING & TROUBLE SHOOTING: *See "Leak Testing" & "Trouble Shooting" at beginning of Air Conditioning Section.*

COMPRESSOR REMOVAL (For service work on engine): Air conditioning compressor cannot be repositioned for service work on engine except by disconnecting and removing it from the engine compartment. See *"Compressor" below.*

ADJUSTMENT

ADJUSTMENTS: Compressor Belt – Adjust as follows: Chrysler, DeSoto, Dodge & Imperial – 3/8" (used belt), 5/16" (new belt) deflection with a 5 lbs. pull at center of longest span.

Plymouth – 5/16" (used belt), 3/16" (new belt) deflection with a 5 lbs. pull at center of longest belt span.

▷*FAN BELT REPLACEMENT NOTE: Always replace both compressor belts. Do not run a new belt with an old one.*

Thermal Switch: Three positions are provided for adjustment at eccentric slot on side of switch. To adjust, turn in clockwise direction for "Cold" or counterclockwise for "Warm". When midway between these two points the temperature setting will be "Normal", which is standard factory setting.

Checking – Insert thermometer bulb through hole at lower left side of evaporator housing into well of suction line, then seal the opening with tape. Connect a test light lead to compressor circuit and the other lead to ground. Operate engine at 1200 RPM, control switch on "Cooling", and control lever at "Cold". Test light should light. Turn blower switch off. Close all windows and allow thermal switch to cycle a few times, indicated by test light going on and off. The following specifications indicate opening and closing of thermal switch (in relation to switch setting).

Thermal Switch Specifications

Adjustment	Switch Opens	Switch Closes
Normal Setting	34°F ± 2°F	37°F ± 2°F
Cold Setting	30°F ± 2°F	34°F ± 2°F
Warm Setting	42°F ± 2°F	45°F ± 2°F

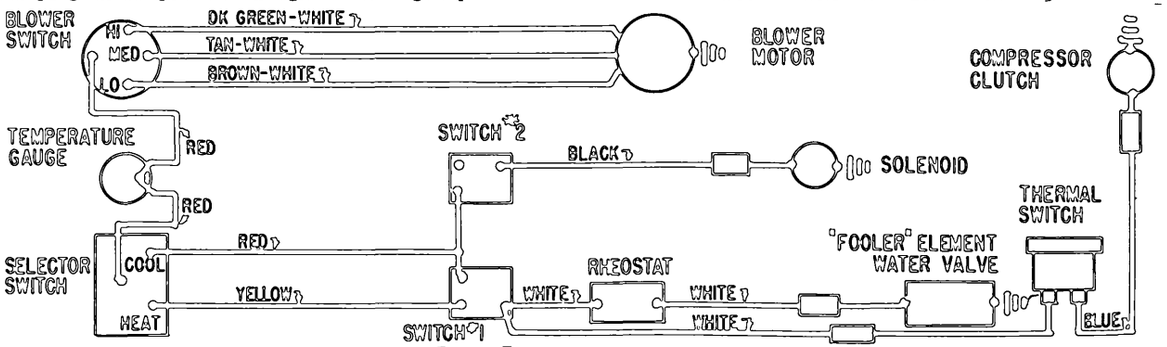
Expansion Valve: Not adjustable. If unit is faulty, it must be replaced.

SERVICING

▷*INTAKE & DISCHARGE SERVICE VALVE NOTE:* On Chrysler and Imperial, both service valves are attached directly to the compressor. On DeSoto, Dodge & Plymouth, the intake service valve is attached to compressor and the discharge service valve is connected in discharge tube at inlet side of condenser. Rotating the valve stems *COUNTERCLOCKWISE,* until valves are fully open, is the operating position. This position also isolates the service ports for connecting gauge manifold set. Rotating valve stems *CLOCKWISE,* until valves are fully closed, isolates the compressor from the system. *CAUTION – Do not operate compressor with valves in CLOCKWISE position.*

COMPRESSOR OIL LEVEL: Checking & Filling – Place temperature control on "Cool", blower motor on "High", and toggle switch on "Cool". Operate engine at 1200 RPM for about 10 minutes to return any excess oil to compressor crankcase. Stop engine and remove protective caps from discharge and intake service valves, then close both valves by turning stem clockwise with Tool C–3361, until valve is firmly seated. *(CAUTION – Do not start engine with service valves in the closed (clockwise) position).* Clean area around compressor filler plug and discharge service valve port cap with solvent and blow dry with air. Carefully loosen the 1/4" flare cap fitting of discharge service valve 1/4 turn and gradually release or purge gas pressure from compressor. When completely purged, loosen (do not remove) oil filler plug on compressor enough to allow gas pressure (if any) to escape. When pressure is released, remove filler plug and use a clean dry dipstick (1/8" round or similar rod) to measure oil level. See table below for correct oil level. Add MoPar Air Conditioning Oil as required, or siphon off excess oil if necessary, then replace oil filler plug. Loosen discharge valve service port cap approximately 1/2 turn, then slightly open the intake service valve (counterclockwise) and let gas drift slowly through compressor for about 10 seconds. This will purge air from compressor. Tighten cap on discharge port and turn both valves fully counterclockwise. Replace protective caps and tighten securely.

Compressor Oil Capacity



Model	Height on Dipstick
Chrysler & Imperial	2-2 1/2"
DeSoto	1 1/8-1 3/8"
Dodge & Plymouth	3/4-1"

GAUGE SET (TOOL C–3354) INSTALLATION: Remove protective caps from intake and discharge valves. Using Tool C–3361, make sure that both valves are turned fully counterclockwise. (*NOTE* – This is the normal operating position). Remove protective caps from both service valve ports. Install 4 ft. test hose from 600 lb. gauge fitting on Tool C-3354 to discharge service valve. Connect a similar hose to 300 lb. and to intake service valve. Turn both valves on gauge set fully clockwise.

DISCHARGING THE SYSTEM: Install Gauge Set, Tool C-3354 (see above) and connect an 8 ft. test hose to gauge manifold center fitting. Open discharge and intake service valves one turn (clockwise from a full counterclockwise position). Crack gauge set manifold discharge valve a fraction of a turn counterclockwise and allow gas to escape. *(CAUTION– Opening manifold valve t much will cause compressor oil to be drawn off with the gas).* As pressure on manifold discharge gauge drops near zero, open manifold intake valve.

EVACUATING THE SYSTEM: *(NOTE – After air conditioning system has been opened to the atmosphere, it is absolutely essential that the system be evacuated and swept with refrigerant to remove all air and moisture).* Connect gauge set to compressor and discharge system (see above). Connect an 8 ft. test hose to center fitting on manifold and to Vacuum Pump, Tool C-3372. Open both discharge and intake service valves about one turn (clockwise). Open both gauge set manifold valves (count-

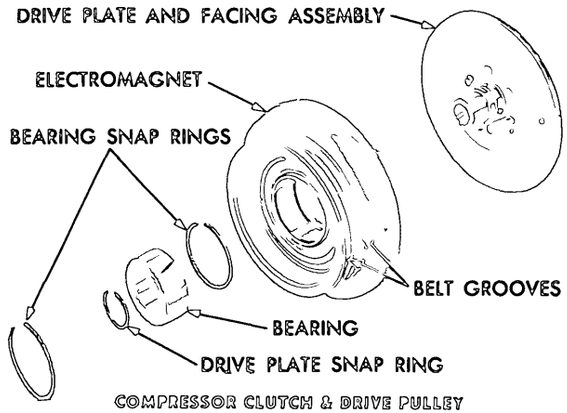
CONTINUED ON NEXT PAGE

CHRYSLER, DE SOTO, DODGE, PLYMOUTH AIR COND. CONTROL DIAGRA

CHRYSLER, DE SOTO, DODGE, PLYMOUTH (Continued)

erclock wise). Start vacuum pump and check compound gauge (vacuum & pressure). Operate pump until gauge registers 26-28 inches of vacuum. Continue evacuating at this vacuum for five minutes. *(NOTE – If vacuum of 26-28 inches cannot be obtained, a leak is indicated in the system and must be corrected. See "Leak Testing" at beginning of Air Conditioning Section).* Close both gauge set manifold valves. Turn off vacuum pump and remove long gauge hose. Charge system with refrigerant gas *(See "Charging The System" below).* Start engine and operate at 1200 RPM for 5 minutes, with temperature control on "Cold", and blower on "High". Check for leaks, then discharge system *(see "Discharging The System" above).* Again evacuate the system at 26-28 inches of vacuum for 10 minutes. Recharge system with 3 lbs. of refrigerant *(see "Charging The System" below).*

CHARGING THE SYSTEM: With air conditioning system purged and evacuated (see above), proceed as follows: Attach "Drier" and "Dry-Eye" units to refrigerant tank (Refrigerant 12), then open valve on "Dry-Eye" unit and purge air from drier by opening valve on refrigerant tank for a few seconds. Close valve on "Dry-Eye" unit and install a 1/4" cap at end of valve. Check all connections for leaks, and correct as necessary. Open valve on refrigerant tank and allow "Drier" to absorb any moisture that may be present in the refrigerant. *(NOTE – Window on "Dry-Eye" unit should change to a deep blue before proceeding further).* Remove cap from valve on "Dry-Eye" unit and connect an 8 ft. test hose between valve and center fitting on gauge manifold, making sure that both valves on gauge manifold are fully closed. Open valve at "Dry-Eye" unit and slightly loosen test hose at center fitting for a second or two to purge air from hose, then tighten hose and close valve. Start car engine and operate at 1200 RPM with blower control set to "High" and temperature control set at "Cold". Open both the discharge and intake valves at compressor one full turn (clockwise). *NOTE* – If gauge hand fluctuates, close discharge valve at compressor (counterclockwise) slowly until gauge hand steadies. Place refrigerant tank upright in a pail of warm water (maximum temperature 125°F), then set tank and pail on a scale and weigh the assembly. Make a note of the combined weight. Open intake valve on gauge manifold slightly (counterclockwise), and control the refrigerant entering system with this valve. *(CAUTION – Do not allow pressure to exceed 60 lbs.).* Carefully watch scale and shut refrigerant tank valve off when system has absorbed 3 lbs. Close intake valve on gauge manifold (clockwise) and both valves on compressor (fully counterclockwise). Remove center hose from gauge manifold, allowing pressure in hose to escape slowly. Remove test hoses from compressor valves.



COMPRESSOR: *(NOTE – "V" type compressor used on Chrysler & Imperial, "In-Line" type compressor used on DeSoto, Dodge & Plymouth.*

▷ *COMPRESSOR REPAIR NOTE (DeSoto, Dodge & Plymouth):* Valve plate assemblies, intake & discharge service valves, cylinder head, gaskets, shaft seal and support brackets are the only parts that are available for service replacement. If pistons, cylinders, crankshaft or connecting rods are damaged, the complete assembly must be replaced.

▷ 1957 *CHRYSLER "V" TYPE COMPRESSOR NOISE (WHISTLING – PULSATING) CORRECTION:* Install a new compressor oil pump relief valve ball (MoPar Service Package, Part No. 1843474) as follows: With compressor removed from engine (see below), secure right head of compressor in a vise in such a manner so compressor body mating line with oil sump is in a horizontal position (to prevent loss of oil when sump is removed). Remove oil sump-to-compressor bolts, making sure that outer surfaces of sump and crankcase are clean Slightly tap sides of sump with a plastic hammer to break seal to compressor. *(CAUTION – When breaking sump-to-compressor seal, do not allow sump to break loose quickly or with a sideways motion as the relief valve spring may be lost).* Remove oil sump and take out the oil pressure relief valve spring. Remove old gasket, being very careful to prevent any foreign material falling into crankcase. Make a small ball out of body sealing compound and place it on the end of a pencil point. Insert it into hole from which spring was removed and press down slightly. Steel relief valve ball will adhere to end of pencil and can then be removed. Place rubber replacement ball in hole and replace the spring. Dampen both sides of a new gasket with refrigerant oil and set it in place. Make sure mating surface of sump is clean. Using two of the longer bolts as guides, place sump onto compressor, compressing the relief ball spring. Install sump bolts and tighten to 22 ft. lbs. Reinstall compressor on engine and evacuate, sweep, test for leaks and charge system *(see above).*

Removal: On Chrysler & Imperial models, the air conditioning system must be completely discharged for compressor removal *(see "Discharging The System" above).* On other cars, start engine and operate at fast idle until compressor is warm, then shut off engine. Close intake and discharge service valves by rotating stems clockwise, using Tool C-3361, until both valves are fully seated. Loosen port caps on both valves a couple of turns to gradually release gas pressure. Loosen oil filler plug a few turns (do not remove). On all cars, remove drive belts. On DeSoto, Dodge & Plymouth, disconnect discharge flared connection at discharge valve fitting. Remove screws securing intake service valve to compressor (all models), and screws securing discharge service valve to compressor (Chrysler & Imperial). Remove compressor-to-support and mounting bracket attaching screws. *(CAUTION – Be careful not to bend vibration eliminator excessively or it will be damaged).* Remove compressor from engine, then cover all openings with masking tape.

Installation: Reverse removal procedure and note the following: On Chrysler & Imperial models, evacuate, sweep, test for leaks, then charge system *(see above).* On DeSoto, Dodge, & Plymouth, purge air from compressor by opening the intake service valve counterclockwise slightly and loosening the discharge service port cap a few turns for about 10 seconds. This will allow gas to drift through compressor and bleed air from system. Rotate both discharge and intake service valve stems counterclockwise until they are fully back seated. Start engine and turn on blower and temperature control switches to "High" and "Cold". Operate engine for 5 minutes, stop engine and test for leaks. Test operation of system, then remove gauge set.

COMPRESSOR CLUTCH & DRIVE PULLEY

COMPRESSOR VALVE PLATE REPLACEMENT (DESOTO, DODGE & PLYMOUTH): Remove compressor from car (see above). Remove cylinder head bolts and tap cylinder head with a plastic hammer. If, when lifting the cylinder head, the valve plate does not come off with it, separate head from plate by placing a brass rod against plate and head between cylinders at side of head and tapping it. *(CAUTION – Do not tap plate near finished surface).* Remove head, valve plate, and gaskets. Examine valves. If valves are broken, and the parts have damaged top of piston or scored cylinder walls, replace the compressor. If compressor is not damaged, clean cylinder block top and cylinder head thoroughly. Be sure to remove all shreds from old gasket. Install cylinder head bolts in head, then place a piece of cardboard over bolt heads and turn assembly upside down. Lay on bench with bolts facing up. Dip new gaskets in clean refrigeration oil. Place cylinder head gasket, then valve plate, and last, the valve plate gasket over bolts. Lift the cardboard, turn assembly over and place the entire assembly on cylinder block and start the bolts. Tighten bolts evenly (from center out) to 15-20 ft. lbs. Install compressor.

COMPRESSOR CYLINDER HEAD REMOVAL & INSTALLATION (Chrysler): *See "Compressor Valve Plate Replacement (DeSoto, Dodge & Plymouth)" above,* and note the following: Install cylinder head bolts and tighten each bolt alternately and evenly to 26 ft. lbs.

COMPRESSOR SHAFT SEAL REPLACEMENT (DESOTO, DODGE & PLYMOUTH): With compressor removed from car (see above), remove self locking bolt from compressor crankshaft at front of pulley. Tap pulley and clutch assembly to free it from tapered shaft *(CAUTION – Do not damage brushes when removing or installing clutch. If brushes are allowed to snap to full travel, they will break).* Remove brush holder assembly. Remove compressor front bearing end plate, then install Puller, Tool C-3473, using the center screw that threads into end of compressor shaft. Install alignment screws in puller and screw them in until inner steps on puller contact the seal bellows evenly. Hold compressor shaft by

CONTINUED ON NEXT PAGE

CHRYSLER, DE SOTO, DODGE, PLYMOUTH (Continued)

inserting a screw—driver in shaft keyway and resting against puller leg while turning the puller screw. Compress bellows sufficiently to expose retaining snap ring, then remove snap ring. Change puller screw, using the one designed to press against center of compressor shaft, and install the two screws through puller plate, threading them into the holes provided in compressor end plate. Turn in on center screw and remove compressor front bearing end plate and seal assembly. Remove carbon seal and "O" ring from bearing end plate. To install seal, coat new bearing end plate gasket and large "O" ring with refrigeration oil. Install "O" ring in front bearing end plate. Install gasket and end plate, then insert two long screws on opposite side of plate. *(NOTE – Make sure that oil pocket is upward).* Start end plate squarely and tighten screws evenly finger tight. Install puller, using the center screw designed to be threaded into center of compressor shaft. Hold compressor shaft with screwdriver and pull bearing end plate into housing. Remove puller and install screws. Tighten evenly to 15—20 ft. lbs. Coat carbon seal with refrigeration oil and place over shaft with tangs in recesses of end plate. Lubricate "O" ring in seal with refrigeration oil, then slide end snap ring over compressor shaft. Install puller and compress bellows (in same manner as for removal). While compressing bellows, rotate to insure proper alignment. Install snap ring, making sure that ring is seated in groove. Remove puller. Install brush holder assembly *(CAUTION – Be very careful not to damage brushes).* Install magnetic clutch and pulley assembly over shaft, lining up keyway and key. Push assembly over shaft and install washer and self locking nut. Tighten to 15—20 ft. lbs.

MAGNETIC CLUTCH: *NOTE – Servicing on this assembly is limited to the drive plate, pulley, and electro-magnet assembly, snap rings, bearing and brush holder assembly.*

▷*SERVICING CAUTION: Do not attempt to remove the electro-magnetic coil from pulley assembly. The coil is held in place with a special adhesive material. Once this bond is broken, the coil cannot be reattached.*

Current Draw: 1. 5—2. 0 amps. at 12.0 volts.

Removal: Loosen and remove the drive belts. On Chrysler, Imperial, & DeSoto, remove the upper right shroud section. Remove self locking bolt and washer from compressor shaft at center of clutch. On Chrysler & Imperial, support clutch assembly and remove pulley with a 5/8" cap screw, screwed into end of clutch shaft. On DeSoto, Dodge, & Plymouth, support clutch assembly with one hand and tap the pulley with a soft hammer and remove assembly from compressor.

Drive Plate Removal & Installation – Remove drive plate retaining snap ring hub with Tool C—3301. Place suitable sleeve against hub and remove drive plate by tapping sleeve with a soft hammer. Inspect springs for loss of tension and cracks, and inspect liner on face of plate. Replace drive plate if liner is worn, springs are weak or broken, or if drive plate is warped. Install drive plate by installing plate hub squarely into inner bearing race. Place a brass drift against drive plate inner hub and tap plate hub into bearing by tapping on brass drift with a hammer. Install snap ring on hub. Use a long feeler that will reach into gap at hub and measure air gap between drive plate and electro-magnet. Air gap should measure .025—.035". Adjust air gap by turning the three screws on front face of drive plate. Adjust all three screws to obtain an evenly spaced air gap.

Clutch Bearing Replacement – Remove drive plate (see above). Remove snap ring and grease slinger (at outer race of bearing) from pulley assembly. Tap bearing from pulley assembly.

Installation: Align key and keyway and push clutch assembly over shaft and key. Install self locking bolt and washer. Install upper right shroud section on Chrysler, Imperial, & DeSoto. Install drive belts.

FRIGIDAIRE & HARRISON

Buick (1957)
Cadillac (1957) See Series 75 Note below.
Chevrolet (1957)
Oldsmobile (1957)
Pontiac (1957)

▷CHANGES, CAUTIONS, CORRECTIONS

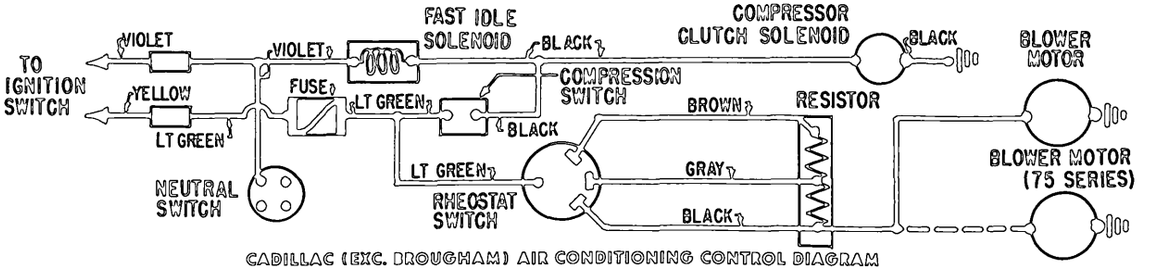
▷*CADILLAC SERIES 75 NOTE: The evaporator unit used in this model is located in the trunk.*

▷*1957 BUICK COMPRESSOR DISCHARGE VALVE PLATE PRODUCTION CHANGE (To correct a noisy compressor condition):* Beginning with compressor Serial No. 44GC002, a new discharge valve plate, Part No. 5913872 is being used to reduce compressor noise. This plate may be used on 1956 and early 1957 compressors. *NOTE - On 1956 compressors, if the discharge plate is defective and the compressor is not noisy, Discharge Valve Plate, Part No. 5912672 should be used.*

▷*1957 BUICK FAN SHROUD PRODUCTION CHANGE & SERVICE REPLACEMENT NOTE:* The full type fan shroud, Part No. 1178037 used on early air conditioned cars has been replaced by a ring type shroud, Part No. 1174402. Use the ring type shroud for service replacement on cars having the full type shroud. Two mounting brackets, Part No. 1178198 & 1178199 must be used to install the ring type shroud. *See "Radiator Production Change" below.*

▷*1957 BUICK RADIATOR PRODUCTION CHANGE:* A new wider radiator is being used on late 1957 air conditioned cars. A new full type fan shroud, Part No. 1179450, and mounting brackets, Part No. 1178198 & 1178199 is used with the wider radiator.

▷*1957 BUICK INSUFFICIENT COOLING CORRECTION:* This condition may be caused by the Ranco valve not being locked out due to improper adjustment of the control cable or the lock pin on cam of Ranco valve not being positioned properly. To adjust control cable, loosen cable clamp at valve, and close valve, making sure that cam is in complete engagement with lockpin and holding lockpin up. Set control knob 1/16" from the off position and tighten cable clamp. Check to see that valve is locked out when control lever is in the "off" position. To adjust lockpin (in instances where the valve is not operating properly, allowing warm water to enter heater core and warming the cool air before it enters passenger compartment), bend lockpin on Ranco valve "down" just enough to cause a drag on cam of valve, or when rotating cam clockwise, the cam over-center spring snaps edge of relieved portion of cam to centerline of lockpin, where further movement of cam to the fully closed position will lock valve closed. *CAUTION - The above lockpin adjustment must be made at room temperature or not more than 70°F.*



▷*1957 BUICK AIR CONDITIONING COMPRESSOR VIBRATION AT LOW SPEED (WITH BLOWER ON "LOW"):* This vibration may be reduced by reworking the compressor rear mounting bracket as follows: Remove bracket and use a 5/8" drill to enlarge bracket-to-intake manifold bolt hole. Remove burrs and rough edges. Reinstall compressor bracket using a spacer made from ½" I.D. welded steel tubing cut to a length of 7/32", and a spring washer. Tighten bolt at intake manifold to 10-15 ft. lbs. This will allow engine to move sideways without exerting pressure against bracket.

▷*1957 CADILLAC AIR CONDITIONER COMPRESSOR CLUTCH CHANGE:* On later cars, the rear face of clutch cover, Part No. 5916841, is not ground with a finished surface. The unground side, identified by a stamped letter "O", must be installed toward rear of compressor.

DESCRIPTION: Similar in design and operation to previous models with all units of the system located on front of dash or in engine compartment (except Cadillac Series 75 which has the evaporator located in luggage compartment). *See "Frigidaire & Harrison Air Conditioning" in 1956 Annual Data and note the following changes.*

Buick: Hand operated shut-off valves at compressor head have been replaced with Schrader type valves which

CONTINUED ON NEXT PAGE

CADILLAC (EXC. BROUGHAM) AIR CONDITIONING CONTROL DIAGRAM

FRIGIDAIRE & HARRISON (C ntinu d)

require special adapters for connection to charging lines *(CAUTION - As these adapters open the Schrader valves when installed, it is very important that Gauge Set, Tool J-5725, manifold valves be closed and charging lines be connected).* A nonadjustable Expansion Valve replaces the adjustable type.

Cadillac: High and low pressure hand operated shut-off valves at compressor head have been replaced by Schrader type valves, the high pressure being located at compressor head, and low pressure at hot gas bypass valve *(CAUTION - As these valves are opened by sp cial adapters on charging hoses, it is very important that charging hoses be connected to Gauge Set, Tool J-5725, and gauge set manifold valves be completely closed).* A Hot Gas Bypass Valve has been incorporated in the system to control operating temperatures, replacing the former Evaporator Freeze Control Thermostat.

Chevrolet: Schrader type valves in high and low pressure lines at compressor head have been replaced with hand operated shut-off valves. *(CAUTION - Both valves should be backseated (turned completely COUNTER-CLOCKWISE) when system is in operation and should b turned completely CLOCKWISE for removal of compressor).* A new nonadjustable thermostatic switch replaces the switch formerly used. The thermostatic expansion valve is factory adjusted and cannot be adjusted after installation. A high pressure line quick disconnect connection located just above the sight glass allows line to be broken without loss of refrigerant charge. This allows components of air conditioning system to be removed for service of other units in engine compartment.

Oldsmobile: A high pressure line muffler is mounted on the compressor to reduce noise and vibration. A new nonadjustable thermostatic expansion valve replaces the adjustable type formerly used.

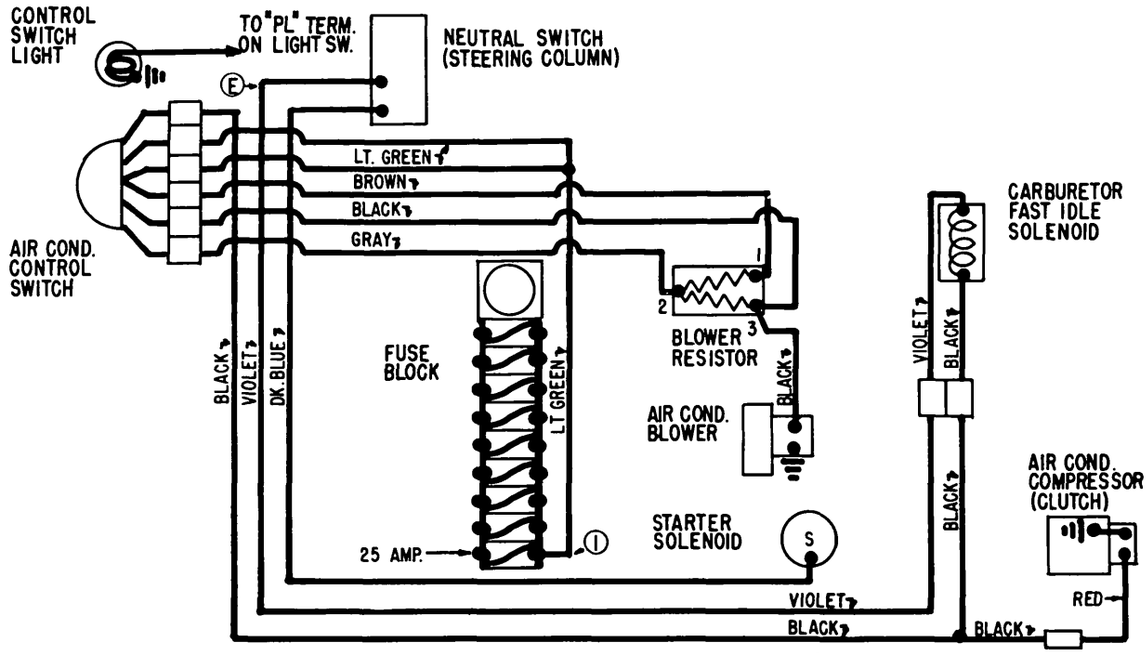
SERVICE CAUTIONS: *Before disconnecting any part of air conditioning system or lines, see "Air Conditioning S rvice Cautions" at beginning of Air Conditioning Section.*

LEAK TESTING & TROUBLE SHOOTING: *See "Leak T sting" & "Trouble Shooting" at beginning of Air Conditioning Section.*

MAINTENANCE & INSPECTION: *See "Frigidaire & Harrison Air Conditioning" in 1956 Annual Data.*

ADJUSTMENTS: Compressor Belt - Adjust as follows:

Buick - Adjust compressor drive belt to 3/8" deflection measured midway between fan and compressor pulleys.



Cadillac - Using Belt Tensioner Gauge, Tool J-6733, install tool on belt and adjust tension so red line on gauge lines up with gauge shoulder.

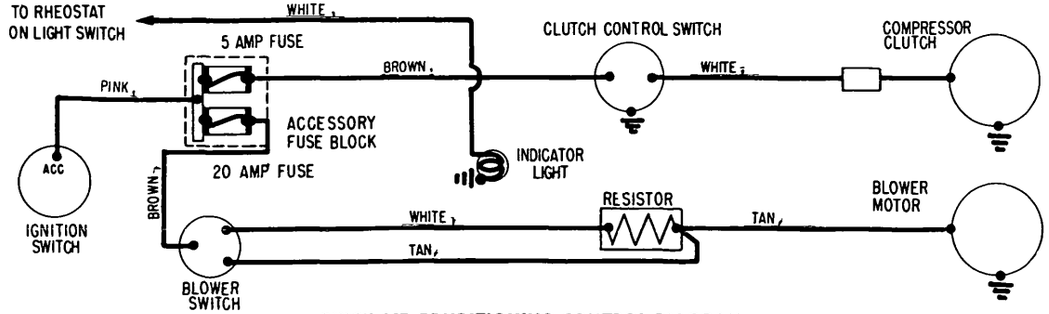
Chevrolet - Install Tool 6212 on torque wrench, then place tool on compressor seal and coil housing with lug of tool facing toward rear of car and inserted into unused hole in compressor mounting flange on battery side of electrical connector. Loosen compressor brace bolt and bracket pivot bolt and apply 30-40 ft. lbs. torque to compressor. Tighten brace and bracket pivot bolts.

Oldsm bil - Loosen generator adjusting link bolt and bracket pivot bolts. Place Tool 33-70 on belt, then pry generator away from engine until pointers on Tool 33-70 are even with line on tool plunger. Tighten generator link bolt and bracket pivot bolts.

Pontiac - Loosen three bolts retaining idler pulley to mounting bracket (pump support bracket on power steering equipped cars). Heads of bolts are located behind pulley. Insert torque wrench in square hole at end of power steering pump (or idler pulley) bracket. Apply 35 ft. lbs. torque with wrench to tighten belt. While holding proper torque, tighten retaining bolts securely. *NOTE - Do not adjust belt unless looseness in indicated by slipping.*

Magnetic Clutch: Energize clutch coil from battery and check clearance between clutch plate armature and coil housing at three different positions. The clearance should be .025-.035". If clearance not correct, remove pulley and add or remove shims as necessary. Shims are furnished in .010", .015", .020", .025" thicknesses.

CADILLAC ELDORADO BROUGHAM AIR CONDITIONING CONTROL DIAGRAM



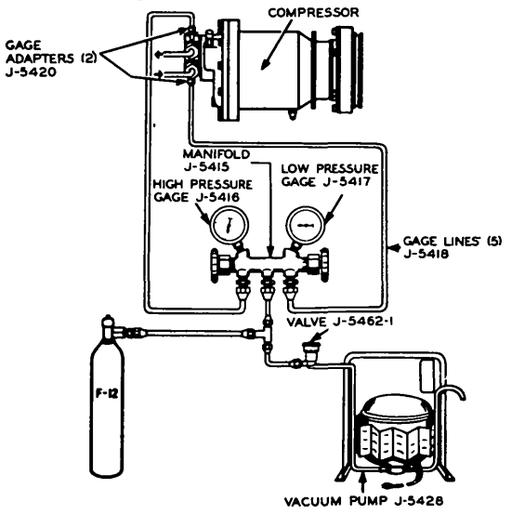
Expansion Valve: Expansion valve is preset at the factory and cannot be adjusted in the field.

Hot Gas Bypass Valve: Used on Buick, Cadillac & Oldsmobile. Adjust valve for each car as follows:

Buick - Disconnect valve control wire and remove control lever, counterbalance spring, and nylon cam follower. Connect Gauge Set, Tool J-5725 to compressor *(see "Gauge Set, J-5725 Installation" below).* Set engine speed at 1600 RPM, and turn unit on, allowing time for stabilization. Turn adjusting screw (located under nylon cam follower) in or out to obtain proper 28-30 lb. reading on "Low Pressure" gauge. Remove gauges, replace protective caps, cam follower, control pin, lever and spring, then readjust and connect control wire *(see below).*

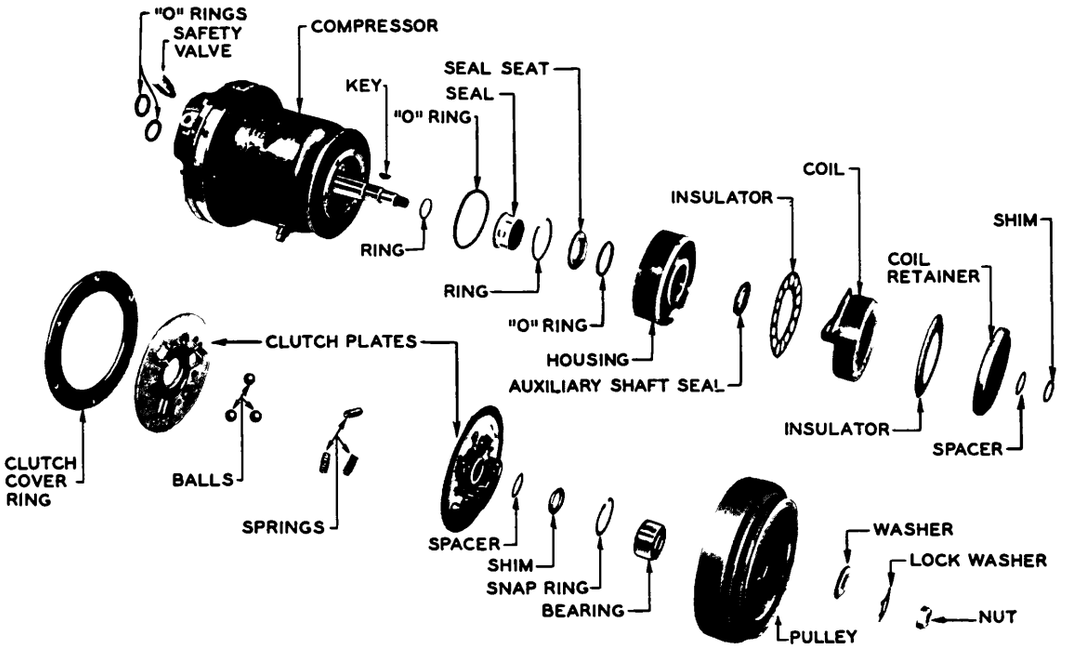
Cadillac - Remove cap from gauge fitting on lower side of Hot Gas Bypass Valve. Install Adapter J-5420 on low

CONTINUED ON NEXT PAGE



BUICK AIR CONDITIONING CONTROL DIAGRAM

FRIGIDAIRE & HARRISON (C ntinu d)



pressure gauge line and connect adapter to gauge fitting. Purge gauge and hose by opening low pressure gauge valve for a few seconds. Start engine and allow to run at 1500 RPM. Move "Temp" lever to coldest setting and set "Air Cond" lever to "low". Check pressure on gauge and adjust only if reading is not 29½-30¼ lbs. To adjust, disconnect return spring and bowden cable, then remove control lever and nylon plunger. Using Tool J-6389, turn adjusting screw clockwise to increase pressure, counterclockwise to decrease pressure, to obtain 30 lbs. pressure. *(NOTE - Turn adjusting screw ¼ turn and allow time for gauge to settle).* With engine off, remove gauge hose from pressure fitting and replace cap. Adjust control cable *(see below).*

Oldsmobile - Remove cap from gauge fitting on low pressure line near the evaporator assembly. Install Adapter J-5420 on low pressure gauge line and connect adapter to gauge fitting on low pressure line. Purge gauge and hose by opening low pressure gauge valve for a few seconds. Start engine and allow to run at 2000 RPM. Move temperature control lever to extreme right position, turn blower speed on "low" and engage "Recirculation" button. Place paper in front of condenser to obtain a head pressure of 200 lbs. Check pressure on low pressure gauge and adjust only if pressure is not 29-30 lbs. To adjust, remove control cable, lever and cam, then insert Tool J-6389 into valve. Adjust pressure to 29½ lbs. by turning screw clockwise to increase pressure, counterclockwise to decrease pressure. Turn engine off, remove gauge hose from pressure fitting and replace cap. Reinstall control lever assembly, then adjust control cable *(see below).*

Control Cable Adjustment (Hot Gas Bypass Valve): Buick - Set temperature control (left hand) lever on lower roll of control panel to "Max.". Disconnect bowden wire loop from pin on lever of hot gas bypass valve and push lever all the way toward dash and release slowly. Lever will stop in "Max." cooling position. Adjust bowden wire sheave so loop matches position of pin on lever. Clamp bowden sheave in position with loop encircling pin and replace spring grip washer.

GAU E SET INSTALLATION

COMPRESSOR CLUTCH & SEAL ASSEMBLY (TYPICAL)

Cadillac - Check to insure cable is not kinked and operates freely, then disconnect return spring. Place "Temp" control lever in extreme forward position. Disconnect control cable from lever on bypass valve and loosen cable clamp on bracket. Loosen lock screw on lever assembly, then with lever against stop, position cam so that it just touches nylon plunger. Tighten lockscrew. Install control wire coil over lever pin and while pushing cable conduit toward lever, tighten cable clamp. Install return spring. Move control lever back and forth to make sure cam is against nylon plunger.

Oldsmobile - Place control lever in extreme right position. Disconnect control cable from lever and loosen cable clamp on bypass valve bracket. Loosen lockscrew on lever assembly. With lever against stop, position cam so that it just touches nylon plunger, then tighten lockscrew. With bypass lever held against its stop, install control wire coil over lever pin while pushing cable conduit toward lever to remove slack. Tighten cable clamp and install return spring. Move control lever to extreme left and back to extreme right position. There should now be 1/16-3/32" spring back of lever. Check to make sure cam is just touching nylon plunger.

Thermostatic Switch: Chevrolet - Adjustment of this switch is not possible as it is preset at the factory and sealed. *See "Control Cable Adjustment" below.*

Control Cable Adjustment (Thermostatic Switch): Chevrolet - Adjust cable as required to give full travel of switch lever. Adjustment may be necessary at both ends of cable and should be made by loosening clamp screws as required, then retightening after proper positioning. *NOTE* - In the off position, COLD lever should be full "UP" and the switch actuating lever fully up. Adjustment should be made to engage compressor when the COLD lever is depressed 1/8" to ¼".

Compressor Clutch Switch: Oldsmobile - Switch should close when sliding lever in control assembly is moved ¼" from extreme left position. To adjust, bend switch bracket for correct operation.

Fast Idle Adjustment: Chevrolet - Adjust hand throttle wire guide stop to limit engine speed to 900 RPM with control lever pulled out and transmission in neutral. Check to see that fast idle control linkage does not interfere with normal operation of carburetor linkage when fast idle is not in operation.

Thermostat Control Cable: Pontiac - Place air conditioning control lever to full right position. Loosen thermostat control cable clamp (on top of blower housing under right side of instrument panel). Hold cable and housing assembly so housing cannot move and slide cable assembly toward left side of car to position temperature valve lever to extreme left position. While holding in this position, tighten cable clamp.

Master Clutch & Relay Control Switch Adjustment: P ntiac - Remove radio speaker, glove box, and radio. Position air conditioning control lever to "VENT" position and blower switch to right for high speed. Loosen clutch and relay control switch locating bracket nut and pull that part of switch and locating bracket assembly held secure by the nut towards rear of car. Set hand brake and move ignition key to "ON" position. Move switch locating bracket towards front of car slowly until blower operates, then hold in this position and tighten nut to secure bracket. Move air conditioning

CONTINUED ON NEXT PAGE

FRIGIDAIRE & HARRISON (Continued)

control lever to left end of "COOLER" band, turn ignition switch to start car and check air conditioning operation (compressor clutch will energize and operate compressor). Turn ignition off and replace radio, glove box, and radio speaker.

SERVICING

GAUGE SET INSTALLATION (TOOL J-5725): Connect gauge set to compressor (see illustration). *(NOTE - For purging or adding oil to system, Freon Tank and Vacuum Pump are not connected to center connection on manifold).* Make sure that shut off valves on gauge set are fully closed and that hand shut off valves on compressor head (cars with this type valve) are turned fully COUNTERCLOCKWISE (back seated).

▷*CADILLAC NOTE: Low pressure Schrader type valve is located at Hot Gas Bypass Valve.*

▷*SCHRADER TYPE VALVE CONNECTION CAUTION: On cars using this type valve in place of hand operated shut off valves in refrigerant lines at compressor head, it is necessary to connect Adapters J-5420 to gauge connecting lines and to make sure that both valves on gauge set are completely closed before connecting adapters to Schrader type valves as the adapters will automatically open these valves.*

▷*HAND OPERATED SHUT OFF VALVE NOTE:* These are two-way valves. When turned COUNTERCLOCKWISE (back seated), compressor is connected to refrigerant lines and line to gauge fitting is closed. This is the normal operating position. When turned CLOCKWISE (front seated), compressor is closed off from refrigerant lines and open to gauge fitting. When valves are turned to middle position, compressor is open to both refrigerant lines and to gauge fitting. In this position, gauge readings can be taken with system in operation.

PURGING THE SYSTEM: Connect Gauge Set J-5725 (see above), then open both compressor hand shut off valves ¼ turn clockwise from a full counterclockwise position (on cars equipped with this type valve). Remove cap from gauge set center connection on manifold, then open high pressure gauge valve being careful not to open it too far, and slowly discharge vapor through center connection *(CAUTION - Opening valve too far will cause compressor oil to be discharged with the Freon).* When pressure is reduced to below 100 lbs., on high pressure gauge, open low pressure gauge valve and continue discharging until 1 to 2 lbs. of refrigerant remain in the system *(NOTE - Valves on gauge set can be closed from time to time to check remaining pressure).* Leave gauge set connected in preparation for evacuating and charging.

EVACUATING THE SYSTEM: (Vacuum Pump Method) - With system completely purged and Gauge Set J-5725 installed (see above), open hand shut off valves on compressor head ¼ turn clockwise from the full counterclockwise position. Install center gauge line to tee connector, Tool J-5462-2. Install female connector, Tool J-5462-7 at inlet side of Vacuum Pump, Tool J-5428. Insert flare seat, Tool J-5462-8, into connector, J-5462-7, at vacuum pump. Install shut off valve, Tool J-5462-1, to connector at vacuum pump. Install a gauge line from one side of tee connector to valve at vacuum pump (make sure valve is closed). Install gauge line from remaining tee connection to drum of Freon 12 or to 3 full cans of Freon 12 in Tool J-6272 *(NOTE - When using a drum, it will be necessary to use fitting, Tool J-5462-9, and reducer, Tool J-5462-4, with lead washer, Tool J-5462-3, between gauge line and drum).* Check level of fluid in vacuum pump and add correct oil if necessary. Make sure dust cap on discharge side of vacuum pump has been removed. Open high and low pressure valves on gauge set *(CAUTION - Shut off valve at vacuum pump must be closed).* Start vacuum pump and SLOWLY open shut off valve at pump *(NOTE - If oil is blown from pump, it must be refilled to proper level).* Operate pump to obtain approximately 28" of vacuum for 10 minutes. *NOTE* - If vacuum of 28" cannot be obtained, close valve at pump. Note low pressure gauge to see if vacuum in system holds. If vacuum holds, pump or gauge may be at fault. If vacuum will not hold, charge system with Freon, check for leaks, and repair as necessary, then purge system. When vacuum of 28" has been obtained for 10 minutes, close valve at pump, stop pump and check vacuum to see that it will hold for 3 minutes. If vacuum holds and no leaks are apparent, open Freon container valve to charge system to cylinder pressure, then close valve. Discharge system and again evacuate it. Close gauge valves. The system is now ready for a complete charge.

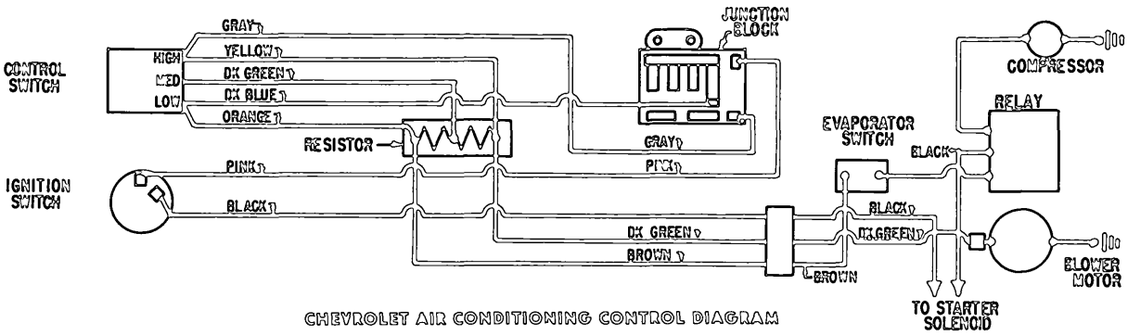
EVACUATING THE SYSTEM: (Pontiac) - *(CAUTION - Before removing protective cap from compressor discharge gauge fitting, make sure that the discharge valve is turned completely COUNTERCLOCKWISE).* In this system, the evacuated air must be discharged through the compressor relief valve as follows: Using a 1" long 3/8"-24 bolt, drill a hole lengthwise through the bolt center, then cut off the bolt head. Press a 12" length of rubber or plastic hose over end of bolt from which the head was removed. Loosen pressure relief valve slowly, letting pressure in compressor escape completely. Screw the above assembly into compressor in place of relief valve and insert hose into a clean container to collect any oil that may be lost during evacuation. Connect Gauge Set J-5725 *(see "Gauge Set Installation" above).* Close valves on gauge set, making sure that center connection on gauge set is plugged. Turn compressor low pressure valve 1½ turns clockwise from a fully counterclockwise position. Turn discharge valve all the way clockwise to seal passage to discharge hose. Start engine and operate at normal idle speed. Place air conditioning centered lever to full right position. Compressor will now evacuate the system, pumping air from system out through high pressure relief valve opening on compressor. Check low pressure gauge and operate compressor until gauge shows 26-28" of vacuum. Continue to run compressor for five additional minutes *(NOTE - If a vacuum of 26" cannot be obtained, a leak is indicated).* Check container to see that compressor has not pumped out more than one ounce of oil. If more than this amount has been pumped out, it should be replaced immediately *(see "Adding Oil" above).* *(NOTE - If a leak in system has been repaired or oil has been added, it will be necessary to again evacuate the system).* Replace relief valve in compressor with compressor operating, then stop engine. Purge air from compressor head as follows: Connect Freon drum to center fitting on gauge set and purge air from gauge line by cracking center line connection at gauge manifold momentarily. Turn low pressure valve on compressor fully clockwise. Open high pressure shut off valve on gauge set, then turn high pressure valve on compressor counterclockwise slightly to open passage to compressor. Open valve on Freon drum and while Freon is passing into compressor, loosen pressure relief valve slowly and leave loose approximately fifteen seconds to allow air to be purged from compressor head. Tighten compressor relief valve and close high pressure valve on gauge set. Turn valves on compressor completely COUNTERCLOCKWISE, then CLOCKWISE 1½ turns.

CHARGING THE SYSTEM (Except Pontiac): With system evacuated, gauge set and Freon tank installed, make sure high and low pressure gauge valves, vacuum pump valve, and valve on Freon container are closed. Open low pressure gauge valve. On cars with hand operated shut off valves at compressor head, make sure these valves are open ¼ turn clockwise from a fully counterclockwise position. Place drum of Freon in a pail of water heated to not more than 125°F., then place Freon and pail of water on scale and weigh accurately. *NOTE* - If disposable cans of Freon are used, scales can be eliminated since each can weighs 15 ounces. *See "Freon Capacity" table below.* If a fraction of a pound of Freon is required to complete filling system, use as much Freon from can as required for sight glass to run clear, but in no instance use more Freon than the amount indicated in Freon Capacity table. Open valve wide on container and allow correct amount of Freon to enter system *(see "Freon Capacity" table below).* Close low pressure valve on gauge set at frequent intervals to be certain pressure is always maintained above 12 lbs. *NOTE* - If it is not possible to charge system to full capacity by this method, then operate engine and compressor at 1000 RPM minimum to complete the charging. Energize clutch operating coil with coil with a jumper wire from battery positive terminal to insure positive operation. When correct amount of Freon has entered system, close container valve and low pressure gauge valve. Operate engine at 1500 RPM to check high and low pressure gauges and sight glass. Stop engine and turn both compressor hand shut off valves fully counterclockwise (if car is equipped with this type valve). If car is equipped with Schrader type valves, close both high and low pressure gauge valves on gauge set, then remove adapters from Schrader valves (or connecting hoses from hand operated valves on compressor). Remove jumper wire, replace caps on fittings and shut off valves.

CHARGING THE SYSTEM (Pontiac): With system completely evacuated, turn both valves on compressor 1½ turns clockwise from a full counterclockwise position. Close both valves on gauge set, then connect center flexible line of gauge set to Freon drum. Place Freon drum in a pail of hot water (maximum 125°F) and place Freon drum and water on scales. Loosen line at center fitting on gauge set and crack valve on Freon drum to evacuate air from line. Retighten line at center fitting, then weigh Freon tank and water on scales. Record the

CONTINUED ON NEXT PAGE

FRIGIDAIRE & HARRISON (Continued)



accurate weight, then open Freon drum valve and both valves on gauge set. Allow Freon to charge system until scales show that 4.25 to 4.5 lbs. of Freon have entered system. *(NOTE - If full charge cannot be attained, close both valves on guage set, connect jumper wire from compressor hot lead to battery terminal, start engine and air conditioning control lever to full right position. Open low pressure valve on gauge set slowly and leave open until full charge of 4.25-4.5 lbs. of Freon is taken in). (CAUTION - Check high pressure gauge while charging with compressor running. Shut off engine if pressure exceeds 300 lbs. A large fan placed in front of car will help reduce excessively high head pressure).* Close both valves on gauge set (high pressure valve will already be closed if charge was completed by running compressor) and close valve on Freon drum. *(NOTE - If engine was used to complete Freon charge into the system, close valve on Freon drum to permit compressor to draw any Freon left in line from drum to center fitting of gauge set, then close low pressure valve on gauge set).* Operate engine at 1200 RPM with air conditioner control lever turned to full right position and blower on high speed. After five minutes of operation, check appearance of Freon in sight glass. If bubbles are present, open low pressure gauge valve and valve on Freon tank and allow more Freon to enter system. Close valve when sight glass clears up *(CAUTION - In no case should the system be charged with more than 4.5 lbs. of Freon).* When system operating properly, close both valves on compressor fully COUNTERCLOCKWISE, remove gauge set and replace protective caps on valves. Remove jumper wire from compressor.

Freon Capacity

Mod l	Capacity
Buick	5 lbs.
Cadillac 60S, 62	4 lbs.
Cadillac 75, 86	4¾ lbs.
Chevrolet	4 lbs.
Oldsmobile	4 7/8 lbs.
Pontiac	4½ lbs.

CHECKING & ADDING OIL TO COMPRESSOR: Checking - Operate engine at slow idle for 5 to 7 minutes with system operating, then stop engine. Loosen screw in oil test fitting on side of compressor and allow a slight seepage of oil to escape. Retighten screw for a moment then "crack" open slightly again. If a steady flow of oil is evident, the oil level is either at a safe minimum level of 4 ounces, or above it. When oil test screw is cracked open a second time and no oil escapes, or there is a hissing sound, the oil is below a safe minimum and oil should be added. *NOTE - Compressors are originally filled with 9 ounces of Frigidaire 525 viscosity oil.*

Adding Oil (Buick & Chevrolet): Remove compressor *(see "Compressor Removal" below)* and place it on a bench. Position a clean container, then remove oil test screw and gasket and drain all oil from compressor. If oil is found to be dirty or contaminated, flush compressor and condenser with liquid Freon which can be obtained by turning drum or can of Freon upside down. If oil is clean, pour 9 ozs. of new Frigidaire 525 viscosity compressor oil into compressor through oil checking fitting. Replace checking screw and install compressor on car. Purge, evacuate, and charge system (see above).

CHEVROLET AIR CONDITIONING CONTROL DIAGRAM

Adding Oil (Cadillac): With Gauge Set J-5725 connected to compressor (see above), attach oil charging line to center connection of gauge set. Operate engine at slow idle in "Dr" (Drive) range with Air Conditioner "On", crack open high and low pressure valves on gauge set and allow Freon vapor to purge air out of gauge set and lines. While Freon vapor is still escaping, insert oil charging line to bottom of a graduated bottle of Frigidaire 525 viscosity oil. Close high and low pressure valves on gauge set. Clamp bypass hose between bypass valve and evaporator (this hose does not have the low pressure gauge fitting) using two wooden blocks and a "C" clamp *(CAUTION - Do not clamp hose more firmly than is required to close off passage of Freon).* Clamp the hose between sight glass and evaporator in the same manner. Slowly open low pressure valve on gauge set, allow 2 ounces of oil to be drawn into equalizer line, then close valve. Remove oil charging line and cap center gauge set connection with a dead-head fitting. Open low pressure valve on gauge set, then slowly open high pressure valve on gauge set, allowing Freon pressure to force all oil out of equalizer line into evaporator. Close both gauge set valves and remove hose clamps. Run engine at 2000 RPM in "Park" position for 5 minutes. Recheck oil level and if found to be low, repeat the above, adding 2 ounces more oil.

Adding Oil (Oldsmobile & Pontiac): With both valves on compressor head turned fully counterclockwise and valves of gauge set closed, install high pressure hose of gauge set to high pressure valve on compressor. Install plug in center hose on gauge set. Turn compressor high pressure shut off valve two turns clockwise and crack open the high pressure valve on gauge set. Crack open low pressure valve on gauge set to purge air from lines and while vapor is still escaping, connect low pressure hose of gauge set to low pressure hand shut off valve on compressor. Close both valves on gauge set and turn the compressor low pressure hand shut off valve fully clockwise. Remove center hose on gauge set and install oil charging line. *(NOTE - Use a 10" piece of ¼" copper tube with fittings connected in center opening of manifold).* Purge air from oil charging line by cracking high pressure valve on gauge set. While vapor is still escaping from oil charging line insert line to bottom of oil bottle (Frigidaire 525 viscisity oil), allowing vapor to bubble through the oil. Close high pressure valve. Run engine at slow idle, with compressor operating until 10" of vacuum is indicated on gauge. Open low pressure valve on gauge set and allow 2 ounces of oil to enter system, then close valve. Remove oil charging line from gauge set and cap opening. Open high pressure valve on gauge set, then open low pressure valve slowly to allow high pressure to force oil remaining in lines into compressor. Close both valves on gauge set, then turn shut off valve on compressor fully counterclockwise. Run engine at 1500 RPM with compressor operating for 5 minutes, then recheck oil level in compressor. If necessary, repeat the above procedure to add 2 ounces more oil.

COMPRESSOR REMOVAL & INSTALLATION

▷ *CAUTION: To prevent dirt and moisture entering air conditioning system, it is very important to cap all openings and to complete work on system as soon as possible.*

REMOVAL: Buick - Purge Freon from air conditioning system *(see "Purging the System" above),* then disconnect mufflers from brackets. Disconnect hot gas line (from high pressure muffler-to-hot gas bypass valve) at hot gas bypass valve fitting. Remove retaining bolt and washer to disconnect mounting plate and lines from rear end of compressor. Discard "O" rings. Cover openings in lines and compressor with tape, then disconnect clutch solenoid wire. Loosen belt and remove compressor from mounting on engine.

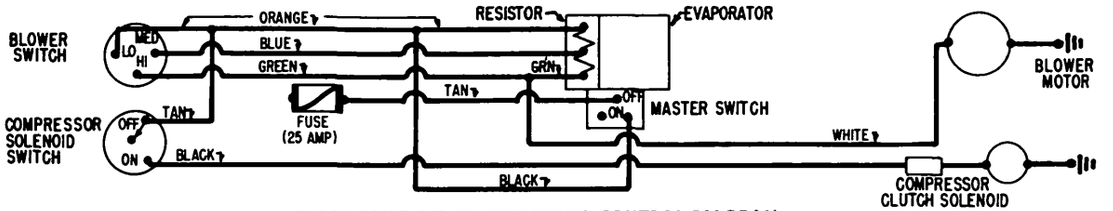
Cadillac: Remove Freon from system by depressing the Schrader core in high and low pressure gauge connection on compressor head. *(NOTE - Depress cores very slowly at first to prevent oil from being forced out of compressor).* Remove high and low pressure line fitting center bolt and remove fitting from compressor. Cover pressure openings in both compressor and pressure line fittings (use a protective plate over compressor openings). Disconnect clutch coil wires and drive belts. Remove two bolts and nuts holding bypass valve to compressor front bracket and move bypass valve, pipe, and hoses away from compressor. Remove compressor from mounting supports.

Chevrolet: Purge Freon from air conditioning system *(see "Purging the System" above).* Back off compressor attaching bolt just enough to loosen suction discharge connector and allow pressure inside to escape. Remove bolt and connectors after low side has been completely purged. Disconnect electrical lead to clutch actuating coil. Remove gauge set and replace caps. Remove two refrigerant line retainer-to-radiator support screws and

CONTINUED ON NEXT PAGE

FRIGIDAIRE & HARRISON (C ntinu d)

remove retainer. Loosen brace and bracket pivot bolts and detach bolt. Remove brace bolt and swing compressor to highest position. Retighten pivot bolt. Remove the four bolts retaining compressor to mounting brackets and remove compressor assembly.



Oldsmobile: Remove protective caps from compressor high and low pressure hand shut off valves, then turn valves two turns clockwise from fully counterclockwise position to open compressor gauge outlets. Crack open compressor high pressure gauge outlet cap and allow Freon to purge from system until "hiss" is no longer heard, then turn both valves fully clockwise. Disconnect both wires at clutch coil, then remove belts from pulley. Remove bolt holding hand shut off valve assembly to compressor and remove assembly. Remove compressor assembly.

INSTALLATION: All Models - Reverse removal procedure, then purge, evacuate, and charge the system *(see above).*

COMPRESSOR OVERHAUL

► *OVERHAUL NOTE: Compressor clutch, discharge valve assembly, compressor clutch coil, and shaft seal are the only parts that are recommended for service replacement. The compressor main body assembly should be replaced as a unit if faulty.*

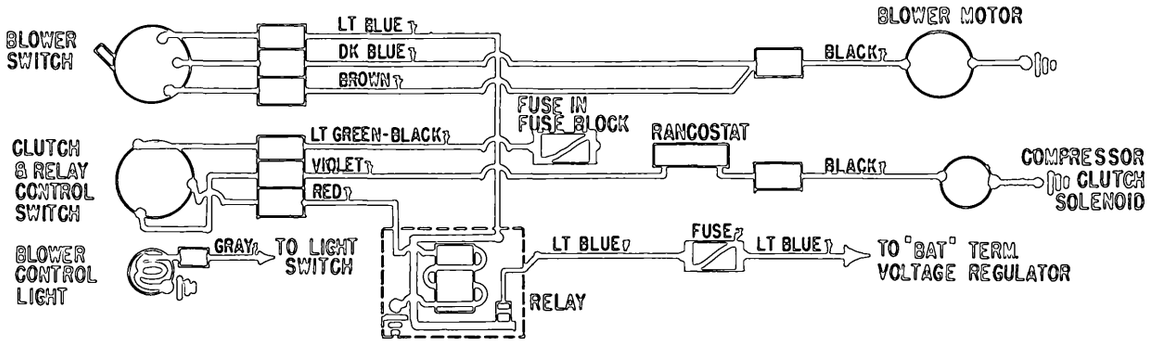
COMPRESSOR CLUTCH: Removal: Remove compressor from car *(see above).* Bend tangs on shaft lockwasher, then loosen the six screws in clutch cover ring. Energize clutch coil with jumper wire from battery to hole compressor clutch and shaft assembly. Remove shaft nut and metal-felt washer. Remove screws and lockwashers securing clutch cover ring to pulley casting *(CAUTION - These screws must be removed at this time to avoid damage to internal parts of clutch. It may also be necessary to remove the three coil retaining screws to allow clutch cover plate to move back).* Remove pulley and ball bearing assembly with Compressor Pulley Puller, Tool J-6351, *(NOTE* - This bearing has a .0001-.0006" press fit onto first step of compressor shaft). Remove hub-to-bearing spacer and shims and set aside. *NOTE* - Spacer and washer and shims may be reused providing original parts are being installed. If new parts are being installed, adjust clearance *(see "Hub-to-Bearing Clearance Adjustment" below).* Check shaft and ball bearing for wear, scoring or pitting. If necessary to replace ball bearing in pulley casting, remove retaining ring and press out bearing. When reinstalling, make sure retaining ring is installed with beveled edge toward outside (away from bearing). Remove clutch plate assembly using Clutch Plate Puller, Tool J-6322. Remove woodruff key and air gap adjusting shims and washer *(NOTE* - If same pulley parts are to be reinstalled, the same shims and washers may be used). Disassemble actuating springs from clutch plate and check plate for wear. *(CAUTION - Do not use any cl aning solv nts on clutch frictional surfaces).* Check nylon balls, replacing all three if any are damaged. **Hub-to-B aring Clearance Adjustm nt** - Place pulley (with bearing installed) on a flat surface with clutch side of pulley facing up. Place two pieces of .008" shim stock on pulley facing across from each other.

OLDSMOBILE AIR CONDITIONING CONTROL DIAGRAM

Select a combination of shims (furnished in .010",.015", .020", .025" thicknesses), and place on inner race of bearing for a trial thickness, then place bearing spacer on shims. Place clutch plate assembly in pulley so that hub is in contact with spacer and shims. Press down firmly at center of hub and rotate clutch plate assembly. If a heavy drag is felt, thicker shims must be selected in order to provide a slight drag across the .008" shim stock. If no drag is felt, thinner shims should be selected. When desired condition is obtained, remove the two pieces of shim stock and use the selected shims when installing clutch and pulley on compressor.

Installation: Install clutch coil retaining screws and place clutch cover ring against coil and seal housing. Install clutch spacer and air gap control shims on shaft against shoulder. Replace woodruff key, tapping it lightly into place. Reassemble nylon balls and clutch plate springs. Press clutch plate assembly on shaft using Tool J-6323, making certain that clutch cover ring does not get caught between coil housing and rear clutch plate. Replace clutch hub and pulley bearing washer and shims on compressor shaft. Place "free" washer of Tool J-6323 over small end of stud so that small diameter of washer will contact INNER race of bearing. Screw stud of Tool J-6323 onto threaded end of compressor shaft, then press pulley assembly into position. Assemble felt and metal washer, shaft lockwasher, and nut. Tighten nut to 5-7 ft. lbs. and bend up tabs on lockwasher. Assemble clutch cover ring, screws, and lockwashers and tighten to 2 ft. lbs. Energize clutch coil with a jumper lead from battery. Use a nonmagnetic feeler gauge and check air gap between armature and coil housing which should be .025-.035". Adjust with correct shims.

Clutch Coil & Shaft Seal Replacement: With compressor clutch removed from compressor (see above), disconnect electrical leads of coil from terminal clip and ground screw. Remove three coil retaining screws from housing and remove coil retainer and insulating gasket. Carefully insert a thin screwdriver through wire opening in rear of coil housing and pry coil forward to remove coil from housing. Remove inner insulating gasket and six housing mounting screws. Remove coil and seal from compressor flange and remove seal seat retaining ring. Remove large diameter"0" ring from outer flange of seal housing. Remove shaft seal assembly. Make certain seal drive pin and retainer ring remain in place on shaft. Remove auxiliary shaft seal from seal housing. *(CAUTION - Discard old "0" ring seals and replace with new ones. The shaft seal, metal seal seat, and retainer should be handled very carefully to avoid damage to fin finished surfaces .Lint-free tissu s should b used for final cleaning of compressor shaft, seal cavity and parts. Seal cavity in coil housing and around auxiliary seal should b flooded with clean fresh Frigidaire 525 viscosity oil befor assembling. All oil seal rings, seal surfaces and parts should also be coated with this oil).* To reassemble, install Shaft Pilot Bushing, Tool J-6320, over compressor shaft and against shoulder of shaft. Apply a light coating of Frigidaire oil to surface of bushing. *(NOTE* - This bushing protects seals during installation). Slide shaft seal and "0" ring into place on compressor shaft. Install "0" ring seal seat and auxiliary seal in coil housing and install large diameter "0" ring seal to outer flange of housing *(NOTE* - Coat inner lip of auxiliary seal heavily with oil before assembly into housing). Install coil housing to compressor flange and install six mounting screws. Add oil to compressor (pour six ounces of Frigidaire 525 viscosity oil into compressor through oil test screw opening).



VALVE PLATE: Disassembly - Remove compressor from car and place on bench in a vertical position with the pulley end down. Form a protective skirt out of heavy paper and tape securely to compressor shell *(CAUTION- This is very important to prev nt oil that will be in head of compressor spilling into the clutch ass mbly).* Remove twelve head bolts and compressor head. Remove cylindrical suction screen and set aside for reuse *(CAUTION - Be careful not to damage gask t mat rial that is vulcanized to irregular center and inner portion of casting).* Lift discharge plate (thick one) assembly from off the two dowel pins. It may be necessary to use two screwdrivers under piston reed retainers, or two pairs of pliers, to "break" oil cohesion and release the plate. Remove suction reed plate (thin one). Do not disturb thrust washer at center of assembly.

Inspection· Inspect discharge and suction reed plates. If any reeds are found broken, examine compressor head and cylinder for any broken portions or slivers of metal. Remove all broken pieces. Inspect each cylinder bore and piston head for damage. Depress each piston by hand for full travel of stroke. Inspect underside of suction reed plate (thin one) in center area where shaft thrust washer contacts this plate A normal condition will be indicated by a slight circular burnished wear pattern. If an overheated condition is indicated by a dark discoloration or burning of reed plate, reed plate must be replaced *(NOTE* - Burned thrust washer is caused by operating the system without sufficient Freon in system which does not allow normal oil return). If scored or damaged cylinder walls, distorted pistons, or burned, seized, or distorted thrust washers are found, the compressor must be replaced If broken discharge reeds or suction plate are found, replace with new discharge valve plate assembly and new suction plate.

CONTINUED ON NEXT PAGE

FRIGIDAIRE & HARRISON (Continued)

Reassembly: Place suction reed plate (thin) over the two dowel pins in cylinder so that the 3/16" diameter hole which is approximately ¾" from center of reed, mates with a similar hole in cylinder block. *(NOTE* - This hole is located between two piston bores). Install discharge plate (thick) over the two dowel pins. Remove and discard old large diameter "O" ring located in recess in head casting. Coat new seal with Frigidaire 525 viscosity oil and install in recess groove in head. Place brass ferrule end of suction screen into center of head casting and grasp head so that suction screen will not fall out when head is inverted for assembly. (This can be accomplished by inserting little finger through center opening to hold screen). Hold compressor head over compressor shell flange so dowel holes register as closely as possible to their proper location. Rotate head slightly until exact dowel pin alignment is obtained, then seat head over dowel pins and onto compressor flange *(CAUTION* - If this is not done properly, there is a possibility of damaging gasket material). Install bolts finger tight, then tighten uniformly, by cross-tightening, to 7½-10 ft. lbs.

PONTIAC AIR CONDITIONING CONTROL DIAGRAM

HUDSON & NASH

Hudson (1957)
Nash (1957)
Rambler (1957)

DESCRIPTION: Similar in design and operation to previous models. *See 1956 Annual Data Pg. 471.*

LINCOLN

Lincoln & Continental (1957)

DESCRIPTION: Similar in design and operation to previous models. *See 1956 Annual Data Pg. 474.*

FORD & MERCURY

Ford V8 (1957)
Mercury (1957)

▷CHANGES, CAUTIONS, CORRECTIONS

▷*SERVICE CAUTIONS: Before disconnecting any part of the air conditioning system or lines, see "Air Conditioning Service Cautions" at beginning of Air Conditioning Section.*

▷*LEAK TESTING: See "Leak Testing" at beginning of Air Conditioning Section.*

▷*COMPRESSOR REMOVAL (For service work on engine):* If engine work makes it necessary that the compressor be removed, it may be isolated without discharging the complete system. *See "Compressor" below.*

▷*1957 FORD AIR CONDITIONER BLOWER HOUSING WHISTLE CORRECTION:* This whistling noise which occurs with air conditioner operating, can be eliminated by sealing the air bleed in the blower housing air valve. Remove blower housing, then with air valve in cooling position, apply body sealer between valve and flange in the area where the valve is cut off at the corner.

▷*1957 MERCURY BLOWER MOTOR BURNING OUT CORRECTION:* This condition may be caused by the cooling tube from blower housing to blower not being installed. If the air conditioner unit does not have the cooler tube, Part No. FEK-17174 must be installed.

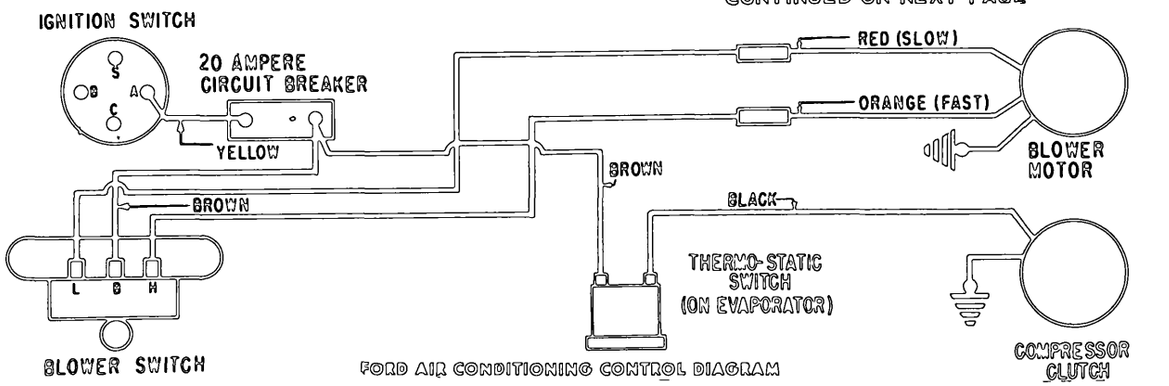
DESCRIPTION: Ford - Simular in design to previous models with the following exceptions: The solenoid bypass valve and control cut-off valve have been eliminated and the magnetic clutch is now controlled by the thermostatic switch. The former oil separator is now integral with the compressor unit.

Mercury - The complete air conditioning unit is located on the dash panel and in the engine compartment. This unit is similar in design to the Ford unit.

ADJUSTMENT

Compressor Belt: Loosen generator-to-bracket bolt and pull generator out so there is ½" (Ford), ¼" (Mercury), belt deflection midway between water pump and compressor pulleys with normal thumb pressure.

▷*BELT REPLACEMENT NOTE: Belts must be replaced in matched pairs. Do not run an old belt with a new one.*



SERVICING

▷*INTAKE & DISCHARGE SERVICE VALVE NOTE:* On field installed SelectAire and PolarAire air conditioners, the intake & discharge service valves are the "Schrader" type, having fast connect and disconnect fittings. On production models, intake & discharge service valves are hand operated. The low pressure valve is mounted on the compressor and the high pressure valve is located on the upper right corner of the condenser. Rotating the valve stems *COUNTERCLOCKWISE* until fully seated, is the normal operating position. This position also isolates the service valve gauge ports for connecting gauge manifold set. Rotating valve stems *CLOCKWISE* until fully seated, isolates the compressor from the system. *(CAUTION - Do not operate compressor with service valves fully seated clockwise).*

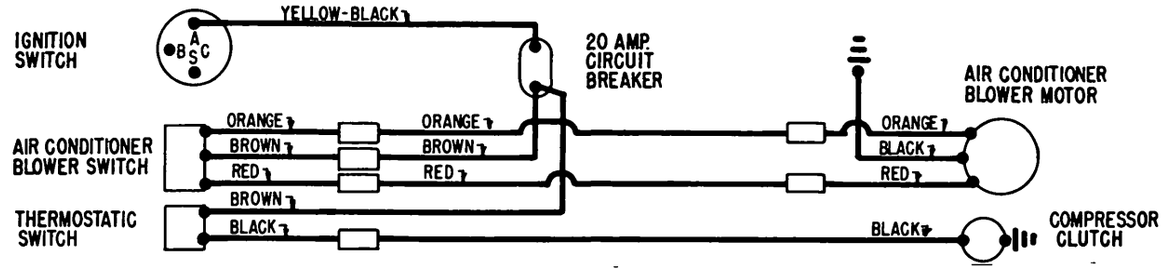
COMPRESSOR OIL LEVEL: Checking & Filling - Operate engine at 1500 RPM with compressor operating. Turn off engine and isolate the compressor (see "Compressor" below). Remove oil filler plug from compressor and insert a 1/8" diameter rod in filler hole until it bottoms. The rod should show ¾" of oil which is equivalent to 9 ounces. If additional oil is required, add Suniso 4-G refrigerator oil, or equivalent. Replace filler plug, evacuate and cut the compressor back into air conditioning system. Check filler opening for leaks.

GAUGE SET INSTALLATION: Remove service valve stem covers and make sure that both service valves are turned fully counterclockwise. Remove service

CONTINUED ON NEXT PAGE

FORD AIR CONDITIONING CONTROL DIAGRAM

FORD & MERCURY (Continued)

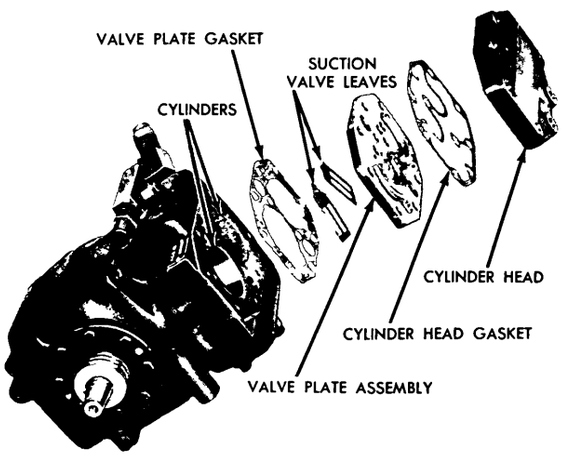


valve gauge port covers, and attach flexible hoses of gauge set to gauge ports. Connect hoses from center fitting on gauge set manifold to tank of Freon 12 and to Vacuum Pump. Turn both manifold gauges to a fully seated clockwise position and close the vacuum pump valve. *(NOTE* - Manifold valves are so arranged that when turned fully clockwise, the center manifold connection is cut off from the gauges, but the gauges continue to read pressures in their respective hoses).

DISCHARGING THE SYSTEM: *(CAUTION - Discharge refrigerant from system before replacing any part of the system, except compressor or compressor high pressure hose).* Connect gauge set to manifold as indicated above (do not connect manifold center connection hoses to Freon tank or to vacuum pump). Place open end of hoses from center connection on manifold in the garage exhaust outlet or into an open area havsufficient air movement to disipate the gas. Set high pressure gauge valve on manifold to open position (fully counterclockwise). Open high pressure service valve a slight amount and allow refrigerant to discharge from system. *(CAUTION - Do not allow refrigerant to rush out, as the compressor oil will be forced along with it).*

EVACUATING THE SYSTEM: Connect the gauge set, tank of Freon 12, and vacuum pump to the system *(see "Gauge Set Installation" above).* Make certain that Freon 12 tank valve is closed tightly. Set both valves to the mid-position (between full clockwise and full counterclockwise positions). Open vacuum pump valve and run pump until low pressure gauge reads at least 25 inches, and as close to 30 inches of vacuum as possible. Continue vacuum operation for 20 to 30 minutes. Close pump valve and turn pump off.

►*FREON CHARGING NOTE:* The correct amount of Freon 12 introduced into the air conditioning system must be accurately determined as follows: Before charging the system (after hoses and lines have been purged of air), place Freon 12 tank in a container of warm water (not to exceed 150°F), then place container and tank, on an accurate scale. Weigh the assembly and record its total weight. As Freon enters the system, the exact amount in pounds can be determined.



CHARGING THE SYSTEM (PARTIAL CHARGE): *(NOTE- If a loss of refrigerant is indicated by bubbles appearing in the sight glass, the refrigerant can be brought up to proper charge as follows).* Attach gauge set *(see "Gauge Set Installation" above).* Open both manifold valves and close vacuum pump valve. Open Freon 12 tank valve. Purge air from high pressure hose by loosening the high pressure hose fitting at the service valve for a few seconds (do not remove hose from fitting). Tighten connections and set high pressure manifold gauge valve at maximum clockwise position. Purge air from low pressure hose in the same manner, then open both service valves to the mid position. With Freon 12 tank setting in a container of warm water (maximum 150°F.), and the assembly on an accurate scale *(see "Freon Charging Not " above),* operate engine at 1500 RPM with COOLING control lever at maximum cold position and blower on HI. Charge system until an additional ½ pound of Freon 12 has been removed from tank, then close tank valve. Place both service valves at the full counterclockwise position. Remove gauge set, and cap service valve ports and valve stems.

MERCURY AIR CONDITIONING CONTROL DIAGRAM

CHARGING THE SYSTEM (COMPLETE CHARGE): Evacuate the system (see above), leaving both service valves at the mid position and the vacuum pump valve closed. Leave low pressure manifold gauge valve at maximum counterclockwise (open) position. Set high pressure manifold gauge valve at maximum clockwise (closed) position. Set COOLING control lever to maximum cold position, and the blower on HI. Open Freon 12 tank valve. Run engine at 1500 RPM and weigh 3½ pounds of Freon 12 into system *(CAUTION - During this operation, do not allow pressure on gauge to exceed 240 lbs.).* When proper charge has entered system, no bubbles will be seen in sight glass. Close Freon 12 tank valve, and check system for proper operation. Place both service valves at the full counterclockwise position. Remove gauge set, and cap service valve gauge ports and valve stems.

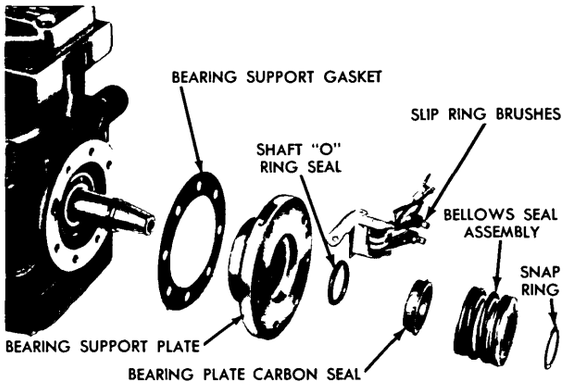
►*HIGH PRESSURE (DURING CHARGING) NOTE: If pressure exceeds 240 lbs., stop engine and check for the cause; which may be due to an overcharge of refrigerant, overheated engine, or air in the lines, with a combination of high surrounding temperatures.*

COMPRESSOR CYL. HEAD & VALVE ASSEMBLY

COMPRESSOR: *(NOTE - All compressor service operations, except belt replacement, can be performed only after the unit has been isolated from the rest of the air conditioning system).*

Isolating The Compressor: Turn both high and low pressure service valves to the full clockwise position. Loosen cap on high pressure service valve gauge port, and allow gas to escape slowly until compressor and attaching hoses are relieved of pressure. *(CAUTION - Loosen the cap a small amount only, and do not remove it until pressure is completely relieved).* To cut compressor back into the system, evacuate the compressor and connecting lines at the high pressure service valve gauge port, turn both service valves to maximum counterclockwise position, shut off vacuum pump and cap high pressure service valve gauge port and service valve stems.

Removal: Isolate compressor, then raise car on a hoist and remove generator adjusting bracket bolt from below. Loosen the two generator to compressor mounting bolts, swing generator inward and disengage both belts from generator and compressor pulleys. Disconnect three leads from generator, remove generator mounting bolts, and remove generator from car. Remove compressor to cylinder block bolt and the compressor to lower bracket bolt. Lower car and complete the operation in engine compartment. Disconnect magnetic clutch wire at bullet connector. Disconnect low pressure service valve and discharge hose from compressor. Remove the two compressor mounting bolts, then loosen the angle bracket bolt and remove compressor from car.



Valve Plate Replacement - *(NOTE - Valve plate may be replaced with compressor in car, after isolating the compressor, see above).* Remove cylinder head bolts and tap cylinder head and valve plate lightly to loosen them, then remove these parts from top of compressor body. *(CAUTION - Be careful not to shear off the valve plate locating pins).* Remove and discard all gaskets and clean gasket shreds from all gasket surfaces. If valves were broken, check piston heads and cylinder walls. Replace complete compressor if damage is evident. Check valve plate for damage, and if necessary, install the entire replacement kit which includes valve plate, valve leaves and the two gaskets. *(CAUTION* - If valve plate and leaves are reused, be sure to replace leaves in their original position on valve plate). Install valve plate gasket on compressor

CONTINUED ON NEXT PAGE

FORD & MERCURY (C ntinu d)

body, then, before installing valve leaves and plate assembly, dip the valve leaves in clean refrigeration oil, and mount them on valve pins that are pressed into underside of valve plate. Install cylinder head gasket and cylinder head. Install all cylinder head bolts and tighten them finger tight, then tighten bolts ¼ turn at a time to 15-20 ft. lbs. Check oil in compressor and add oil if necessary *(see "Compressor Oil L vel" abov).* If compressor was not removed from car, cut compressor back into the system *(see "Isolating The Compr ssor" abov).*

C mpr ss r Crankshaft S al Replacement (Ford) - With compressor removed from car, remove clutch and key from compressor shaft. Use a wheel puller and remove compressor clutch. Remove slip ring brush assembly. Compress bellows assembly with Tool T56P-19670-A, and remove snap ring and bellows assembly. Remove bearing support plate mounting screws. Mount bearing support plate removing tool, T56P-19670-A to the plate, using two threaded holes in plate, and remove plate. Press bearing plate carbon seal from plate and remove "O" ring. Clean all old gasket material from bearing plate and compressor. *(CAUTION - Do not force bearing support plat from its seat with the use of the two scr ws through th thr ad d holes in plate).* Lubricate new shaft seal parts with compressor oil. Install new "O" ring seal in bearing plate and carefully insert new carbon seal into place. Attach bearing plate mounting tool to plate, position the new gasket and force bearing plate into position. When plate is nearly in position, rotate it so that the slip ring brush assembly mounting holes are at the top. Install two bearing mounting plate bolts to act as guides, and seat plate with the installing tool. Remove tool and install and tighten mounting plate bolts. Place bellows seal in

COMPRESSOR SEAL ASSEMBLY

position and compress the assembly with mounting tool, then install snap ring. Remove tool and install slip ring brush assembly, key and clutch. Make certain there are no burrs or dirt on compressor shaft before installing key and clutch. Install clutch mounting bolt and washer. Tighten to 18-22 ft. lbs.

Compressor Crankshaft Seal Replacement With Compressor Mounted on Engine (Mercury) - *(NOTE - For seal replacement with compressor removed, see "Ford" above).* Isolate the compressor (see above), then remove both drive belts. Remove capscrew securing magnetic clutch assembly to compressor shaft. Using a soft hammer or suitable pry bar, remove clutch from crankshaft, then remove woodruff key. Remove brush holder assembly from compressor housing, then compress bellows seal assembly with Tool ACL-53-20. Remove snap ring and bellows. Remove capscrews holding bearing support plate to housing, then install Tool ACL-53-20 and remove the bearing support plate. Press bearing plate carbon seal from plate and remove the "O" ring. Lubricate new shaft seal parts in compressor oil, then install a new "O" ring in bearing plate and carefully insert the new carbon seal into place. Attach bearing plate mounting tool (ACL-53-20) to plate and start installation. When plate is nearly in position, rotate it so that slip ring brush assembly mounting holes are at top, then install two bearing plate bolts for guides, and seat the plate with installing tool. Remove tool and install and tighten mounting bolts. *(CAUTION - Be careful when installing plate in housing to prevent tilting carbon ring off c nter as this will cause it to chip).* Place bellows seal assembly in position and compress bellows with mounting tool, then install snap ring. Remove tool and install slip ring brush assembly, key and clutch. Make sure there are no burrs or dirt on shaft before installing key and clutch. Install clutch mounting bolt and tighten to 18-22 ft. lbs. Cut compressor back into system, then check compressor oil level.

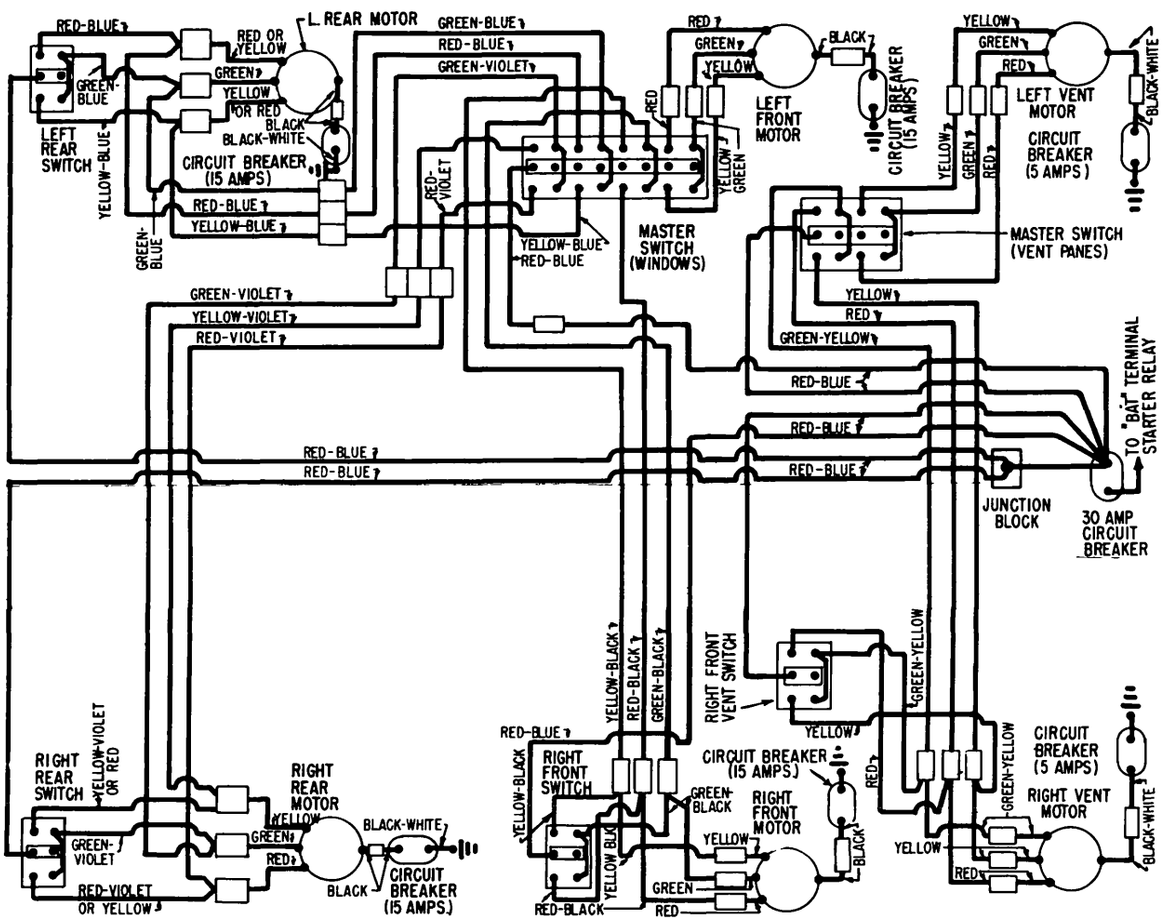
Installation: Place compressor on engine and install the two upper mounting bolts. Tighten the mounting bolts and the angle bracket bolt. Raise car on hoist and install compressor to cylinder block bolt and the compressor to lower bracket bolt. Connect three leads to generator, then mount generator to brackets on compressor and install the bolts. Install generator adjusting bracket bolt but do not tighten it. Engage the two belts with generator and compressor pulleys and adjust belt tension so there is ½" deflection midway between water pump and compressor pulleys, with normal thumb pressure. Tighten generator adjusting bracket bolt, then tighten the two generator to compressor mounting bolts. Lower car and connect low pressure service valve and the discharge hose to compressor, using new gaskets. Check for leaks, evacuate compressor *(See "Isolating The Compressor" above),* then cut back into system.

FORD, LINCOLN, MERCURY

Continental (1957)
Ford (1957)
Lincoln (1957)
Mercury (1957)
Thunderbird (1957)

DESCRIPTION: Power windows are operated by a reversible type electric motor combined with each individual window regulator assembly. Front and rear doors (rear quarter windows on 2-door models) are controlled by individual switches located adjacent to each window and by a master control switch located on left front door. *(NOTE* - On Mercury, the master control switch is located on the instrument panel left hand extension). In addition to power door and quarter windows, other power operated windows are used as follows:

Door Vent - Standard on Continental, and optional on Lincoln models.



Back Window - Standard on Mercury Turnpike Cruiser. Controlled by a switch on instrument panel left hand extension.

Tail Gate Window - Optional on Mercury Station Wagon models. Controlled by a switch on instrument panel left hand extension and by a key operated switch on tailgate. A limit switch in tailgate prevents operation of window when door is in an open position.

REMOVAL & INSTALLATION (REGULATOR ASSEMBLY): Proceed as follows:

Continental (Door Windows): Disconnect battery ground cable, then remove door lock control rod knob. Remove garnish molding from inner door panel, then loose setscrew on door handle and unscrew handle. Pry door arm rest upper molding from panel and remove rest panel from door *(NOTE* - It will be necessary to work through the access hole to remove inner screws). Remove upper trim panel and water seal. Place window in half closed position and remove access hole plate and lower window stop. Lower window glass and remove two spring retainers securing glass channel rollers to regulator arms, then remove rollers from arms. Raise window to full up position and secure in place with a rubber wedge. Disconnect wires from motor-to-relay at bullet connectors. Remove capscrews from regulator and remove regulator through access hole. To install, reverse removal procedure.

Continental (Quarter Windows): Place glass in full down position, then remove rear seat and seat back cushions. Remove garnish molding and lower arm rest panel. Disconnect wires from window regulator switch, then remove upper trim panel. Remove arm rest panel mounting bracket. Disconnect relay and breaker assemblies from wheelhouse flange, then disconnect lead wires from relay and circuit breaker. Remove lower cover plate and remove nut from window guide lower adjusting screw. Remove capscrews holding regulator panel assembly to quarter panel and remove panel assembly as follows: Free window guide adjusting screw at locking point. Rotate top of regulator panel to rear of quarter panel, disengaging glass from rear glass run. Remove regulator panel assembly from quarter panel. Remove retainers attaching quarter window assembly to guide, and retainers from roller assemblies. Remove window glass from regulator panel assembly. Remove screws holding regulator assembly to panel and remove regulator.

LINCOLN WINDOW CONTROL WIRING DIAGRAM

Ford (Front Door Window): Remove door lock push button, garnish molding, door handles, arm rest and door trim panel. Remove plastic water shield, then proceed as follows:

Custom 2 & 4-Door Sedans, Station Wagons - Remove division bar lower retaining screw. On 2-Door models, remove clip, washer and spring retaining regulator arm to scissors arm and plate assembly. On 4-Door models, pull clip out of roller assemblies and remove all roller assembly parts. Raise window and retain in place with a prop or tape. Remove regulator retaining screw, then spring lower end of division bar outward slightly to allow regulator assembly to pass between inner door panel and division bar and remove assembly through access hole. To install, reverse removal procedure.

Town Sedan & Club Sedan - Remove division bar lower bracket screw and the glass stop. On 4-Door models, lower glass and remove roller assembly from glass lower channel. On 2-Door models, remove regulator arm-to-scissors arm and plate assembly clip washer and spring. Raise glass manually and tape to door upper frame. Remove regulator retaining screws, then remove regulator through access hole. To install, reverse removal procedure.

Town Victoria, Club Victoria & Convertible - Remove clip, washer and spring retaining regulator arm to scissors arm and plate assembly. Raise window manually

CONTINUED ON NEXT PAGE

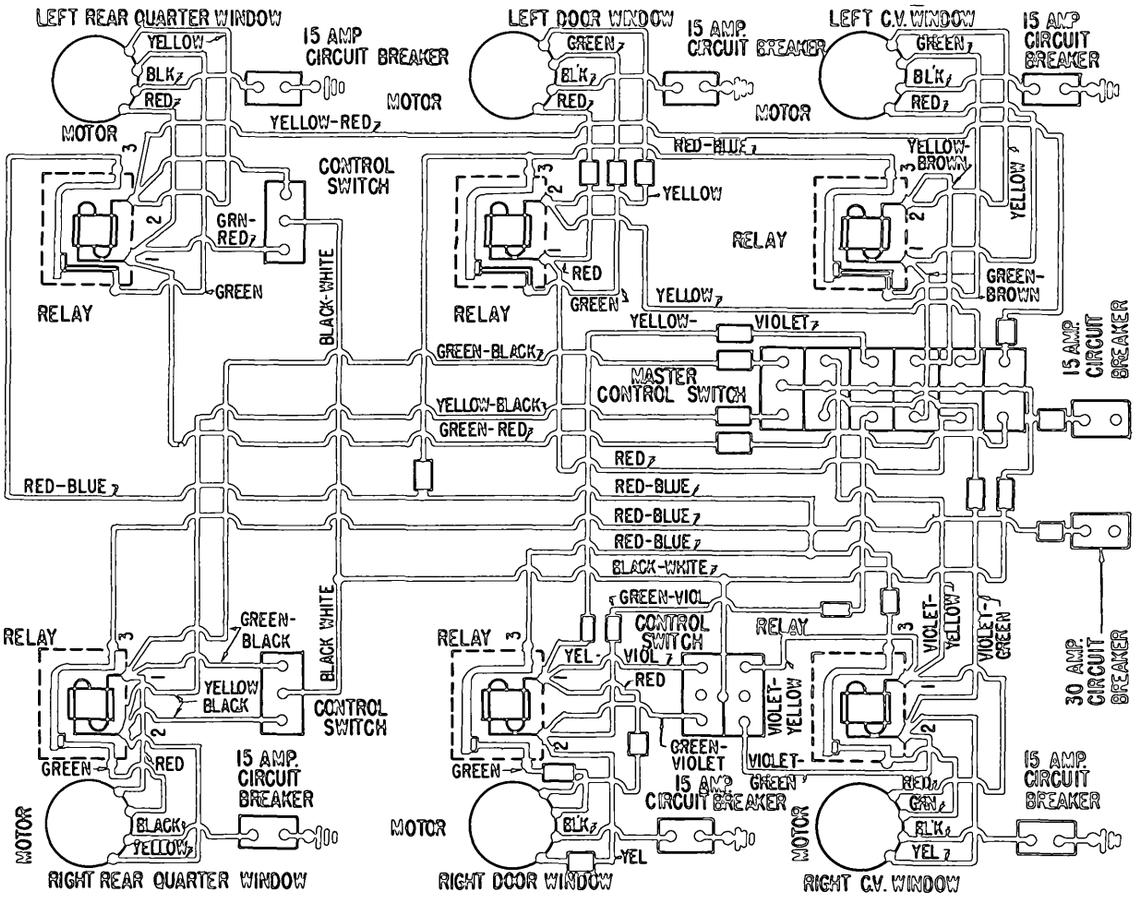
FORD, LINCOLN, MERCURY (Cont.)

and tape in the full up position. Remove regulator retaining screws and remove regulator.

Thunderbird - Remove access hole cover, leaving lower stop attached to the cover. Disconnect regulator arm at the arm and plate assembly. Working through the small access holes, remove four screws attaching regulator to regulator arm supports. Do not remove regulator supports. Pull regulator out through the access hole. Pull clip out of each lower channel roller assembly, remove roller parts, then raise and support the glass. Remove arm and plate assembly retaining screws. Slip equalizer arm roller out of its bracket, then remove arm and plate assembly through the access hole. To install, reverse removal procedure.

Ford (Rear Door Window): Remove door lock push button, garnish molding, arm rest, door handles, door trim panel and plastic water shield. Proceed as follows:

Custom 4-Door Sedan & Station Wagons - Disconnect regulator arms from lower glass channel by pulling the hairpin clips and removing parts of the roller assemblies. Raise window and tape it to upper door frame. Remove regulator retaining screws, then pull regulator sideways to slip the equalizer arm roller out of stationary guide, and remove regulator through access hole. Remove roller assembly from equalizer arm pin. To install, reverse removal procedure.



Town Victoria & Town Sedan - Disconnect regulator arm from arm and plate assembly pivot by pulling the hairpin clip at pivot. Remove regulator retaining screws, then remove regulator through access hole.

Ford (Quarter Window): Remove rear seat cushion, arm rest, rear seat back medallion (on Club Victoria), rear seat back, garnish molding and quarter trim panel. Proceed as follows:

Custom 2-Door Sedan - Remove fibre lower access hole cover, and lower the quarter window. Disconnect regulator arm from lower glass channel by removing hairpin clip from roller assembly, and removing all parts of roller assembly. Raise glass and tape in place. Remove regulator assembly retaining screws, then remove regulator through lower access hole. To install, reverse removal procedure.

Club Victoria - Remove fibre lower access hole cover and the upper access hole cover. Lower quarter window so regulator arm is accessible through the upper access hole, then disconnect regulator arm from glass lower channel by pulling the roller assembly hairpin clip and removing parts of the roller assembly. Raise glass to top of opening and tape in position. Remove regulator retaining screws and remove regulator through lower access hole. To install, reverse removal procedure.

Club Sedan - Remove upper and lower access hole covers. Remove front guide adjusting screw nuts and the front guide retaining screws, then pull front guide down to disengage it from guide roller on lower channel, and remove front guide through lower access hole. Lower window so regulator arm is accessible through upper access hole, then disconnect regulator arm from lower channel by pulling the hairpin clip and removing the parts of the roller assembly. Raise quarter window to top position and tape in place. Remove regulator retaining screws and remove regulator assembly through lower access hole. To install, reverse removal procedure.

CONTINENTAL WINDOW CONTROL WIRING DIAGRAM

Convertible - Remove access hole cover and lower the window half way. Disconnect regulator arm from glass lower channel by pulling roller assembly hairpin clip and removing all parts of the roller assembly. Raise glass to the top position and tape in place. Remove regulator retaining screws, then remove regulator assembly through the access opening. To install, reverse removal procedure.

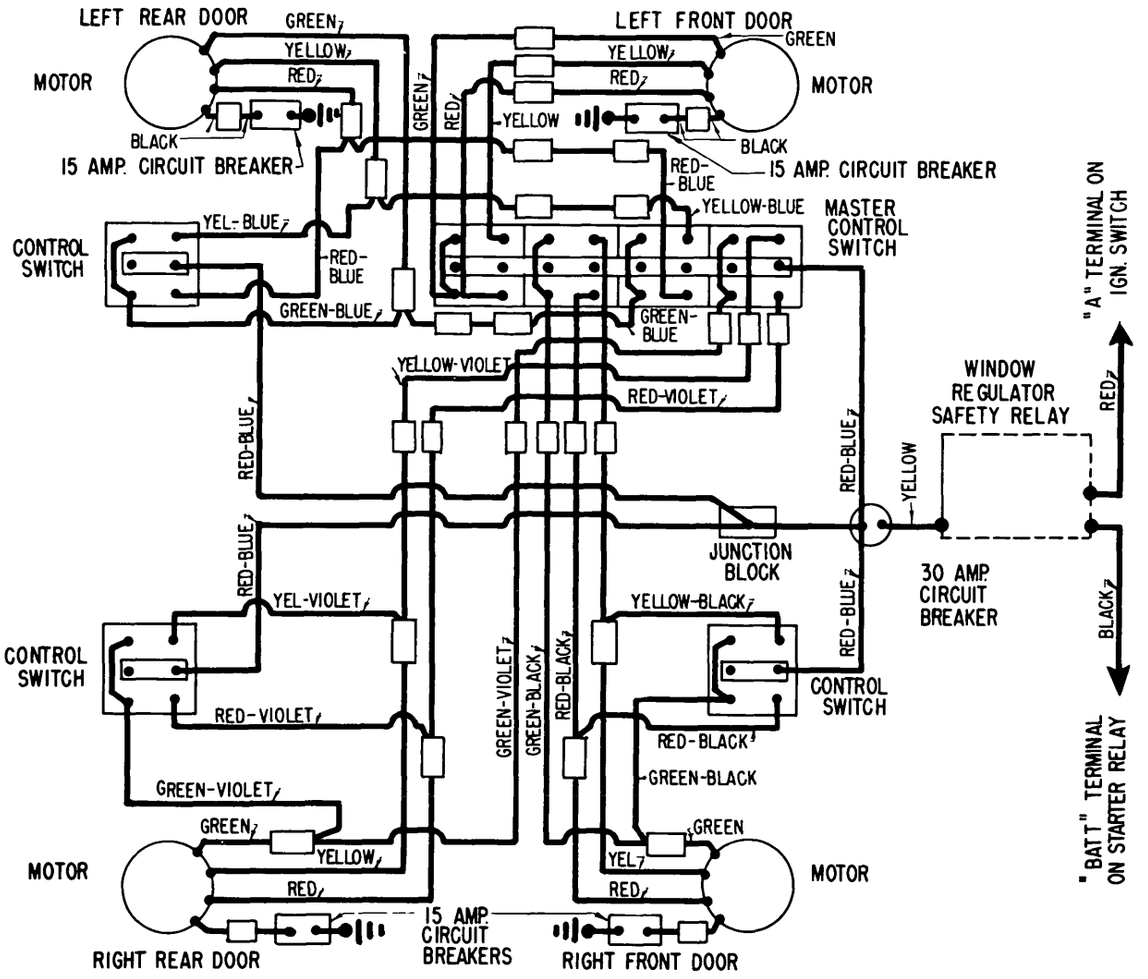
Lincoln (Front Door Windows): Disconnect battery ground cable. Remove door locking control rod knob and inside door handle. Remove screw attaching arm rest to inner panel bracket and remove trim panel from door. Disconnect courtesy light wires at bullet connectors. Remove access hole cover plate, window glass stop bracket with stop attached, two spring type retainers that attach glass channel rollers to window regulator arms, and remove rollers. Raise glass to top position and tape in place. (NOTE - On models without channel and frame assembly, use a rubber wedge to hold window glass up). Remove screws securing regulator assembly to inner door panel. Disconnect wires from motor at bullet connectors. Remove regulator assembly through access hole. To install, reverse removal procedure.

Lincoln (Rear Door Windows): Disconnect battery ground cable. Lower window to full down position and remove door locking control rod knob and garnish molding, inside door handle, and screw attaching arm rest to inner panel bracket. Pry off trim panel. Remove access hole cover plate and window glass stop. Raise window to full up position and tape glass in place. Disconnect wires from motor at bullet connectors. Remove screws attaching regulator to door inner panel and remove regulator through access hole. To install, reverse removal procedure.

Lincoln (Quarter Windows): Lower glass to full down position. Disconnect battery ground cable and remove rear seat and back cushions. Remove sheet metal screws retaining trim garnish molding and remove molding. Remove sheet metal screws securing trim panel to quar-

CONTINUED ON NEXT PAGE

FORD, LINCOLN, MERCURY (C nt.)



ter panel and remove trim panel. Disconnect wires at bullet connectors from window switch and cigar light ground. Remove positive (hot) wire from cigar lighte r. Remove water shield, then disconnect wires from motor at bullet connectors. Remove capscrews securing quarter window and regulator panel assembly to quarter panel. Move quarter window and regulator panel assembly to rear and lift front end upward to remove. Remove two nuts securing window glass to glass channel rollers and remove window glass. Remove screws securing regulator assembly to panel assembly and remove regulator. To install, reverse removal procedure.

Lincoln (Ventilator Window): Proceed as for removal of front door window regulator assembly (see above) for removal of molding and trim panel. At this point, remove front access hole cover, then remove capscrews securing ventilator window motor mounting bracket to door inner panel. Remove motor and bracket assembly through access hole. To install, reverse removal procedure.

M rcury (Front & Rear Door Windows): Lower window to full down position. Remove inside door handle, then remove garnish molding, edge trim molding, or lower trim molding as necessary. Remove screws securing arm rest finger tip plate to support bracket and screws securing lock control escutcheon to door inner panel. Remove two screws from lower edge of trim panel. Pry trim clips free along sides of trim panel and lift panel to free lower trim clips from retainer at bottom edge of door. On rear doors, disconnect window regulator switch from connector. Remove arm rest support from door inner panel, then peel plastic shield down to lower edge of door. *(NOTE* - To remove motor only, disconnect motor wires at bullet connectors. Remove two nuts and eyelets securing motor assembly and coupling to regulator assembly. Remove motor and coupling through door inner panel access hole). Remove two screws from window lower stop to door inner panel and remove stop. Disconnect motor wires at bullet connectors. With window at full down position, remove two spring type retainers securing window channel roller assemblies to window regulator arms. Separate regulator arm pivots from rollers. Raise window assembly to full up position and retain in place with tape or rubber wedge. Remove screws securing regulator assembly to door inner panel and remove regulator assembly.

Mercury (Quarter Windows): Disconnect battery at ground cable, then proceed as follows:

C nvertible - Lower convertible top, then remove rear seat and back cushions. Remove quarter window garnish molding and upper rear quarter trim panel. Remove arm rest panel assembly and disconnect courtesy lamp from panel. Remove quarter front trim panel. Lower quarter window to full down position by operating the switch, then remove wires from switch. Remove plastic shield, then remove spring retainer securing window channel guide roller assembly to regulator arm pivot. Remove two screws securing quarter window guide button retainer assembly and remove retainer and guide button from guide assembly. Remove screws retaining regulator assembly to quarter panel and remove regulator through access hole. To install, reverse removal procedure.

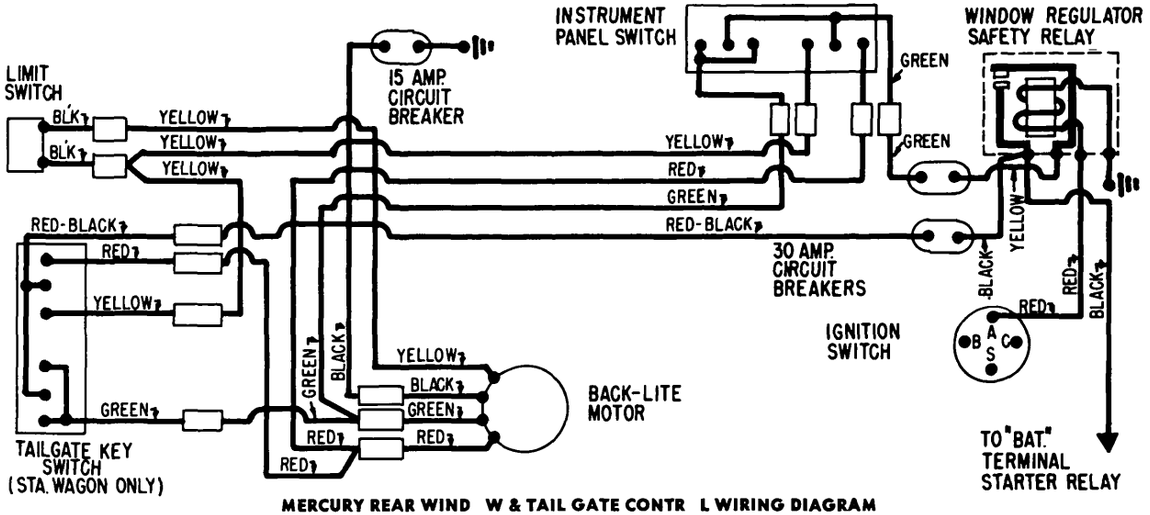
FORD & MERCURY WINDOW CONTROL WIRING DIAGRAM

Other Models (Exc. Convertible) - Remove rear seat and back cushions, then remove window garnish molding. If necessary, remove two screws at lower front of trim panel and one screw at lower edge of trim panel directly below ash tray. Pry trim clips loose from inner quarter panel along forward edge of trim panel and remove panel. Peel off plastic shield, starting at forward edge of inner panel, leaving shield attached at rear edge. Move window to a position where regulator arm is accessible through rectangular access hole. Remove spring type retainer securing window channel roller assembly to window regulator arm pivot. Pull regulator arm free of window guide. Raise window and retain in the full up position with tape or by inserting a screwdriver in slanted slot at upper edge of inner panel. Remove wires from regulator switch, then remove screws securing regulator to inner panel and remove regulator through access hole. To install, reverse removal procedure.

Mercury Turnpike Cruiser (Back Wind w): Remove spare wheel and tire assembly and luggage compartment front lining board. Remove back window housing cover. Lower back window assembly down to approximately one inch above lower stops. Disconnect battery ground cable, then remove spring retainers securing window channel roller assemblies to regulator arms. Push regulator arms forward to separate pivots from rollers. Remove two capscrews securing each lower side run assembly.

CONTINUED ON NEXT PAGE

FORD, LINCOLN, MERCURY (C nt.)



Remove back window assembly by pulling down and out of lower side run assemblies. Temporarily connect battery ground cable and operate back window switch to lower regulator arms to full down position *(CAUTION Do not raise regulator arms as they may damage packag tray trim panel)*. Disconnect regulator motor wires at bullet connectors. Remove capscrew securing motor bracket to regulator back panel, then remove screws securing regulator assembly to back panel and remove regulator and motor as an assembly. To install, reverse removal procedure.

M rcury Stati n Wag n (Tailgate Window): Lower tailgate and remove latch handle. Remove three screws securing tailgate lock release control assembly to window lower garnish molding. Remove garnish molding and end spacers. Remove four tailgate skid strips. Remove both side tailgate inner panel lock access hole cover plates and regulator access hole cover plate. Remove plastic shield. *(NOTE* - If motor only is being removed, remove two nuts securing motor to regulator and screw securing motor brace to inner panel. Turn motor coupling manually to raise window to gain access to wires, then disconnect wires at bullet connectors. Remove motor). Depress back window latch with a screwdriver and raise window to full up position. While supporting window, remove spring retainers from window channel guide roller assemblies. Lower window into tailgate approximately two inches. While raising regulator arms for free arm pivots from rollers and window channel guides, remove back window from tailgate. Disconnect wires at bullet connectors and key-switch wires at quick disconnect. Disconnect right side lock control rod from lock release control assembly and disconnect lock trigger release rod from trigger. Move lock control rod and lock release control assembly out to sides. Remove screws attaching regulator assembly to tailgate inner panel and screw attaching motor brace to tailgate. Move regulator assembly to free roller assembly from regulator equalizer arm guide bracket, then remove regulator and motor out of window opening. To install, reverse removal procedure.

► *MERCURY STATION WAGON TAILGATE KEY-SWITCH & LIMIT SWITCH NOTE: Replacement procedure are the same as for motor and regulator assemblies. See above.*

DISASSEMBLY (MOTOR & REGULATOR ASSEMBLY): Turn coupling until regulator quadrant completely disengages from drive assembly gear, relieving regulator spring tension. *(NOTE - Coupling must be turned in direction of least resistance)*. Make sure that regulator arms are held when disengaging quadrant from drive assembly gear to prevent arms from springing. Remove nuts and steel eyelets attaching motor to regulator. Pull motor shaft from coupling and remove motor from regulator. Remove capscrews attaching drive assembly to regulator and remove drive assembly.

REASSEMBLY (MOTOR & REGULATOR ASSEMBLY): Install drive assembly to regulator with capscrews and install coupling on drive assembly shaft. Install motor with motor shaft properly engaged in coupling. Secure motor with steel eyelets and nuts to regulator assembly. To obtain proper torque, tighten the nuts until eyelets on each side of rubber grommet butt together. Pull regulator arms against spring tension so that first tooth of quadrant begins to engage with one tooth of drive assembly gear, then turn coupling to complete engagement of gear teeth. Continue to turn coupling until quadrant travels approximately three-quarters of its distance over drive assembly gear.

MERCURY REAR WIND W & TAIL GATE CONTR L WIRING DIAGRAM

G.M. ELECTRIC

Buick (1957)
Cadillac, Exc. Brougham (1957)
Chevrolet (1957)
Oldsmobile (1957)

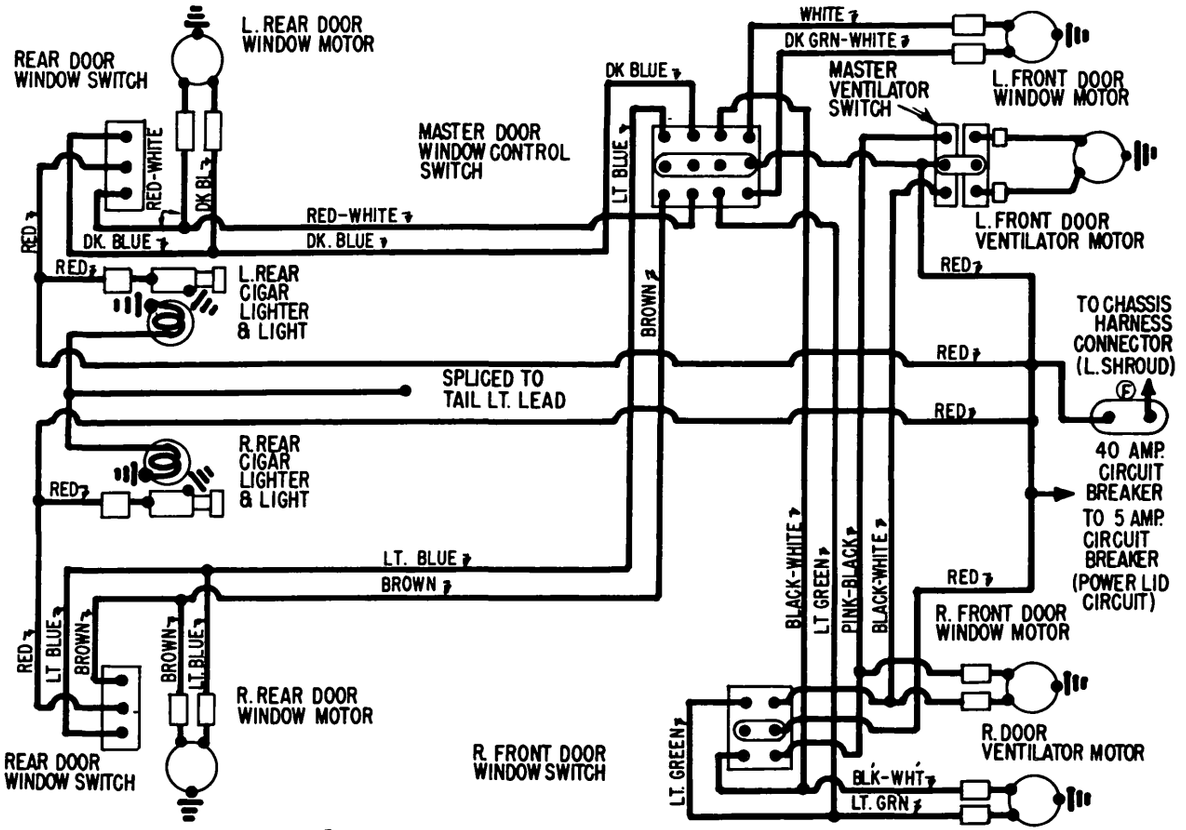
HUDSON & NASH

Huds n H rn t (1957)
Nash Ambassad r (1957)

DESCRIPTION: Similar in design and operation to previous electric types used. *S e 1956 Annual Data Pg. 485.*

CADILLAC ELDORADO BROUGHAM

Cadillac Eldorado Brougham (1957).



DESCRIPTION: Electrically operated door windows and front door ventilator windows having individual motors. A master control switch on left front door controls all windows. Individual window controls are also located on right front and both rear doors. The right front door also includes a control switch for operation of both front door ventilators.

REMOVAL & INSTALLATION: Front Door Window Regulator Assembly - Lower the window and remove door belt finishing molding and door trim finishing panels. Remove inner panel access hole cover. Remove window assembly and front guide assembly. *(CAUTION - Do not operate regulator motor after assembly is disngaged from regulator).* Remove front guide-to-rear guide brace rear attaching screws, then disconnect regulator motor lead wires at connector. Remove inner panel cam attaching screws and detach cam from regulator balance arm. Through access holes in door inner panel, remove regulator attaching screws and remove regulator assembly through large access hole. To install the assembly, reverse removal procedure.

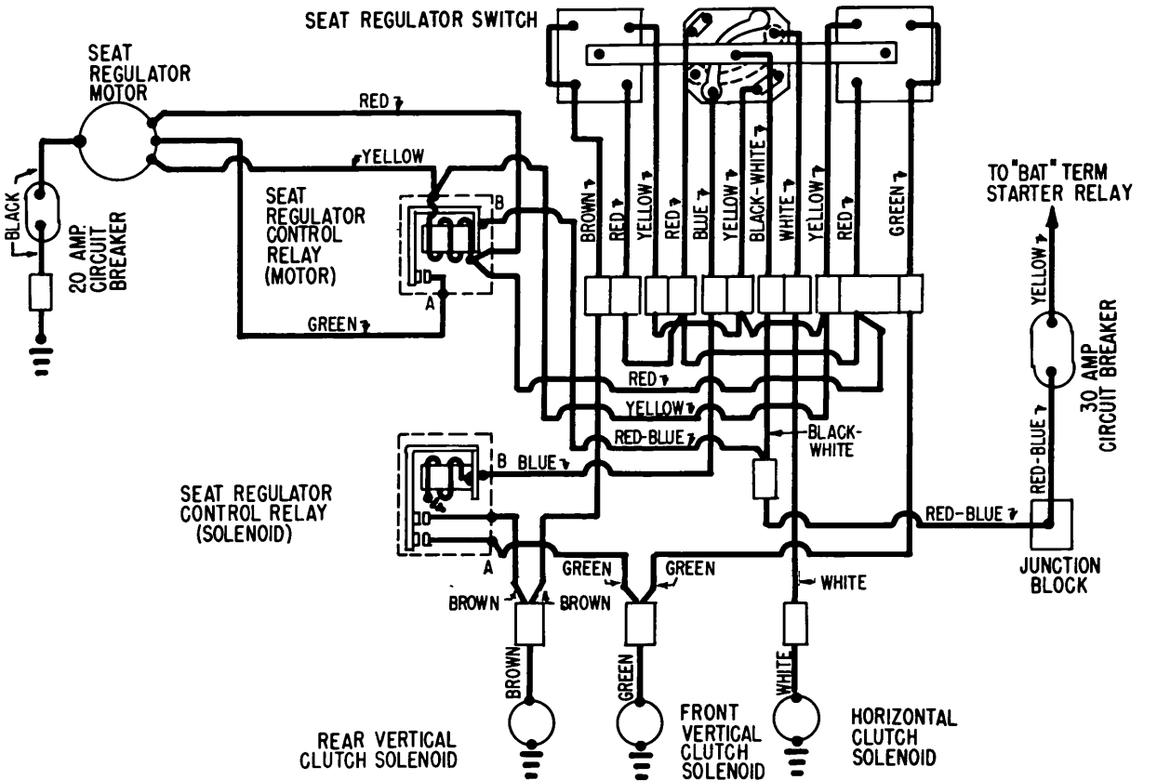
Fr nt Door Window Regulator Electric Motor Assembly: Remove window regulator assembly from door (see above), and clamp in a vise. *(CAUTION - Be sure to p rform the following steps in sequence indicated or s rious injury may result).* Drill a ¼" hole through back plate and sector within the area immediately above motor assembly (location of hole depends on position of lift arm). *(CAUTION - Do not drill into motor housing. Locate hole not less than ¾" away from edge of back plate or sector).* Insert a 3/16" bolt through back plate and sector and install a nut (do not tighten). Remove three motor attaching screws and remove motor assembly from regulator. To install, reverse removal procedure being sure to remove nut and bolt locking the sector.

Fr nt Door Ventilator Regulator and Motor Assembly: Remove door belt finishing molding and door trim finishing panels. Remove inner panel access hole cover and disconnect switch and lead wires from ventilator regulator motor wires. Remove ventilator tee shaft attaching screw, then remove ventilator regulator attaching screws. With windows in "up" position disengage regulator shaft from ventilator tee shaft and remove regulator and motor assembly from door through large access hole.

R ar Door Window Regulator Assembly: Raise window and remove belt finishing molding and door trim finishing panel. Remove inner panel acce ss hole cover. Through small access hole remove window lower sash channel front cam rear attaching screw. Through small access hole (approx. 1 ½" diameter), remove rear cam rear attaching screw. Lower window to a position where, through the large access hole, the window lower sash channel front cam front attaching screw and rear cam front attaching screw can be removed. Disconnect window regulator motor wiring harness connector. Disengage window lower sash channel front and rear cams from window lower sash channel and from window regulator arms and remove cams from door. Lift window and "prop" it in up position. *(CAUTION - Do not operate regulator motor after assembly is disengaged from regulator).* Remove window lower bumper support from door. Disconnect door lock remote control freewheeling solenoid feed wire at connector. Disengage spring clip and detach remote control connecting rod from remote control. Remove remote control attaching screws, disengage remote control handle shaft from hole in door inner panel and remove assembly through large access hole. Remove window rear guide lower attaching stud and nut. Remove front-to-rear guide brace attaching screws and remove front-to-rear guide brace. Remove inner panel cam attaching screw, disconnect cam from window regulator arm and remove cam from door. Remove window regulator attaching screws. Position regulator assembly so that motor end of regulator can be started out of access hole first; then remove window regulator assembly from door. To install, reverse removal procedure.

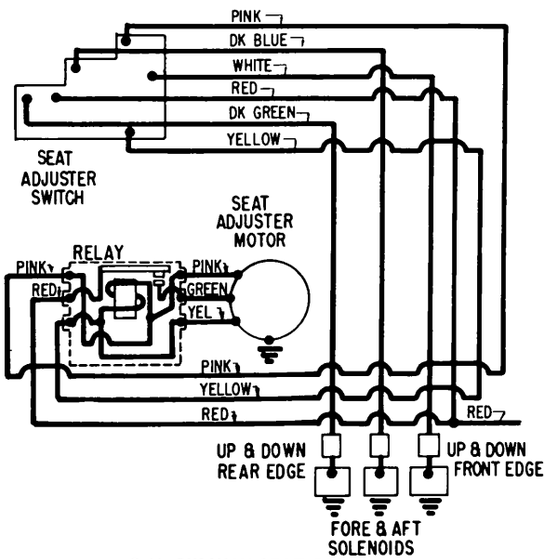
CADILLAC ELDORADO BROUGHAM WINDOW CONTROL WIRING DIAGRAM

Rear Door Window Regulator Electric M tor Assembly: Remove regulator assembly from door, then proceed as for removal of front door motor assembly. (See above).



TROUBLE SHOOTING & OTHER DATA: S *"G.M. El ctric Window Regulators" in 1956 Annual Data.*

G.M. & LINCOLN FOUR & SIX-WAY SEAT CONTROL



Buick (1957).
Cadillac (Exc. Eld rado Brougham) (1957).
Lincoln (1957) *See "4-Way Seat Control Note" below.*
Oldsm bil (1957) *See "4-Way Seat Control Note" below.*
P ntiac (1957).

►*ACTUATOR ROLL PIN INSTALLATION CAUTION:* When replacing an actuator spinning nut assembly or an actuator assembly (less spinning nuts) roll pins should be installed so that center of protruding portion of pin is located **b tween** threads of the jackscrew. If pin installed in center of a thread there is a possibility pin may shear or cause assembly to jam. When installing roll pins in jackscrew, install pin so that 1/16" of pin protrudes above jackscrew threads.

DESCRIPTION: The 6-Way Seat Adjusters provide horizontal and vertical movement, and forward and rearward tilt. The 4-Way Seat Adjusters provide horizontal and vertical movement only (see "4-Way Seat Control Note" below). The adjusters are operated by an actuator assembly consisting of a reversible motor, gear box, jackscrew and relay. Spinning nut (solenoid clutch) assemblies located on regulator jackscrew transmit movement to seat adjusters through torque tube assemblies and links *(NOTE* - There are three spinning nuts on 6 way seat adjusters, and 2 spinning nuts on 4-way seat adjusters). In each of the three spinning nut (solenoid clutch) assemblies, there is a free-wheeling nut mounted in ball bearings which freewheels with the jackshaft unless locked out of freewheeling by the solenoid located in spinning nut assembly. When spinning nut is locked out of free-wheeling by solenoid action, the nut assembly moves on jackscrew and transmits movement to seat adjusters through connecting links and torque tube assemblies.

LINCOLN SIX-WAY SEAT CONTROL WIRING DIAGRAM

G.M. SIX-WAY SEAT CONTROL WIRING DIAGRAM

Seat regulator is controlled by switches located at left panel of front seat.

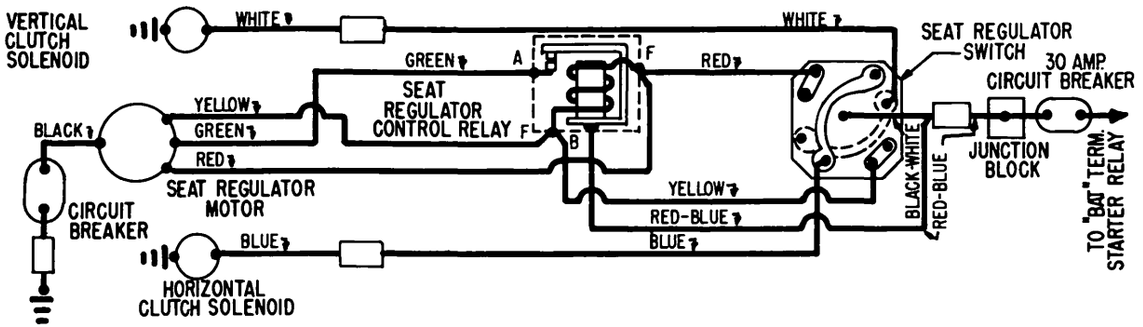
►*4-WAY SEAT CONTROL NOTE:* 4-Way Seat Adjusters are basically the same as 6-Way Seat Adjusters. The rear vertical torque tube and the center spinning nut (solenoid clutch) and linkage which operate rear of seat up and down on 6-way seat adjusters are not used on 4-way seat adjusters. The rear of the 4-way adjusters is operated up and down in unison with the front of the adjusters by means of a connecting link to front vertical linkage. Service is the same for both types.

REMOVAL & INSTALLATION: Front Seat Assembly (Including Seat Adjusters & Actuator Assembly): Operate seat to raised position. Under front of seat disconnect adjuster control wire harness from adjuster feed wire harness and detach control harness from clip on floor pan. Disconnect lighter feed wire (where applicable) and detach wire from clip on floor pan. On Cadillac, remove screws securing rear floor carpet to right and left adjusters. On all cars, remove seat adjuster to floor pan bolts, then with aid of helper lift seat assembly, with adjusters and actuator assembly attached, from body. To install, reverse removal procedure. Make sure ground wire is secured under seat adjuster floor pan bolt. When installing seat assembly to body, carefully align seat adjuster attaching holes with attaching holes in floor pan to avoid possible binding of seat adjuster linkages. Seat adjusters should be parallel when properly aligned. Check operation of seat to extreme limit of each position.

Front Seat Assembly (Less Seat Adjusters & Actuator Assembly): Operate seat to fully raised position and midway between full forward and rearward horizontal positions. Remove both right and left seat side panels. Under front of seat disconnect control wire harness from adjuster feed wire harness. Detach lighter feed wire and detach wire from clip on floor pan; remove ground wire from under seat adjuster bolt. At both adjusters remove front and rear seat adjuster-to-seat frame attaching bolts. Tilt seat assembly rearward and remove control wire harness from spring clips along front of seat bottom frame. With aid of h e l p e r carefully lift seat assembly (less seat adjusters and actuator assembly) from body. To install, reverse removal procedure. Make sure ground wire is secured under seat adjuster floor pan bolt. Check operation of seat to extreme limit in each position.

Front S at Adjuster: Remove seat assembly including seat adjusters and actuator assembly (see above). Place

CONTINUED ON NEXT PAGE



G.M. & LINCOLN FOUR & SIX-WAY SEAT CONTROL (Cont.)

seat assembly upside down on a covered bench. Remove seat side panel and counterbalance spring from adjuster being removed. Support torque tube assembly with board between torque tube and seat front and rear rails on side of seat from which adjuster is being removed. Remove cotter keys and washers securing adjuster links to torque tube assembly and cotter key and washer securing torque tube link to adjuster. Remove both front and rear seat adjuster-to-seat frame attaching bolts. Lift adjuster slightly, then carefully work adjuster outboard to disengage it from torque tube. Disengage link from adjuster. If removing right adjuster, remove cotter key and washer and disengage actuator assembly from support pin. To install, reverse removal procedure.

Adjuster Actuator Assembly: Operate seat midway between forward and rearward horizontal positions. Operate front of seat to up position and rear of seat midway between up and down positions. Remove seat assembly including seat adjusters and actuator assembly. Place assembly upside down on covered bench. Remove both right and left seat adjuster counterbalance springs. Check to see that all spinning nut attaching screws are accessible for removal. If screws not accessible, hook up control harness feed wire to power and ground seat frame; hook up control switch, then operate actuator to position spinning nuts so that all screws are accessible. Disconnect the three spinning nut solenoid feed wires at connectors. Disconnect control harness feed wires from motor relay. Remove anti-creep spring from center spinning nut. Remove shoulder screws securing spinning nuts to mounting supports. Remove cotter key and washer securing actuator to support pin. Raise spinning nut mounting supports to vertical position. Raise front of actuator sufficiently to allow unit to be removed from support pin, then remove actuator assembly from seat. To install, reverse removal procedure. Connect relay and solenoid wires.

Adjuster Actuator Spinning Nut Assembly (Including Solenoids): Remove seat adjuster actuator assembly (see above). Carefully drive roll pins out of jackscrew. Insert drift punch or suitable tool into spinning nut frame mounting hole, rotate spinning nut frame slowly until drift punch engages in locking nut of spinning nut, then unscrew complete spinning nut assembly from jackscrew. To install, reverse removal procedures. *CAUTION - See "Actuator Roll Pin Installation Caution" above.*

Adjuster Actuator Spinning Nut Solenoids: Remove seat assembly (less seat adjusters and actuator assembly). Disconnect solenoid feed wire at connector. Remove solenoid cover carefully bending down tabs at bottom of cap and pulling upward. Remove solenoid plunger, plunger shunt, and shunt spring. Remove nut and washer securing solenoid ground wire to spinning nut frame. Carefully push solenoid forward or rearward and remove from retainer on spinning nut assembly. To install, reverse removal procedure. Solenoid plunger should move up or down freely; if necessary, move solenoid slightly forward or rearward to allow free movement of plunger. Before installing seat assembly, hook up feed wire with control harness and check operation of solenoid.

LINCOLN FOUR-WAY SEAT CONTROL WIRING DIAGRAM

Control Switch (GM Cars): Remove switch and escutcheon assembly from seat side panel. Through holes in side of switch escutcheon, depress tabs of clips and remove clips securing switch to escutcheon and remove switch. To install, reverse removal procedure.

LUBRICATION: Jackscrew – Thoroughly wipe off old lubrication. Apply Lubriplate No. 630 AA-W (winter grade). Operate adjuster to all positions and to extreme limit. Wipe off excess lubricant.

TROUBLE SHOOTING: Seat Adjuster Motor Does Not Operate – Short or open circuit between power source and motor; defective motor.

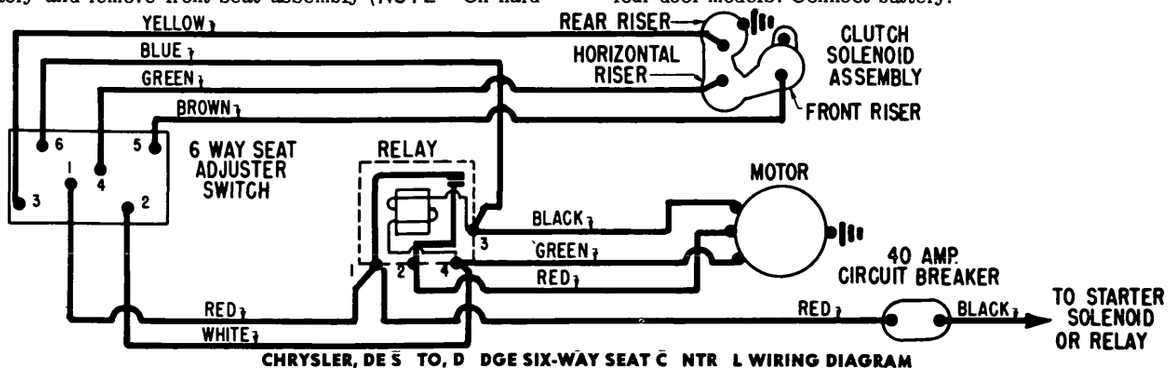
Seat Adjuster Motor Operates, But Seat Adjusters Are Not Actuated: Short or open circuit between switch and affected solenoid; defective solenoid.

Seat Adjuster Motor Operates, Rear Edge of Seat Cannot be Adjusted (Other Operations Normal): Short or open circuit between switch and affected solenoid.

Seat Adjuster Motor Operates, Front & Rear Edge of Seat Move Up & Rearward, But Will Not Move at Down & Forward: Short or open circuit between one of motor field wires and seat control switch; defective field coil in motor.

Seat Adjuster Motor Operates, Front & Rear Edge of Seat Move Down & Forward, But Will Not Move at Up & Rearward: Short or open circuit between one of motor field wires and seat control switch; defective field coil in motor.

SERVICE PARTS: Actuator Assembly (With Motor, Less Spinning Nuts & Relay) - G.M. Part No. 5047975 (Exc. Lincoln). Lincoln No. BAJ-5860472-A (Lincoln).
Motor Relays - G M Part No. 4711553 (Exc. Lincoln). Lincoln No. FDU-14546-B & FEL-14546-A.



CHRYSLER, DE SOTO, DODGE SIX-WAY SEAT CONTROL

Chrysler, Imperial, DeSoto & Dodge (1957).

DESCRIPTION: 6-Way Power Seat operated by a single reversible electric motor located under the front seat. The motor drives a gear assembly which transmits power to slave units located in the seat tracks. Solenoid clutches in the gear assembly, when energized by actuation of the control switches on left side of front seat, engage the flexible drive cables with the gear assembly to operate the seat horizontally, up and down, and tilt it.

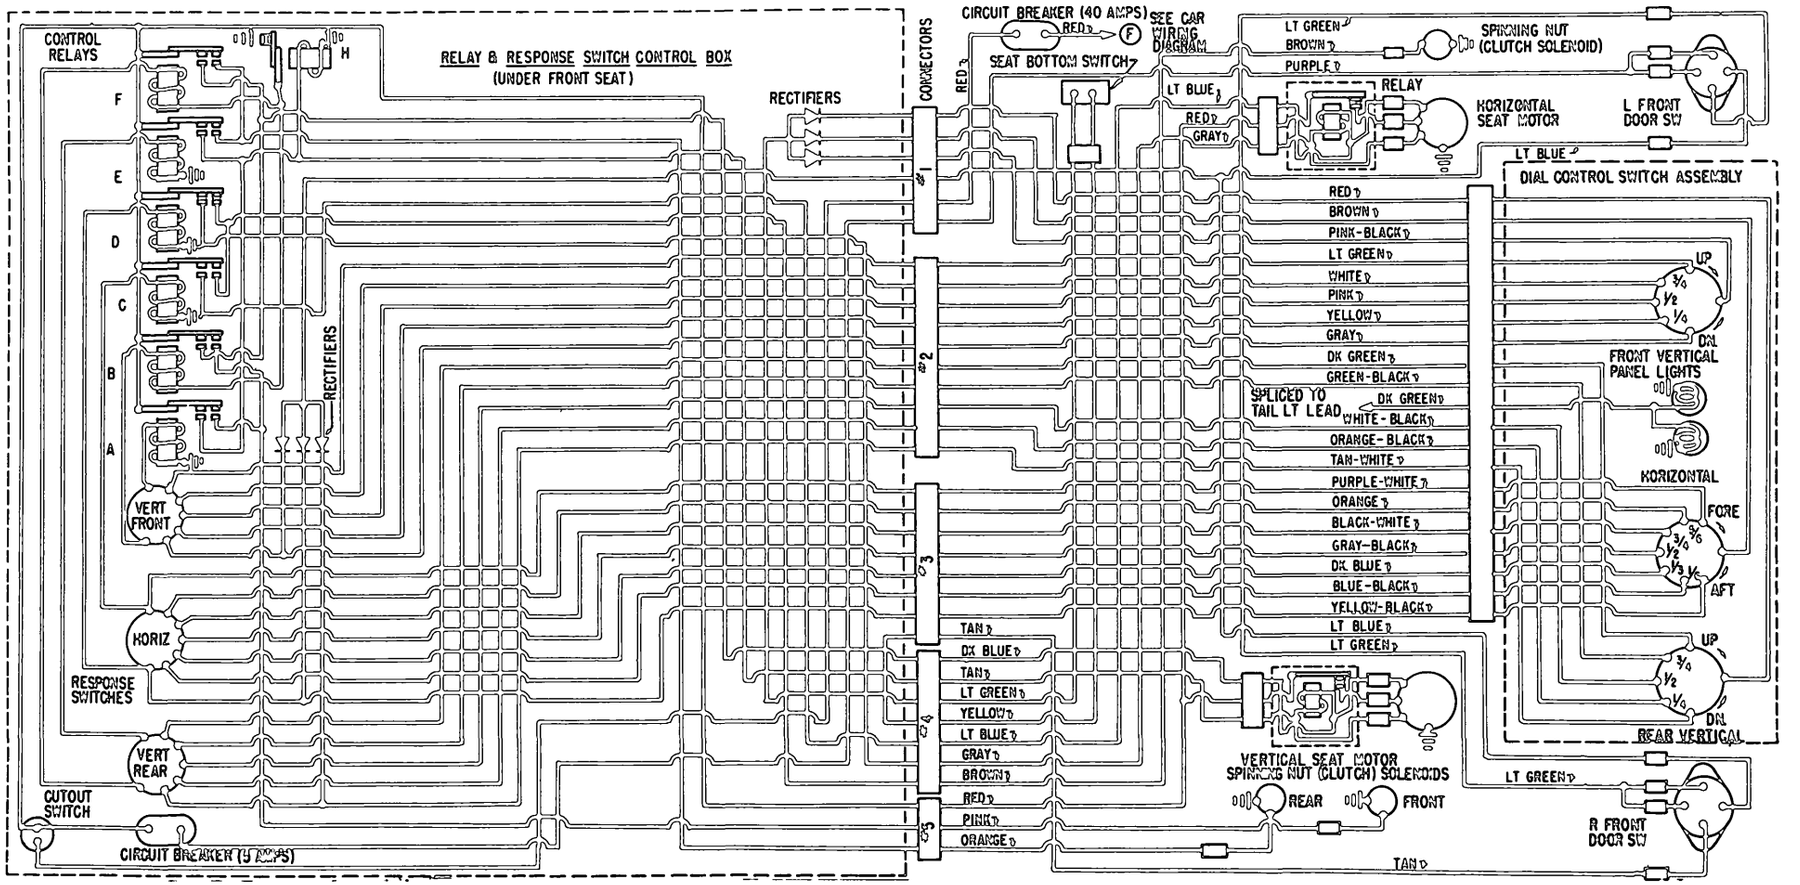
FRONT SEAT ASSEMBLY: Removal - Disconnect battery and remove front seat assembly *(NOTE* - On hardtop models, remove front seat and cushion as an assembly). Disconnect control wires at switch and disconnect seat adjuster battery wire at circuit breaker in cowl. Remove seat guide attaching stud nuts and remove adjuster. *CAUTION - Do not damage flexible tubing during removal.*

Installation: Install adjuster and stud nuts. Connect seat adjuster battery wire to circuit breaker on cowl. Form a loop in the wires from relay to clip on floor for horizontal travel. Install front seat assembly. Connect control wires to switch and install front seat cushion of four-door models. Connect battery.

CHRYSLER, DE SOTO, DODGE SIX-WAY SEAT CONTROL WIRING DIAGRAM

CADILLAC ELDORADO BROUGHAM

Cadillac Eldorado Brougham (1957).



DESCRIPTION: This six-way front seat control consists of two reversible motors for vertical and horizontal seat movement. The right hand assembly controls vertical movement of the front and or rear edge of seat through a jack screw and two spinning nuts (solenoid clutches). The left hand assembly controls horizontal seat movement through a jack screw and one spinning nut (solenoid clutch). The electrical control unit provides automatic movement of the seat to a "favorite" position as determined by the driver. A dial selector control switch installed on left front door arm rest controls front edge and rear edge to five positions, and the horizontal movement to seven positions, by manual operation. Two buttons, one red and one green, over each control knob selects the "favorite" position to two locations when actuated. Opening either front door causes the seat to operate to a full "back" and "down" position. Closing either front door, with a person in the drivers seat causes the seat to automatically return to the selected "favorite" position. A switch on relay control box under front seat at left side is provided to turn off the seat controls.

OPERATION: By Adjusting Dial Selector Control Switch- Current from power source flows through door jamb switches (with door closed), through the seat bottom switch (when closed) and then to the three control knobs of control switch. If the front vertical control knob is adjusted to operate seat to extreme "up" position, the current flows from switch indicator, through the extreme "up" wire circuit to the left half of the response switch bar, thereby energizing relay "A" which energizes the "up" field coil in the vertical motor, and the front vertical spinning nut solenoid (clutch solenoid). The response switch rotates, due to the connecting link being attached to the seat torque tube, until the gap between switch bars opens the circuit between the feed from control switch to response switch. *NOTE* - This principle is used in all operations of the system.

Automatic Operation: With one of the front doors opened, current from the power source is directed from selector control switch to the automatic circuit which simultaneously energizes the extreme "down" and "back" positions and automatically stops when the gap in each of the response switches opens the circuit. When driver enters the car, sits in driving position on front seat cushion and closes both front doors, the current from power source is directed from the automatic circuit to dial control switch circuit; then the seat operates back to its original position (the position seat was in before driver left car).

Vertical Actuator Motor: Operates front and/or rear edge of seat up and down and is located at the left seat adjuster.

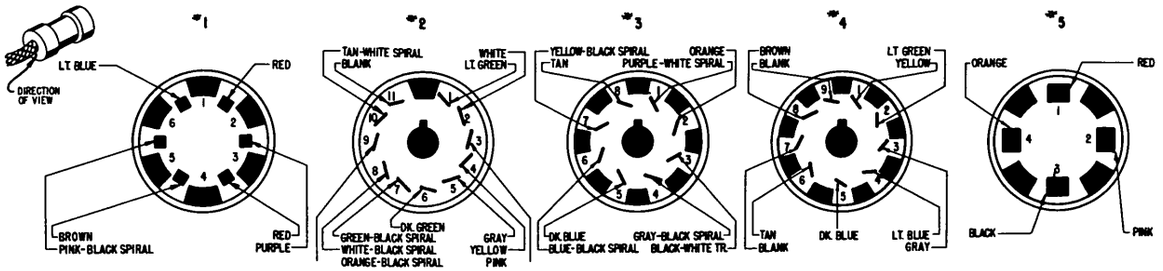
CONTINUED ON NEXT PAGE

CADILLAC ELDORADO BROUGHAM SEAT CONTROL WIRING DIAGRAM
(SEE FOLLOWING PAGE FOR NUMBERED CONTROL PLUGS)

CADILLAC ELDORADO BROUGHAM (Continued)

H rizontal Actuator Motor: Operates the complete seat assembly forward and rearward and is located at the left seat adjuster.

Fr nt Seat Bottom Switch: Controls circuit from power source to selector control switch. The complete system is inoperative when doors are closed and this switch is open (seat unoccupied). This switch is located in the seat spring construction on drivers side of front seat cushions. When driver sits in the seat, the switch is closed.



D or Jamb Switches: Directs current from power source to dial selector control switch when doors are closed, and to the automatic circuit when one or both doors are open.

S at Relay & Response Switch Control Box: This box consists of seven control relays and three response switches. The relays energize actuator motors and spinning nuts (solenoid clutches on jack screws) to operate the seat. Relays must first be energized by current from one of the response switches which in turn is actuated mechanically by linkage connected to the front seat torsion bar. (*NOTE* - There is a response switch for each major movement of seat assembly). Current flows from dial control switch circuit or the automatic circuit, energizing response switches and control relays. The response switch remains energized until feed from power source to relay is broken by action of the response switch mechanical linkage.

Dial Selector Control Switch: Control switch is installed on left front door arm rest and is designed with three switches, each of which energize a particular response switch in the control box. When doors are closed, and the seat bottom switch is actuated (drivers seat occupied), current flows to the three control switches. From control switches, current flows through one side of response switch which energizes the affected relay.

PRE-SELECTION "FAVORITE" SEAT POSITION: (*NOTE* - The seat can also be pre-set for the "favorite" position of a second person. Each of the two persons adjusting the seat to a "favorite" position must choose one color of the two push buttons located above each switch knob to control the seat adjustment, and each person must follow the pre-setting procedure outlined below. Other persons driving the car can manually operate the control knobs to obtain the desired seat position).

Adjustment: Sit in driving position and close both front doors. Choose one color (red or green) for the drivers use in setting controls. Rotate each control knob until arrowhead of the chosen color is lined up with the stationary arrowhead in the outer lens. Depress button of the chosen color behind first control knob, using a dull pointed tool. While holding button down, rotate this control knob until seat is in the desired position. Repeat this procedure with the buttons of the chosen color behind each of the other control knobs.

POWER SEAT CONTROL PLUGS
(AT CONTROL BOX)

CADILLAC ELDORADO BROUGHAM SEAT CONTROL PLUGS

The seat will now return to the "favorite" position of this driver each time he enters the car and indexes the arrowheads of the chosen color.

REMOVAL & INSTALLATION: Front Seat Assembly (Complete) - Remove front seat cushions (see below), then turn back floor carpets to expose pedestal-to-floor pan attaching bolts on each side and remove bolts. Identify wiring for correct installation, then disconnect seat wire harness from seat control box and seat actuator motors and remove complete assembly from body. To install, reverse removal procedure.

Front Seat Cushion, Back & Frame Assembly: Remove seat cushion from seat frame assembly by lifting front edge of cushion upward. Disconnect seat bottom switch wire connectors, then pull cushion forward and remove seat from frame. To remove seat back from frame assembly, remove seat cushion, then remove two screws securing lower edge of seat back to frame. Pull bottom edge of seat back cushion forward and lift upward. Remove back from frame assembly. To remove seat frame from adjusters, remove seat cushion, then remove four bolts securing each seat adjuster to seat bottom frame. Identify wiring for correct installation, then disconnect seat wiring harness from control relay and seat actuator motors and remove frame assembly. To install, reverse removal procedure.

Front Seat Adjuster Assembly: Remove seat assembly (without adjusters and pedestals) from body. Operate seat to a full "up" position. Detach vertical assist spring and remove horizontal anti-chuck spring from adjuster being removed. Support torque tube assembly on side from which adjuster is being removed. Remove three bolts securing torque tube links to adjuster and pedestal. If removing left adjuster, proceed as follows: Remove bolts securing relay box to adjuster, then disconnect wire harness from motor relay and solenoid feed wire from solenoid. If removing right adjuster, remove retaining ring from motor support pin. Disengage adjuster from torque tube links and remove adjuster. If removing left adjuster, remove adjuster and horizontal regulator from body. Remove regulator assembly from left adjuster as a bench operation. To install adjuster, reverse removal procedure.

V rtical Actuator Ass mbly: Operate seat to full "up" position. Remove complete seat assembly with adjusters and pedestal and place upside down on covered bench. Remove retaining ring from motor support pin. Remove anti-creep springs from spinning nut (solenoid clutch) assemblies. Disengage actuator from support pin, and spinning nut assemblies from between torque tube links and remove from body. To remove spinning nut assemblies, see below. To install reverse removal procedure.

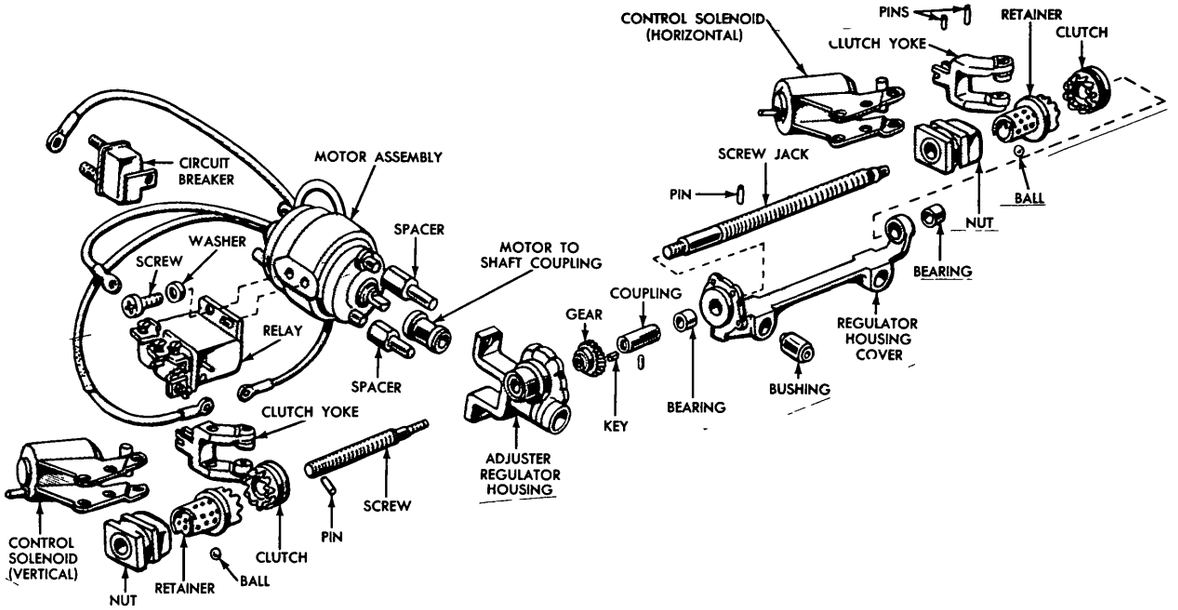
Horizontal Actuator Assembly: Operate seat to full "up" and "rearward" positions. Remove complete front seat assembly with adjusters and pedestal and place upside down on a covered bench. Remove bolts securing torque tube links to spinning nut assembly and disengage anti-creep spring from spinning nut. Remove retaining ring from motor support pin and disengage motor-to-response switch connecting link. Disengage motor from support pin and spinning nut assembly from support; then, remove actuator assembly from seat adjuster. To remove spinning nut assemblies, see below. To install, reverse removal procedure.

Vertical & Horizontal Spinning Nut (S l n id Clutch) Assemblies: Remove actuator assembly, then, as a bench operation, carefully drive roll pins located in front of spinning nut out of jackscrews. Insert drift punch or suitable tool into one of the spinning nut frame mounting holes. Rotate spinning nut frame slowly until drift punch engages in locking notch in spinning nut; then rotate spinning nut until it runs off jackscrew. (*NOTE* - In cases where the motor operates, it may be actuated to rotate the jackscrew while the spinning nut is held stationary). To install spinning nut, reverse removal procedure and note the following: When installing roll pins into jackscrew, install pins so that the center of protruding end of pin is located between threads of jackscrew threads.

Relay & Response Switch C ntr l Ass mbly: Remove seat cushion assembly from seat frame. Identify harness connectors for proper installation then disconnect from relay box. Disengage horizontal response switch connecting link from torque tube. In addition, disengage connecting links at outboard side of relay box from torque tube. Remove three relay box attaching screws and remove box from adjuster assembly. To install, reverse removal procedure and note the following: When connecting harness to relay box, line up key in harness plug with slot on relay plug.

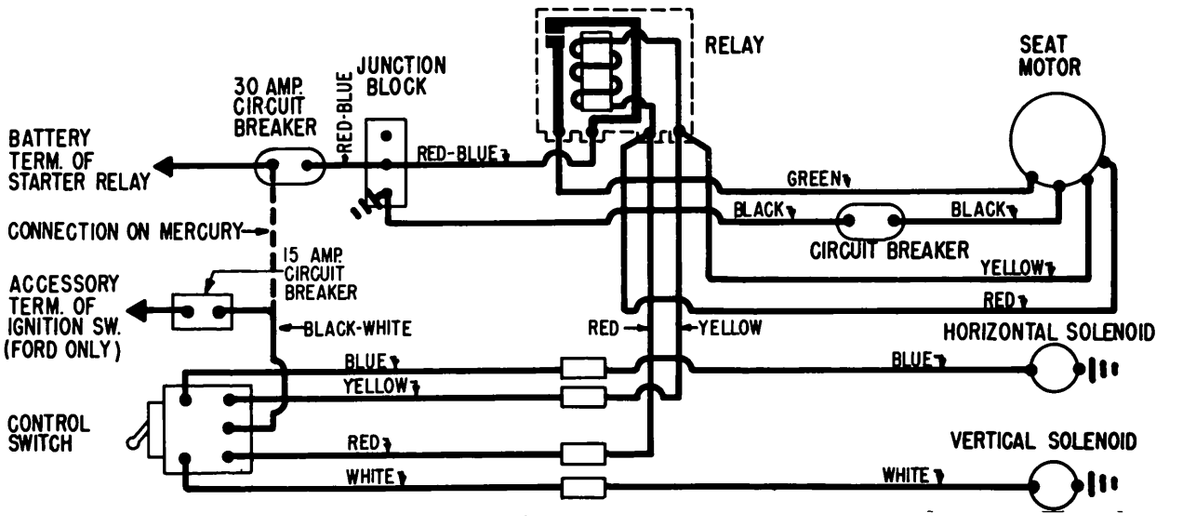
FORD & MERCURY FOUR-WAY SEAT CONTROL

Ford, Exc. Thunderbird (1957).
Mercury (1957).



DESCRIPTION: This 4-Way power seat is operated by a single reversible type electric motor driving two jackscrews. Mechanical type clutches operated by solenoids engage the jackscrews for up and down and fore and aft movement of the seat. Operating the toggle switch located on left side of seat (Ford), left side of instrument panel (Mercury), in the direction of desired seat movement energizes the reversible motor and the proper clutch solenoid.

TROUBLE SHOOTING: Seat Will Not Operate in Any Direction: Check for open circuits in all wires. Check circuit breakers and switches. Check for current at green wire terminal on relay (under seat). If current not available, replace relay. On the ground circuit breaker mounted on motor, ground the terminal which has the wire running into the motor and operate seat switch. If motor runs, either the ground circuit breaker or wire between circuit breaker and junction block is defective. If wiring and circuit breaker are not at fault, replace the motor. Check for faulty operating clutch solenoids.



Seat Operates Opposite Switch: Crossed wires at relay or switch. Check wiring diagram.

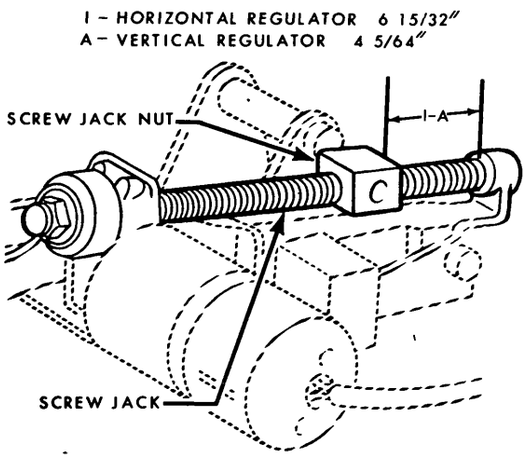
Seat Operates Sluggishly: Binding in seat track or jackscrew. If no binding is evident, disconnect wires from solenoid which will allow motor to run free without any load. Connect an ammeter in series with the ground (black) wire at junction block and operate motor. The no-load current draw should be 8-10 amperes at 12.0 volts. If current is less than specified, replace motor.

REMOVAL & INSTALLATION: *See "Mercury Seat-O-Matic 4-Way Power Seats".*

FORD & MERCURY FOUR-WAY POWER SEAT ASSEMBLY

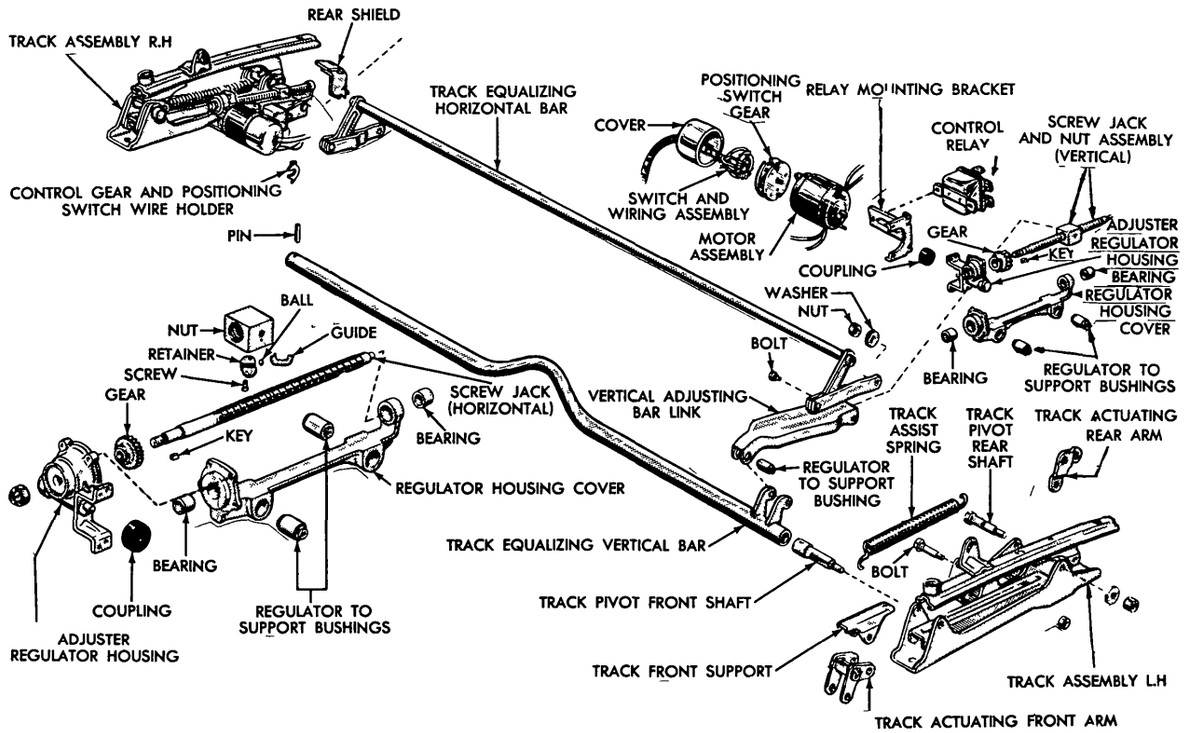
FORD & MERCURY FOUR WAY SEAT CONTROL WIRING DIAGRAM

MERCURY SEAT-O-MATIC SEAT CONTROL



M rcury (1957).

DESCRIPTION: Seat-O-Matic Power Seat consists of two electric motors and jackscrew assemblies operating the seat adjusters for vertical and horizontal movement. An electrical control system automatically positions the seat to one of five vertical, or seven horizontal, preset positions when ignition key is turned to the "On" or "Acc" position. The seat will automatically be moved to the extreme rear position when ignition key is turned to the "Off" position.



OPERATION: The power seat control components operate as follows·

S at Relay: The "easy entry" seat relay is located on the left front fender apron and allows the seat to return to extreme rear position by completing the circuit to No. 7 terminal of horizontal motor seat positioning switch when ignition key is turned to "Off" position. When key is turned to "On" position, the relay completes the circuit to seat horizontal positioning switch which then assumes control and moves seat to a preselected position.

Seat Dial Control Switch: This dial control switch on the instrument panel is a combination of two multiple switches. The horizontal switch incorporates seven contacts and is controlled by the outer bezel. These contacts are labeled "1" through "7" on face of control dial. The No. 1 position places seat furthest forward. The vertical switch contacts are labeled "A" through "E", with the "A" placing the seat in its highest position

"I-A" INDEX POSITION OF SCREW JACK

MERCURY SEAT-O-MATIC POWER SEAT ASSEMBLY

Motor Seat Positioning Switch: Horizontal and vertical seat motor positioning switches are the "wafer" type and are mounted under the seat on the rear of their respective motors and are driven through clock-like gear reduction mechanisms. Wafer switches establish position of seat by interrupting seat regulator control relay circuits when seat reaches a pre-selected position.

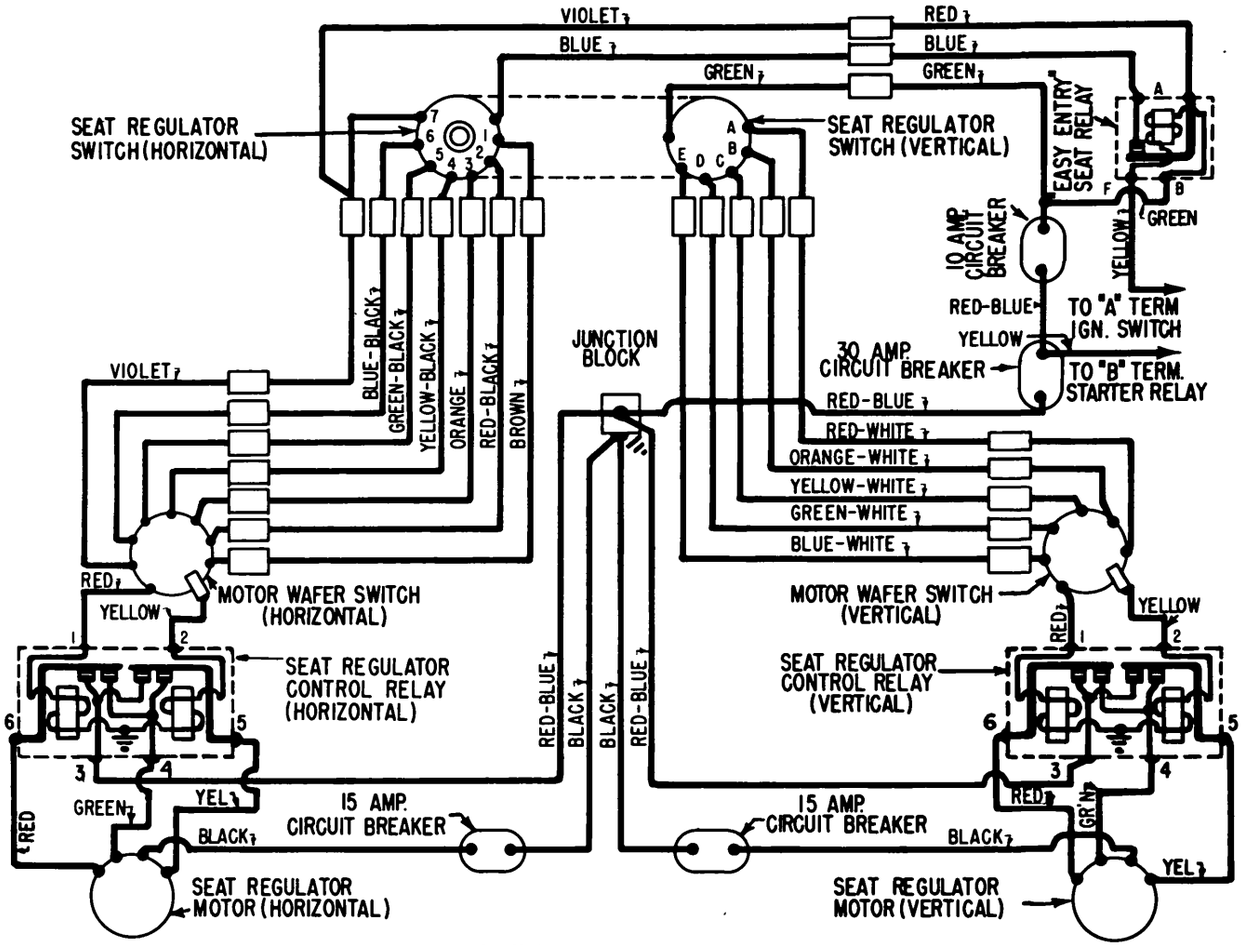
Seat Regulator Control Relay: This relay completes seat regulator motor armature and field circuits as dictated by seat dial control and motor positioning switches.

TROUBLE SHOOTING: *CAUTION* - Should it be necessary to operate seat regulator motor assemblies independently of seat dial control, extreme caution should be taken to prevent extending the seat past normal extreme positions (dial positions "A" or "E" and "1" or "7"). If seat is extended past these positions, the seat track and associated parts will be damaged. *DO NOT use a jumper wire for locating el ctrical troubles.*

Seat Will N t Mov in Any Directi n Wh n Dial C ntr l P siti ns ar Chang d: With a test light or voltmeter, check for current at green wire terminal on "easy entry" seat relay. If current not indicated, replace the 10 amp. circuit breaker. If current is indicated, check for current at the No. 3 terminal at either seat regulator control relay. If no current is indicated at this point, replace the 30 amp. circuit breaker.

Seat Will Not Move Up or Down But Will M v F r and Aft: Check current at terminals No. 2 and No. 5 of vertical regulator control relay with seat control switch in several different positions. If current is available at No. 2 terminal and not at No. 5 terminal, replace seat vertical regulator control relay. If current available at No. 5 terminal, check for current at No. 1 and No. 6 terminals with control switch in several different positions. If current is available at No. 1 terminal and not at No. 6 terminal, replace seat vertical regulator control relay. If current is not available at No. 1 or No. 2 terminals when previous tests are made, check wiring harness and seat control switch for loose connections.

Seat Will Not Move Fore or Aft But Will M ve Up and Down: Remove green wire from terminal on "easy entry" seat relay. Temporarily connect green wire to blue wire terminal. Place vertical seat control switch in various positions to check operation. If seat operates, replace "easy entry" seat relay.



CONTINUED ON NEXT PAGE

MERCURY SEAT-O-MATIC (C n.inued)

REMOVAL & INSTALLATION: Regulator Motor (Seal-O-Matic) - If either of the regulator motors are removed for any reason other than motor failure, the seat should be placed in the "1-A" position before disassembly is made. If either seat motor is replaced because of motor failue, the seat must be positioned manually in the "1-A" position by locating the horizontal regulator screwjack nut 6 15/16"; and the vertical regulator screwjack nut 4 5, 64" from end of screwjack (see illustration).

Fr nt S at Ass mbly: R m val - To remove seat cushion and front seat back from the seat tracks as an assembly, proceed as follows: Remove front seat cushion side shields and remove side shield brackets at rear of seat cushion. Remove two nuts securing rear of seat assembly to seat tracks. With seat assembly in forward position, remove two screws securing front of seat assembly to tracks. *(NOTE* - If seat assembly cannot be moved forward due to failure of seat mechanism, remove nut and bolt securing front seat regulator to frame seat and move seat manually). Tilt seat assembly back or remove from car to gain access to seat assembly mechanism.

Installati n - Install front seat assembly over seat tracks with rear studs on tracks inserted in seat cushion frame holes. Connect front seat regulator link to seat cushion frame bracket with nut and bolt. Install two nuts to secure rear of seat assembly to seat tracks. *(NOTE* - On "4-Way" seats, place two spacers on front of seat tracks over screw holes). Install two screws to secure front of seat assembly to tracks. Install side shield brackets and front seat cushion side shields.

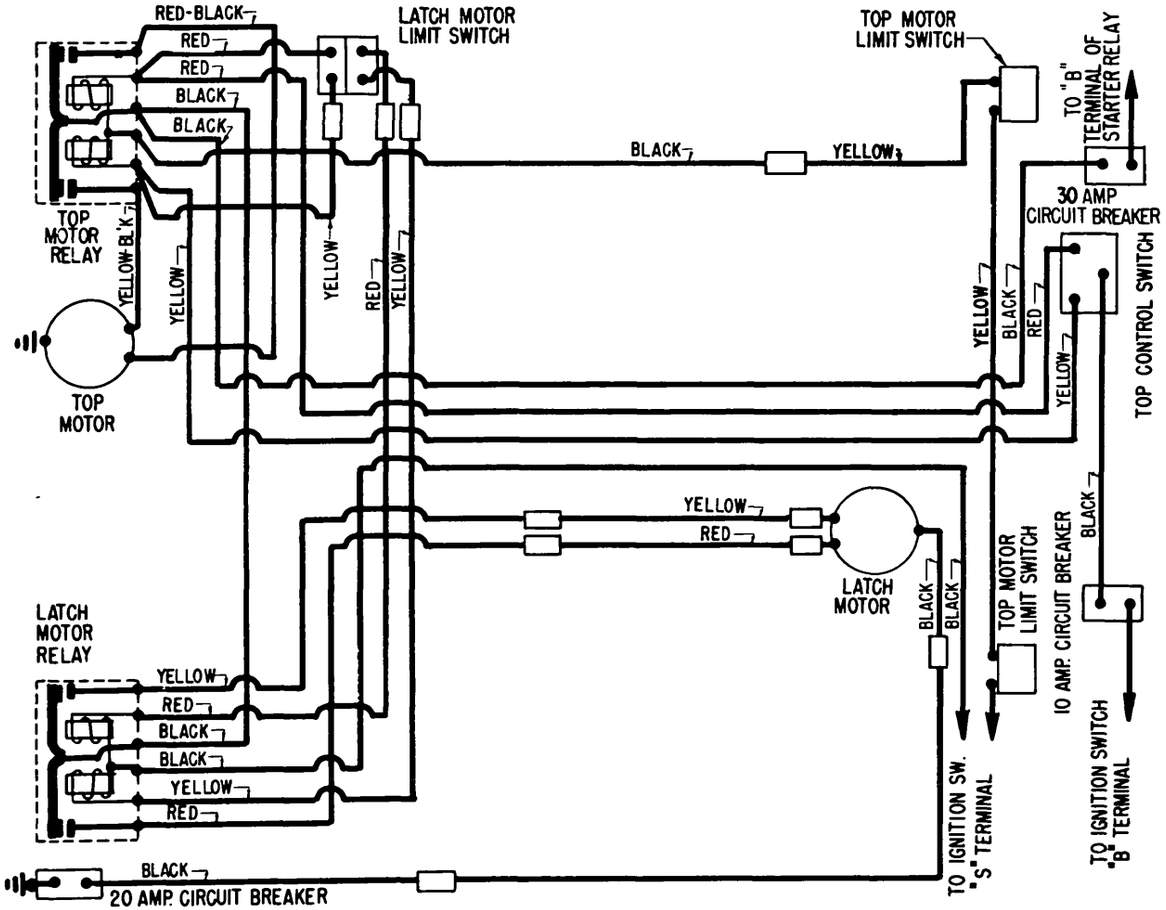
MERCURY SEAT-O-MATIC WIRING DIAGRAM

LINCOLN POWER TOP & LATCH CONTROL

Lincoln (1957)

►CHANGES, CAUTIONS, CORRECTIONS

►*TRANSMISSION ASSEMBLY PRODUCTION CHANGE & CORRECTION:* When shaft pulls out of early production type transmission assembly, replace with new type transmission assembly Part No. BY-7653504-1-A now used in production.



DESCRIPTION: Power Top Control – Hydraulic-electric type. System consists of an electric motor, hydraulic pump, and two hydraulic cylinders. A valve and port assembly directs flow of fluid in the system. The electric motor is controlled through a circuit breaker, limit switches, control switch, and relay.

T p Locking Mechanism – Consists of an electric motor and two transmission assemblies which are connected to and driven by the motor through two casing and cable assemblies. These two components are located in the No. 1 top bow and engage and lock into two lock nut housing assemblies which are attached to the inside of the windshield header bar. Locking mechanism is controlled automatically by a limit switch mounted in the left rear top linkage stack compartment.

ADJUSTMENTS: The following adjustments should only be made after top stack adjustment is correct. *Do not overheat motor while making adjustments.*

L cking Mechanism Limit Switch: Adjust limit switch, located in left rear quarter, so locking motor will start just before the No. 1 bow contacts the windshield header bar. Make sure it will operate the motor in the up direction, too.

L cking Mechanism Nut Housing: Nut housing can be adjusted up and down and slightly from side to side with respect to windshield header bar. In addition, it can be given a certain amount of tilt to rear by installing caster shims between windshield header bar and locknut boss on the nut housing. Locknuts should freewheel or ratchet.

LINCOLN POWER TOP & LATCH CONTROL WIRING DIAGRAM

Locking Mechanism Transmission Assembly: Transmission assembly can be moved fore and aft with respect to No. 1 top bow because of floating tapping plate installation and slotted holes.

Locking Mechanism Locking Screw: Can be adjusted for length by first loosening Allen setscrew in hex head and then turning screw transmission shaft until desired length is obtained. *CAUTION* - Do not attempt any trial locking of top unless Allen setscrew is properly tightened.

MOTOR & PUMP ASSEMBLY (POWER TOP): *See "Power Operated Top Motor & Pump (Rotor Type)".*

CHECKING FLUID LEVEL: *See "Auto-Lite Electric Top Control".*

SERVICE PARTS: Power Top M t r – Lincoln No. B6A-15667-A.
Locking Mechanism Motor - Lincoln No. FDR-15690-A.

FORD RETRACTABLE HARDTOP

Ford (1957)

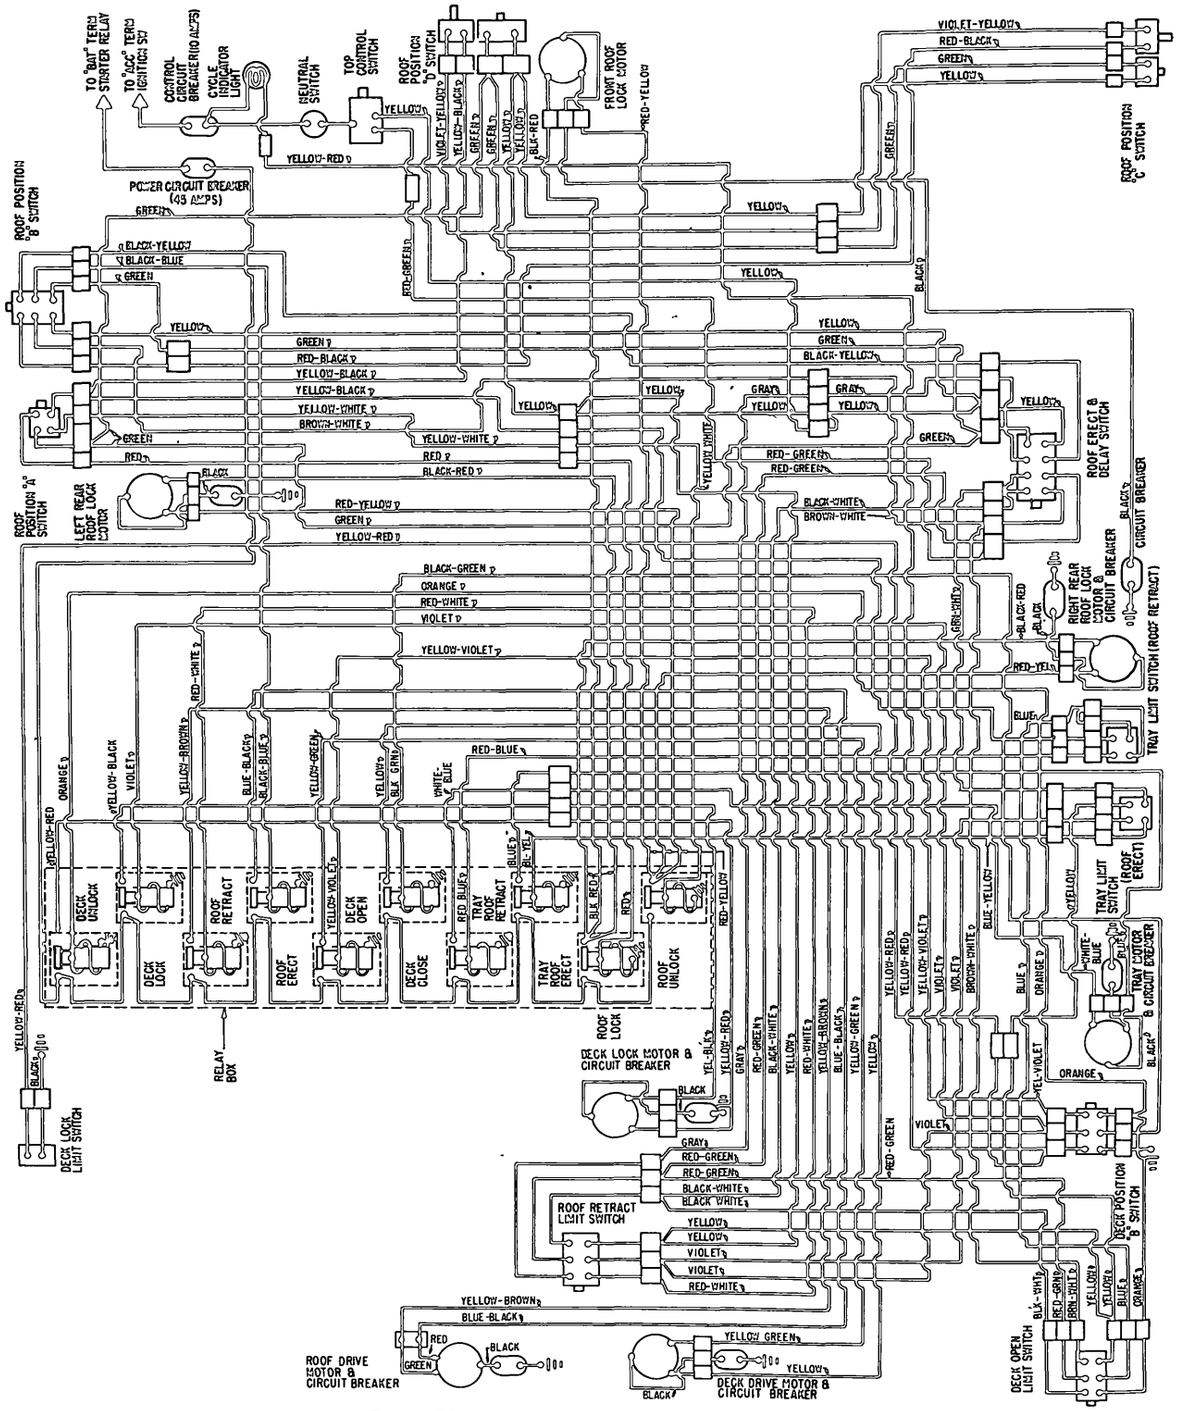
▷CHANGES. CAUTIONS. CORRECTIONS

▷*RETRACTABLE HARDTOP OPERATION CAUTION: DO NOT retract or raise top with the car in motion. To operate top, stop car, place transmission in neutral position before operating top control switch on instrument panel.*

DESCRIPTION: The retractable hardtop has a complete metal roof assembly which may be lowered into luggage compartment automatically through electric power mechanical linkage. The electrical system includes seven reversible motors, ten power relays, eleven limit switches, an actuating switch and a cycle indicator light. Circuit breakers in control circuit feed, motor feed circuits, and in each motor ground feed protect the system. A neutral switch mounted on steering column prevents operation of top when transmission is in any drive range. A three-position spring loaded switch on the instrument panel automatically returns to the "OFF" (Center) position when switch plunger is released.

OPERATION: Retract Cycle - *NOTE - This cycle starts with roof in erected position and deck lid closed and locked.*

Deck Lid Unlock - With top control switch in retract position, current flows through roof erect and delay switch, deck open limit switch, and deck unlock power relay, actuating the deck lock motor which unlocks the deck lid through two flexible drive shafts.



Deck Lid Opening - Mechanical motion of unlocking deck lid actuates the deck position "B" switch and deck lock limit switch allowing current to flow to deck open power relay, actuating deck motor. As deck lid reaches open position, mechanical motion of deck actuates deck open limit switch stopping deck lock motor and deck drive motor

Package Tray Extend - The actuation of deck open limit switch by the deck (which opens deck motor and deck lock motor circuits) also closes a second set of contacts in deck open limit switch allowing current to flow through tray limit switch (roof retract cycle) to tray power relay (roof retract cycle), actuating tray motor and extending package tray so it is parallel with deck lid. As tray reaches the parallel position, it opens the tray limit switch (retract cycle), stopping tray motor.

Roof Unlock - When tray limit switch (retract cycle) is opened by package tray, another set of contacts in limit switch close, allowing current to flow through roof position "A" switch, to unlock power relay, actuating roof front lock motor and two roof rear lock motors. These motors drive power lock, two at the header and one at each roof quarter, unlocking the roof.

Roof Retract - As roof is raised by the roof locks, the roof position "D" switch, "C" switch, "B" switch, and roof erect & delay switch are actuated, allowing current to flow through roof retract power relay and actuate the roof motor, retracting the roof. When roof is raised approximately 4" off locks, the rear roof left power link actuates the roof position "A" switch and stops roof lock motors. As roof retracts, front portion of roof is folded under rear roof by means of mechanical

CONTINUED ON NEXT PAGE

FORD RETRACTABLE HARDTOP WIRING DIAGRAM

FORD RETRACTABLE HARDTOP (Continued)

linkage. When roof reaches fully retracted position, the roof retract limit switch is actuated, stopping the roof motor.

D ck Lid Close & Lock - As roof retract limit switch opens, another set of contacts in this switch closes allowing current to flow to deck lock power relay through deck position "B" switch to deck close power relay - actuating deck lid and deck lock motors, closing the deck lid and locking it. As deck lock screws draw deck lid down, the deck position "B" switch is opened, stopping the deck motor. When deck is fully locked, deck position "B" switch and deck lock limit switch are actuated, turning off the cycle indicator light, indicating that deck lid is fully locked and that top control switch can be released, shutting off the deck motor.

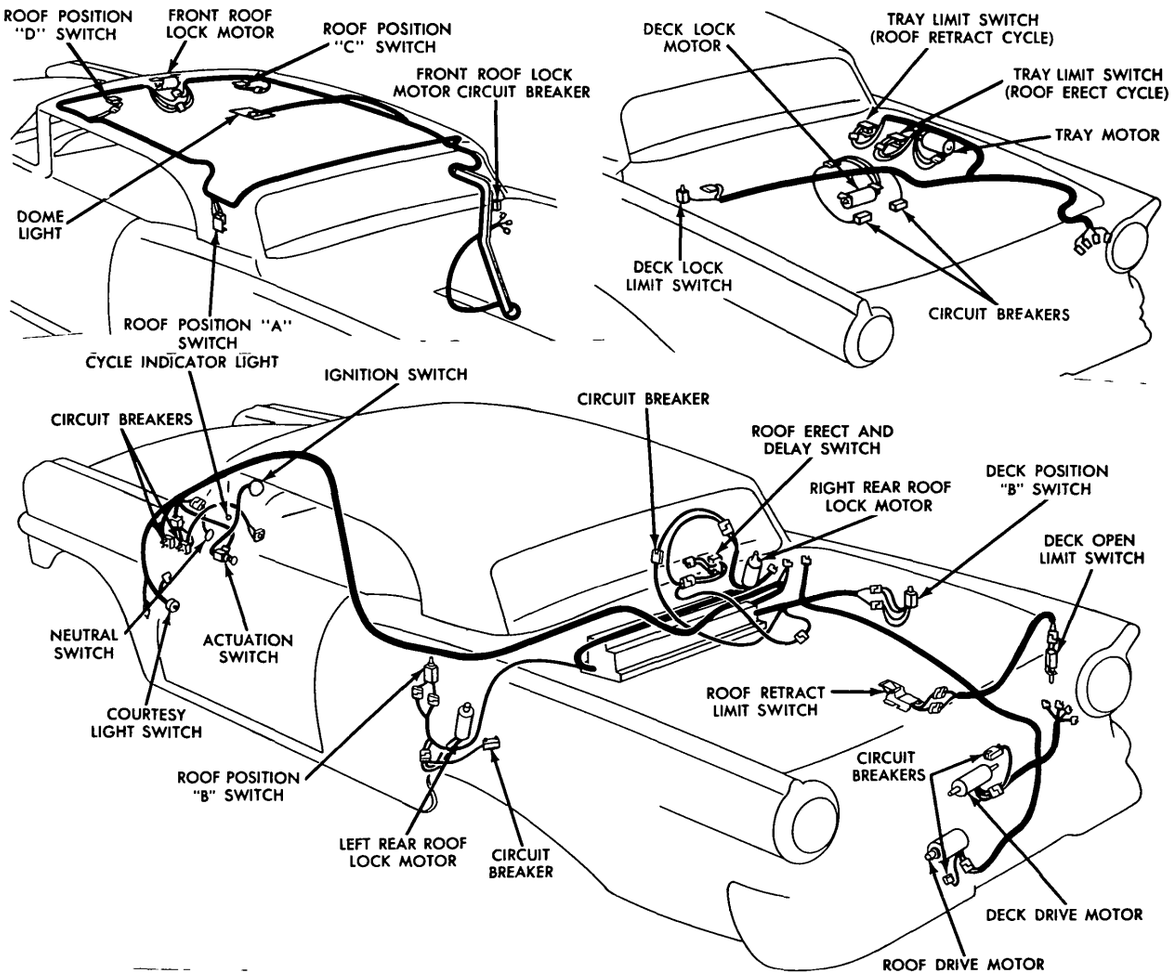
Er ct Cycle: *NOTE - This cycle starts with roof in lugg ag compartment and deck lid closed and locked.*

D ck Lid Unlock - With top control switch in erect position, current flows through roof retract limit switch, deck open limit switch, to deck unlock power relay actuating the deck lock motor and unlocking the deck lid.

D ck Lid Opening - As deck lid is unlocked, the deck position "B" switch and deck lock limit switch closes, allowing current to flow to cycle indicator light. At the same time, other contacts in deck position "B" switch close allowing current to flow to deck open power relay, actuating the deck motor, which opens the lid. As deck lid reaches fully open position, it opens the deck open limit switch, stopping deck lock motor and deck motor.

R of Erect - When the deck open limit switch opens, another set of contacts in the same switch close. This allows current to flow through roof position "B" switch (middle contacts) to roof erect power relay, actuating the roof motor, and erecting the roof. As roof reaches erect position, middle contacts of roof position "B" switch are opened, stopping the roof motor.

R of Lock - When roof reaches a position approximately 4" above the roof locks, the roof position "A" switch closes allowing current to flow through four parallel switches to roof lock power relay, actuating the three roof lock motors. When the left rear lock engages, the roof position "B" switch middle contacts open, stopping the roof motor (erect cycle). The motion of roof locking also opens the roof erect and delay switch (contacts farthest from plunger), roof position "C" switch, roof position "D" switch, and roof position "B" switch (contacts farthest from plunger). When all four of these paralled switches are opened, the roof lock power relay is de-energized, stopping the three roof lock motors.



Package Tray Fold - As roof reaches erect position, it also closes roof erect and delay switch (contacts closest to plunger), allowing current to flow through tray limit switch (roof erect cycle) to tray power relay (roof erect cycle) actuating the tray motor. This motor folds tray under the deck lid. When tray is completely folded, tray limit switch (roof erect cycle) is opened stopping the tray motor.

D ck Lid Cl s And L ck - As package tray is folded, a second set of contacts in tray limit switch (roof erect cycle) are closed, allowing current to flow to deck lock power relay and also through deck position "B" switch (middle contacts) to deck close power relay. These two power relays actuate deck lock motor and deck motor, closing and locking the deck lid. As deck lid reaches closed position, the deck position "B" switch (middle contacts) are opened, stopping the deck motor. As deck locks pull deck lid to locked position, the deck position "B" switch (contacts farthest from plunger), and deck lock limit switch are opened. This turns off cycle indicator light showing operator that cycle is completed and that top control switch can be released, stopping the deck lock motor.

EMERGENCY MANUAL OPERATION: Unlocking Deck Lid - If deck motor fails to operate and it is necessary to gain access to motor, proceed as follows: Place a floor jack under frame rear crossmember and raise car approximately 9". From underside of wheelhouse, remove deck lid lock retaining screws (one on each side). Lift front edge of deck lid about 1", then operate the top control switch to complete opening of deck lid.

Opening Deck Lid: Unlock deck lid by operating top control switch. If deck lid will not operate, unlock deck lid manually (see above). From underneath lower back panel, remove deck lid lirt jack retaining screws (two on each side). *(CAUTION* - Have a helper hold deck lid down while removing the screws, then raise deck lid just far enough so that clevis pins can be removed from top of lift jacks. This must be done to avoid damage to flexible shafts). Complete opening of deck lid manually. *NOTE* - If deck lid locks have been released from wheelhousings, the nut and housing portion of locks will remain attached to deck lid.

CONTINUED ON NEXT PAGE

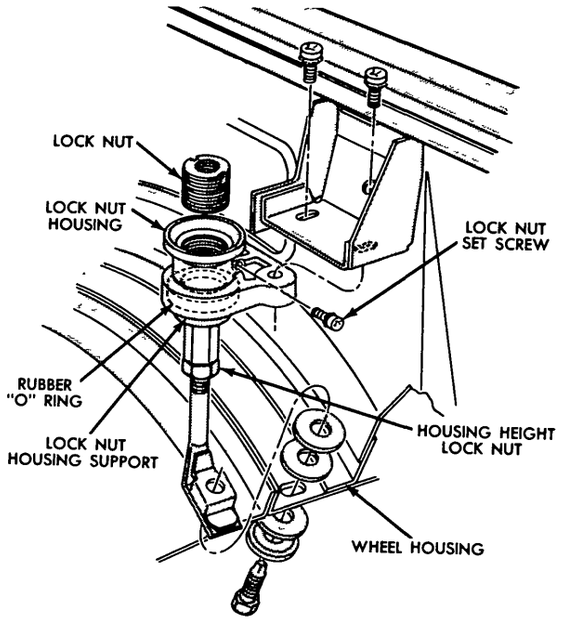
FORD HARDT P M TOR & SWITCH L CATI NS

FORD RETRACTABLE HARDTOP (Continued)

Erecting Roof: Open deck lid. Lift forward edge of roof slightly (about 5") and block it in position. Remove roof lift jack-to-roof lift arm bolts. Complete roof erection to the point of roof lock engagement.

Unlocking Roof: *(NOTE* - If locks fail to operate when top is erected, it will be necessary to manually release locks in order to retract roof far enough to remove lock assemblies as follows): Remove windshield upper garnish mouldings, then remove roof lock-to-header screws (two on each side) which can be removed through the access holes in header. This will release locks from header, and locks will remain attached to roof. Remove center panel from roof front section and disconnect header lock motor wires. Manually lift roof at header, then pull out top control switch to continue the retract cycle.

Releasing Quarter Lock - Remove roof quarter trim panel and retainer. Remove two lock-to-roof retaining screws. *(NOTE* - Clearance is provided between quarter panel and roof panel so screws can be removed with a box wrench). This will release lock from roof and lock will remain attached to quarter panel. Disconnect wires from motor, then manually lift rear of roof at both sides. Pull out top control switch to continue retract cycle.



TROUBLE SHOOTING & DIAGNOSIS

►*DIAGNOSIS NOTE:* Make sure that battery is fully charged. To determine if control circuit is at fault, operate basic motor power circuit of that portion of system that does not operate. Any of the ten basic circuits can be operated by energizing the applicable power relay directly by connecting a wire from hot or common terminal of relay to relay actuating terminal (all relays are housed in a metal box behind rear seat back and are identified as indicated below). Before bypassing a relay, make sure that motor is not stalled against a jammed lockscrew, or running free due to a broken flexible shaft. If bypassing a control circuit does not operate the motor, and no mechanical failure is evident, the power relay may be at fault. Check power relay by connecting a jumper wire from hot terminal of relay to motor feed side of relay. Check circuit breaker in motor ground circuit and in power circuit.

►*STUCK RELAY NOTE:* If a motor continues to run after a particular portion of cycle has been completed, and releasing the top control switch does not stop the motor, a stuck power relay is indicated. Disconnect battery, then replace relay.

►*RELAY IDENTIFICATION NOTE:* Ten relays (five mounted vertically and five horizontally) are enclosed in a metal box behind back of rear seat. With cover removed and looking down on relays (facing rear of car), their location from **left to right** are as follows: (1) - Deck Unlock. (2) - Deck Lock. (3) - Roof Retract. (4) - Roof Erect. (5) - Deck Open. (6) - Deck Close. (7) - Tray (Roof Retract Cycle). (8) - Tray (Roof Erect Cycle). (9) - Roof Lock. (10) - Roof Unlock.

DECK LID WILL NOT UNLOCK (ONE SIDE) Check flexible drive shaft and deck lock assembly.

FORD RETRACTABLE HARDTOP DECK LID LOCK ASSEMBLY

DECK LID WILL NOT UNLOCK (BOTH SIDES): Check the following: Control circuit breaker and power circuit breaker. Neutral switch. Top Control Switch. Deck unlock power relay. Deck open limit switch (the contacts closest to plunger). Roof retract limit switch contacts farthest from plunger (on retract cycle). Roof erect and delay switch contacts second from plunger (on erect cycle). Deck lock motor and circuit breaker. Deck lock flexible drive shafts and lock assemblies.

DECK LID UNLOCKS WITH CYCLE INDICATOR LIGHT OUT: Check the following: Cycle indicator light. Deck position "B" switch (contacts closest to plunger initiate deck motor when deck lid is locked).

DECK LID UNLOCKS, BUT WILL NOT OPEN: Check the following: Deck open power relay. Deck position "B" switch (contacts closest to plunger initiate deck motor when deck lid is locked). Deck motor and circuit breaker. Deck lid flexible drive shafts. Deck lid lift jacks.

DECK LID OPENS OR CLOSES ERRATICALLY: Check deck lid assist springs.

DECK LID OPENS, BUT MOTOR WILL NOT STOP: Check the following: Deck open limit switch (contacts closest to plunger opens circuit to deck open power relay). Deck open power relay. Deck unlock power relay.

DECK LID WILL NOT CLOSE: Roof Retract Cycle - Check the following: Roof retract limit switch (middle contacts initiate the deck close cycle). Deck position "B" switch (middle contacts). Deck motor and circuit breaker. Deck lid flexible shafts. Deck lid lift jacks. **Roof Erect Cycle** - Tray limit switch (roof erect cycle); contacts farthest from plunger initiate deck close cycle. Deck position "B" switch (middle contacts). Deck motor and circuit breaker. Deck lid flexible drive shafts. Deck lid lift jacks. Deck close power relay.

DECK LID CLOSES, BUT WILL NOT LOCK: Check the following: Deck lock motor and circuit breaker. Deck lock power relay. Deck lock flexible drive shafts. Deck lock assemblies.

DECK LID CLOSES, BUT MOTOR WILL NOT STOP: Check the deck position "B" switch (middle contacts open circuit to deck power close relay as the lock engages).

DECK LID LOCKS WITH CYCLE INDICATOR LIGHT ON: Check the following: Deck position "B" switch (contacts farthest from plunger together with deck lock limit switch energize the cycle indicator light). Deck lock limit switch.

TRAY WILL NOT EXTEND: Check the following: Deck open limit switch (middle contacts initiate tray extend cycle). Tray limit switch (roof retract cycle); contacts closest to plunger. Tray motor and circuit breaker. Tray transmission. Tray power relay (roof retract cycle).

TRAY EXTENDS, BUT MOTOR WILL NOT STOP: Check the following: Tray limit switch (roof retract cycle); contacts closest to plunger limit tray extend travel). Tray power relay (roof retract cycle).

TRAY WILL NOT FOLD: Check the following: Tray motor and circuit breaker. Tray limit switch (roof erect cycle); contacts closest to plunger. Tray transmission. Tray power relay (roof erect cycle). Roof erect and delay switch (contacts closest to plunger initiate tray fold cycle).

TRAY FOLDS, BUT MOTOR WILL NOT STOP: Check the following: Tray limit switch (roof erect cycle); contacts closest to plunger limit tray fold travel. Tray power relay (roof erect cycle).

REAR ROOF LEFT LOCK WILL NOT OPERATE: Check the following: Roof left lock motor and circuit breaker. Roof lock flexible drive shaft. Roof lock assembly.

REAR ROOF RIGHT LOCK ONLY WILL NOT OPERATE: Check the following: Roof right lock motor and circuit breaker. Roof lock flexible drive shaft. Roof lock assembly.

FRONT ROOF LOCKS ONLY (ONE OR BOTH WILL NOT OPERATE): Check the following: Roof front lock motor and circuit breaker. Roof front lock flexible drive shafts. Roof front lock assemblies.

ROOF WILL NOT UNLOCK (ALL LOCKS): Check the following: Tray limit switch (roof retract cycle); the contacts farthest from plunger initiate roof unlock cycle. Roof position "A" switch (contacts with yellow wires). Roof unlock power relay.

ROOF UNLOCKS, BUT WILL NOT RETRACT: Check the following: Roof motor and circuit breaker. Roof retract limit switch (contacts closest to plunger). Roof flexible drive shafts. Roof lift jacks. Roof retract power relay. Roof position "D" switch (switch with the long plunger). Roof position "C" switch (switch with the long plunger). Roof position "B" switch (contacts closest to plunger). Roof erect and delay switch (third set of contacts from plunger).

ROOF PANEL WILL NOT FOLD OR UNFOLD: Check front roof power linkage.

ROOF WILL NOT ERECT: Check the following: Deck

CONTINUED ON NEXT PAGE

FORD RETRACTABLE HARDTOP (Continued)

open limit switch (contacts farthest from plunger initiate roof cycle). Roof erect power relay. Roof position "B" switch (middle contacts). Roof motor and circuit breaker.

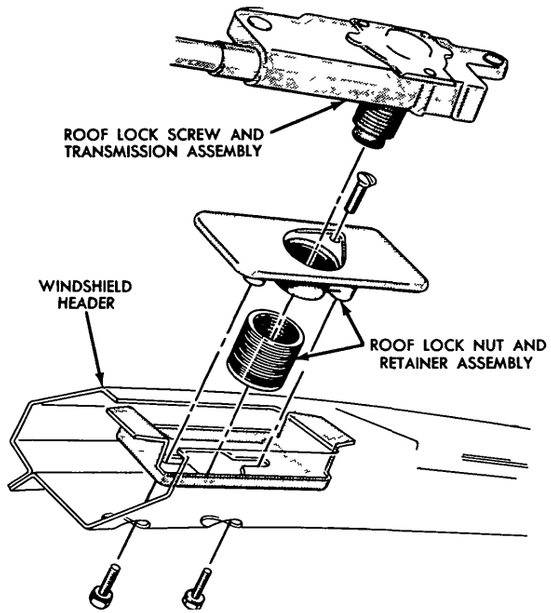
ROOF ERECTS, BUT WILL NOT LOCK (ALL LOCKS): Check the following: Roof position "A" switch (contacts with red and green wires attached, initiate the lock cycle). Roof lock power relay.

ROOF MOTOR WILL NOT STOP: Roof retract cycle - Check roof retract limit switch (contacts closest to plunger limits roof retract travel). Roof retract power relay.

R f Erect Cycle - Roof erect power relay. Roof position "B" switch (middle contacts stop roof motor when locks engage).

ROOF LOCK MOTORS WILL NOT STOP: Roof lock power realy. Roof position "B" switch (contacts farthest from plunger). Roof erect and delay switch (contacts farthest from plunger). Roof position "C" switch (switch with short plunger). Roof position "D" switch (switch with short plunger). Check roof and roof lock alignment, since misalignment can result in binding and stalled locks.

ADJUSTMENT



NEUTRAL SWITCH: Located on steering column back of instrument panel. Tighten switch actuator and place transmission selector lever or gear shift in neutral. Rotate switch and bracket assembly against actuator with a 1/64" shim held between actuator and switch plunger. Push switch firmly to the end of its travel and tighten mounting screws.

DECK LOCK LIMIT SWITCH: Adjust limit switch so contacts open when there is .045" clearance between male and female lock parts as follows: Disconnect deck position "B" switch wires at a wiring connector. Using an extra locknut, screw on the left deck lock screw to a point of ratchet. Turn ignition switch to "ACC" position and then, back off the locknut from the ratchet point until cycle indicator light comes on. The deck lock limit switch should be adjusted so that the light comes on one-half turn from the ratchet point.

DECK OPEN LIMIT SWITCH: With deck lid in fully open position, place a .100" shim between switch plunger and the actuator on hinge. Adjust switch firmly against shim with the plunger fully depressed, then tighten switch mounting screws.

TRAY LIMIT SWITCH (ROOF ERECT CYCLE): With package tray folded to stall point of motor, place a .100" shim between end of switch plunger and actuator part of tray support arm. Then, push the switch to end of its travel against actuator and tighten switch mounting screws.

TRAY LIMIT SWITCH (ROOF RETRACT CYCLE): With package tray extended to stall point of tray motor against tray stops, insert a .100" shim between tray switch actuator (roof retract cycle) and the end of tray switch plunger. Move actuator toward tray switch (roof retract cycle) until plunger is completely depressed, then tighten actuator attaching screws.

FORD RETRACTABLE HARDTOP ROOF HEADER LOCK ASSEMBLY

ROOF RETRACT LIMIT SWITCH: With roof completely retracted and firmly on wheelhouse boots, place .100" shim between actuator and the roof control link. Adjust roof retract limit switch and housing forward to limit of its travel, then tighten switch mounting screws.

DECK POSITION "B" SWITCH: Actuator Adjustment - A special tool, Ford No. T57P-15780-A, is required to adjust deck position "B" switch actuator. Position the tool over lockscrew using the 5/8" hole in tool. Press tool firmly against lockscrew shoulder and pivot the tool to line up with deck position "B" switch actuator. Using pliers, bend actuator until it just touches raised portion of tool.

Switch Adjustment: After adjusting switch actuator, adjust switch as follows, using the same tool. It will be necessary to operate the deck lock limit switch by inserting a small screwdriver between the switch plunger and the actuator as the cycle light will not go out until both the deck lock limit switch and deck position "B" switches are actuated. Press tool firmly into locknut and slide switch upward until cycle indicator light goes out. Then, tighten switch mounting screws. *NOTE* - If operation of deck lid discloses that cycle indicator light does not go out when deck lid is fully closed and the locks are ratcheting, or if deck lid "pops" up when opening, the deck position "B" switch actuator may be bent very slightly downward.

ROOF ERECT & DELAY SWITCH: Use an extra rear roof lock stationary screw for this adjustment. *(NOTE* - An existing rear roof lock stationary screw can be removed from the car and used, but be very sure to measure the length of exposed threads before removal so that screw may be installed to its original position). Install lockscrew into rear roof locknut to the ratchet point. With a self powered test light, connect the lead to the contacts farthest from switch plunger on roof erect and delay switch, then back out the lockscrew until light comes on. *(NOTE* - Switch should be adjusted so that light comes on one-half turn from the ratchet point).

ROOF POSITION "B" SWITCH: Adjust this switch in same manner as for Roof Erect & Delay Switch (see above).

ROOF POSITION "C" SWITCH & "D" SWITCH: *(NOTE* - These switches each have two switches mounted side by side, functioning as one switch. One switch, with short plunger, is used for the front roof lock circuit, and the other switch, with long plunger, is for the roof motor circuit). Remove lock screw and switch assemblies from roof front section. Attach a self powered test light to front roof lock circuit switch. Use a spare locknut screwed on lock screw to the point of ratchet, then back off the locknut until test light goes on (light should go on at one-half turn from ratchet point). If light goes on before one-half turn, move switch away from linkage; if light goes out after one-half turn, move switch toward linkage. On the roof motor circuit switch, with long plunger, which is used only on the roof retract cycle, the light should go on one full turn before the lockscrew threads disengage. Adjust roof motor switch as necessary, then recheck roof lock switch. *(NOTE* - Actuator pin and switch linkage must be free to assure full return of switch plunger).

ELECTRICAL SPECIFICATIONS

OPERATING CURRENT DRAW: Measured at starter relay terminal with a fully charged battery.

Roof Retract Cycle

Operation	Current Draw
Deck Unlock	16–24 amps.
Deck Open (with deck unlocked)	36–48 amps.
Tray Extend	22–28 amps.
Roof Unlock	60–75 amps.
Roof Retract	8–30 amps.
Deck Close	36–48 amps.
Deck Lock	16–24 amps.

Roof Erect Cycle

Operation	Curr nt Draw
Deck Unlock	16–24 amps.
Deck Open (with deck unlocked)	36–48 amps.
Roof Erect (lift from compartment)	20–40 amps.
Roof Erect (moving roof forward)	10–25 amps.
Roof Locking & Tray Folding	80–120 amps.
Deck Close	36–48 amps.
Deck Lock	16–24 amps.

NO LOAD CURRENT DRAW: With all drive shafts disconnected except for tray motor.

Motor	Current Draw
All (except Roof Motor)	16–23 amps.
Roof Motor	10 amps.

CIRCUIT BREAKERS: Various capacities used as follows:

Circuit	Capacity
Control Circuit	10 amps.
Motor Power Circuit	45 amps.
Roof Motor Ground Circuit	20 amps.
All Other Motor Circuits	15 amps.

G.M. HYDRO-LECTRIC

Buick (1957)
Cadillac (1957)
Chevr l t (1957)
Oldsmobile (1957)
P ntiac (1957)

DESCRIPTION: Similar in design and operation to models previously used. System is a sealed unit and is not vented to the atmosphere, making it unnecessary to replace hydraulic fluid periodically. System is "self-air bleeding". Should air become trapped in lines due to replacement of hydraulic units, a few operational cycles of the top will expel trapped air into reservoir.

CHECKING FLUID LEVEL: With top in raised position, disconnect positive or negative battery cable. Remove pump and motor shield, in rear compartment, and place absorbent material below reservoir. Remove filler plug from reservoir. On motor and pump assemblies installed horizontally, fluid should be at lower edge of filler cap hole. If fluid low, add hydraulic fluid Delco No. 11 (GM Hydraulic Brake Fluid Super No. 11).

REPLACING FLUID (Aft r Repairs): Cylinders and hydraulic system contains more fluid than one filling of reservoir will supply. Check reservoir frequently during refilling of system. Air in system will automatically bleed out with a few operations of top.

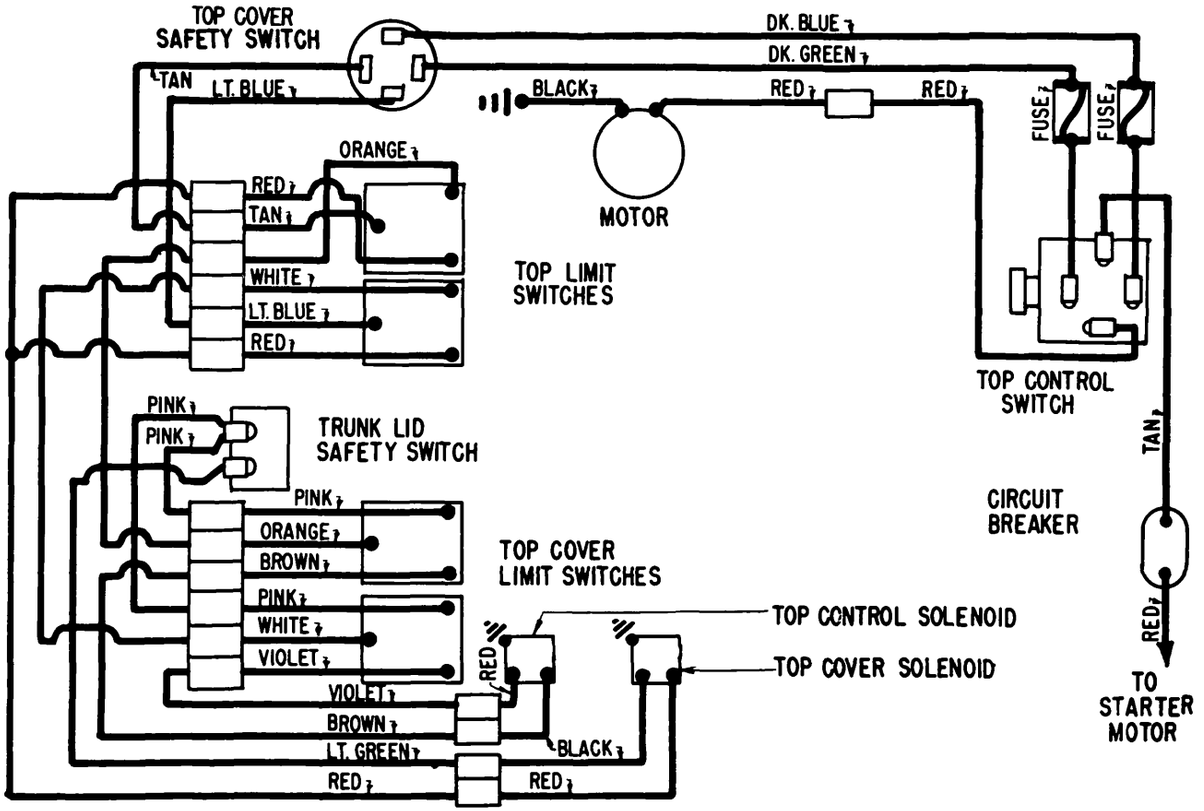
CHECKING HYDRAULIC PRESSURES: Remove motor and pump assembly. Install plug in one port and pressure gauge in port to be checked. Actuate motor with an applied terminal voltage of 9.5-11.0 volts. Gauge should show a pressure between 240 and 280 PSI. Check pressure in other port. *NOTE*–A difference in pressure readings may exist between pressure port for top of cylinders and for bottom of cylinders. This condition is acceptable if both readings are within the limits of 240-280 PSI. If pressure not within specified limits, unit is defective and should be repaired or replaced.

CHECKING OPERATION OF LIFT CYLINDERS: Remove rear seat cushion and folding top compartment side panel assembly. Operate folding top control switch and observe lift cylinders during up and down cycles for these conditions;
1) If movement of cylinder rods is not coordinated or sluggish when motor is actuated, check hydraulic hoses from the motor and pump to cylinders for kinks.
2) If one cylinder rod moves slower than other, cylinder with slow moving rod is defective and should be replaced.
3) If both cylinder rods move slowly, or do not move at all, check pressure of pump. See "Checking Hydraulic Pressures" above.

MOTOR & PUMP ASSEMBLY: *Se "Power Operated Top Motor & Fump (Rotor Type)".*

SERVICE PARTS: Mot r - Part No. 4711912. *NOTE* - Motor replaced as an assembly only.

CHEVROLET CORVETTE



Chevrolet Corvette (1957)

DESCRIPTION: Power operated folding top and folding compartment cover. A safety switch in the rear compartment breaks the folding top circuit and prevents top mechanism from operating while rear compartment lid is open. This prevents damage to finish of either rear compartment or folding top compartment lids. A second safety switch, in the top compartment, prevents operation of the top compartment cover or folding top operating mechanism unless cover is unlatched. Hydraulic motor will run but a by-pass prevents pressure build-up in the system. Raising and lowering operations require about 20 seconds each.

► *CAUTION: Never operate top control without first unlatching top compartment cover.*

OPERATION: Raising The Top - Unsnap top compartment end straps at outer edge of each seat back. Push button located on seat separator panel. This unlatches the folding top compartment and at the same time completes the folding top electrical circuit. *(CAUTION* - Do not attempt to operate top without first unlatching the top compartment cover). **Push** folding top control and hold it in until the folding top compartment-cover opens, the top lifts out, and the cover closes. Push top compartment cover down until it latches. Unhook snap fasteners and allow rear bow to drop. Latch rear bow to the body. Latch header to windshield.

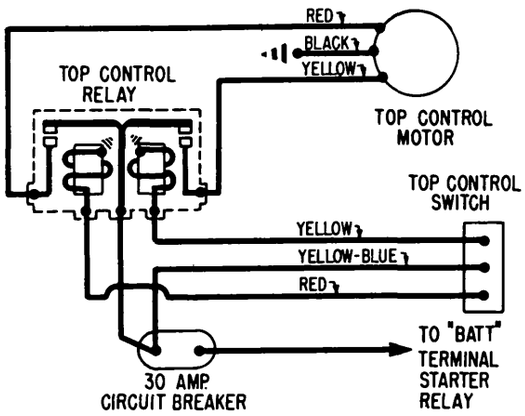
Lowering The Top: Unlatch header and rear bow. Double check to see that all latches are completely free and not caught. Hook rear bow with straps provided. Push button to unlatch top compartment cover. **Pull** the folding top control and hold until top compartment cover opens, the top folds into the compartment, and the cover closes. Push cover to close on latch. Snap top compartment end straps.

CHEVR LET CORVETTE TOP CONTROL DIAGRAM

AUTO-LITE POWER TOP CONTROL

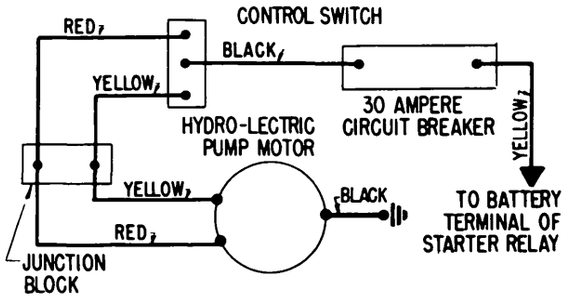
Chrysler & Imperial (1957)
De Soto, Dodge (1957)
Ford, Mercury (1957)
Plymouth (1957)

DESCRIPTION: Hydraulic-electric type. System consists of an electric motor, hydraulic pump and two hydraulic cylinders. A valve and port assembly directs flow of fluid in the system. The electric motor is controlled through a circuit breaker, switch, and on some cars, a relay.



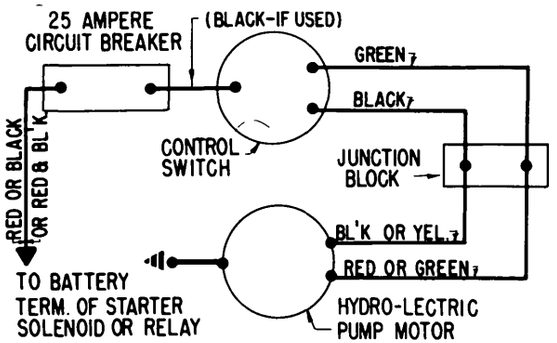
MOTOR & PUMP ASSEMBLY: *See "Power Operated Top Motor & Pump (Rotor Type)".*

CHECKING FLUID LEVEL: Remove rear seat cushion, then proceed as follows:



Ford, Lincoln, Mercury: Loosen filler plug in end of reservoir. Operate top three times to remove all air from system. With top in "UP" position, remove filler plug and check oil level. If hydraulic fluid does not run from filler hole, add enough hydraulic brake fluid to raise level to edge of filler plug hole.

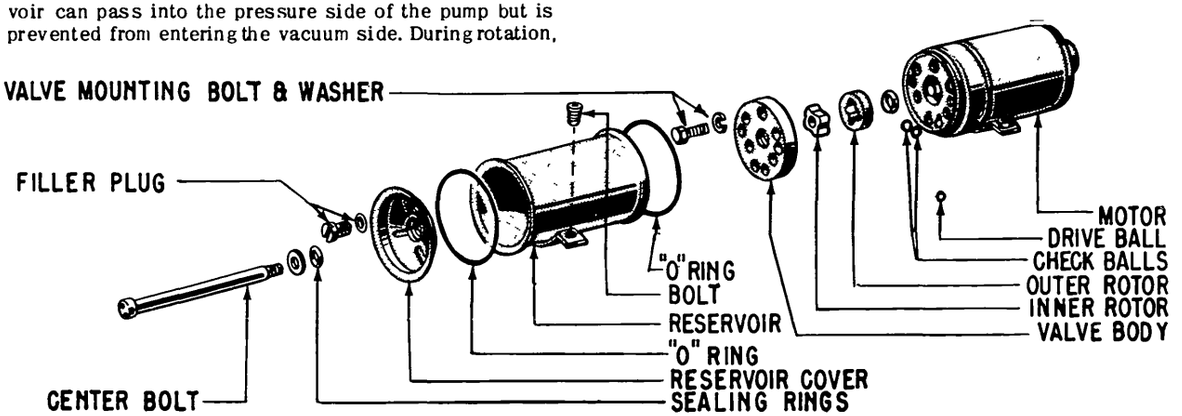
Others: Check fluid level in reservoir. If low, check for a leak due to a broken line or loose connection. Fill reservoir until fluid runs out of filler hole. Use hydraulic brake fluid such as MoPar Super Brake Fluid. After filling reservoir, raise and lower top several times to force out air in system. Always check fluid level when top is "DOWN".



SERVICE PARTS: Motor - (Chrysler, DeSoto, Dodge, Plymouth) Auto-Lite No. EMJ-4104. (Ford, Mercury) Ford or Mercury No. B6A-15667-A. *NOTE* - Motor replaced as an assembly only.

MERCURY TOP CONTROL DIAGRAM

FORD TOP CONTROL DIAGRAM



CHRYSLER, DE SOTO, DODGE, PLYMOUTH TOP CONTROL WIRING DIAGRAM

POWER OPERATED TOP MOTOR & PUMP (ROTOR TYPE)

DESCRIPTION: Motor - 12 Volt, direct current, reversible type. Serviced by replacement.

Pump - Rotor type. Pump housing is attached to motor frame by two through bolts from end cover. The outer rotor fits into the pump housing and the inner rotor revolves within the outer rotor. The pump is connected to the motor armature shaft by means of a drive ball located in a hole in end of armature shaft. The drive ball fits into a groove in the inner rotor. The valve body is mounted to the pump body by five mounting bolts. The reservoir is attached to the valve body by a center bolt which engages threads in center of valve body. Reservoir is sealed at each end with a neoprene "O" ring.

OPERATION: Hydraulic pressure is created by the rotation of the inner rotor gears, and is exhausted through one of two ports in the pump housing. Since motor is reversible, either port may be on the vacuum or pressure side of the pump, depending on direction of pump rotation. When pump rotors turn, hydraulic pressure is created through one side of the pump while the other side of the pump becomes the vacuum side. Two small check valves are seated in the valve housing and are held in place by a fulcrum and lever-type retainer. The vacuum created on the inlet side of the pump pulls the ball against its seat and thus cuts off the reservoir from the inlet side of the pump. This seating action of the ball at the inlet side permits the ball on the other end of the fulcrum to raise off its seat in the outlet side of the pump. At the beginning of pump rotation, fluid from the reservoir can pass into the pressure side of the pump but is prevented from entering the vacuum side. During rotation, excess fluid can pass from pressure side back to the reservoir. When pump rotation is reversed, pressure and vacuum sides are reversed; and the check balls and fulcrum act to make the pressure reversal almost instantaneous.

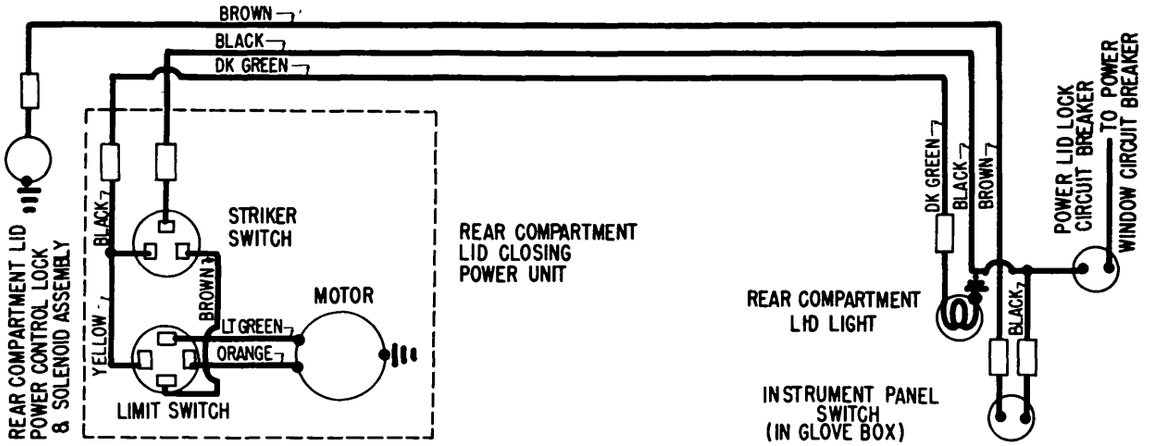
TYPICAL POWERTOP MOTOR & PUMP (ROTOR TYPE)

CADILLAC (EXCEPT BROUGHAM)

Cadillac, Exc pt Br ugham (1957).

DESCRIPTION: Trunk Lid Lock Unit consists of a power-operated closing unit and a solenoid-operated lock assembly. Closing unit fastens to inside of rear end panel at lid lock position. Its 12-Volt motor operates a jackscrew mechanism which retracts and extends trunk lid striker approximately 1". This action creates a pressurized seal between lowered lid and trunk opening. The solenoid operated lock assembly fastens to rear compartment lid at the normal lid lock position and operates like past model lid locks in that it can be unlocked from the outside with a key. In addition, a remote unlocking solenoid permits unlocking the lid from inside body by means of a switch located in glove compartment.

OPERATION: L cking - When trunk lid is lowered manually to a position approximately 1" above closed position, lid lock bolt engages the lock striker and depresses the striker switch, actuating closing unit motor, causing jackscrew to retract striker, pulling lid shut until proper closing pressure seal is reached. At this pressure a spring-loaded limit switch breaks the circuit and stops motor. Lid remains locked until lock assembly is again actuated.



Unl cking - When trunk lid is unlocked by either key or switch, lock bolt is disengaged from the striker, releasing striker switch and completing circuit to reverse action of power closing motor. The motor raises the striker and lid upward approximately 1" to a counterbalanced position. From this position lid may be raised manually. A light on instrument panel signals when lid is unlocked.

REMOVAL & INSTALLATION: Lock Cylinder - Insert hooked tool through opening in rear compartment lid inner panel and pull lock cylinder retainer away from lock cylinder. Remove lock cylinder and gasket from outer panel. To install reverse removal procedure, after sealing lock cylinder gasket to outer panel.

Lid L ck & C ver - Remove lock cylinder, see above. Remove protective cover screws and cover and lock mounting screws. Remove lock and cover.

Lid L ck Strik r - Scribe location of striker for reinstallation, then remove striker.

Lid L ck - Remove unit cover and three attaching bolts and remove closing unit. *CAUTION* - Mark position of tabs to insure accurate reinstallation.

CADILLAC (EXC. BROUGHAM) REAR COMPARTMENT LID LOCK WIRING DIAGRAM

ADJUSTMENTS: Striker Position - To check striker engagement, insert small quantity of clay at bottom of slot, and close lid with light slam. Open lid and check amount of engagement of lock bolt with striker. Measure distance between base of "U" in clay and base of "U" in lock bolt which should be 1/8-5/32". Adjust striker by loosening bolts and move striker up or down as required. To adjust striker forward, loosen bolts, insert emergency spacer between striker and support and tighten bolts.

Striker and Lock Bolt Alignment - Place clay over striker and lower lid until bolt makes an impression in clay. Note relative lateral position of bolt and striker. If necessary, adjust power closing until horizontally by loosening three attaching bolts and sliding unit to right or left in slotted holes then retighten bolts.

TROUBLE SHOOTING ELECTRICAL CIRCUITS: *NOTE* - Before checking for electrical failures, check power unit and lid lock bolt for mechanical failure then proceed as follows:

1) Ground one wire of tester and check for current at power unit by contacting black wire at starter switch, or current at circuit breaker by contacting battery side of circuit breaker.

2) To check power unit striker switch, place switch knob, in released position, ground test lead, and contact yellow lead wire terminal of striker and limit switch. If tester doesn't light, check wire, and striker switch.

3) To check switch operation for closing unit, depress switch knob and connect test lead to brown wire terminal. If tester does not light, check brown wire or striker switch.

4) To check power unit limit switch, first place knob in released position, then contact brown, orange, and green terminals of limit switch individually. If light comes on at any of the three terminals, replace limit switch. If tester does not light at brown terminal, depress switch knob and contact green terminal. If tester does not light replace limit switch.

5) To check power unit, connect No. 12 jumper wire to either orange or green lead of motor. If motor does not operate, check motor ground lead or repair motor if ground lead checks all right.

6) To check solenoid operated lid lock circuit, check circuit breaker, see above, then disconnect solenoid switch lead at instrument panel, attach test light to lead wire and check for current. If tester does not light, trouble is between end of wire and circuit breaker.

7) To check switch, disconnect lock solenoid wire from switch, ground test lead and contact solenoid terminal of switch and actuate switch. Tester should light, or switch is defective. If switch operates light, failure is in solenoid or wire leading to switch.

CADILLAC ELDORADO BROUGHAM

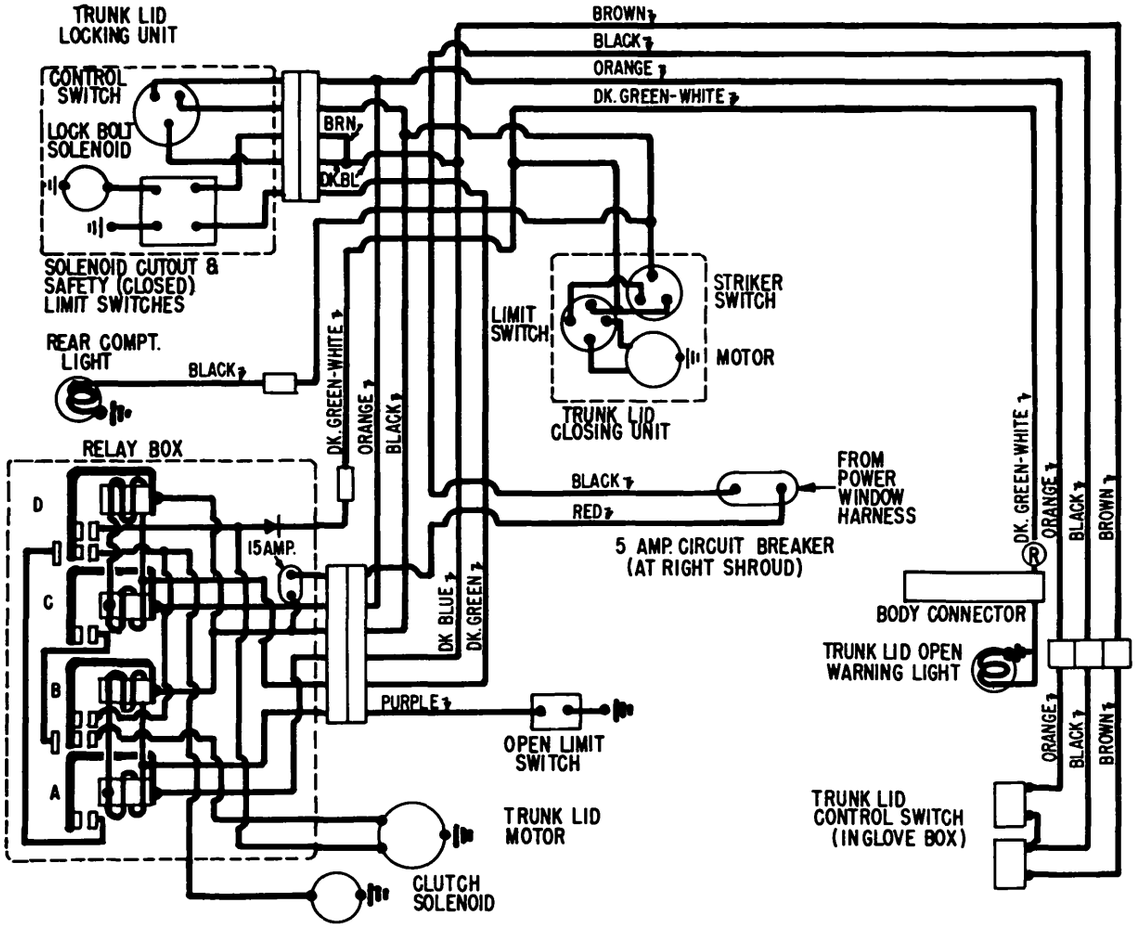
Cadillac Eldorad Br ugham (1957)

DESCRIPTION: This electrically operated automatic trunk lid consists of a motor and regulator assembly, power opening & closing unit, and a power control lock assembly. Opening and closing of the lid is controlled by two switches in glove compartment and a two-way (key operated) switch at rear compartment lid lock.

OPERATION: T Op n Lid - When control switch in glove compartment or at trunk lid lock is actuated, the lid lock solenoid is energized, retracting the lock bolt. The power closing unit is then energized, extending the striker and opening lid slightly. This action operates a switch and opens the solenoid circuit; at the same time closing the circuit to energize clutch solenoid and motor assembly to open the lid. When lid is fully open, a hinge contacts a limit switch, opening the motor circuit. A warning light on instrument panel indicates when lid is opened.

T Cl s Lid - Closing is accomplished in a similar manner except that a different set of relays are energized. The lid is lowered sufficiently to enable power closing unit to trip lock bolt and energize power lock unit to lock lid.

TROUBLE SHOOTING: Motor & Regulator Assembly - Disconnect motor and solenoid wire connectors from relay box. Using a 12 gauge jumper wire, connect power source to a motor lead and a solenoid lead. Regulator should raise or lower lid. If motor operates and regulator does not move lid, the clutch solenoid is inoperative. If motor does not operate it is defective. If motor and solenoid operate with a jumper wire, but do not operate with control switches, check for defective or inoperative relay box.



CONTINUED ON NEXT PAGE

CADILLAC ELDORADO BROUGHAM (Continued)

Control Switches, Circuit Breaker & Relay Box Circuits: Disengage harness connector from relay box. With light tester, check for current at red wire terminal of connector. Tester should light. If it does not, there is an open or short circuit between power source and circuit breaker. Insert tester in blue wire terminal connector, then actuate control switch to open lid. Tester should light. If it does not, control switch is inoperative or there is an open circuit between connector and power source to or from control switches. Insert tester in orange wire terminal of connector and actuate control switch to close lid. Tester should light. If it does not, there is an open circuit between connector and power source to or from control switches. To check ground circuit of relay coils, proceed as follows: Make sure the "open" limit switch plunger is not depressed and lid lock bolt is in "open" position. Connect one end of light tester to power source and connect other end to dark green or purple wire terminal of connector. Tester should light. If it does not, ground circuit of relays which control opening of lid is not complete.

Relay Assembly: Disconnect motor and solenoid connector and harness connector at relay box. Connect one end of a 12 gauge jumper wire to power source and the other end to red wire connector on relay. Connect a second jumper wire to body ground and to dark green wire terminal of connector on relay. Then, momentarily connect power source to dark blue wire terminal. With light tester, check for current at yellow wire (opening cycle) motor terminal and solenoid wire terminal on relay box. Tester should light. If it does not, relays "A" and/or "B" are inoperative. Disconnect ground wire from dark green wire terminal and connect it to purple wire terminal of relay connector. Then, momentarily connect power source to orange wire terminal of relay box. With light tester, check for current at black wire (closing cycle) motor terminal and solenoid wire terminal on relay box. Tester should light. If it does not, relays "C" and/or "D" are inoperative.

Lid Power Control Lock Assembly: Disconnect harness connector from lock connector. Use a 12 gauge jumper wire and connect power source to black wire terminal of lock connector. Then, insert key into lock cylinder. Turn cylinder clockwise and with light tester, check for current at dark blue wire terminal. Tester should light. Turn cylinder counterclockwise, and with tester, check for current at orange wire terminal of connector. Tester should light. If it does not, switch is inoperative. Position lock bolt to lid closed position; then, using a 12 gauge jumper wire, connect power source to brown solenoid wire terminal of lock connector. The solenoid should retract lock bolt to lid open position. In addition, check for current at input side of solenoid cut-out switch. Current should be present at only input end of switch when lock bolt is in lid open position. To check operation of lid closing limit switch, connect one end of light tester to power source and other end to dark green wire terminal of lock connector. With lock bolt in lid open position, tester should light. With lock bolt in lid closed position, tester should not light.

CADILLAC ELDORADO BROUGHAM LID LOCK WIRING DIAGRAM

Power Closing Unit: Ground one light tester lead and connect other lead to white wire terminal (#1) of limit switch. If tester does not light, fault is in white wire or striker switch. To check switch operation for closing unit, depress switch knob and simultaneously connect light tester to red wire terminal (#2) on limit switch. If tester does not light, fault is in red wire or striker switch. To check warning light on instrument panel (if light is inoperative and does not light up when lid is unlocked) proceed as follows: Remove bulb, and with light tester, check for current at bulb socket. If tester lights, the bulb is defective. If tester does not light, fault is in wire between light socket and limit switch. To check power unit limit switch, ground one tester lead and connect the other lead to white wire terminal of limit switch. If tester does not light, fault is in white wire or striker switch (with striker switch knob in released position). Ground one lead of light tester and connect other lead to red (#2), orange (#3), and green (#4) terminals of limit switch. Check each terminal individually. The tester should not light up. If tester lights at any of these terminals, limit switch is defective. If tester does not light up, depress striker switch knob to simulate a lid closed position. Simultaneously connect light tester lead to green terminal of limit switch. If tester does not light up, limit switch is defective. To check power unit motor, connect one end of a jumper wire to either of the motor leads (orange or green). If motor does not operate, check ground connection. If motor is still inoperative, failure is located in motor.

DIAGNOSIS: Lid Will Not Open Or Close Electrically (non-rear compartment lid units operate electrically) - Check feed wire from power window harness to circuit breaker for failure. Check circuit for proper operation.

CONTINUED ON NEXT PAGE

CADILLAC ELDORADO BROUGHAM (Continued)

Lid Regulator Assembly Will Not Raise or Lower Lid (power closing unit and solenoid operated lock operate satisfactorily): Check feed from circuit breaker to relay box for open or short circuit. Check operation of switches and relay box.

Closing Unit Does Not Retract or Extend Striker When Striker Switch is Actuated (lid regulator assembly raises and lowers lid): Check circuit between circuit breaker at right shroud side panel and power closing unit for open or short circuit. Check operation of power closing unit.

Trunk Lid Does Not Operate When Instrument Panel Switch is Actuated (operates with switch at lock cylinder only): Check affected circuits for open or short circuit. Check operation of control switch and lock solenoid.

Motor Lowers Lid (will not raise lid): Check feed wire from control switches to relay box for open or short circuits. Check ground circuit from relay box, through open limit switch in hinge box; then through safety limit switch in lock assembly. Check operation of relay box and motor.

Trunk Lid Does Not Raise or Lower (regulator motor operates in both directions): Check circuit from relay to clutch solenoid for failure. Check operation of solenoid and check clutch for mechanical failure.

Regulator Motor Continues to Operate After Lid Reaches Full Open Position: Check adjustment of limit switch for proper contact with hinge when lid is opened. Check wire from relay box to limit switch for ground.

REMOVAL & INSTALLATION: Lid Motor & Regulator Assembly - Loosen trunk compartment trim at right hinge, then with a suitable tool disengage retaining ring from pin securing regulator arm and remove pin. Disconnect wire harness from relay box, and disconnect wire leads from limit switches and regulator motor. Remove bolts securing regulator support to floor pan supports and remove complete assembly. To install regulator, reverse removal procedure and connect wires to original locations.

Lid Power Closing Unit: Remove access hole cover from trunk lid and disconnect wire harness from power closing unit. Remove four screws securing unit to lid and remove unit from between lid inner panels through access hole. To install unit, reverse removal procedure.

Lid Power Control Lock Assembly: Remove luggage guard attaching screws and remove guard. Disconnect wire harness from connector on lock assembly and scribe location of lock on support. Remove lock cylinder, then remove lock. To install lock, position it within scribe marks and reverse removal procedure.

Lid Lock Cylinder: Remove luggage guard. With a suitable tool, engage hooked end of sliding retainer and disengage it from lock cylinder, then remove cylinder. To install, reverse removal procedure.

Lid Power Closing Unit & Power Lock Adjustment: (*NOTE* - Power closing unit attaching holes are slotted to permit lateral and forward or rearward adjustment). Insert a small quantity of modeling clay at bottom of bolt slot and close lid. Open lid and check amount of engagement of lock bolt with striker as indicated by compression of clay. With a rule, carefully measure distance between base of "U" in clay-to-base of "U" in lock bolt. This dimension should be 1/8-5/32". If not as specified, loosen four power closing unit attaching bolts and adjust as required. (*CAUTION* - Lid lock bolt should contact centerline of power closing unit striker when lid is closed to insure proper operation of closing unit). Check adjustment visually by lowering lid manually until striker contacts lock bolt.

ELECTRICAL SPECIFICATIONS: Relay - Delco-Remy No. 1116925.
Air Gap - .012". At core with points closed.
Contact Gap - .030".
Closing Voltage - 7.0-8.0 volts.
Trunk Control Unit: Delco-Remy No. 4695445.
Lid Unlatch Solenoid - Delco-Remy No. 1119930 (Early), 1119958 (Late):
Current Draw - 34-36 amps. at 10.0 volts.
Lid Motor Actuating Switch: Delco-Remy No. 1119941.
Current Draw - 10.5-11.7 amps. at 9.0 volts.
Transmission Interlock Solenoid: Delco-Remy No. 1119917.
Lid Limit Switches: Delco-Remy No. 1998176 & 1998179.

CADILLAC ELDORADO BROUGHAM ELECTRIC DOOR LOCK

Cadillac Eldorado Brougham (1957)

DESCRIPTION: Consists of solenoid operated lock assemblies in each door which prevent opening door with outside door handle when actuated by a switch located in each front door panel. To unlock the doors, each door locking lever must be operated separately. The rear door locking assemblies include a solenoid controlled by the neutral switch that causes the inside remote door handles to freewheel when transmission is placed in any drive range, preventing opening of rear doors when car is in motion. A safety interlock switch also included in rear door locking assemblies controls operation of the transmission interlock solenoid which prevents transmission selector lever being placed in a drive range with either of the rear doors in an open position.

OPERATION: Transmission Interlock Solenoid - This solenoid is energized when a switch secured to each rear door lock is actuated by opening rear door.

Rear Door Remote Control Freewheeling Unit: Freewheeling circuit is completed when transmission selector lever is placed in one of the drive positions. With circuit completed, solenoids on rear door remote control assemblies are energized, providing a freewheeling movement of remote control knob.

Door Inside Remote Locking Unit: Circuit is completed by relay "C" which is energized when either front door inside locking switch lever is depressed. The relay provides current to a locking solenoid in each of the four door locks. To unlock the doors, it is necessary to unlock each door individually by actuating the inside locking levers manually.

Relay "A": Completes circuit to side roof rail lamp and courtesy light when energized by one of the door jamb switches.

Relay "B": Completes circuit to car leveling system when energized by actuating one of the door jamb switches.

TROUBLE SHOOTING: Door Lock Relay Box - (*NOTE* - This relay box is located beneath right side of front seat cushion and incorporates three relays. Power feed is routed from circuit breaker on left shroud). To check operation of relay box, proceed as follows: With light tester, check for current at feed terminal in harness connector. If current is present, connect a 12 gauge jumper wire between relay box No. 1 terminal and power source. With another jumper wire, ground No. 8 wire terminal in relay connector. With light tester check for current at No. 6, No. 7 and No. 4 terminals on lock connector. Tester should light at all three terminals checked. If tester does not light, relay "A" and/or "B" are inoperative. With light tester, check for current at No. 5 terminal on box connector. Tester should light. (*NOTE* - This terminal feeds transmission selector solenoid circuit). With a jumper wire, ground No. 2 terminal on relay box connectors; then with light tester check for current at No. 3 wire terminal on lock connector. Tester should light. If it does not, relay "C" is inoperative.

DIAGNOSIS: Door Locks do not Lock Electrically - Check operation of relay box (see "Trouble Shooting" above).

All Doors Lock Electrically From Left Front Door Switch (but do not operate from right switch): Check feed circuit from relay "C" to right door control switch for open circuit. Check ground lead attachment behind shroud trim panel (*NOTE* - Each control switch has its own ground lead which terminates at right shroud). Check operation of right switch with light tester.

All Doors Lock Without Actuating Control Switches: Check for and eliminate short circuit between relay "C" and one of the control switches.

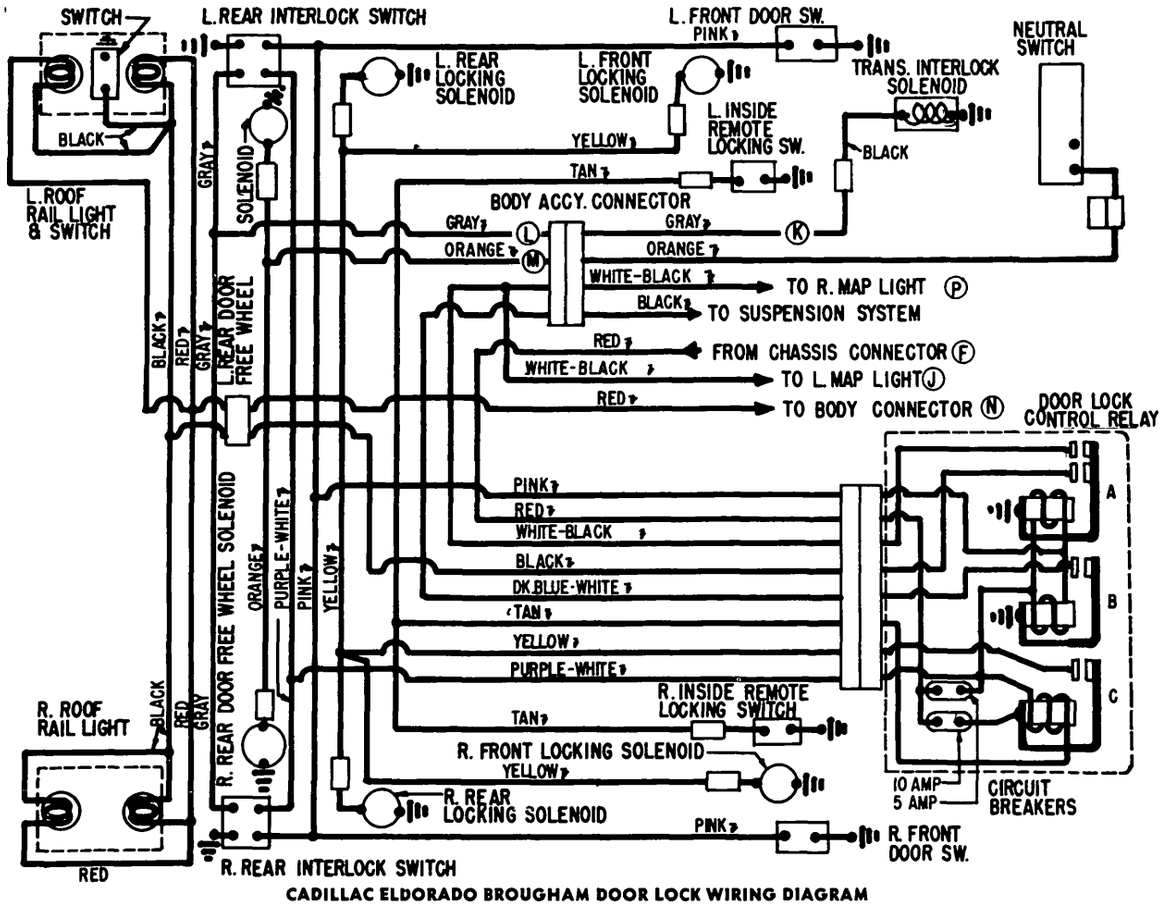
Three Doors Lock Electrically (the other does not): Check for and eliminate short circuit between relay "C" and the affected lock solenoid. Check engagement of harness connectors. Check operation of solenoid by connecting one end of a jumper wire to hot lead, and the other end to solenoid.

Transmission Selector Lever can be Placed in a Drive Position With Rear Doors Open: Check operation of transmission interlock solenoid. Locate and eliminate short or open circuit between lock relay box and selector lock. Check body harness to lock connector engagement.

CONTINUED ON NEXT PAGE

CADILLAC ELDORADO BROUGHAM ELECTRIC DOOR LOCK (Cont.)

Transmission Selector Lever can be Placed in a Drive Position but Lever is Locked in a "P" or "N" Position When Left Rear Door is Open (roof rail lamps and courtesy lamps do not light): Check and eliminate open circuit between relay box and left rear door lock switch. Check engagement of harness connectors at lock. Check switch actuating mechanism on lock and operation of jamb switch.



R ar Door (or Doors) Open When Remove Control Ass mbly is Actuated While Shift Lever is in Drive Position: Check for short circuit in freewheeling circuit. Check remote control assembly for mechanical failure. Check operation of solenoid with a jumper wire.

REMOVAL & INSTALLATION: Front Door Inside Locking Control and Switch Assembly - Raise door window and remove door belt finishing molding and door trim finishing panels. Remove inner panel access hole cover. Through large access hole, disengage spring clip and detach inside locking connector rod from lock lever. Disconnect inside locking control switch wires at connectors and detach wires from clips. Remove inside locking control attaching screws and remove control with attached connecting rod and switch from door (switch may be removed from control assembly if necessary). Before installing inside locking control and switch assembly, first install switch and connecting rod to locking control, then lubricate connecting rod attaching point with Lubriplate. To install locking control and switch assembly, reverse removal procedure.

Fr nt & Rear Door Locking Solenoid: Remove door lock assembly, then carefully remove rivet securing lock link to solenoid plunger. Remove solenoid attaching screws and remove solenoid from lock assembly. To install, reverse removal procedure. *NOTE* - Check operation of locking solenoid and adjust as necessary by moving up or down to provide proper locking action.

R ar Door Lock Remote Control Freewheeling Solenoid: Remove rear door lock remote control, then carefully remove rivet securing remote control linkage to solenoid plunger. Remove solenoid attaching nuts and bolts and remove solenoid from remote control assembly. To install remote control solenoid, reverse removal procedure. *NOTE* - Check operation of solenoid and adjust as necessary by moving up or down to provide proper operation of remote control assembly.

ELECTRICAL SPECIFICATIONS: Relay - Delco-Remy N . 1116936.
Air Gap - .012". At core with contact points closed.
C ntact Gap - .030".
Closing V ltag - 7.0-8.0 volts.
D or Lock Switches: Delco-Remy No. 1119944 (Right Hand), 1119945 (Left Hand).

CADILLAC ELDORADO BROUGHAM DOOR LOCK WIRING DIAGRAM

LINCOLN ELECTRIC DOOR LOCK

Lincoln (1957).

DESCRIPTION: The electric door lock assemblies consist of an electric solenoid connected to the sliding lock bellcrank in each door assembly. When solenoid is actuated by a toggle switch on the instrument panel, solenoid plunger moves out and operates the door lock bellcrank to lock the door. Front doors may be opened by pulling rearward on inside door handles. To open rear doors, the lock control on rear door must be moved to the "unlock" position before door inside handle can be moved manually. By depressing door lock toggle switch on instrument panel, prior to leaving car, the driver need only lock his exit door by key to completely lock car. With the ignition switch "On", or turned to the "Accessory" position, a red indicator light over the toggle switch indicates if all doors are not locked.

OPERATION: Closing toggle switch on instrument panel allows current to flow through switch to an auxiliary relay on right fender apron. Points in relay will close, sending battery current through the circuit breaker and into solenoids located in each door, energizing them and locking the door. (*NOTE* - When toggle is released, no current flows into solenoid, however, solenoid remains in its energized or locked position, returning to the unlocked position only when inside door handle (front doors), sliding lock control (rear doors) is actuated). When the ignition switch is turned to the "On" position or "Accessory" position and any or all of the doors are not locked, the warning light circuit is closed and the red warning light will come on.

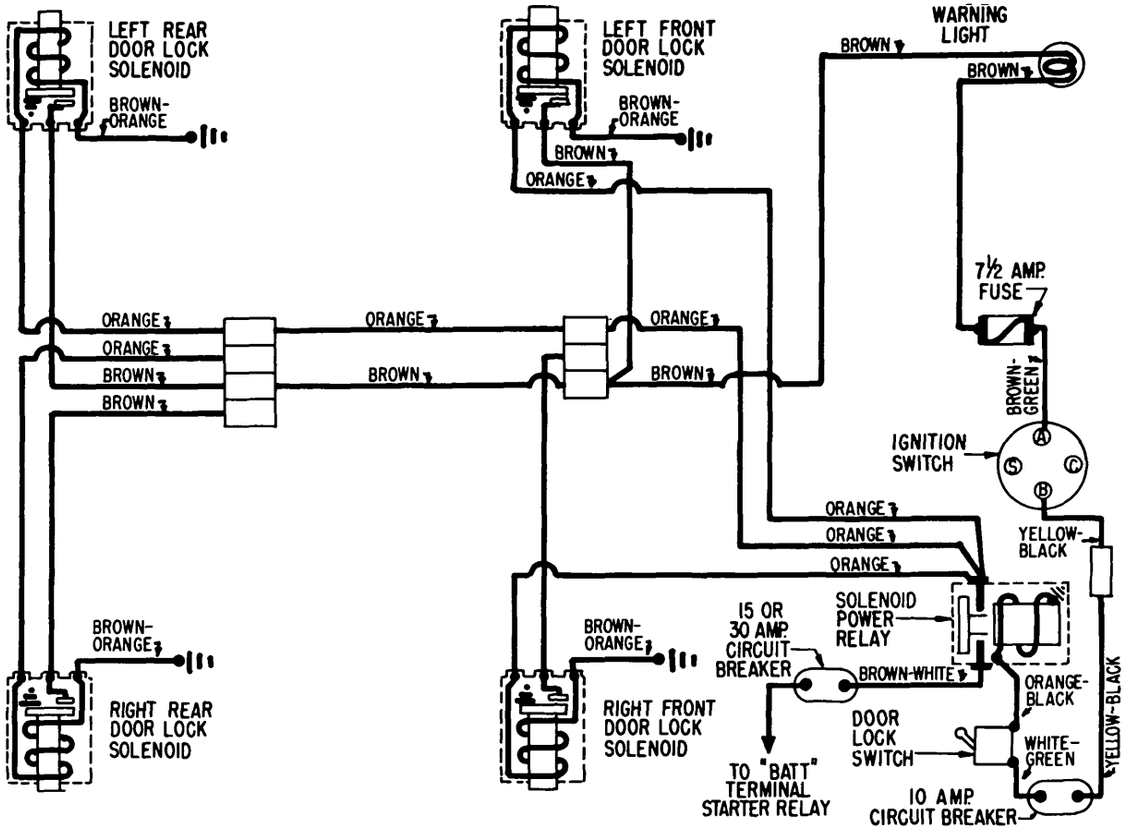
TROUBLE SHOOTING: Warning Light D s N t Op rat When Any or All Doors Ar N t L cked - Check ignition switch to make sure it is turned to "On" or "Accessory" position. Check warning light wiring to determine if circuit is closed. Bypass solenoids by grounding solenoid-to-warning light wire. If warning light

CONTINUED ON NEXT PAGE

LINCOLN DOOR LOCK (C nt.)

comes on, the solenoid and/or bellcrank is misaligned on door panel, or solenoid is defective. Check rod from solenoid-to-bellcrank as improper bends in this rod will not allow solenoid to extend to its full travel and actuate warning light switch contacts.

On r All D rs Will Not Lock Electrically: Check for open circuit. Bypass the auxiliary relay on right front fender apron with a jumper wire. If door locks, auxiliary relay and or toggle switch is defective. If one door remains unlocked, lock linkage is broken, disconnected or maladjusted. A circuit is open or the solenoid is defective.



ADJUSTMENTS: R m te C ntrol & Link Assembly - Adjusted fore and aft by elongated holes in remote control and link assembly

B llcrank: Adjusted fore and aft by elongated holes in door inn er panel.

S l n id: Adjusted up and down by elongated holes in door cover plate. To position solenoid, move sliding bellcrank to the "Lock" position (forward). Adjust solenoid up or down as far as it will go without undue tension on solenoid rod. Tighten solenoid attaching screws and test operation of electric lock by depressing switch on instrument panel. Adjust solenoid up or down to obtain correct operation of electric lock and toggle switch indicator light.

REMOVAL & INSTALLATION: Front Door Lock Assemblies - Remove door glass, then remove front cover plate from door inner panel, being careful not to break the solenoid wires (solenoid is attached to cover plate by two screws). Disconnect tie rod from solenoid by removing clip retainer. Remove the two screws holding bellcrank to door inner panel, and remove five screws holding remote control assembly and bracket to door inner panel. Remove the lock cylinder retainer and lock cylinder, then remove outside door handle. Remove lock plate cover and screws holding lock assembly to inner door panel. Remove door window lower stop and brace assembly. Lower the lock assembly, rods, bellcrank, and remote control and link assembly and remove through rear access hole. To install, reverse removal procedure

R ar D or Lock Assemblies: Raise window to topmost position, then remove inside door handle with Tool 21812-A. Remove garnish molding with door lock control attached. Remove screws holding finger tip plate to door arm rest support, then remove wires from window switch. Remove arm rest support from door inner panel. Remove two screws holding window assembly lower stop bracket to door inner panel and remove bracket with stop attached. Remove front cover plate from door inner panel, being careful not to break solenoid wires. Disconnect rod from solenoid by removing clip retainer. Remove screws holding bellcrank assembly to door inner panel and disconnect bellcrank link from lock assembly by removing clip retainer. Remove bellcrank link and rod. Remove the three screws holding remote control assembly to door inner panel. Disconnect and remove remote control link from lock assembly. Remove outside door handle, then remove the four screws holding door lock assembly and remove lock. To install, reverse removal procedure.

LINCOLN DOOR LOCK WIRING DIAGRAM

WINDSHIELD WIPERS

VACUUM (CABLE OPERATED)

Buick (1957)
Cadillac (1957)
Chevrolet (1957)
Ford (1957)
Lincoln & Continental (1957)
Mercury (1957)
Oldsmobile (1957).
Pontiac (1957)
Willys (1957)

►CHANGES, CAUTIONS, CORRECTIONS

► *BUICK WIPER CAM PRODUCTION CHANGE:* To improve cleaning action, install new type wiper cam Part No. 4726069 (Rt.), No. 4726070 (Lt.) which entered production on cars built approximately March 1st 1957. New cams give smoother operation and wider arc.

► *PONTIAC CABLE ADJUSTMENT AND WIPER INSTALLATION NOTE:* Excessively loose cables can be corrected as follows:

1) Install Cable Tighteners Part No. 4726957 as necessary on each cable on each side.

2) When cable tighteners will not take up all slack, check and relocate wiper transmission. Remove wiper arm and blade assembly. Relocate transmission base flush with shroud inner panel. Use body sealer on body side of gasket and locate transmission with key in notch of body panel. Install spacer and spanner nut on outside of body, then install support attaching screws on inside of body and attach cables to auxiliary drive. Install blade and arm assembly.

► *BUICK WIPER ARM SPRING NOTE:* When splines on end of shaft are visible under wiper arm, remove arm for inspection and install retaining spring (if missing) Part No. 1172260 (Trico No. 81021).

► *CADILLAC WIPER ARM TENSION NOTE:* If blades do not wipe complete area, check arm tension by removing blade and attaching ounce spring scale to tip of arm with arm in center of blade travel. 10.5 to 12.5 ounces should be required to lift blade off glass. Replace arm if tension not to specifications.

CONTINUED ON NEXT PAGE

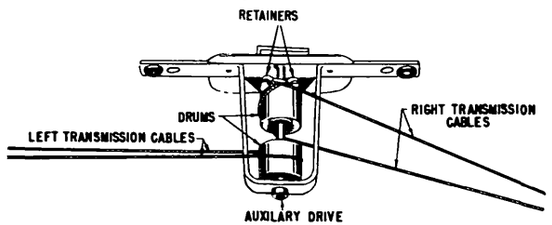
VACUUM WINDSHIELD WIPERS (CABLE OPERATED) (Cont.)

►*MERCURY WIPER CABLE BREAKAGE CORRECTION:* Check tensioner pulley for freedom of rotation. Bend cowl trough (in tensioner area) to provide 3/8" clearance for pulley to rotate. Failure to rotate causes cable to fray and break.

►*BUICK WIPER OPERATION CORRECTIONS:* When wipers operate with hesitation or erratic action check the following items:

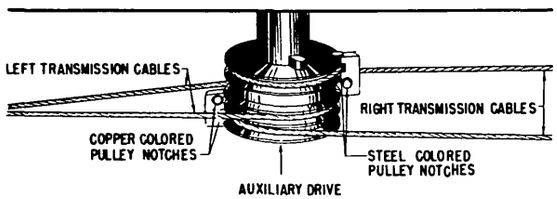
1) Cam-O-Matic wiper arm black nylon plastic guide for wear, cracked, or damage. If defective replace wiper arm assembly.

2) Wiper arm must be fully seated on splines, *see "Wiper Arm Spring Note" above.*



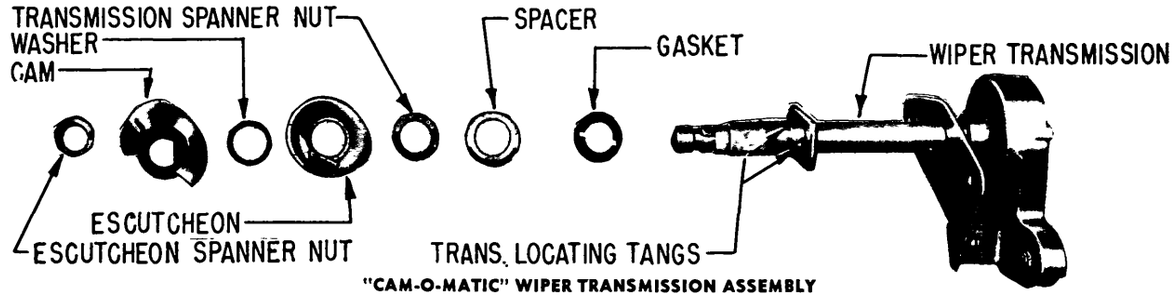
3) Distance from top of blade vertically down to rubber windshield seal with blade at furthest travel of outboard stroke (wide stroke operation), should be 8" (Std.), 11" (Cam-O-Matic). Replace wiper auxiliary drive Part No. 4716598 (Std.), No. 4716685 (Cam-O-Matic). *NOTE* - Drive pulley diameter stamped on face of pulley, 1.76" (Std.), 1.94" (Cam-O-Matic).

4) Vacuum pump should register 22" at 1600 engine RPM with vacuum line disconnected from check valve and connected to gauge. If below specifications, replace vacuum side of oil pump.



5) Check for bind in transmission shaft by removing blade and operating wiper transmission at wide stroke. Shaft should move in and out approximately ¼". If bind present in shaft, replace transmission.

6) Cable must be free, with no bind or contact with other items. Drive pulley must be clear of cowl, drive adjusted to remove bind or cowl panel opening enlarged. There should be no interference between pulley tab and pulley guard. If interference noted replace transmission.



DESCRIPTION: Drive is through auxiliary pulleys and cable to windshield wiper transmission at each side of windshield (Chevrolet uses two drums, and Lincoln uses a lever as auxiliary drives). Tensioners are located within each wiper transmission (Buick, Cadillac, Chevrolet, Oldsmobile & Pontiac), in auxiliary drive (Continental), in pulley brackets (Others).

AUXILIARY CHEVROLET DRIVE

AUXILIARY DRIVE (BUICK, CADILLAC, LDSMOBILE, P NTIAC)

"CAM-O-MATIC" WIPER TRANSMISSION ASSEMBLY

CABLE ADJUSTMENT: Buick, Cadillac, Chevrolet, Oldsmobile & Pontiac (Except CAM-O-MATIC Equipped Cars) - Push in on end of transmission shaft. Spring-loaded pulleys will unlock and tension cables.

Cam-O-Matic Equipped Cars - Remove arm and blade assembly by raising upper section of wiper arm to disengage cam follower from cam. With wiper arm in raised position, carefully pull or pry arm from transmission shaft. Push in on end of transmission shaft. Spring-loaded pulleys will unlock and tension cables.

Continental: Loosen wing nut on auxiliary drive. Adjust cable tension. Tighten wing nut.

Lincoln: No adjustment except to see that tensioners are free to operate.

REMOVAL & INSTALLATION: Wiper Motor - Remove screws securing motor to auxiliary drive, detach control cable and vacuum hose from motor, remove motor. To install, reverse removal procedure.

Auxiliary Drive Assembly: Buick & Cadillac - Remove upper section of instrument panel. Remove arm and blade assemblies (Cam-O-Matic). (See ADJUSTMENT for Cam-O-Matic removal). Obtain slack in cables by pushing in on end of transmission shaft. With helper inside car to pull on cable to hold slack, release end of transmission shaft to lock cable in slack position. Observe attachment of transmission cables at auxiliary drive pulleys to assure proper reassembly, disconnect cables from auxiliary drive pulleys. Remove screws securing auxiliary drive, remove auxiliary drive assembly. To install, reverse removal procedure.

Chevrolet, Oldsmobile & Pontiac - Remove instrument panel compartment box. Obtain slack in cables by pushing in on end of transmission shaft. With helper inside car to pull on cable to hold slack, release end of transmission shaft to lock cable in slack position. Observe attachment of cables to auxiliary drive, then detach cables from pulleys or drums. Remove screws securing wiper motor, remove motor. Remove screws securing drive to dash, remove auxiliary drive. To install, reverse removal procedure.

Continental - Remove lower insulator panels and carpet. Remove two screws securing control tower to tunnel brackets. Remove glove box liner and screws from check straps. Remove screws securing glove box hinge to brace. Disconnect spring at firewall. Slide check arms from glove box door. Remove glove box. Remove screws securing control tower to firewall and screws on right hand side securing control tower to instrument panel brace. Remove screws securing speaker frame to lower control panel. Lower control tower using care not to kink bowden wires. Remove antenna lead, hot wires and two speaker leads, remove radio. Loosen wing nut on idler puller and retract tension on cables, disconnect cables. Remove capscrews securing auxiliary drive to firewall, remove auxiliary drive. To install, reverse removal procedure.

Ford, Mercury - Remove cowl top ventilator grille and weather strip assembly (Ford), fresh air intake grille and rubber seal (Mercury). Remove idler pulley water shield (Ford), rubber plugs from tensioner access holes (Mercury), and remove tensioners.

Lincoln - Remove screws securing auxiliary drive to cowl, remove auxiliary drive. To install, reverse removal procedure.

Wiper Transmissions: Buick & Cadillac - Remove wiper blade and arm assembly (see ADJUSTMENT for Cam-O-Matic removal). Remove upper section of instrument panel. Obtain slack in cables by pushing in on end of transmission shaft. With helper inside car to pull on cable to hold slack, release end of transmission shaft to lock cable in slack position. Observe attachment of transmission cables at auxiliary drive pulleys to assure proper installation, then disconnect cables from auxiliary drive pulleys. Remove transmission spanner nut, escutcheon, cam, and reveal molding clip. Remove transmission support bolts, rubber gasket and retainer nuts. Disconnect windshield washer hose, and carefully pull transmission down through shroud panel and remove from body. To install, reverse removal procedure. *NOTE* - Copper-colored cable ends must be installed to copper-colored pulley notches and steel-colored cable ends to steel-colored pulley notches.

Chevrolet, Oldsmobile & Pontiac - Remove wiper blade and arm assemblies. Remove instrument panel glove box. Obtain slack in cables by pushing in on end of transmission shaft. With helper inside car to pull on cable to hold slack, release end of transmission shaft to lock cable in slack position. Observe attachment of transmission cables to auxiliary drive, then disconnect cables from pulleys or drums. Remove escutcheon spanner nut. Lift esctucheon from body, disconnect washer hose and remove escutcheons. Remove transmission spacer spanner nut. On inside of body pull each transmission down through shroud panel, remove from body. To install, reverse removal procedure. *NOTE* - Right transmission cables are crossed.

CONTINUED ON NEXT PAGE

VACUUM WINDSHIELD WIPERS (CABLE OPERATED) (Continued)

Continental (Right Hand) - Remove wiper arm, nut, and gasket. Remove cowl trim panel, glove box liner, defroster nozzle and windshield washer hose. Remove capscrew securing transmission to brace, remove transmission. Remove capscrew and special bolt securing spacer to cowl top, remove spacer. To install, reverse removal procedure.

Continental (Left Hand) - Remove three screws securing wiper switch plate to underside of instrument panel, and eight screws securing courtesy light switch plate to instrument panel. Remove wiper arm, nut and gasket. Remove washer hose. Remove capscrew securing transmission to brace, remove transmission. Remove capscrew and special bolt securing spacer to cowl top, remove spacer. To install, reverse removal procedure.

Ford, Mercury - Remove motor, tensioners, and disconnect cable from motor drive pulley. Then remove mounting plate assembly.

Lincoln - Remove wiper arm and blade. Remove nut, spacer and gasket that secure transmission to cowl top. On right side, remove defroster outlet. Remove glove compartment box. Pull cable tensioner toward center of car and lock in this position with drift pin through hole provided. Remove drive cable from auxiliary drive, remove transmission. To install, reverse removal procedure. When installing, be sure to rig cables properly on pulleys before connecting to auxiliary drive. Take drift pin out of cable tensioner and allow pulleys to take up slack.

Ford, Mercury - Lift off wiper arms and blades. Remove idler pulley water shields (Ford), rubber plugs from tensioner access holes (Mercury), and remove tensioners. Disconnect cables from motor pulley. Remove pivot attaching nuts, spacers and washers and lower pivot assembly into cowl compartment.

Cable Tensioner (Lincoln): Remove defroster outlet from right side. Remove glove compartment box. Pull cable tensioner toward center of car, and lock in this position with a drift pin through hole provided. Remove drive cable from auxiliary drive. Remove two capscrews that secure tensioner to cowl panel, remove tensioner. To install, reverse removal procedure.

(LINK & CRANK ARM)

Chevrolet Trucks (1957)
Ford Thunderbird (1957)
Hudson (1957)
Nash (1957)
Rambler (1957)

DESCRIPTION: Wiper consists of single motor unit connected to right and left hand wiper arm shafts by flat or round metal links. Motor control valve is either integral with motor or is a separate remote control depending on car application.

REMOVAL & INSTALLATION: Wiper Motor - (Except Rambler) Remove radio. On Hudson & Nash models, remove wiper motor access hole cover. Disconnect vacuum hose and control cable. Remove link retainers and disconnect links. Remove motor mounting screws and lower wiper motor assembly. To install, reverse removal procedure.

Rambler - Open heater control valve. Drain approximately two quarts of liquid from radiator to lower coolant level. Disconnect heater hoses and remove heater core. Remove rain baffle below motor. Remove link retainers. Disconnect control conduit and vacuum hose from motor. Remove motor mounting screws and lower wiper motor assembly. To install, reverse removal procedure.

Pivot Shaft: Remove wiper arm and blade. Remove link from pivot shaft. Remove nut, spacer and gaskets as required, remove pivot shaft. To install, reverse removal procedure. *NOTE* - On Hudson, Nash & Rambler models it will be necessary to remove cowl air intake for access to retaining nuts.

CHEVROLET & PONTIAC ELECTRIC

Chevrolet, Truck & Pass. Cars (1957).
Pontiac (1957).

DESCRIPTION & OPERATION: Similar in design and operation to previous models with the following exceptions:

► *1957 CHEVROLET WIPER PRODUCTION CHANGE:* Cars produced after Dec. 1st. 1956, have "Slow-Park" type wipers. A new type drive gear returns blade to park position slowly. Motor and switch assembly are identical to previous type with the exception that the early Series 1957 wiper switch has five contacts (No. 5 contact not used) and later series have only four contacts. When servicing the switch, there are only two wires to unsolder and they should be installed as follows: Hold switch in its installed position, with switch mounting bracket downward and away from you. The **black** lead should be soldered to upper left switch connection and **red** lead to lower right connection.

REMOVAL, OVERHAUL, INSPECTION & ADJUSTMENTS:
See Page 494 in 1956 Annual Data.

AUTO-LITE ELECTRIC

CHRYSLER & IMPERIAL	Auto-Lite Wiper Motor No.
C75,76	EPV-4001A
IM-1,2,4	EPV-4001
DE SOTO

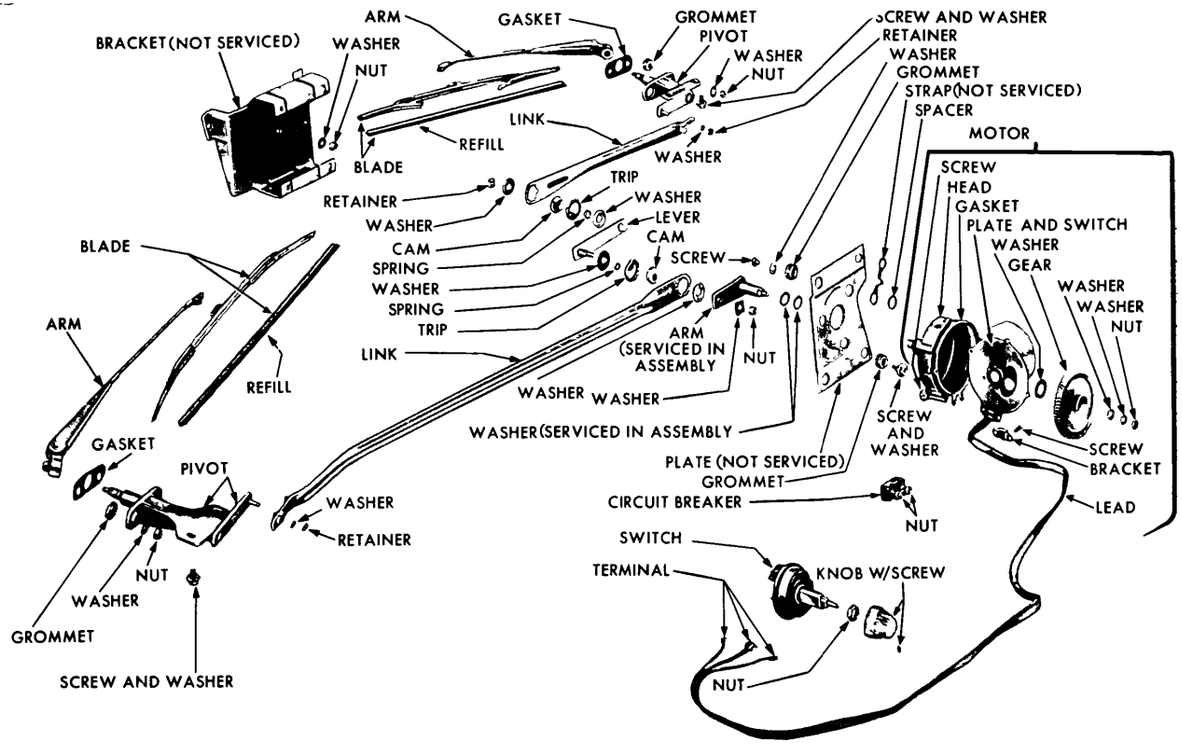
Special Equip.	EPV-4001B
PLYMOUTH	
P30,31	EPW-4001
Special Equip.	EPV-4001A
STUDEBAKER	
All Models	EPS-4001



DESCRIPTION: Single and Variable types used, similar in design and operation to previous models. Both types use the same wiper blades, arm assembly and pivots. *NOTE* - Convertible and Sport Coupe blades, arms and pivots are different. Variable speed type has "Off Glass Parking" accomplished by reversing motor, and use of parking cams at pivot pins of intermediate crank arm.

►*WINDSHIELD CLEANING CAUTION:* Do not move wiper blades across glass to clean glass. Raise blades and arms outward and away from glass against pivot spring mechanism to save damage to wiper motor gears.

►*WIPER MOTOR REMOVAL CAUTION (Variable Speed Type):* Wiper should be operated and shut off by disconnecting it at circuit breaker, or by turning off ignition key. Damage to motor switch and spring parking cam, upon removal of switch cover, will result if cranks are in parked position.

REMOVAL: Remove windshield wiper assembly as a unit whenever wiper or links are to be serviced. Disconnect wires at wiper motor. On De Soto remove radio if so equipped. On Chrysler (with Heater and Deforster Ducts), remove glove box and door, and radio if it removes from front of instrument panel. Disconnect links from pivot cranks, remove motor mounting screws and remove motor from bracket (Chrysler), or motor and bracket (Others), from instrument panel. Lower assembly and remove from car.

Disassembly: Remove left hand link from crank arm, parking cam and spring release. Remove coil spring by spreading the ends. Remove right hand link in same manner after removing crank arm to lever nut, spacing washers between link crank arm and lever. To replace wiper switch or Geneva Wheel, remove switch plate.

AUTO-LITE ELECTRIC WINDSHIELD WIPER ASSEMBLY

Reassembly: Make sure gear box contains lubricant, and Geneva Wheel follower pin engages smoothly with top of gear. Then install spring washer with concave surface toward crank arm. Expand ends of crank pin coil spring and install on crank pin. Install spring release. *NOTE* - The same code letter must be visible when looking directly at the crank, the spring release, and the link. Install parking cam so that it will index with spring release and engage ends of spring between release and parking cam in openings at point of index. Install washer with convex surface toward cam and link assembly. Install retaining bolt and nut. Assemble right link and cam assembly to crank lever pivot in same manner, locking in place with clip instead of retaining bolt.

Wiper Pivot Replacement: Remove wiper blade. Disconnect link from pivot and remove pivot retaining plate pivot and gasket. Install new gasket and pivot with retaining plate. Install Bellville washer so convex surface is against head of bolt. Tighten retaining bolts to 75 ft. lbs. torque and install wiper blade.

Installation: Attach links to pivot crank pins. Install spring washer and lock clips on crank pins. Install wiper motor and bracket assembly making sure rubber mounting gasket is in place. Tighten mounting bolts to 25 ft. lbs. Reinstall radio, glove box and door.

Adjustment: Adjust parking cam at motor switch plate so that blades park as low as possible, then loosen blade arms at pivots. Position blades against windshield moulding on variable speed motors and tighten pivot attaching nuts. Position blades of constant speed motors one inch from windshield moulding.

TROUBLE SHOOTING: Wiper Operates Slowly - High resistance in brush to commutator contact, or carbon deposits in slots. Check armature commutator and brushes. High resistance in ground connection, or defective control switch.

Wiper Fails to Operate - Linkage binding, defective switch, motor, or open or grounded wiring.

Wiper Blades Not Parking Off Glass - Broken link spring, link spring not releasing, link spring not engaging stop on linkage, parking switch out of adjustment.

Blades Slap Windshield Mulding - Improperly installed link spring trip.

Blades Chatter - Twisted arm or wrong type blades used.

Motor Will Not Park - Follower pin in parking switch plate is bent too low and is not breaking contact. Contact spring leaf on parking switch plate is distorted causing excessive tension and not breaking contact. Dirty or worn contact points.

①—See Application Data below

►CHANGES, CAUTIONS, CORRECTIONS

►*CARTER REPLACEMENT CARBURETOR APPLICATION* When installing this carburetor on **Air Conditioned Cars,** it will be necessary to use Unitized Pkg No 202-44U consisting of complete Speed-up Control (Fast Idle device) and attaching parts

►*CARTER & ROCHESTER CARBURETOR PRODUCTION CHANGE* "Later" carburetors listed above were used after approximately first 3000 cars These carburetors have larger Secondary System parts as follows Secondary Throttle Bore, Main Venturi, & Metering Jets

►*1955 CADILLAC "OFF-IDLE LEANNESS" AT 20-30 MPH DURING LIGHT ACCELERATION (Rochester Carburetors before Engine No. 44710)* May be accompanied by slight vibration and is caused by insufficient fuel during initial action of accelerating pump Correct by installing new parts listed below *NOTE—Carburetors marked "A-5" on brass tag (Engine No. 34110 to 44710) have later type Pump Plunger Assy. and Power Valve Piston Assy. Carburetors marked "B5X" (used beginning Eng. No. 44710) have latest type parts and do not require modification.*

Late Type Carburetor Parts

Carburetor Type :	Single 4GC	Eldorado (Two 4GC)
Pump Plunger Assy	7000208	7007807
Power Valve Piston Assy	7000204	
Primary Venturi Cluster	7008768	7008770

►*1952-55 CADILLAC CARBURETOR "ICING" CORRECTION* This condition generally noted after consistent high speed driving with outside temperature of 32-65°F and high relative humidity. Causes loss of power and high fuel consumption and may result in stalling Icing can be prevented by installing Sheet Metal Baffle No 1463839 on radiator support tie bar to reduce gap between tie bar and radiator upper tank and prevent outside cold air entering engine compartment Edge of baffle must be 1/8" from radiator upper tank and must not pinch wiring harness *NOTE—This baffle installed in production on later 1955 cars.*

►*1955 CADILLAC "FLAT-SPOT or SHUDDER" at 20-40 MPH ON PART THROTTLE ACCELERATION* May be caused by over-rich Idle Mixture Setting and Idle Adjustments must be made exactly as detailed below *ROCHESTER CARBURETOR NOTE—See "Off-Idle Leanness Correction" above also*

►*1955 CADILLAC HIGH IDLE SPEED (First Cars)* May be caused by loose or improperly positioned throttle valves or improperly adjusted secondary throttle linkage causing throttle valves to remain slightly open Check throttle valve position and linkage adjustment

►*1955 CADILLAC ROUGH IDLE OR DETONATION* May be caused by vacuum advance ports in carburetor being too low, causing distributor vacuum advance mechanism to operate and provide too much advance at idling speeds Check for this condition by connecting a vacuum gauge at the vacuum advance line fitting on the carburetor If gauge reading is over 5' with engine idling, ports are incorrectly located Correct by replacing carburetor throttle body

DESCRIPTION Four-barrel downdraft types with automatic choke These carburetors have new idle system as follows

Cadillac Idle System—Consists of SEPARATE Primary Idle Fuel System and Idle Air System (new) as described below Vapor vent passages located in throttle bores directly above the throttle valves dissipate spill over fuel from above throttle valves and improve hot idling performance

Idle Fuel System—Primary idle fuel system is similar to previous models with Idle Mixture Adjusting Screw controlling fuel discharge through lower idle port below the throttle valves Throttle valves are COMPLETELY closed at low idle and air is admitted through Idle Air System (below) Secondary idle fuel system has been modified by elimination of closed throttle idle ports (below primary throttle valves) so that the secondary idle system does not operate during closed-throttle idling At part-throttle positions, the secondary idle system discharges fuel through the ports located **above** the primary throttle valves

Idle Air System—Consists of air by-pass passage (primary barrels only) through which air for closed-throttle idling is taken from above the throttle valves and discharged into the manifold below the valves through a metered (non-adjustable) orifice and an adjustable orifice in each primary barrel An Idle Speed Screw (single screw for both barrels) controls this adjustable orifice and all Idle Speed Adjustments are made by means of this screw (No throttle stopscrew used) Throttle valves are COMPLETELY closed at low idling speed

ADJUSTMENTS *Make all adjustments exactly as follows* **Idling Adjustment:** *Each model must be adjusted exactly as detailed below. This is important to secure correct balance between Idle Mixture and Idle Air settings.*

Cadillac (Single Carburetor)

►*CAUTION This carburetor has TWO Idle Mixture Adjusting Screws (primary barrels only) and ONE Idle Air Adjusting Screw (regulates idle speed by controlling air for both primary barrels).*

1)—Make a preliminary carburetor adjustment by setting Air Adjusting Screw three turns open from point where spring is compressed, set each Idle Mixture Screw two turns open from inner seated position Connect Vacuum Gauge and Tachometer to engine, set hand brake securely. Start engine and run until it reaches **normal operating temperature.**

2)—Adjust idle speed by turning Air Adjusting Screw in or out for speed of 400 RPM with selector lever in either "Dr" position (or slightly higher without "creeping") *CAUTION—Air Conditioning must be turned "On".*

3)—Adjust one Idle Mixture Screw until highest engine RPM and vacuum reading is secured

4)—Adjust second Idle Mixture Screw likewise for highest engine RPM and vacuum

5)—Readjust engine idle speed (step 2 above)

6)—Repeat idle mixture and idle speed adjustments (steps 3, 4, 5 above) until no increase in engine speed results from idle mixture screw adjustment and smoothest engine idle is secured with highest vacuum reading

►*IDLE SETTING CAUTION Make certain that highest engine RPM is obtained with MINIMUM Air Adjusting Screw setting. An over-rich mixture will cause a flat spot at 20-40 MPH. on light acceleration*

7)—Adjust Fast Idle *See Fast Idle Adjustment below.*

Cadillac Eldorado (Two Carburetors)

►*CAUTION These carburetors are same design as single carburetor (above) The linkage connecting the two carburetors must also be adjusted to secure correct balanced performance.*

1)—Adjust linkage as follows Remove carburetor air cleaner, disconnect throttle return spring and manual control rod from end of connector link at forward carburetor, loosen connector link jam nut Hold or block both choke valves fully open and all throttle valves tightly closed, adjust connector link so that front end of link fits freely in hole in throttle lever of forward carburetor, tighten jam nut Connect manual control rod and throttle return spring

2)—Make preliminary carburetor adjustments by setting each Air Adjusting Screw three turns open from point where spring is compressed, set all Idle Adjusting Screws two turns open from inner seated position

3)—Replace air cleaner Connect Vacuum Gauge and Tachometer to engine, set hand brake securely Set selector lever in "Dr" Start engine and run until it reaches **normal operating temperature.**

4)—Adjust idle speed by turning Air Adjusting Screw on **each carburetor equally** in or out for speed of 480 RPM with selector lever in "Dr" position (or slightly higher without creeping) *CAUTION—Air Conditioning must be turned "On"*

5)—Adjust each Idle Mixture Adjusting Screw **in same number listed below** by turning screw in to its lean limit (RPM will drop off or flutter will be noted), then richen mixture by turning screw out ¼ turn *Special Screwdriver Tool J-6044 will make adjustment easier.*

CONTINUED ON NEXT PAGE

CADILLAC CARBURETORS (C nt.)

Adjustm nt Sequ nc

(1) Right hand screw on rear carburetor.
(2) Right hand screw on front carburetor.
(3) Left hand screw on front carburetor.
(4) Left hand screw on rear carburetor.

6)—Repeat Idle Speed adjustment (step 4 above) turning each screw an equal amount to reduce engine speed to 480 RPM.

7)—Repeat idle mixture and idle speed adjustments (steps 5 and 6 above) in sequence to obtain highest engine RPM (should be over 480 RPM) with highest possible manifold vacuum reading. Final setting should provide smooth idle at specified RPM.

►*IDLE SETTING CAUTION: Make certain that highest engine RPM is obtained with MINIMUM Air Adjusting Screw setting. An over-rich mixture will cause a flat spot at 20-40 MPH. on light acceleration.*

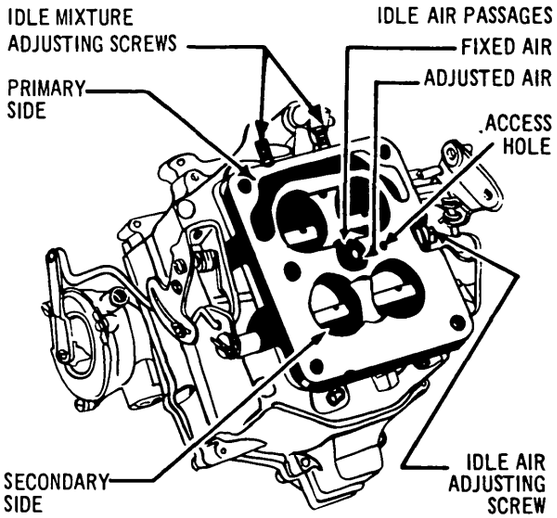
8)—Adjust Fast Idle. *See Fast Idle Adjustment below.*

►*HYDRA-MATIC THROTTLE LINKAGE ADJUSTMENT: Linkage is not disturbed by carburetor Idle Adjustment.*

Idl Speed-Up Control (Air Conditioned Cars): After idling adjustment completed, and with engine at normal operating temperature, position selector lever in Neutral and turn Air Conditioning "On". Engine should idle at 900 RPM. Adjust by loosening locknut on diaphragm shaft and turning knurled nut for correct idling speed. Lock adjustment by tightening locknut.

Atmospheric Idle (Bowl Vapor) Vent Adjustment: *On Carter WCFB carburetors, make this adjustment after Pump and Metering Rod Adjustments completed.*

Carter Carburetors—With throttle valves seated in bores, clearance between lower edge of bowl vapor vent valve and dust cover should be 1/16" (Gauge T109-197). To adjust, remove dust cover and bend vapor vent arm up or down as required.



Rochester Carburetors—Open primary throttle valves .063" by inserting LARGE end of Gauge BT-79 between edge of valve and bore on side opposite idle adjusting screws. Operating tang on pump lever should just contact vent valve. Adjust by bending tang on contact arm using BT-69 bending tool.

Accelerating Pump Rod Adjustment: *Throttle valves must be tightly closed (fast idle screw must be backed off) when making this adjustment.*

Carter Carburetors— See that pump connector link installed in outer hole (long stroke) of pump arm. Remove dust cover and gasket. Place straightedge across dust cover boss at pump arm. Flat on top of pump arm should be parallel to straightedge. Adjust by bending throttle connector rod at lower angle using bending tool T109-213.

Rochester Carburetors—Use scale on bowl cover to measure height of pump plunger rod. Distance from top of bowl cover to bottom edge of plunger rod should be 63/64" (except Eldorado), 1 1/16" (Eldorado Front & Rear Carburetors). Adjust by bending throttle connector rod at lower angle.

Metering Rod Adjustm nt (Carter Carburet rs): *No gaug r quir d and met ring rods us d only on primary sid of carburetor. Check m t ring rods aft r making pump rod adjustment (abov).* Make certain that throttle valves seated in bores. Remove dust cover and gasket. Loosen metering rod arm clampscrew, press down on vacumeter link until metering rods bottom in carburetor body. Hold rods in this position, rotate metering rod arm until finger on arm contacts lip on vacumeter link, carefully tighten clampscrew.

CADILLAC CARBURETOR IDLE SYSTEM

Float Level Adjustment: *Primary and secondary floats must both be adjusted VERTICALLY and LATERALLY and Float Drop must also be adjusted.*

Carter Carburetors

Carter Float Level—With bowl cover assembly removed from carburetor and inverted, **remove cover gasket,** place correct gauge (see table) directly under center of floats with notched portions of gauge fitted over edges of cover. **Vertical Adjustment**—Floats should just clear horizontal portion of gauge (see table for vertical distance between tops of floats and machined surface of cover). Adjust by bending float arms up or down. **Lateral Adjustment**— Sides of floats should just clear vertical uprights of gauge. Adjust by bending float arms as required.

Carter Float Level	Checking Gauge	Vertical Distance
Primary (All)	①T109-232	1/8"
Secondary (All)	②T109-222	3/16"

①—Cadillac No. J-5437. ②—Cadillac No. J-5458.

Carter Float Drop—Hold bowl cover upright with floats down at limit of travel. Measure distance from top of each float at center to machined undersurface of bowl cover. Adjust by bending stop tabs on float bracket.

Carter Float Drop	
Primary (All)	5/8"
Secondary (All)	11/16"

Roch st r Carbur t rs

Roch ster Fl at L v l—With bowl cover assembly removed from carburetor and inverted, and **c v r gask t in plac ,** place correct gauge (see table) directly over center of floats with gauge against curvature in air horn bore. **Vertical Adjustm nt**—Floats should just touch top portion of gauge between gauge legs (see table for vertical distance from bottom of each float to gasket). Adjust by bending float arm at rear of float assembly. **Lateral Adjustm nt**—Each float should be centered between the gauge legs. Adjust by bending float arms horizontally. Check by tilting air horn assembly 90° to each side and make certain floats do not touch gauge legs.

Rochester Float L v l	Checking Gaug	Vertical Distanc
Primary & Secondary	③BT-101	1 19/32"

③—Cadillac No. J-5683.

Rochester Float Drop—Hold bowl cover upright with floats down at limit of travel. Measure distance from bottom of floats at center to gasket on bowl cover. Adjust by bending float tang at rear of float toward needle seat to lessen drop and away from seat to increase drop.

Rochester Float Drop	
Primary & Secondary (All)	2¼"

Automatic Choke & Modifier Adjustment: Choke setting on all models is CENTERED (at Index). Choke Modifier must be adjusted as directed below.

►*WARM-UP PERFORMANCE IMPROVEMENT (CARS WITH CARTER CARBURETORS):* If warm-up performance is poor due to a too-rich choke setting, the standard Centered setting can be changed to **l P int L an** which will correct this condition. Adjust Modifier as follows:

Carter Choke Modifier—Set cover assembly at index for centered setting (see Warm-up performance improvement above). Disconnect choke modifier rod at lower end, rotate metal pointer and lever (to which rod connected) until it is in line with raised pointer on coil housing. Hold pointer in this position, loosen clampscrew in modifier lever, rotate lever until scribed line on lever is vertical, tighten clampscrew. Make certain that throttle valves fully seated, bend rod at upper angle until rod freely enters hole in throttle arm. Connect rod.

Rochester Choke Modifier—Set cover assembly at index for centered setting. Make certain that throttle valves fully seated, loosen lockscrew in modifier lever on choke cover, rotate index pointer counter-clockwise until it lines up with long scribed line on cover (choke valve should be closed), tighten lockscrew securely.

Choke Rod Adjustment: *This adjustm nt sh uld b mad BEFORE adjusting Fast Idl , Unload r, and Sec ndary Throttle Linkage.*

Carter Carburetors—Loosen clamp screw on lever on choke shaft. Insert .020" feeler gauge between lip of fast idle cam and boss on flange casting, hold choke valve tightly closed and remove all slack from linkage by pressing choke lever toward closed position, tighten clampscrew while holding lever in this position.

Rochester Carburetors—Turn fast idle adjusting screw in until it contacts the SECOND step of the fast idle cam, close choke valve until screw is against high step of cam and make certain that choke trip lever is in contact with counterweight lever. Hold linkage in this position and check choke valve opening or clearance between upper edge of valve and dividing wall in air horn using SMALL end of Gauge BT-102 (.040"). Adjust by bending choke rod.

CONTINUED ON NEXT PAGE

CADILLAC CARBURETORS (C nt.)

Unl ad r Adjustm nt: *This is don aft r Chok Rod adjusted.*

Carter Carbur tors—Move throttle lever to wide open position. Check choke valve opening or clearance between upper edge of valve and inner wall of air horn using Gauge T109-39 (13/64"). Adjust by bending unloader lip on throttle shaft lever using T109-41 bending tool.

R ch ster Carbur tors—Move throttle lever to wide open position and hold trip lever down in contact with choke counterweight. Check choke valve opening or clearance between upper edge of valve and dividing wall in air horn using LARGE end of Gauge BT-102 (.125"). Adjust by bending tang on fast idle cam using BT-69 bending tool

Fast Idl Adjustm nt: *CAUTION—When Fast Idle set "Off Engin ", a final adjustment should be made "On Engin " as d tail d below to insure correct ngin warm-up p rformanc .*

"Off Engin " Fast Idle Setting

Carter Carburetors—Hold choke valve tightly closed so that high step of fast idle cam is in line with fast idle screw, turn fast idle screw in until primary throttle valve opening or clearance between edge of valve and wall on side opposite idle ports is .015" (Gauge T109-44).

R ch st r Carburet rs—Hold choke valve tightly closed and hold throttle lever in closed position so that fast idle screw rests on high step of fast idle cam Turn fast idle screw in until throttle valve opening or clearance between edge of valve and air horn wall is 020' (SMALL end of Gauge BT-67)

"On Engin " Fast Idle Setting

All Carbur t rs—After completing Idle Adjustment (above), idle engine, place selector lever in Neutral, rotate fast idle cam so that fast idle screw contacts highest step of cam, adjust fast idle screw for engine speed of 1700 RPM (All Cars except Eldorado Engine), 2000 RPM (Eldorado engine)

Secondary Throttle Linkage· *Separate adjustments required on each carburetor as follows*

Carter Carburetors

1) Secondary Throttle Lever—With choke valve wide open, move throttle lever to wide open position and note movement of secondary throttle valves which should reach wide open position at same time as primary valves Adjust by bending secondary throttle operating rod at upper angle using bending tool T109-213

2) Secondary Throttle Lock-out—With fast idle adjustment correctly made (above), close choke valve and hold in tightly closed position Lock pawl should be in unlocked position If not, adjust by bending tang on lock pawl using bending tool T109-105 Hold primary throttle valves halfway open, open choke valve fully, then open primary throttle valves all the way Tang on secondary throttle arm should engage notch in lock-out lever preventing secondary throttle shaft movement Then close primary throttle valves (with choke valve wide open) until lock pawl is unlocked, finally open primary throttle valves all the way Lock-out lever should fall free allowing secondary throttle valves to open before primary throttle valves are fully open Adjust by bending tang on secondary throttle lever to provide clearance for proper operation of lock-out lever

Rochester Carburetors

►*ROCHESTER CARBURETOR SECONDARY LEVER CLEARANCE CAUTION (Insufficient clearance will interfere with correct Idling Adjustment)* With both primary *and secondary* throttle valves completely closed, check the following points (1) Clearance between secondary throttle lever and secondary throttle actuating lever must be 010- 015" (2) Clearance between upper edge of secondary throttle lever and bottom of float bowl must be 020' After establishing these clearances, operate linkage and check for positive closing of the throttle valves (bend secondary throttle, if necessary, to secure positive closing)

1) Secondary Throttle Lever—With choke valve wide open, move throttle lever to wide open position and note movement of secondary throttle valves which should reach wide open position at the same time as primary valves. If adjustment required, remove secondary throttle actuating link, check wide-open stops for both primary and secondary valves and adjust by bending tangs so that wide-open position can be secured, connect link Bend link so that both throttle shafts contact wide-open stops at the same instant

2) Secondary Throttle Lock-out—With choke valve partially closed and throttle valves closed, check clearance between secondary lock-out lever tang and edge of slot in fast idle cam using a feeler gauge Clearance should be 015' Adjust by bending tang horizontally using bending tool BT-18

3) Secondary Throttle Contour Clearance—With choke valve wide open, open throttle valves so that tang on secondary lock-out lever rides over top of fast idle cam Measure clearance between tang and fast idle cam edge using a feeler gauge Clearance should be 015' Adjust by bending tang up or down using bending tool BT-91

OVERHAUL: *See "Carter 4-Barrel Carburetors" & "Rochester 4-Barrel Carburetors".*

SERVICE PARTS

Gasket Sets—Carter No. 263 (2255S, 2266S, 2267S, 2354S, 2355S). Rochester No. 7006135 (7006962, 7006963), No. 7007134 (7007970, 7007971).

Repair Pkg.—Carter No. 1792 (2255S, 2266S, 2267S, 2354S, 2355S). Rochester No 7006375 (7006962, 7006963, 7007970, 7007971).

②—See Application Data below.

►CHANGES, CAUTIONS, CORRECTIONS

►***1952 BUICK NO. 894S & 894SA CARBURETOR CHANGE TO SHORTEN CRANKING TIME WITH HOT ENGINE:*** ***The following modifications can be made on first No. 894S & 894SA carbureors (CAUTION—Later carburetors have similar changes made in production and do not require this rework):***

1) With carburetor off engine, remove air horn assemblies, remove float and needle assemblies *(CAUTION*—mark floats to insure re-installation in same position), remove choke housing, choke valves, and choke shaft.

2) Working from bottom side of air horn and cover assembly, drill two ⅛" (.125") holes through cored passages on secondary side (these passages are at center of opening on each side and immediately adjacent to rib around inner edge of casting).

3) With air horn and cover assembly upright, drill four No. 42 (.0935") holes (3/32" drill can be used) into the vertical vent passages in the air horn to provide external vents. Locate these holes as follows: On Choke Housing Side: Locate primary side vent (to right of choke housing mounting boss) 13/16" down from upper edge of air horn and in line with existing vent hole. *NOTE*—plug this existing vent hole with ⅛" lead plug. Locate secondary side vent 1" down from upper edge of air horn. **On Side opposite Choke Housing:** Locate both primary and secondary vent holes 1⅛" down from upper edge of air horn (left hand or primary side vent should be in line with existing vent near upper edge of air horn). *NOTE*—Plug this existing vent hole with ⅛" lead plug. Carefully clean casting, reassemble all parts of the air horn assembly and re-install assembly on carburetor.

4) Remove throttle body assembly from carburetor, use a No. 36 (.1065") drill (7/64" drill can be used) to drill an external vent hole into each of the four carburetor barrels, locating holes as follows: All holes should be 5/16" down from upper (main body mounting) face of throttle body. On throttle lever and fast idle cam side of throttle body, secondary side hole should be located at top of flat boss to right of auxiliary throttle shaft, primary side hole should be to left of center line of throttle valve shaft. On secondary throttle linkage side of throttle body, primary side hole should be to right of secondary throttle lever, secondary side hole should be to left of boss on flange closed by plug. Carefully clean casting and re-install throttle body on carburetor.

5) Remove metering rod housing cover (dust cover), use a No. 36 (.1065") drill (7/64" drill can be used) to drill an external vent hole at center of flat surface on left hand end of cover (viewing cover from side from which "Carburetor" can be read) locating hole ⅛" up from bottom mounting face of cover.

6) Adjust carburetor and re-install on engine. ***See "Carter WCFB 4-Barrel Carburetor" in 1952 Annual Data.***

►***BUICK 894SA FLOAT CHANGE:*** "Wedge" type floats used on later carburetors REQUIRE SPECIAL FLOAT SETTING. See Float Setting data below.

►***1953 BUICK ACCELERATION HESITATION CORRECTION (Early Cars):*** If a cold engine tends to hesitate on quick throttle opening, completely tune-up engine using extreme care that all settings are correct and exact, check manifold heat control thermostatic spring, and operation of carburetor hot-air stove. ***See Buick 50, 70 Tune-up data in Car Model Section.***

►***1953 BUICK 70 CHANGE TO ELIMINATE DETONATION OR SPARK RAP (Carter 996S and First 2053S Carburetors tag dated prior to "E3"):*** Increase size of vacuum spark control port from .040" to .081" as follows: Remove carburetor from engine, place throttle valves in wide open position and protect valves from damage by drill. Remove spark control fitting from throttle body. Working through spark control fitting hole, use No. 47 drill to enlarge original .040" spark control hole, then finish drill hole with No. 46 drill (.081"). Blow out all chips and thoroughly clean carburetor, re-install spark control fitting, re-install carburetor. ***NOTE—Carburetors tagged "E3" & later have this change.***

►***1954 BUICK METERING ROD PRODUCTION CHANGE (All Series with 2082S Carburetor):*** Metering Rod No 75-1108 used on later carburetors and supersedes No. 75-995 used on early carburetors

►***1954 BUICK ACCELERATING PUMP PLUNGER LEATHER TURNING BACK CAUSING IMPROPER ACCELERATION & THROTTLE RESISTANCE (Early Cars with carburetors tag-dated "L3" through "C4"):*** Caused by too long pump stroke allowing leather to catch in overflow slot in pump cylinder at closed-throttle. Correct as detailed below. ***CAUTION—Unless these changes made, replacement of pump plunger will result in recurrence of trouble.***

(1) Install new Pump Plunger and READJUST PUMP STROKE (see Accelerating Pump data below).

(2) Adjust Metering Rods (see below).

(3) Remove Pump Jet Cluster Hold-down Screw and rework inner slotted end to assure full stroke of pump discharge needle. Screw has slotted projection extending 1/16" beyond end of threads. Grind off one side of projection entirely and reduce height of opposite side from 1/16" to 1/32". Re-install screw.

►*1955 BUICK CARBURETOR CHOKE PISTON CHANGE TO IMPROVE WARM-UP PERFORMANCE (First Carburetors tag-dated "L-4" & Earlier):* If rolling, loading, or stalling noted immediately after engine started, and this is not caused by leak in Intake Manifold or vacuum lines (Windshield Wiper, Washer, or Power Brake), install new type Choke Piston furnished in Carter Unitized Pkg. No. 160-140U or Buick Kit, No 1169567. Attach new Copper identification tag (furnished in kit) which will indicate modification has been made *NOTE—Carburetors tag-dated "M-4" and later have this piston installed in production.*

►***CADILLAC 896S SECONDARY THROTTLE STICKING CORRECTION:*** If secondary throttle tends to stick open, check wide-open stop position, and change secondary throttle spring hook-up as follows:

Wide-open Stop Position—Valves must not open beyond the vertical position (intake air force would tend to hold valves open). Adjust by bending tangs of primary and secondary throttle stops on throttle levers with heavy pliers as required.

Secondary Throttle Return Spring—Connect spring in UPPER hole of secondary throttle lever (move spring up from lower hole), loosen screw on spring bracket and move bracket back 20-30° from original position to increase tension of spring *(CAUTION*—clearance between spring and bowl

CONTINUED ON NEXT PAGE

CARTER WCFB 4-BARREL CARBURETORS (Cont.)

casting must not be less than 1/32"). These changes will increase closing torque on secondary throttle shaft.

NOTE—Above change was made in production after approximately 70,000 cars.

▷*CADILLAC 896S FLOAT CHANGE TO CORRECT ENGINE STALLING ON QUICK STOPS:* On carburetors with date code earlier than G2, new type float assembly with "wedge" type floats can be installed and will prevent flooding of the primary side due to surging of fuel in bowl on quick stops. This new Float Assembly No. 1459998 may be used as a service replacement on both Primary and Secondary side of any carburetor prior to code date G2 to correct flooding and subsequent rough idle or stalling caused by a quick stop. *See Float Level data below. These "wedge" type floats are used in production on all 896S carburetors code dated "G2" and later.*

▷*CADILLAC FLOAT SETTING CAUTION*—New "wedge" type floats have greater buoyancy and REQUIRE SPECIAL FLOAT SETTING. *See Float Level data below.*

▷*FLOAT ARM INTERFERENCE CORRECTION:* On early WCFB carburetors, the sideways float adjustment should be made very carefully to make certain that floats and arms are positioned correctly and do not scrape on sides of bowl casting. In addition, greater clearance can be secured between arms and venturi by relieving the upper edge of each arm with a file on the venturi side. *PRODUCTION CHANGE NOTE*—Later carburetors have floats with extra bend in arms to provide greater clearance.

▷*FLOAT BOWL COVER SCREW CAUTION:* Later WCFB carburetors have THREE DIFFERENT LENGTHS of bowl cover screws which must be used in correct locations as follows:

Seven Long Screws—Install in shallower counterbores in air horn section (six), and under dust cover (one).

One Intermediate Screw—Install at secondary throttle return spring bracket location.

Eight Shorter Screws—Install in remaining bowl cover holes.

NOTE—On first WCFB carburetors, all 16 bowl cover screws were of same length.

▷*1953 CADILLAC "SPEED-UP" CONTROL ON AIR-CONDITIONED CARS:* This device automatically increases engine idle speed to 750-800 RPM. when air-conditioning switch turned on. *See Speed-Up Control Adjustment data following Idle Adjustment.*

▷*CADILLAC & OLDSMOBILE "TWIN-TURBINE DYNA-FLOW" CAR CAUTION:* If "Throttle Return Check Dashpot" used, this unit should be adjusted as directed below (following Idle Adjustment).

▷*1952-54 CADILLAC 2143S CARBURETOR APPLICATION:* This carburetor must be used with special accessory packages as listed below on all cars except the following: 1952 (All Models), 1953 (Hydra-Matic Cars without Air-conditioning), 1954 (All Models without Air-conditioning). On other models use the following Unitized Packages:

1953 Hydra-Matic & All 1954 with Air-conditioning: Use Unitized Pkg. 202-44U (Idle Speed-up Control).

1953 Twin-Turbine without Air-conditioning: Use Unitized Pkg. No. 202-60U (Slow-closing Throttle Dashpot).

1953 Twin-Turbine with Air-conditioning: Use Unitized Pkg. No. 202-44U (Idle Speed-up Control) & No. 202-60U (Slow-closing Throttle Dashpot).

▷*1953 CADILLAC CARBURETOR THROTTLE BODY PRODUCTION CHANGE & 1952-53 REPLACEMENT NOTE:* Cast Iron Throttle Body used in production beginning Engine No. 91594. This cast iron throttle body can be used for replacement on 1952-53 carburetors where excessive corrosion found in heat passage and will also reduce warpage resulting in frozen or binding throttle valve shafts or leakage between carburetor mounting flange and manifold.

▷*1953 CADILLAC CARBURETOR CLEANING CAUTION TO PREVENT FLOODING:* When disassembling carburetors marked by daub of blue dye on fuel inlet connection, fuel passage between fuel inlet and primary float needle valve should be very carefully cleaned with carburetor solvent and blown out with air to remove any loose particles of bowl sealing material (sodium silicate) which might lodge under the needle valve. *NOTE*—This sealing material not used on later carburetors.

▷*1954 CADILLAC IDLE SPEED SETTING CAUTION ON AIR-CONDITIONED CARS:* Idle speed setting should be adjusted seasonally: (1) When air-conditioning use discontinued for winter months, (2) When air-conditioning is put into use for summer months. This is necessary to compensate for compressor load when engine idling in "Dr." *See Idling Adjustment below. CAUTION—Engine may stall during summer months, or operate at too fast an idle speed during winter months, if proper procedure not followed.*

▷*1955 CHEVROLET LOADING (WHEN STARTING PARTIALLY WARM ENGINE):* Choke setting has been changed to 2 Points Lean (superseding Centered setting) which will improve this condition.

▷*1955 CHEVROLET HARD STARTING (AFTER FLOODING):* May be caused by primary throttle valves not opening wide which prevents Unloader operating. Check throttle linkage to make certain that primary throttle valves wide open when accelerator pedal pressed to floorboard. Check Unloader setting. *See ADJUSTMENTS below.*

▷*1955 CHEVROLET AIR CLEANER INSTALLATION CAUTION:* When installing air cleaner, make certain that cutouts in gasket line up with carburetor bowl vent tubes and use care that gasket does not rotate when cleaner installed. *Blocking of carburetor bowl vents will interfere with carburetor operation.*

▷*1952 OLDSMOBILE 932S SECONDARY THROTTLE LINKAGE CHANGE & INSTALLATION CAUTION:* Secondary throttle linkage parts changed in production as listed below. *See "Throttle Linkage" Reassembly under OVERHAUL below for each type linkage assembly.*

932S Secondary Throttle Linkage

Part	First	Later
Throttle Operating Rod	115-185	115-199
Secondary Operating Lever	53A-341S	53A-348S
Sec. Throttle Shaft Assy.	3-796S	3-788S

▷*1954 OLDSMOBILE CHOKE HEAT TUBE REMOVAL & INSTALLATION:* Choke heater tube is installed in intake manifold (extending crosswise through exhaust gas cross-passage). If necessary to replace tube proceed as follows: Removal—Remove pipe plug in right side of manifold directly below manifold-to-carburetor passage. Apply penetrating oil to both ends of heat tube, drive tube out through pipe plug hole. Installation—Insert small necked end of tube first through pipe plug hole, use Tool BT-47 to drive tube into place until large end protrudes about 1/16" into vertical manifold-to-carburetor passage. Replace pipe plug.

▷*PACKARD CARBURETOR FLOODING (Early 985S):* May be caused by equalizer tube (cast in body) leaking into vacuum passage for starter switch allowing raw gasoline to go directly into intake manifold. Check by blowing smoke through starter switch vacuum hole below throttle valve. Correct by replacing carburetor.

▷*PACKARD 985S CARBURETOR CHANGES:*

1) Choke Setting Change to reduce possibility of flooding during cold starts—Set automatic choke to Centered (At Index) instead of 1½ Points Rich as originally specified.

2) Low Speed Jet Size Change to correct part-throttle engine surge and improve cold weather idling—All low speed jets (primary and secondary) have been increased from .032" or #67 drill size to .033" or #66 drill size (Part No. 11-234S). *NOTE—Carburetors tagged "B3" & later have these new jets.*

3) Unloader Setting Change—Setting should be 9/32" ± 1/64" (was 9/64"). See Unloader data.

4) Throttle Rod Override Spring Note—If override in throttle rod lengthens before choke valve opens 9/32", install throttle rod assembly with stronger spring (furnished as Part No. 446613).

▷*1955 PACKARD ROUGH ENGINE IDLE, POOR PERFORMANCE & POOR ECONOMY (Due to high vacuum at Distributor Advance Unit):* High vacuum may be caused by foreign material deposits in either primary or secondary throttle bores, or insufficient clearance of secondary throttle valves in bores. This condition makes it necessary to open primary valves too far to obtain the correct 400 RPM idle speed and results in distributor vacuum port being uncovered, causing distributor vacuum advance to operate at idle speed. The resulting too early ignition at idle speed and late timing throughout the rest of the range will not only cause a rough idle but also poor performance and poor gasoline economy. Check and correct this condition as follows:

Checking for High Vacuum—Connect vacuum gauge at distributor line fitting on carburetor. Idle engine at 400 RPM with selector lever in Drive Range. Vacuum must not exceed 5" Hg.

Correcting High Vacuum—Examine throttle bores for foreign material deposits at the throttle valves. Correct by cleaning throttle body in carburetor cleaner. If no deposits noted, reposition secondary throttle valves on shaft as follows: Loosen secondary throttle valve screws, place a .002" shim ¼" wide between upper edge of valves and carburetor bore, retighten screws while holding valves in this position.

▷*1955 PONTIAC LOADING OR CARBURETOR FLOODING: May be caused by excessive fuel pump pressure. See "Fuel Pump" under CARBURETOR on Car Model page for corrective procedure.*

▷*1955 PONTIAC HARD STARTING CORRECTION (DUE TO UNSATISFACTORY UNLOADER OPERATION*

CONTINUED ON NEXT PAGE

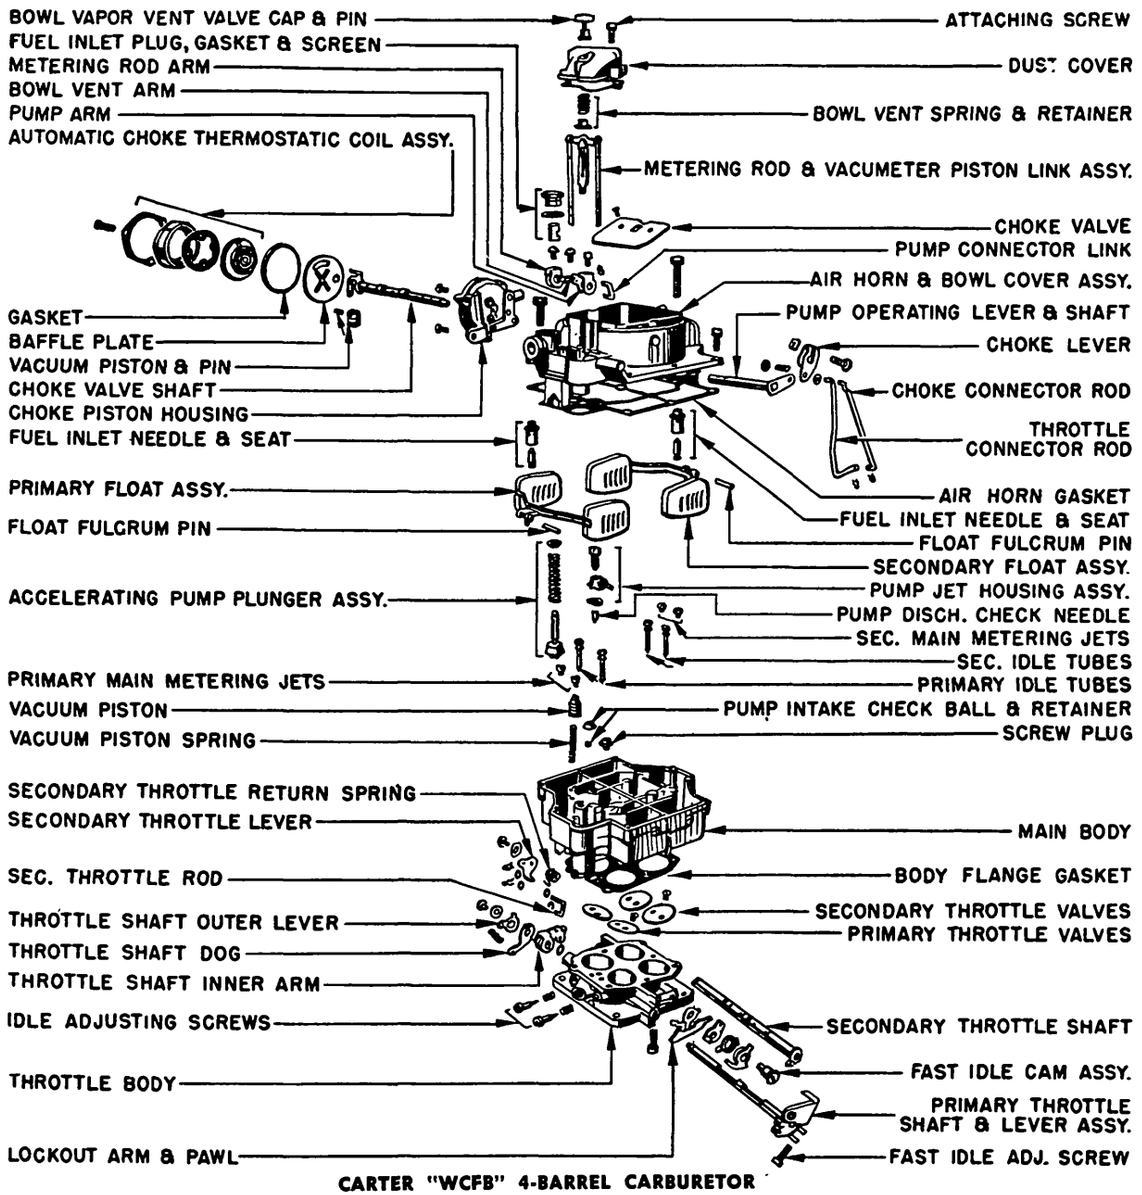
CARTER WCFB 4-BARREL CARBURETORS (Cont.)

AFTER FLOODING: If this condition not corrected by regular Unloader Adjustments, follow the procedure given below and install new parts as indicated.

1) Install new Throttle Flex Spring, Pontiac No. 7008801, on carburetor (spring is linked between throttle shaft dog and outer throttle lever). New spring is lighter type and will reduce effort required to unload carburetor.

2) Install new Engine Throttle Control Bracket Assembly, Pontiac No. 521986. This is a redesigned assembly.

3) Adjust throttle control linkage (see "Throttle Linkage Adjustment (Hydra-Matic drive Cars)" under CARBURETOR on car model page) and adjust the throttle control intermediate rod as follows: Push rod downward until end of accelerator pedal rod lever is felt to touch the end of its travel, shorten the intermediate rod enough to allow 1/8" clearance between end of accelerator pedal rod lever and rubber bellows assembly (3 turns of the trunnion nut). This adjustment will provide maximum allowable accelerator pedal travel.



4) Inspect accelerator pedal. Replace pedal if hinge pin or pedal rod holes worn oversize or out-of-round.

5) Check for interference between accelerator pedal lever and throttle control dash bracket at wide open throttle position. If interference noted grind 1/16" relief on dash bracket at point of contact. *NOTE*–This interference will be noted particularly on cars where 4-barrel carburetor installed in the field.

DESCRIPTION: These models are essentially double dual (two-barrel) carburetors with a conventional dual **primary** unit supplemented by a similar dual **secondary** unit for maximum engine performance. Both the primary and secondary units have separate fuel bowl and float systems, idle systems, main metering and discharge systems, and interconnected throttle valves as described below. Only the primary unit has an accelerating pump system and choke valve with an automatic choke control (the secondary throttle valves or auxiliary throttle valves are locked closed for starting and warming up and remain closed during part-throttle operation). ***See Throttle Linkage data below.***

Fuel System: A single fuel inlet is used (located on secondary side of bowl cover) with a passage in the cover leading to the fuel inlet valve for each float chamber. Each bowl has a twin float assembly controlling the fuel inlet valve. Bowls are vented to the air horn by vent tubes and have additional vent passages terminating at the air cleaner mounting flange. ***See Idle Vent data below also.***

Idling & Low Speed—Entire idle system is duplicated for both the primary and secondary sides of the carburetor except that idle mixture adjusting screws are provided only on the primary side (adjusting screw holes closed by plugs on secondary side). Fuel is discharged into each of the carburetor barrels and secondary idle system continues to function through-out the part throttle range until the secondary throttle valves also begin to open. Secondary throttle valves (auxiliary throttle valves on Buick carburetors) are locked out by the choke mechanism when the engine is cold and even when the engine is warm these valves do not begin to open until primary throttle valves are 50-60% open.

CARTER "WCFB" 4-BARREL CARBURETOR

►*SECONDARY IDLE SYSTEM NOTE:* On some carburetors (Oldsmobile 1954-55, Chevrolet, Packard, Pontiac, Studebaker 1955), no secondary side idle system is used (primary idle system only).

Driving Range (Less than 50-60% Throttle)—The primary throttle valves are directly connected to the accelerator pedal and open as the pedal is depressed (secondary throttle valves are linked to the primary throttle valves and remain closed until primary valves are 50-60% open). Opening of the primary throttle valves bring the main discharge nozzles into action and the primary idle systems drop out (secondary idle systems continue to operate as long as secondary throttle valves are closed). Fuel for these main nozzles is metered by primary main metering jets (these jets have the usual vacumeter type metering rods). Under conditions of low manifold vacuum (hill climbing, acceleration, etc.), the vacuum piston spring lifts the metering rods

CONTINUED ON NEXT PAGE

CARTER WCFB 4-BARREL CARBURETORS (Cont.)

out of the metering jets and permits a greater fuel flow to the nozzles.

High Speed or Full Power (More than 50-60% Throttle)—At 50-60% throttle, the linkage between the primary and secondary throttle valve levers begins to open the secondary valves. These secondary valves open at a relatively greater rate so that both the primary and secondary valves reach the "wide open" position at the same time. In this range, fuel is discharged through all four carburetor barrels to provide maximum engine power. Secondary fuel is metered by secondary main metering jets and discharged through secondary main nozzles in exactly the same manner as on the primary side except that no metering rods are used with the secondary metering jets.

Accelerating Pump—Used only on primary side of carburetor. Pump is conventional type with pump plunger linked to primary throttle valve lever so that the additional fuel needed for acceleration is discharged through the pump jets into the primary carburetor barrels when the primary throttle valves are opened for acceleration. A relief check valve is located in the pump discharge channel to prevent excessive pressures in the pump circuit (opening of check valve permits by-passing of fuel back into the bowl). Pump is effective only at car speeds below 30 MPH. (at higher speeds, pump plunger bottoms in cylinder and air is drawn through the jets from a vent passage opening into the bowl above the fuel level).

Auxiliary Throttle Valves (Buick Carburetors): These are offset type counterweighted valves located directly above the secondary throttle valves (not used on primary side of carburetor). These valves are locked closed by the choke mechanism during choke operation (to insure faster cold engine starting) and when unlocked are controlled entirely by the air velocity through the carburetor (not connected to the throttle linkage).

Primary & Secondary Throttle Linkage: Secondary throttle valve lever is linked to a secondary actuating lever on the primary throttle valve shaft with an overrun provision so that secondary valves do not begin to open until primary valves are 50-60% open. The linkage provides a more rapid opening of the secondary valves so that both the primary and secondary valves reach the wide open position at the same time. This linkage must be checked and adjusted to insure this synchronized opening. *See Adjustment data.*

Secondary Throttle Lock-out (Auxiliary Throttle Valve Lock-out on Buick): A means is provided by which the choke mechanism locks the secondary or auxiliary throttle valves closed while the choke is in operation so that no choke valve is required on the secondary side of the carburetor. This lock-out mechanism differs on the various carburetors but all types must be checked and adjusted to insure unlocking of the secondary valves for normal operation. *See Adjustment data.*

Atmospheric Idle Air Vent: *CAUTION—Several types have been used in production as follows:*

First Type (In Air Horn Casting)—Consists of a ball or disc type check valve located in the air horn casting under the dust cover and actuated by an arm on the pump countershaft. Valve is opened when throttle valves are closed to provide an external bowl vent which minimizes hot weather starting and idling difficulties due to fuel vapor formation in the fuel bowl. Vent valve closes when the throttle valves are opened. *NOTE*—On first carburetors produced after this type vent discontinued, a spacer collar was used to cover the flat area around the tapped hole in countershaft (to hold metering rod lever in correct position on countershaft).

Later Type (On Dust Cover)—Consists of a cap type valve on top of dust cover actuated by arm on pump countershaft (arm contacts lower end of valve stem and raises valve off its seat). Vent operates in same manner as first type (above).

Automatic Secondary Throttle Control (Chrysler 2126S & DeSoto 2210S): Secondary throttle valves operated by vacuum control unit which opens and closes secondary throttle valves in accordance with air velocity through primary venturi. Vacuum is supplied from the primary venturi. A mechanical overriding linkage insures that secondary throttle valves always close with the primary throttle valves.

ADJUSTMENT: *CAUTION—Adjustments should be made in sequence as shown below.*

IDLE SETTING

Idle Setting: *Adjust only with engine at normal operating temperature with automatic choke not operating* (choke valve wide open, fast idle inoperative so that engine idles at hot or slow idle speed). If initial adjustment required to allow engine to be started and warmed up, set both idle adjusting screws as indicated in table below. With engine warm, adjust idle speed adjusting screw for correct engine idle speed as shown in table below (use tachometer), then adjust each idle mixture adjusting screw (one screw for each primary carburetor barrel—two screws only) until engine idles smoothly and RPM. is at maximum. Recheck idle speed. Adjust Throttle Return Check and check Speed-up Control (on cars with these units) as directed below.

▷*OLDSMOBILE 1955 NOTE:* Manufacturer recommends that after setting idle as above (for highest vacuum reading and RPM), each screw should be turned out (Rich) ¼ turn which will provide desired idling performance. Check this setting by opening throttle to 1000 RPM point and then snapping throttle closed. If engine rolls from richness, turn each screw in (Lean) ⅛ turn.

Idle Mixture Setting

Car & Carb.	Idle Screw Opening
Buick 894S, SA	¼-1¼ turns
Buick 2082S	½-1½ turns
Buick (Others)	¾-1¾ turns
Cadillac 896S	1¼-2 turns
Cadillac 2005S, SA, 2072S	1¼-2¼ turns
Cadillac (Others)	¾-1¾ turns
Chevrolet 2218S, 2351S	¼-1¼ turns
Chrysler 2041S	1-2 turns
Chrysler 2126S	¾-1¾ turns
Chrysler 2317S	¼-1¼ turns
DeSoto 2210S	1-2 turns
Dodge 2191S	1-2 turns
Dodge 2181S, 2253S	½-1½ turns
Oldsmobile 2016S, 2080S	⅜-1¾ turns
Oldsmobile (Others)	1-2 turns
Packard 985S, 2142S	1-2 turns
Packard 2084S, 2103S	1¼-2¼ turns
Packard 2112S	¾-1¾ turns
Packard 2232S, 2284S	½-1½ turns
Plymouth 2253S	½-1½ turns
Pontiac 2268S, 2283S	¾-1¾ turns
Studebaker (All)	½-1½ turns

Idle Speed Setting

Car	Synchro-mesh Tr.	Automatic Tr.
Buick	450 RPM	② 450 RPM
Cadillac ('52)	400 RPM	② 375 RPM
Cadillac ('53-55)	400 RPM	① 400 RPM
Chevrolet	450-500 RPM	② 400-450 RPM
Chrysler (300)		③ 700 RPM
Chrysler (Others)		③ 475-500 RPM
DeSoto	500 RPM	③ 500 RPM
Dodge	450-500 RPM	③ 475-500 RPM
Oldsmobile	425 RPM	② 400 RPM
Packard ('53-54)	400-450 RPM	③ 375 RPM
Packard ('55)	400-450 RPM	③ 400 RPM
Plymouth	450-500 RPM	④ 475-500 RPM
Pontiac	450-470 RPM	② 390-410 RPM
Studebaker	500 RPM	③ 550-600 RPM

①—With selector lever in "Dr" and Air-conditioner "ON" (Summer months), "OFF" (Winter months). See special procedure following.

②—With selector lever in "Dr".

③—With selector lever in "H".

④—With selector lever in "N" neutral.

▷*CADILLAC IDLE SPEED SETTING PROCEDURE:* Set idle speed in accordance with season as follows: When air-conditioning being used (Summer months), place selector lever in "Dr," turn Air-conditioner "ON," set idle speed at 400 RPM. When air-conditioning not being used (Winter months), place selector lever in "Dr," see that Air-conditioner "OFF," set idle speed at 400 RPM. (It will be necessary to cut idle speed setting down from summer setting to maintain this 400 RPM. idling speed).

Throttle Return Check (Dashpot) Adjustment: Adjust each model as follows:

Buick (1953)—Dashpot is adjusted as part of Throttle Linkage Adjustment. *See "Buick Dynaflow Drive" in Transmission Section.*

Buick (1954-55)—After linkage adjusted, and engine at normal operating temperature, rotate fast idle cam to cold idle (choke closed) position, insert .030" feeler gauge between stop screw and highest step of fast idle cam. Loosen dashpot mounting stud locknut, position dashpot so that plunger barely clears throttle lever, tighten locknut. Check setting by noting engine performance when throttle closed. If engine stalls, move dashpot forward (toward throttle lever); if engine slow in returning to idle speed, move dashpot to rear. Tighten locknut after each adjustment.

Cadillac (1953 Twin-Turbine Dynaflow Cars)—After idle adjustment completed, close throttle valves, loosen dashpot mounting stud locknut, adjust dashpot for .047" clearance between end of plunger and throttle lever tang with dashpot plunger bottomed in housing (use pliers to hold plunger in while measuring clearance). Check performance by accelerating engine (with selector lever in "Dr" and brakes applied) release accelerator quickly. If engine stalls, decrease dashpot plunger clearance;

CONTINUED ON NEXT PAGE

CARTER WCFB 4-BARREL CARBURETORS (Cont.)

if engine does not return to idle speed promptly, increase clearance. Tighten locknut after each adjustment.

Adjustment (Oldsmobile Dynaflow Cars)—Hold plunger shaft with wrench, turn adjusting screw in or out of return check plunger to secure 1/16" clearance between screw and throttle lever with plunger bottomed in return check and throttle valves closed in hot or slow idle position. *NOTE*—Plunger has 7/32" total travel (from inner to outer position).

Studebaker (1955)—On cars with dashpot, after fast idle adjustment completed, hold choke valve tightly closed with fast idle screw on high step of cam, loosen locknut and adjust dashpot unit for 1/16" clearance between throttle lever and lower tip of plunger shaft Tighten locknut

Cadillac Speed-Up Control (Air-conditioned Cars): This unit increases engine idle speed when idling with selector lever in "N" and air-conditioner "ON"

Adjustment—With engine warm and idling, place selector lever in "N", turn air-conditioning ON, loosen locknut on diaphragm shaft and turn knurled adjusting nut to obtain engine speed of 900 RPM, tighten locknut *NOTE*—This setting supersedes previous recommendation of 750-800 RPM

FLOAT LEVEL SETTING

Float Setting: ***CAUTION—Primary and Secondary Float Assemblies must be checked and adjusted separately and both FLOAT LEVEL and FLOAT DROP must be checked for each assembly.*** Remove bowl cover and float assembly from carburetor for these checks:

Float Level—*Primary & Secondary Float Assemblies set to different heights (some carburetors only). Check & adjust carburetors as follows:* Remove bowl cover gasket (take out float hinge pins, remove float assemblies with intake needles attached, remove gasket, re-install floats). Invert bowl cover, install correct gauge for each float assembly (see table below) on bowl cover under center of floats with notched ends of gauge fitted tightly against sides of bowl cover casting. Both floats should just clear horizontal section of gauge (adjust by bending float arms as required) and each float should barely touch vertical uprights on gauge (bend float arms sideways for this clearance). This sideways adjustment is extremely important to prevent floats hanging up on sides of bowl casing

►***"WEDGE TYPE" FLOAT CHECKING CAUTION***—Float measurements (both horizontal & vertical) should be made near free end of floats.

Float Setting

ACCELERATING PUMP

Accelerating Pump Stroke: ***CAUTION—This is a linkage adjustment and not a seasonal change recommendation.*** Remove dust cover, make certain that pump connector link installed in uter (long stroke) hole of pump arm. Back off throttle stopscrew so that primary throttle valves are fully seated. Hold a straightedge across top of dust cover boss at pump arm. The flat on the top of the pump arm should be parallel with straightedge. Adjust by bending pump connector link at lower angle using tool T109-213.

►***STUDEBAKER NOTE*** On carburetors with dashpot, after completing pump rod adjustment (above), make certain that clearance between lower edge of countershaft arm and dashpot bracket is 015" minimum Correct by bending pump connector rod slightly

METERING RODS

Metering Rods (Primary Side): ***No gauge required for this adjustment and no metering rods used on secondary side.*** With dust cover removed and primary throttle valves fully seated (as for Pump Stroke Adjustment above), loosen setscrew in metering rod arm on pump countershaft just enough so that arm has slight bind on shaft, lift arm slightly. Depress metering rod link until metering rods just bottom in bowl casting, position metering rod arm so that it contacts link, tighten arm setscrew. Then adjust Atmospheric Idle Vent (following).

BOWL VAPOR VENT

Bowl Vapor Vent (Atmospheric Idle Vent) Adjustment: *NOTE—First type vent adjusted differently.*

Checking & Adjustment (Buick 894S & Cadillac Early 896S)—With dust cover removed, close primary throttle valves against wire gauge of correct size (see table below) and hold valves in this position Vent arm should just contact vent ball Adjust by bending vent arm using long-nosed pliers

Vapor Vent Setting (First Type)

Car & Carb.	Checking Gauge Size & No.
Buick 894S	020" T109-29
Cadillac 896S (Early)	040" T109-193

Checking & Adjustment (All Later Carburetors): *CAUTION*—Dust cover and gasket must be in place Back out primary throttle lever stopscrew fully so that primary throttle valves fully closed. Check clearance between lower edge of vapor vent valve and dust cover using correct gauge (see table below). Adjust by removing dust cover and bending vapor vent arm.

Cadillac Note—Clearance is same as other models (1/16" Gauge T109-197) but manufacturer recommends that adjustment be checked as follows Measure difference in height of vent valve (measure at rivet on head) with primary throttle valves open and closed (choke valve must be wide open) This difference should be 1/32"

CONTINUED N NEXT PA E

CARTER WCFB 4-BARREL CARBURETORS (Cont.)

Vapor Vent Setting (Later Type)

Car & Carb.	Vent Cap Clearance	Checking Gauge
Cadillac 896S (Later)	1/16"	T109-197
Cadillac (Others)	1/16"	See Note above
Chevrolet (All)	1/16"	T109-197
Chrysler (All)	1/16"	T109-197
DeSoto & Dodge	1/16"	T109-197
Oldsmobile 932S	3/32"	T109-125
Oldsmobile (Others)	1/16"	T109-197
Packard 2232S, 2284S	1/16"	T109-197
Packard (Others)	3/32"	T109-125

AUTOMATIC CHOKE

Automatic Choke: *CAUTION—Cadillac carburetors have Choke Modifier and are adjusted differently than other models as described below.*

Choke Setting (All models except Cadillac): See table below for settings. Adjust by loosening choke cover retaining screws and rotating the cover and coil assembly. Then adjust choke connector rod (following).

Automatic Choke Setting

Car & Carb.	Choke Setting
Buick (All Models)	Centered (At Index)
Cadillac (All Models)	See Modifier Adjustment
Chevrolet 2218S, 2351S	①2 Points Lean
Chrysler, DeSoto, Dodge	Centered (At Index)
Oldsmobile (All Models)	Centered (At Index)
Packard 985S	②Centered (At Index)
Packard 2084S, 2103S, 42S	Centered (At Index)
Packard 2112S	1½ Points Lean
Packard 2232S, 2284S	1 Point Rich
Plymouth 2253S	Centered (At Index)
Pontiac 2268S, 2283S	Centered (At Index)
Studebaker (All Models)	1 Point Rich

①—Supersedes Centered setting. Will correct loading when starting partially warm engine.

②—Supersedes 1½ Points Rich (original setting).

Choke Modifier Setting (Cadillac)—Loosen choke cover retaining screws, rotate cover assembly as required for 1 Point Lean setting (896S), Centered setting (Other Carburetors), tighten cover screws to retain this setting. Disconnect choke modifier rod at lower end, rotate metal pointer and lever (to which rod connected) counter-clockwise from its free position until the thermostatic spring picks up the choke valve lever and continue to rotate pointer until it lines up with plastic pointer on cover. Hold pointer in this position. Loosen clampscrew in modifier lever, rotate lever until it points forward (away from fuel inlet) and scribed line on lever is vertical, tighten clampscrew. Use Bending Tool J-1137, to bend modifier rod at upper angle until rod freely enters hole in primary throttle valve lever with throttle valves seated. Connect rod and install clip.

Choke Rod: *This adjustment is preliminary to checking and adjusting Fast Idle, Unloader, and Secondary Throttle Lock-out.* Loosen choke lever clampscrew, insert wire gauge of correct thickness (see table below) between tang on fast idle cam and boss on throttle body casting (hold gauge in place by pressure on choke lever) and take up all slack in linkage. Hold choke valve tightly closed and tighten clampscrew.

Choke Rod Setting

Car & Carb.	Checking Gauge Size & No.
Buick 2358S	.025" T109-189
Buick (Others)	.020" T109-29
Cadillac (All Models)	.020" T109-29

Studebaker (All Models)	.020" T109-29

FAST IDLE

▷*OLDSMOBILE CAUTION—Manufacturer recommends that fast idle be set with carburetor on engine. See special adjustment procedure below.*

Fast Idle: *NOTE—This adjustment is made with carburetor OFF engine or ON engine as follows:*

▷*CADILLAC CAUTION—Secondary Throttle Lock-out Adjustment should be made first (fast idle setting is disturbed by this adjustment).*

Carburetor Off Engine—Hold choke valve tightly closed so that fast idle cam rotated to point where high step of cam is under fast idle screw. Turn fast idle screw in or out until primary throttle valve opening is correct (see table below). Measure opening between edge of valve and carburetor wall on side opposite idle ports.

Carburetor On Engine—Run the engine until both engine and transmission are at operating temperature. With the engine idling, and choke valve wide open, rotate fast idle cam against the spring until the high step is under the fast idle screw. Use tachometer to check engine speed and adjust fast idle screw until engine speed is correct as shown in table below.

Fast Idle Setting Off Engine

Car & Carb.	Throttle Opening	Checking Gauge
Buick 894S,SA,996S	.020"	T109-29
Buick 2053S	.020"	T109-29
Buick 2082S, 2197S	.018"	T109-44
Buick 2358S	.016"	T109-44

Oldsmobile ('54-55)	1400-1500 RPM
Packard ('55)	1500 RPM
Pontiac ('55)	1900 RPM

UNLOADER

Unloader: *After Choke Rod adjusted (above),* rotate primary throttle valves to wide open position and hold valves in this position. Check choke valve opening by inserting correct Unloader Gauge (see table below) between edge of choke valve and air horn wall. With correct setting, choke valve should have slight drag on the gauge. Adjust by using bending tool T109-41 to bend unloader tang on throttle lever as required.

Unloader Setting

Car & Carb.	Choke Opening	Checking Gauge
Buick 894S, SA	3/16"	T109-28

Studebaker (All)	1/8"	T109-36

CARTER CAR STARTER CHECKING & ADJUSTMENT (Buick & Packard): With the carburetor on the bench, the switch timing can be checked as follows. Connect battery and 6 volt test lamp across switch so that lamp will light when switch contacts close. Back off throttle stopscrew so that primary throttle valves tightly closed, disconnect pump connector rod and choke connector rod, rotate fast idle cam to slow idle position. Place a scale horizontally against the choke unloader arm of the throttle lever and make a mark on the carburetor body at the ½" point on the scale. Hold end of scale against unloader arm and slowly open throttle until the test lamp lights indicating that switch contacts have closed. Note scale reading at mark on carburetor body. Correct scale reading (and travel as measured by arm movement) is shown in table below. If travel not correct, adjust switch timing by adding or removing shims located under the "W" shaped switch contact spring. These shims furnished in two sizes. No. 153-11 (.018"), and No. 153-12 (.006").

CAR STARTER SWITCH SETTING

Car Model	Scale Reading	Arm Travel
Buick	1¼-1 9/16"	¾-1 1/16"
Packard	1½-1⅞"	1-1⅜"

AUXILIARY THROTTLE VALVES

Auxiliary Throttle Valves (Buick All Models, Chrysler 2317S, Dodge 2181S & 2253S, Plymouth 2253S): Velocity type valves located directly above secondary throttle valves. Auxiliary throttle valves are "locked out" when choke is operating. Adjust as follows: **Auxiliary Throttle Valve Adjustment (Buick 996S, 2053S, & 2082S; Chrysler 2317S, Dodge 2181S & 2253S, Plymouth 2253S)**—Disconnect secondary throttle operating rod Adjust stop lug on secondary throttle lever (use bending tool T109-214) until clearance between lower edge of auxiliary throttle valve and bore is 27/64" (Gauge T109-242) with stop lug against stop on flange casting.

Auxiliary Throttle Lockout Adjustment (All Models)—After fast idle adjusted, proceed as follows (1) With choke valve closed make certain edge of hook on lockout arm contacts auxiliary throttle lever with maximum contact of locking step on lever (2) Open choke valve and make certain that auxiliary throttle valves are unlocked a few degrees before choke reaches wide open position Adjust by bending the lockout arm

SECONDARY THROTTLE LEVER & LOCK-OUT

Secondary Throttle Lever & Lock-out: *Adjustment procedure and settings differ on these carburetors due to different linkage designs. No secondary lock-out is used on carburetors with Auxiliary Throttle Valves (above).*

Secondary Throttle Lever: *Adjust each model as follows:* **Buick 894S,SA; Cadillac All Models, Chrysler 2041S; Dodge 2191S; Oldsmobile 932S, 2016S, 2059S, 2080S; Packard 985S, 2084S, 2103S, 2112S, 2142S**—Primary and secondary throttle valves must reach wide open position at the same instant. Adjust by bending secondary throttle operating rod at upper angle using bending tool T109-213

Buick (Except 894S,SA), Chrysler 2317S; Dodge 2181S & 2253S; Plymouth 2253S—Stop lugs on both primary throttle lever and secondary throttle lever should contact stop bosses on throttle body at the same instant as throttle valves are opened. *(NOTE*—At this point, secondary throttle valves will be a few degrees from wide open position). Adjust by bending secondary throttle operating rod at angle bend using bending tool T109-213.

Chrysler 2126S & DeSoto 2210S—Block choke valve in wide open position, back out throttle stopscrew so that primary throttle valves fully closed Hold secondary throttle valves slightly open, close primary throttle valves Secondary throttle valves should close tightly at same instant as primary valves Hold primary valves closed It should not be possible to open secondary valves Adjust by bending throttle operating rod (Secondary connector rod) slightly at the angle bend

Chevrolet All Models, Oldsmobile 2246S, Packard 2232S & 2284S, Pontiac & Studebaker All Models—Primary and secondary throttle valves must reach wide open position at same instant Adjust by bending throttle operating rod at upper angle using T109-213 bending tool Close both primary and secondary throttle valves tightly, check clearance between positive closing shoes on primary and secondary throttle levers This clearance should be 017-022" (Gauge T109-29 can be used) Adjust by bending the shoe on the primary lever

Secondary Throttle Lock-out (All Carburetors except where Auxiliary Throttle Valves used—see Auxiliary Throttle Valves above): Adjust each model as follows:

Cadillac (All Carb.), Chrysler 2041S, Dodge 2191S: (1) Hold choke valve closed so high step of fast idle cam is under fast idle screw, tighten fast idle adjusting screw until primary throttle valve opening is .015" (use Gauge T109-44 to measure clearance between edge of valve and carburetor wall on side opposite idle ports—valve should have slight drag on gauge). Lock pawl should be in unlocked position at this point. Adjust by bending tang on lock pawl using bending tool T109-105. (2) Hold primary throttle valves halfway open, open choke valve fully, then open primary throttle valves fully. Tang on secondary throttle arm should engage in notch on lock-out lever preventing secondary throttle shaft movement. Then hold choke valve wide open and close primary throttle valves sufficiently so that lock pawl is unlocked, finally open primary throttle valves fully. Lock-out lever should fall free allowing secondary throttle valves to be open before primary throttle valves are fully open. Adjust by bending tang on secondary throttle lever, as required, to provide clearance for correct operation of lock-out lever. *R adjust Fast Idl (see Fast Idle data above).*

Oldsmobile 932S, 2016S, 2080S; Packard 985S, 2084S, 2103S, 2112S, 2142S—Close choke valve tightly, open primary throttle valves fully and make certain that the tang on secondary throttle arm engaged in notch in lock-out lever to prevent secondary throttle valves opening. Hold choke valve wide open and open primary valves fully. Check to make certain that lock-out lever falls free allowing secondary valves to open before primary valves are fully open. Adjust as necessary by bending tang on secondary throttle lever to provide clearance for correct operation of lock-out lever.

Chevrolet, Chrysler 2126S, D Sot 2210S, Oldsmobil 2059S & 2246S, Packard 2232S & 2284S, P ntiac & Studebaker—Hold choke valve wide open, close primary throttle valves fully, allow choke valve to close. Tang on secondary throttle lever should freely engage notch on lock-out dog Adjust by bending tang on secondary throttle lever.

Automatic Secondary Throttl Control (Chrysl r 2126S & DeSoto 2210S): This unit requires no adjustment. Bend operating rod, as necessary, to insure that secondary valves close simultaneously with primary valves. See that linkage is free and that there are no vacuum leaks between carburetor body and unit.

OVERHAUL: *CAUTION—When disassembling carburetor, be sure to keep PRIMARY and SECONDARY side parts separate so they will not be confus d or interchanged when carburetor reassembled.*

DISASSEMBLY: Carburetor consists of three main subassemblies (Air Horn & Bowl Cover, Bowl and Throttle Body) which can be overhauled separately.

Air Horn & Bowl Cover—Remove fuel inlet fitting, gasket, and strainer assembly. Disconnect and remove choke connector rod, accelerating pump rod, secondary throttle return spring *(NOTE*—On Cadillac, remove choke modifier rod). Remove dust cover and gasket, Remove metering rods by rotating rods off pins on vacumeter link and lifting rods out carefully. Remove pump connector link by removing pin spring, sliding upper end of link out of pump lever, and rotating link around lever. Remove vent arm (when used) by taking out vent arm screw. Loosen (do not remove) screw holding pump operating lever on pump countershaft and screw in metering rod arm, slide pump countershaft and lever assembly out, remove pump arm and metering rod arm. Take out all air horn attaching screws (inner screws will be lifted out after air horn removed), make certain that screw located within pump countershaft housing is removed, lift air horn assembly straight up (*CAUTION*—use care not to damage floats). Disassemble remaining parts from air horn as follows·

C NTINUED ON NEXT PAGE

CARTER WCFB 4-BARREL CARBURETORS (Cont.)

Invert air horn on bench, take out float hinge pins, remove floats with intake needles and clips attached, remove needle seats and gaskets (*CAUTION*–Keep each float assembly, intake needle, and needle seat together, DO NOT mix primary and secondary side parts). Remove vacuum piston by rotating it 90° in either direction and lifting it out. Remove accelerator pump plunger assembly. Remove and discard bowl cover gasket. If automatic choke to be disassembled, proceed as follows: Remove choke lever from choke shaft, remove choke valve (file burrs from staked ends of attaching screws before removing the screws), take out attaching screws and remove thermostatic coil housing and gasket remove baffle plate, rotate choke shaft counter-clockwise to disengage vacuum piston from cylinder, withdraw choke shaft and piston assembly, disconnect piston from link by pushing piston pin out with a piece of wire. Take out attaching screws and remove choke housing and gasket (vacuum passage rubber gasket can be removed from inner side of choke housing by rotating gasket using blunt end of a thin wire).

▷*CADILLAC CHOKE CAUTION:* Choke modifier lever can be removed from pointer shaft but DO NOT remove metal pointer or thermostatic coil from housing.

Carburetor Bowl–Invert bowl to remove pump spring and vacuum piston spring. Take out housing screw and remove pump jet housing, gasket, and pump discharge check needle (needle will drop out if bowl inverted). Remove primary and secondary metering jets (*CAUTION*–keep these jets separate). Remove pump relief valve plug and gasket. Remove pump intake ball retainer from bottom of pump cylinder, invert bowl to remove intake check ball. Remove all primary and secondary low speed jets. (*NOTE*–No low speed jets used on secondary side of Oldsmobile, Packard, Pontiac or Studebaker carburetors). Loosen bowl to throttle body attaching screws, remove throttle body from bowl, remove screws, remove and discard gasket.

Throttle Body–Remove two idle adjusting screws and springs (used on primary side only). Remove four idle port rivet plugs. Remove idle stop screw and spring, and fast idle adjusting screw. Take out fast idle cam mounting screw, remove all fast idle parts (fast idle cam, spring, trip lever, and lockout cam and pawl). Remove primary-to-secondary throttle connector rod, remove secondary throttle lever by loosening clamp-screw and sliding lever off shaft, remove primary throttle lever screw from end of shaft, remove all lever parts from shaft. On Buick carburetors, remove accelerator vacuum switch (remove terminal cap and switch return spring, lift out switch guide block with contact spring and shims, turn body over to allow plunger and ball to drop out). It is recommended that throttl body not be disassembled further, however, if necessary to remove throttle valves and shafts, proceed as follows: File burrs from staked ends of all throttle valve screws, take out screws and remove valves from shaft. Remove secondary throttle shaft. Remove primary throttle shaft by using rawhide hammer to tap shaft through retaining washer. Remove auxiliary throttle valves and shaft when so equipped.

Cleaning & Inspecti n: Wash all parts in carburetor cleaning solvent except pump plunger assembly, thermostatic coil and housing assembly, and choke housing gasket (clean these parts in clean gasoline). Clean and blow out all passages with compressed air. Remove all gum and carbon deposits. Make certain all calibrated restrictions are clean but DO NOT use drills to clean out these passages. Inspect floats for dents and leaks. Check choke and throttle shafts for excessive wear, inspect pump plunger leather and replace plunger if cracked or creased. See that choke piston operates freely in cylinder (if carbon or dirt present in slots, remove welch plug in bottom of housing to clean slots, install NEW welch plug and make certain that it is air-tight).

REASSEMBLY: Use all NEW gaskets. Install all parts in reverse order of disassembly procedure (above) and pay particular attention to the following points:

Throttle Valve Installation: On all models (except as noted below), install primary and secondary valves with stamped numbers downward and toward middle of flange, install auxiliary valves with trademark (c in circle) toward top of flange. Use new screws, and before tightening screws, shift valves to provide closest possible fit in barrel in closed position (short end of auxiliary valves should have good bearing on stop bosses), tighten screws securely and stake ends lightly (*CAUTION*–support shaft on steel block while staking screws). Install retaining washer on end of primary throttle shaft with prongs outward, press washer in on shaft just far enough to obtain snug fit without endplay in shaft.

Buick & Studebaker. Install both primary and secondary valves, with stamped numbers on valve downward and toward middle of flange. The dimple on auxiliary valve must point toward throttle valve.

Chrysler. Primary valve thin, secondary valve thick. Each valve should be returned to its original position. Install valves with numbers facing down and away from idle ports.

Pontiac. Install both primary and secondary valves from top of body with (C in circle) away from center of carburetor.

Buick Vacuum Switch Installation: Assemble the contact spring in guide block with original number of timing shims. Place ball in body flange, guide block in switch plunger and install in body flange with grooved side of plunger upward toward main body flange. Install switch return spring and terminal cap.

Secondary Throttle Linkage: The secondary throttle lever return spring, and operating rod design and hook-up differ on these carburetor models and each type should be assembled and connected as follows:

Buick–Single hole provided in primary throttle lever and secondary throttle lever for operating rod engagement. Likewise single hole provided in secondary throttle lever for return spring connection.

Cadillac (896S)–Connect throttle operating rod in middle hole of inner throttle shaft arm (on primary throttle shaft), and in inner hole of secondary operating lever (on secondary throttle shaft). Connect secondary throttle return spring in UPPER hole of secondary lever and spring bracket to which other end of spring attached should be moved back 20-30° from original position to increase spring tension and prevent possibility of secondary valves sticking in service. *CAUTION–Above return spring installation data supersedes original instructions (see Changes & Corrections).*

Cadillac (Except 896S)–Connect throttle operating rod in middle hole of inner throttle shaft arm (on primary throttle shaft) and in inner hole of secondary operating lever (on secondary throttle shaft). Helical secondary throttle return spring should be wound-up one-half turn with throttle in closed position.

Chrysler 2041S & Dodge 2191S–Connect secondary throttle operating rod in inner hole of inner throttle shaft arm (on primary throttle shaft) and in single hole of secondary throttle operating lever (on secondary throttle shaft). Helical secondary throttle return spring should be wound-up 1½ turns clockwise when installed on shaft.

Chrysler 2317S, Dodge 2253S & 2181S, Plymouth 2253S–Connect secondary throttle operating rod in inner hole of inner throttle shaft arm (on primary throttle shaft) and in single hole of secondary throttle operating lever (on Secondary throttle shaft).

Oldsmobile 932S–*CAUTION–Two types of secondary throttle linkage used. Assemble each type as follows:*
1) *First type* 932S Linkage–Connect throttle operating rod in lower hole of inner throttle shaft arm (on primary throttle shaft) and in outer or upper hole of secondary operating lever (on secondary throttle shaft). Engage secondary throttle return spring in extreme outer or upper hole of secondary operating lever (spring connector holes are left hand row facing the carburetor).
2) *Later type* 932S Linkage–Connect throttle operating rod in inner hole of inner throttle shaft arm (on primary throttle shaft) and in the single hole of the secondary throttle operating lever (on secondary throttle shaft). Engage secondary throttle return spring in middle hole of secondary operating lever (spring connector holes are left hand row facing carburetor).

Oldsmobile 2016S & 2080S–Connect throttle operating rod in inner hole of inner throttle shaft arm (on primary throttle shaft) and in the single hole of the secondary throttle lever, Secondary throttle return spring is helical type and should be wound-up one-half turn with throttle closed.

Oldsmobile 2059S & 2246S–Connect secondary throttle operating rod in single hole of both the inner throttle shaft arm (on primary throttle shaft) and secondary throttle operating lever (on secondary throttle shaft). Secondary throttle return spring is helical type and should be wound-up one-half turn with throttle closed.

Packard (All Models)–Connect throttle operating rod in inner hole of inner throttle shaft arm (on primary throttle shaft) and in single hole of secondary throttle lever (on secondary throttle shaft). Secondary throttle return spring is helical type and should be wound-up one-half turn with throttle closed.

CONTINUED ON NEXT PAGE

CARTER WCFB 4-BARREL CARBURETORS (Cont.)

Chevrolet, Pontiac, Studebaker–Connect secondary throttle operating rod in single hole in primary throttle inner lever and single hole in secondary throttle lever.

Oth r Reassembly Cautions:

Throttle Body-to-Bowl Gasket–Use a NEW gasket and make certain that all passage hole line up.

Pump Discharge Jet Assembly–Install pump discharge check needle with pointed end down, hold jet housing square with carburetor while tightening attaching screw.

Metering Jet Installation Caution–Primary and Secondary metering jets must not be interchanged

Choke Assembly–When installing choke housing, line up choke shaft hole with bore in air horn so that shaft will not bind. Install choke valve with trade mark (C in circle) upwards, use new attaching screws, tighten screws while holding valve closed, stake ends of screws lightly. Check assembly for free operation after valve installed

Vacumeter Piston Link–Install link with lip or tang at center opening pointing toward air horn.

Carburetor Adjustments– Make all carburetor adjustments as directed under ADJUSTMENTS above

SERVICE PARTS: Gasket Sets–Carter No. 219 (894S, SA), No. 221 (932S), No. 229 (985S, 2084S, 2142S), No. 233 (2005S,SA; 2072S, 2088S, 2103S, 2109S, 2110S, 2112S, 2119S,SA, 2143S), No. 234 (996S, 2016S, 2053S, 2080S, 2082S, 2181S, 2253S), No. 244 (2041S, 2191S), No. 250 (2059S, 2246S), No. 257 (2197S), No. 260 (2214S, 2219S, 2330S), No 264 (2126S, 2210S), No. 266 (2232S, 2284S), No. 267 (2268S, 2283S), No. 269 (2317S), No. 273 (2358S).

Repair Pkg. (with Std. M t ring R ds)–Carter No. 1599B (894S,SA), No. 1703 (932S), No. 1718 (896S), No. 1717A (985S), No. 1730 (2016S), No. 1733 (2005S, SA; 2072S), No. 1734 (996S), No. 1744 (2053S), No. 1745A (2080S), No. 1751 (2082S), No. 1752 (2041S, 2191S), No. 1756 (2059S), No. 1761 (2109S, 2110S), No. 1781 (2197S), No. 1783 (2214S, 2219S), No. 1786 (2126S), No. 1789 (2210S), No. 1796 (2268S), No. 1813 (2358S).

►CHANGES, CAUTIONS, CORRECTIONS

►*BUICK (1946-48) THROTTLE CONNECTOR ROD INSTALLATION* Connector rod linking throttle valve lever and countershaft on bowl cover must be installed with grooved end (for pin spring) at top, and flattened end (for spring and spring retainer) at bottom Spring and spring retainer retain rod in throttle valve lever

►*BUICK (1947) 608SA & 609SA CARBURETOR PRODUCTION CHANGE* These carburetors used on late 1947 cars have new type **Body Flange Casting & Switch Assembly** No 1-547S (608SA), 1-549S (609SA) and new type **Throttle Shaft & Lever Assembly** No 3-594S (608SA), 3-596S (609SA) No throttle centering screw is used (special retaining ring used instead) See Reassembly of Carburetor for installation of this retaining ring

►*BUICK 608SC & 609SC REPLACEMENT CARBURETORS* These carburetors have same type Body Flange Casting and Throttle Shaft & Lever Assembly as 608SA & 609SA described above See specification tables following for other differences

►*BUICK 1950 725S & 726S CARBURETOR CHANGE (to correct complaints of gasoline odors noticeable in the car)* Remove and discard original Air Horn & Piston Housing Assembly and Air Horn Gasket, drill two ¼" holes in bowl cover to coincide with new vent hole locations in air horn (use new air horn gasket as template in locating holes), install new type Air Horn Gasket No 121-186 and Air Horn & Piston Housing Assembly No 6-730S With this change, carburetors will be similar to later 725SA and 726SA models

►*BUICK LATE 1950 CARBURETOR PRODUCTION CHANGE* New 725SA & 726SA (superseding earlier 725S & 726S) carburetors have bowl vents faced toward rear of engine to eliminate possibility of gasoline fumes being noticed in car (see 725S and 726S recommended change above)

►*BUICK AIR CLEANER "BLOW-UP" CORRECTION (1950-51 Series 725S, SA, 726S, SA, 882S, 883S Carb.)* Caused by vapors collecting in silencer chamber and can be prevented by venting carburetor by drilling holes to allow fumes to escape into the atmosphere as follows Drill 1/16" holes in rear of carburetor, locating one hole 13/16" on each side of center-line boss cast in center of throttle body and exactly 7/8" up from bottom face of flange *CAUTION*—If this modification made with carburetor on car, use extreme care to prevent metal chips falling into manifold *882SA NOTE*—This carburetor has these vent holes incorporated in production

►*BUICK LATE 1951 882S & 883S CARBURETORS* These carburetors have modified idling specifications designed to prevent stalling tendencies during cool humid weather Previous carburetors cannot be converted to new specifications

►*BUICK 1953 SERIES 50 ACCELERATION HESITATION (FIRST CARS)* If not corrected by careful and exact tune-up, see Manifold Heat Control data under Tune-Up on 1953 Buick car model page for recommended changes

►*BUICK 1953 SERIES 50 CHANGE TO ELIMINATE DETONATION OR SPARK RAP (FIRST 2017S CARBURETORS TAG-DATED PRIOR TO "E3")* Increase size of vacuum spark control port in carburetor throttle body from 040" to 081" as follows Remove carburetor from engine, place throttle valves in wide open position and protect valves from damage by drill Remove spark control fitting from throttle body Working through spark control fitting hole, use a No 47 drill to enlarge original 040" spark control hole, then finish drill the hole with a No 46 drill (.081") Blow out all chips and thoroughly clean carburetor, reinstall spark control fitting, check metering rod adjustment, re-install carburetor on engine *NOTE—All carburetors tag-dated "E3" and later have this .081" spark control port*

►***1954 BUICK SERIES 40 & 50 SYNCHRO-MESH CARS LOADING UP ON ACCELERATION WITH COLD ENGINE CAUSING A STUMBLE OR BUCK (Cars with first 2081S Carburetor):*** Can be corrected by making following changes *NOTE*—All required parts are furnished in Carter Unitized Pkg No 170-353U
(1) **Choke Coil & Cover Assembly**—Remove and discard original assembly, Carter No. 170AJ73S (stamped on cover). Install NEW assembly, Carter No. 170U73S, using a new gasket and set choke for Centered (At Index) setting.
(2) **Choke Warm Air Passage Bushing**—Remove air horn assembly and gasket Install special Reducer Bushing (I.D. #42 Drill or 0935") in choke warm air passage which is hole in top edge of bowl cover under choke mounting location (this passage has #38 drill or 1015" metering orifice at bottom). Use a square end tool to drive bushing in flush with upper surface of bowl cover Re-install air horn assembly using a new gasket
(3) **Metering Rod**—Make certain carburetor has later type No. 75-1107 Metering Rods See Metering Rod Production Change following
(4) Install new Identification Tag stamped 2081SA
NOTE—Later 2081SA carburetors do not require the above change.

►***1954 BUICK SERIES 40 & 50 METERING ROD PRODUCTION CHANGE (Early No. 2081S Carburetors):*** First type Metering Rods, Carter No 75-994, changed to No. 75-1107 which will improve performance and correct low-speed buck (see Correction immediately above) *NOTE*—All 2081SA carburetors have this later metering rod

►***1955 BUICK 40 ROUGH IDLE ON SYNCHRO-MESH CARS (Bucking or Missing)*** May be caused by flash in cylinder head exhaust crossover passages resulting in uneven manifold heat Remove head, examine passages and make certain that openings are at least 5/8" diameter Correct by knocking out flash with a punch and blow passages out thoroughly

►***1954-55 BUICK 40 WARM-UP PERFORMANCE IMPROVEMENT (SYNCHRO-MESH CARS) Check and correct the following***

CONTINUED ON NEXT PAGE

CARTER "WCD" (C nt.)

1) Check cylnder head for obstructed exhaust crossover passages (see Rough Idle Correction above) 2) Make certain that correct Carter carburetor installed On 1954 cars with first 2081S carburetor, make certain that carburetor brought up to later 2081SA specifications and that later type No 75-1107 Metering Rod installed *See "1954 Buick Series 40 & 50 Synchro-mesh Cars Loading up on Acceleration with Cold Engine" in Carter WCD Carburetor data in 1954 Final Data.*

3) Adjust carburetor (Fuel Level, Pump Stroke, Metering Rod Setting, Idle Adjustment) *Idle setting must not be too lean.*

4) Set Automatic Choke at 2 Points Lean (original setting was CENTERED) Choke setting may be varied on individual engines but must not exceed 3 Points Lean

►*CADILLAC (1947-48) 595SA CARBURETOR PRODUCTION CHANGE:* This carburetor has new type **Body Flange Casting Assembly** Carter No 1-553S and a new type **Throttle Shaft & Lever Assembly** No. 3-601S without throttle centering screw. See Throttle Shaft & Lever Assy. data for Buick 608SA & 609SA (above).

►*CADILLAC 1949 722S CARBURETOR JET CHANGE TO CORRECT A SLIGHT ACCELERATION STUMBLE AT 20-35 MPH:* On carburetors dated before February 1949, this condition can be corrected by installation of following parts furnished in Carter Unitized Package No 75-680U. **Low Speed Jets** No. 11-196S (identified by 5/8" long hexagonal collar integral with tube), and **Metering Rods** No. 75-670 (identified by additional raised dot of same size as trademark on rod flat opposite part number). *NOTE*—These parts installed in production after February 1949

►*CADILLAC 1950 742S & 1951 845S CARBURETOR CHANGE TO CORRECT DETONATION COMPLAINTS:* Manufacturer recommends installation of modified Metering Rods and 1949 type Vacuum Piston Spring (furnished in kit as Cadillac Part No 1458068 or Carter Unitized Package No 75-772U) as part of detailed procedure to correct this complaint See *"Detonation Complaint Correction" in Cadillac Special Data in Car Model Section.*

Cadillac 742S & 845S

Parts Change	First Type	Later Type
Metering Rods (2 req'd)	75-716	Ⓒ75-771
Vacuum Piston Spring	61-226	61-332

Ⓒ—Can be identified by two trademarks (c in circle) on rod flat

►*CHRYSLER 1951 830S CARBURETOR SLOW WARM-UP CORRECTION (BEFORE APRIL 1951):* This condition caused by air leak at thermostatic coil housing gasket. Correct by installing new gasket, special thermostatic coil housing retainer ring (63-153) installed **with flared side away fr m air horn** and two special thermostatic housing retainer screws (101-82). These parts furnished in Unitized Pkg. 63-155U. **D not r -us original th rm static coil housing retain rs and retain r screws.** Carburetors "D1" and later (April 1951) have above parts installed.

►*CAUTION· Hold thermostatic coil housing with opennd wr nch on fitting wh n tight ning heat tube connection. Use extreme care not to turn or distort cover.*

►*CHRYSLER 1951 CARBURETOR PRODUCTION CHANGE:* First type 830S carburetor superseded by later type 830SA carburetor, 830SA has new No. 1-861S Body Flange Assy. and special thermostatic coil housing assembly retainer ring (see 830S recommended change above)

►*CHRYSLER 1951 830S & 830SA Carburetor Correction for Engine Cutting out on Turns:* If this complaint not corrected by servicing air cleaner and properly tuning engine, carburetor can be altered for outside venting (by plugging existing vents and drilling new vents as directed below) and new parts installed as furnished in Unitized Pkg. No 75-820U

Carter Unitized Pkg. 75-820U

Metering Rods (2) 75-769 Indent. Tag(830SB) 107-40
Vent Tube Rivet
Plugs(2) 11B-228 Instruction Sheet MSI-15

Venting Procedure—Remove air horn assembly from carburetor (not necessary to remove carburetor from engine). Use 3/16" drill to drill outside vent hole upward and through top of the two BOWL VENT STACKS *(CAUTION—do not drill kick-down switch vent stack).* Blow out all passages with compressed air to remove metal chips. Plug the two inside bowl vent tubes (in air horn) by tapping a 11B-228 plug lightly in end of tube. *(CAUTION—do not plug kick-down switch vent tube).* Install NEW metering rods, adjust rods. Re-install air horn assembly on carburetor and attach NEW 830SB identification tag.

►***1953-54 CHRYSLER POPPING BACK ON ACCELERATION (Cars with 935SA, 2039S, 2039SA Carburetors):*** If this condition noted on acceleration between 5-50 MPH. after a hard run at high speed, and if not corrected by regular tune-up procedure, install special Vacuum Piston Spring No. 61-485 (replacing regular production spring No. 61-134).

►*DE SOTO V8 1952 HESITATION WHEN ACCELERATING BETWEEN 10-20 MPH. (In 3rd Gear) OR 25-35 MPH. (In 4th Gear) with Carter 884S & 884SA Carburetors·* Correct this complaint as follows.

1) Tune-up engine carefully. See *DeSoto S17 car model page for complete data.*

2) Check Manifold Heat Control Valve. Valve must operate freely and thermostatic spring must have sufficient tension to close valve when engine is stopped. See *"Manifold Heat Control" in DeSoto Special Data.*

3) Check engine water temperature and make certain engine warming up properly (carburetor is water-jacketed and too little heat will reduce vaporization of fuel).

4) *If above steps do not correct complaint,* on carburetors with BRASS identification tag only, replace standard metering rods with One Size Rich or Two Size Rich rods (try one size rich rods first, if trouble not corrected, then try two sizes rich rods), *CAUTION—Both m t ring rods must b sam size. DO NOT mak this chang on later carbur tors with COPPER id ntification tag.*

On Siz Rich M t ring R ds—Carter No. 75-841 (.001" smaller).

Tw Siz Rich M t ring R ds—Carter No. 75-842 (.002" smaller).

►*FRAZER & KAISER 685S CARBURETOR CONVERSION TO 685SA:* First type 685S carburetors can be converted to later 685SA by installing following parts: Needle & Seat Assembly No. 25-162S. **Chang float level to 1/16".**

NOTE—Later 685SA carburetors have above Needle & Seat Assembly and new float level setting. Pump Jet & Housing Assembly No. 48-158S (superseding No. 48r143S) is also used.

►***1954-55 KAISER HOT ENGINE STARTING IMPROVEMENT (Venting of Supercharger Enclosure)*** Installation of gravity type rubber disc valve in carburetor hood will allow venting of supercharging pressure when engine is stopped (disc drops away from hood, opening vent hole) All parts required for this installation are furnished in Vent Valve Kit Part No 908167 Install valve as follows

Carburetor Hood Vent Installation—With hood removed from carburetor, cut 1" diameter hole perpendicular to slanting top of hood at point 3¾" in from edge of supercharger connection and 1½" to right of centerline Drill a 5/32" hole 1 1/16" toward supercharger connection from center of the 1" vent hole Attach support arm to hood by installing self-tapping screw through arm and into this 5/32" hole in the hood (hole in opposite end of arm must be centered in vent hole) Assemble rivet in hole of rubber disc, install disc and rivet on underside of support arm, install cotter pin in outer end of rivet Make certain that disc and rivet move freely up and down in support arm and that disc closes vent hole when in upper position

►***1953 NASH STATESMAN ENGINE STALLING ON QUICK STOPS (Cars with Carburetor No. 2034S):*** Can be corrected by installing "Split Type" Floats, Carter No 21-150U. This requires modification of float mounting pivot boss but does not require removal of complete carburetor assembly from engine Make this modification as follows

1) Remove carburetor bowl cover assembly from carburetor, remove all parts including intake needle and seat assembly from cover. See OVERHAUL data below.

2) File 3/64" from inside of each float bracket to widen distance between brackets to 25/32" as required for mounting of new split type floats. Carefully clean all filings from cover with compressed air.

3) Install needle seat Remove pull clip from intake needle and **discard this clip,** install intake needle. Install auxiliary float lever and both float assemblies. Check for free operation of float lever and both float arms. If binding noted, correct by additional filing of brackets as required.

4) Set **both** floats for float setting of 5/32" (Gauge T109-196). Adjust both floats alike. See FLOAT SETTING below. Reassemble and adjust carburetor.

►*NASH 1953 STATESMAN ENGINE CUTTING OUT ON EXTREME RIGHT TURNS (First Cars):* If engine cuts out during or at end of a hard right turn, install 5° angular spacer plate, Nash No. 3138063, under carburetor so that it is inclined 5° toward right side of

CONTINUED ON NEXT PAGE

CARTER "WCD" (C nt.)

engine. *NOTE*—This spacer installed in production beginning with following Serial Numbers: K-568401 (Kenosha), KC-43793 (El Segundo).

►*NASH 1953 STATESMAN STUMBLE ON LIGHT ACCELERATION (Cars b fore engine No. S-378530 with Carburetors tag-dat d prior to "B3"):* Install all parts included in Carter Unitized Pkg. No. 75-900U (Nash No. 3116455) as listed below. *NOTE*—This change made in production beginning with above engine number and carburetor tag-date.

Cart r Unitiz d Pkg. No. 75-900U

Idle Jet (2 used) ..... Part No. 11-171S
Metering Rod (2 used) ..... Part No. 75-899

►*NASH 1953 STATESMAN ENGINE STALLING ON QUICK STOPS (Cars with No. 2034S Carburetor with First Type Float):* This condition can be corrected by installing SPLIT TYPE floats, Carter No. 21-150U. Float mounting pivot boss must be modified but complete carburetor need not be removed from engine. Make this modification as follows:

1) Remove carburetor bowl cover assembly from carburetor, remove all parts including intake needle and seat assembly from cover.

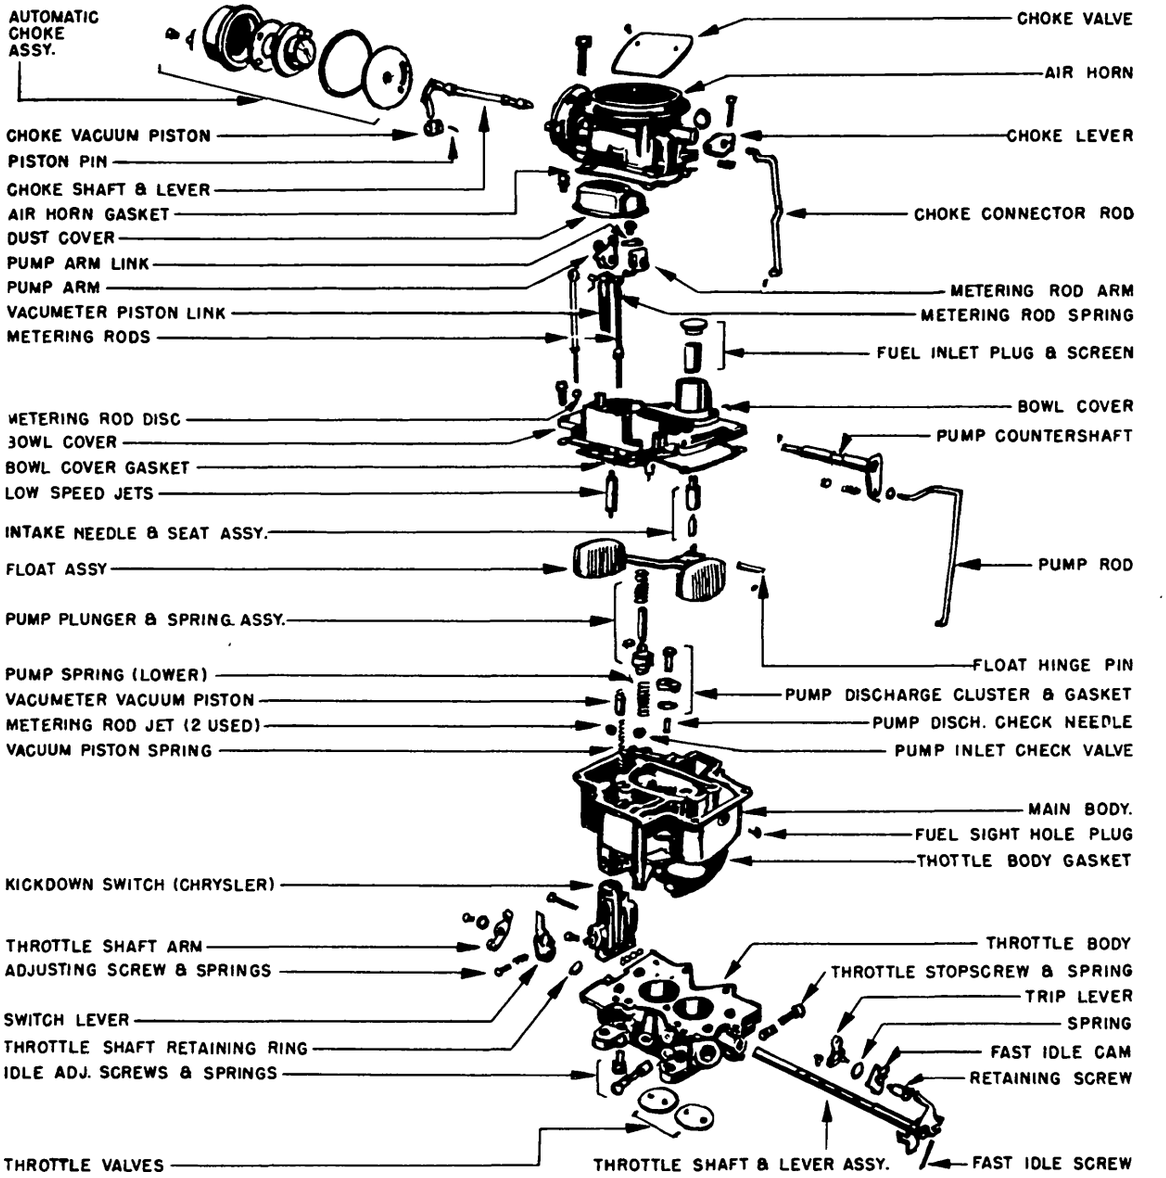
2) File 3/64" from inside of each float bracket to widen distance between brackets to 25/32" as required for mounting of new type split floats. Clean all filings from cover with compressed air.

3) Install needle seat. Remove pull clip from intake needle and **discard this clip,** install intake needle. Install auxiliary float lever and both float assemblies. Check for free operation of float lever and both float arms. If binding noted correct by additional filing of brackets as required.

4) Check float level and set BOTH floats alike. See Float Level Data below.

5) Reassemble and adjust carburetor. See ADJUSTMENTS below.

►*OLDSMOBILE 665S CARBURETOR REPLACEMENT BY MODEL 503SA:* The 665S carburetor used on approximately 6000 1947 cars and superseded by 503SA which is furnished for replacement. When installing 503SA carburetor on these cars, note the following settings:



Idl Sp d—375 RPM (for all cars with Hydra-Matic Drive).

Climatic C ntr l S tting—2 Points Rich (Centered on Synchro-mesh cars).

►*PONTIAC 630S, 630SA, 630SB CARBURETOR PRODUCTION CHANGES:* These carburetors used successively during 1947-48. 630SA & 630SB have following new parts: **B dy Flange Casting & Switch Ass mbly N . 1-551S and Throttle Shaft & Lever Ass mbly N . 3-598S.** No throttle centering screw used with these parts. See Throttle Shaft & Lever Assy. installation in Reassembly of Carburetor.

Air H rn & Climatic Control Assembly No. 6-576S. Climatic Control should be set 1 Point Lean on all carburetors with this new assembly (Carburetors with first type No. 6-547S assembly should be set at index "centered").

Pump Plung r, R d, Spring & R tain r Ass mbly N . 64-113S. This assembly supersedes first type plunger and rod assembly No. 64-112S.

CARTER "WCD" DUAL CARBURETOR

►*PONTIAC 630S CARBURETOR FLOODING CORRECTION:* Caused by back of float pivot arm striking on inside wall of float bowl and preventing free movement of the floats. If flooding noted on early 1947 cars, check back of float arm and float bowl wall for evidences of contact and rubbing. Correct by filing the curved edge of the float arm to provide clearance between arm and wall.

►*PONTIAC 630S, 630SA, 630SB CORRECTION FOR ENGINE STALLING ON SHARP RIGHT TURN:* Use Unitized Package No. 75-648U and install new carburetor parts as directed.

►*PONTIAC 1947-48 CORRECTION FOR RICH CHOKE ACTION:* To correct complaints of too-rich mixture during warming up period (too much choke action), check thermostatic coil housing for mark "RPD"

CONTINUED ON NEXT PAGE

CARTER "WCD" (C nt.)

(molded on outer face). Test coil action as follows: With carburetor at room temperature (75°F), remove air cleaner, disconnect fast idle connector rod, loosen three thermostat housing screws so housing can be rotated freely. Rotate housing clockwise by hand until choke valve is open, then rotate housing until choke valve is just closed, note adjustment mark on housing which should coincide with center mark of scale on air horn. If choke valve closes before this point reached (may be 2-4 points rich), replace Thermostatic Coil and Housing Assembly (Carter No. 170N-77S).

►*PONTIAC (1949-50) 719S & 720S CARBURETOR CHOKE RATTLE CORRECTION:* This complaint can be corrected by installing new type Air Horn Assembly with choke valve anti-rattle feature as used on 719SA & 720SA carburetors (see description following). Part Nos. are 6-674S (719S), 6-675S (720S) and choke valves have special bleed hole in valve No. 45 drill or .082" (719S,SA), 5/32" or .156" (720SA type used to replace original 720S valve which had .218" bleed hole). *CAUTION—Correct valve must be used on each type carburetor—SMALL bleed hole on cars with Synchro-mesh Trans., LARGE bleed hole on Hydra-Matic cars.*

►*PONTIAC (1950) CARBURETOR PRODUCTION CHANGE:* New carburetors 719SA (Cars with Synchro-mesh Trans.), 720SA (Hydra-Matic Drive Cars) used on later cars have new Air Horn Assembly with new choke valves designed to prevent choke valve rattles. Choke valves have irregular sides and are installed with spacer washer and special self-locking retainer washer (see Choke data).

►*CAUTION: Air Horn Assemblies and Choke Valves on these models NOT INTERCHANGEABLE and can be identified as follows:*

719SA Air Horn & Choke Valve Assy.—Part No. 6-674S. Choke Valve No. 7-166 has SMALL bleed hole in valve (No. 45 drill or .082" size). *This carburetor must be used on cars with Synchro-mesh Transmission.*

720SA Air Horn & Choke Valve Assy.—Part No. 6-675S. Choke Valve No. 7-167 has LARGE bleed hole in valve (5/32" or .156" size—decreased from .218" size used on 720S). *This carburetor must be used on Hydra-Matic Drive cars.*

►*PONTIAC SIX 1953 CARBURETOR PRODUCTION CHANGE & ADJUSTMENT CAUTION:* First carburetors had TWO Idle Adjusting Screws (one for each barrel of the dual carburetors), later carburetors have ONE screw only. *Special Idle Adjustment procedure required for these carburetors (see ADJUSTMENT below).*

►*PONTIAC SIX 1953 ACCELERATION FLAT SPOT (When accelerating from Part-throttle to Full-throttle position):* Carburetors tag-dated "B3" and earlier (except where "X" stamped in place of usual star) had first type metering rods as listed below. Carburetors tag-dated "C3" and later (also earlier carburetors with "X" stamped in place of star) have later type metering rods which will correct this condition.

Pontiac Six Metering Rod Change

	First Type	Later Type
Std. Metering Rod (2 used)	No. 75-873	No. 75-910

►*1954 PONTIAC SIX CHOKE SETTING CHANGE TO CORRECT ENGINE LOADING DURING WARM-UP (Carburetor No. 2010S):* New choke setting of **2 Points Lean** supersedes original Centered setting.

►***1954 PONTIAC SIX CHOKE SETTING CHANGE TO CORRECT ENGINE LOADING DURING WARM-UP (Carburetor No. 2010S):*** New choke setting of **2 Points Lean** supersedes original Centered setting.

DESCRIPTION: These "WCD" carburetors differ from previous Carter Vacumeter types ("WDO" models) mainly in that they have a new design concentric float bowl and double float, new type permanently assembled main nozzles, high pressure type spring operated accelerating pump, and built-in Carter Car Starter (Buick models only). Conventional plunger type anti-percolators not used. Carburetors have Fast Idle and Climatic Control.

►*CADILLAC 845S "CHOKE MODIFIER":* Consists of connector rod linking the automatic choke thermostatic coil to the throttle valve lever so that the thermostatic coil tension is lessened as the throttle valves are opened. Provides improved economy and performance during the warming up period. *See Climatic Control.*

►*CHRYSLER & DESOTO CLIMATIC CONTROL:* Have heat tube connection at center of thermostatic coil housing and "delayer plate" within housing which provides longer choke action during warm-up and prevents too rapid closing of the choke after engine is shut off. *See Climatic Control data below.*

►*CHRYSLER & DESOTO "WATER JACKETED" THROTTLE BODY:* Two water connections at carburetor throttle body and passages in body casting used to circulate engine coolant water around throttle valves. This provides sufficient heat to prevent ice formation on throttle valves at idling speed which might cause stalling of engine during warming-up period (vaporizing of fuel has refrigerating effect sufficient to cause ice formation at temperatures below 65°F).

►*INSTALLATION CAUTION:* Water tubes must be properly connected and coupling nuts tightened to prevent water leaks when carburetor installed on engine.

►*NASH STATESMAN (MODIFIED 2034S) & PONTIAC SIX "SPLIT" FLOAT ASSEMBLIES:* On these carburetors floats operate independently on auxiliary float lever and floats must be adjusted separately for correct float level. See Float Level data below.

ADJUSTMENT: ***Set these carburetors to the following specifications:***

►***CAUTION—Adjust only with engine warmed up so that choke valve wide open and fast idle inoperative. See individual car model pages for complete Tune-Up instructions.***

IDLING ADJUSTMENT

Idle Adjustment—Adjust only with engine warmed up to normal operating temperature so that choke valve is wide open and fast idle inoperative. Adjust each idle adjusting screw until best mixture and highest vacuum reading obtained, at specified engine RPM.

Idle Mixture Screw Setting

Car & Carb.	Idle Screw Opening
Buick 608S,SA	½-1 turns
Buick 608SC, 609S,SA,SC; 663S, 664S	¾-1¼ turns
Buick 725S,SA	7/8-1 1/8 turns
Buick 726S,SA	¾-1¼ turns
Buick 882S,SA	1¼-1¾ turns
Buick 2017S,2081S,SA; 2179S	½-1½ turns
Buick 883S	1-1½ turns
Cadillac 595S,SA; 682S, 722S	½-1½ turns
Cadillac 742S, 845S	¾-1¼ turns
Chrysler 830S,SA	½-1½ turns
Chrysler (All Others)	½-1 turns
DeSoto 884S,SA,SC	½-1 turns
Frazer & Kaiser 685S,SA; 723S	1-1½ turns
Kaiser 2146S	½-1½ turns
Nash 2034S, 2061S	½-1½ turns
Oldsmobile 665S	¾-1¾ turns
Pontiac 6 (Early-2 screws)	¾-1¾ turns
Pontiac 6 (Later-1 screw)	1¼ (½-1½) turns
Pontiac 8 (All Models)	¾-1¾ turns
Willys 2204S	1-2 turns

Idle Speed Setting

©—With selector lever in "N" Neutral.
②—Cars WITHOUT Air-conditioning.
③—Cars WITH Air-conditioning. See Idle Speed-up Control following.

►***KAISER MANHATTAN CARBURETOR ADJUSTMENT:*** This carburetor used with Supercharger and is completely shrouded by supercharger air pipe. Three access plugs in shroud are provided for carburetor adjustment (Idle Mixture Screws and Idle Speed Screw). Shroud must be removed for other carburetor adjustments.

►***PONTIAC 8 IDLE SPEED-UP CONTROL (Air-conditioned Cars):*** Consists of a solenoid controlled dashpot which increases engine idle speed to 750 RPM. with transmission lever in Neutral and Air-conditioning Switch ON (and clutch engaged on Synchro-mesh Cars).

Dashpot Adjustment—After slow idle speed correctly adjusted (above), see that transmission selector lever in Neutral, turn Air-conditioning Switch

CONTINUED ON NEXT PAGE

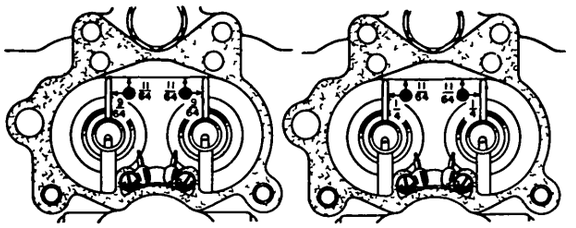
CARTER "WCD" (C nt.)

ON, loosen locknut on diaphragm shaft, turn knurled nut to secure engine idle speed of 750 RPM., tighten locknut.

Control Switch Adjustment—See "Idle Speed-Up Control" data under CARBURETOR on Pontiac 8 car model page.

ACCELERATING PUMP

►*ACCELERATING PUMP NOTE: All "WCD" Pumps or not ch ck d and adjusted in the same manner. See separat data for ach as follows:*



Car & Carb.	Pump Type
Buick 608S,SA,SC, 609S,SA,SC	"A"
Buick 663S, 664S	"A"
Buick 725S,SA, 726S,SA	"B"
Buick 882S,SA, 883S, 2017S	"B"
Buick 2081S,SA, 2179S	"B"
Cadillac 595S,SA	"A"
Cadillac 682S, 722S, 745S, 845S	"B"
Chrysler & DeSoto (All)	"B"
Frazer & Kaiser 685S,SA, 723S	"B"
Kaiser 2146S	"C"
Nash (All)	"C"
Oldsmobile (All)	"B"
Pontiac 6 2010S	"C"
Pontiac 8 (All Models)	"B"
Willys (All)	"B"

Typ "A" Accel rating Pump: Pump is high-pressure delayed-action type with positive throttle lever connection. Pump plunger is loose on plunger stem and is positioned by spring above plunger to provide uniform pump action (compression and expansion of spring provides uniform plunger movement and pump discharge). Check and adjust as follows.

►*CAUTION:* When measuring pump stroke, care must be taken not to compress spring on plunger stem. Pump stroke measurement must be plunger stroke (not plunger stem movement)

Pump Str k Adjustment—See table below for correct plunger travel (from closed throttle to wide open throttle position) To check stroke, take out cover screws and remove dust cover, back off throttle stopscrew so that throttle valves tightly closed Place Universal Pump Gauge T109-117S in inverted position on upper edge of dust cover boss on carburetor and adjust knurled nut on gauge so that lip on lower end of gauge indicator arm rests on top of pump plunger stem. Note gauge reading. Open throttle slowly until plunger bottoms in pump cylinder (at approximately half-throttle—can be determined by added resistance felt when plunger spring begins to compress—*CAUTION*—Do not open throttle further than necessary to bottom plunger in cylinder) Turn knurled nut on gauge until indicator lip again rests on top of pump plunger stem Note gauge reading The difference between the two readings is pump stroke (in 64ths of an inch) and should agree with figure in table below Adjust by bending throttle connector rod at lower angle near throttle lever

SERIES 40, 50 PUMP JET TARGETS SERIES 70

BUICK PUMP JET TARGET CIRCLES

Type "A" Pump Setting

Car & Carb.	Stroke	Setting
Buick 608S,SA, 609S,SA.	21/64"	Non-Adj
Buick 608SC, 609SC	21/64"	Long Stroke
Buick 663S, 664S	21/64"	Long Stroke
Cadillac 595S, SA	27/64"	Non-Adj

Pump Jet Aim Adjustment (Buick Models)—Fuel discharged from pump jets must strike within 3/16" diameter target circles on carburetor wall Pump jet aim should be checked and pump jets adjusted, if necessary, as follows: Note location of pump jet target circles on carburetor wall (target circles not marked on first carburetors and targets must be established as directed in Note below). Operate pump by opening throttle with short quick stroke and note whether discharge stream strikes in target circle Adjust by bending pump jets

►*CAUTION: Use extreme care not to distort jets when making adjustments.*

Pump Jet Target Note—On first carburetors where pump jet targets are not marked on the carburetor wall, it will be necessary to establish these by measurement (as shown in illustration) Mark target circles with a pencil.

Type "B" Accelerating Pump: Pump is high-pressure delayed-action type (same as Type "A" above) but pump stroke is checked and adjusted differently as follows:

►*CAUTION·* When measuring pump stroke, proceed exactly as follows (gauge reading indicates plunger shaft position rather than actual movement.

Pump Stroke Checking & Adjustment—Install pump connector link in hole of pump arm which provides correct stroke for checking (see table), back out throttle lever stopscrew so that throttle valves are tightly closed (CAUTION—See that fast idle cam does not hold throttle valves open).

►*CAUTION: Check pump stroke by either of the two following methods:*

(1) Gauge T109-117S Method—Invert gauge on edge of dust cover boss of bowl cover at pump plunger shaft (CAUTION—hold gauge vertical to insure correct reading). Turn knurled nut on gauge until gauge finger just touches upper end of plunger shaft. Number indicated on gauge should agree with "Gauge" figure in table below. Adjust by bending throttle connector rod at upper angle.

(2) Scal M th d—Use a scale to measure distance from top of pump plunger shaft to top of dust cover boss on bowl cover. This distance should agree with "Scale" figure in table. Adjust by bending throttle connector rod at upper angle.

Type "B" Pump Setting

Car & Carb.	Reading Gauge	Reading Scale	Pump Stroke
Buick 725S,SA,726S,SA	33	20/64"	Short
Buick 882S,SA,883S	33	20/64"	Short
Buick 2017S,2081S,SA	29	17/64"	Long
Buick 2179S	29	17/64"	Long
Cadillac 682S	24	7/32"	Non-Adj.
Cadillac 722S,845S	32	5/16"	Long
Cadillac 742S	30	19/64"	Long
Chrysler 8 (All)	29 ℂ	17/64"	Long
DeSoto (All)	33	23/64"	Long
Frazer 685S,SA,723S	29	9/32"	Short
Kaiser 685S,SA, 723S	29	9/32"	Short
Oldsmobile 665S	24		Long
Pontiac 630S,SA,SB, 653S	30		Short
Pontiac 719S,SA	32	20/64"	Short
Pontiac 720S,SA,2122S	32	20/64"	Short
Willys 2204S	28	3/16"	Long

ℂ—Supersedes 26 (15/64") setting on 830S

Pump Jet Aim—Pump jets must be properly aimed so that pump discharge stream strikes venturi at correct angle To check (with air horn removed), operate pump by opening throttle with short quick stroke and note direction of pump jet stream Stream should miss outer wall of primary venturi and strike lower part of inner wall of secondary venturi To adjust, bend pump jet slightly Check both pump jets similarly.

►*CAUTION· Use extreme care not to distort jets when making adjustments.*

Type "C" Accelerating Pump: Pump is high-pressure delayed-action type (same as Types "A" & "B" above) but pump stroke is checked and adjusted differently as follows

Pump Stroke Adjustment—Back out throttle stopscrew so that throttle valves seated (CAUTION—make certain fast idle screw does not hold throttle valves off seat) Remove dust cover over pump countershaft. Place straightedge across top of dust cover boss at pump arm. Flat op top of pump arm should be parallel to straightedge Adjust by bending throttle connector rod at upper angle using bending tool T109-213.

METERING ROD SETTING

►*METERING ROD CHECKING NOTE Gauge is required to check metering rod setting on some carburetors only. Check each type as follows:*

Metering Rod Check (With Gauge)—Use special metering rod gauge (see table below). Install gauge in place of either metering rod seating gauge in metering rod jet Back out throttle lever stopscrew so that throttle valves tightly closed. Press down lightly on vacuum piston link until lug of piston link contacts lip of metering rod arm. In this position, clearance between metering rod bearing and shoulder in notch or gauge should be less than 005" Adjust by bending lip of metering rod arm using bending tool T109-105 Re-

CONTINUED N NEXT PAGE

CARTER "WCD" (Cont.)

move gauge and reinstall metering rod.

Metering Rod Check (No Gauge Required)—Check and adjust the rods as follows: Back off throttle lever stop-screw so that throttle valves tightly closed, loosen metering rod arm clampscrew (on countershaft under dust cover on bowl cover), press down on vacumeter link until both metering rods just bottom in carburetor casting, rotate metering rod arm until finger on arm contacts lip on vacumeter link, tighten clampscrew *(CAUTION*—do not disturb arm position).

Metering Rod Setting

Car & Carb.	Metering Rod Gauge
Buick 608S,SA	T109-152 (2.440")
Buick 609S, SA	T109-163 (2.940")
Buick (All Others)	No Gauge Req'd
Cadillac 595S,SA, 682S	T109-163 (2.940")
Cadillac (All Others)	No Gauge Req'd
Chrysler & DeSoto (All)	No Gauge Req'd
Frazer 685S,SA, 723S	T109-163 (2.940")
Kaiser 685S,SA, 723S	T109-163 (2.940")
Kaiser 2146S	T109-163 (2.940")
Nash 2034S	No Gauge Req'd
Nash 2061S	T109-163 (2.940")
Oldsmobile 665S	T109-163 (2.940")
Pontiac 6 2010S	No Gauge Req'd
Pontiac 8 (All Models)	T109-163 (2.940")
Willys 2204S	No Gauge Req'd

FLOAT LEVEL SETTING

Float Level Setting—With bowl cover and float assembly removed from carburetor, invert assembly, remove cover gasket, install correct gauge on cover directly under floats with notched portions of gauge fitting over edge of cover casting. Sides of floats should just barely touch vertical legs of gauge (lateral adjustment). Adjust by bending arms of floats. Both floats should just clear horizontal portion of gauge (vertical adjustment).

►***FLOAT SETTING CAUTION—Floats must be adjusted laterally (parallel to gauge uprights) as well as vertically (Float Level figure in table below).***

Float Level Setting

Car & Carb.	Float Level	Checking Gauge
Buick 608S,SA,609S,SA	3/16"	T109-162
Buick 608SC,609SC	5/32"	T109-196
Buick 663S,664S	5/32"	T109-196
Buick 725S,SA,726S,SA	5/32"	T109-196
Buick 882S,SA,883S	5/32"	T109-196
Buick 2017S,2081S,SA	5/32"	T109-196
Buick 2179S	3/16"	T109-162
Cadillac 595S,SA	9/64"	T109-160

Pontiac 6 2010S ⑤, 2061S	5/32"	T109-196
Pontiac 8 (All Models)	3/16"	T109-162
Willys 2204S	3/16"	T109-162

①—With 1st.type Needle & Seat Assy.No.25-161S.
②—With 2nd.type Needle & Seat Assy.No.25-162S.
③—Allow floats to hang freely on inverted cover so that spring not compressed Floats should be flush to 1/32" above edge of bowl cover.
④—For both Double Float & Later "Split" floats.
⑤—Adjust both floats alike (Split type)

►***NASH & PONTIAC 6 "SPLIT" FLOAT NOTE:*** **Float consists of two floats (right & left hand) and auxiliary lever. Floats are adjusted in same manner as on other carburetors and should be set for uniform height (float level or vertical adjustment). In service, fuel level is controlled by highest float so that uniform level is maintained regardless of any fuel surges in the bowl.**

Fuel Level Note—Quick check for correct float setting can be made by removing sight hole plug on side of bowl. Fuel level should be even with bottom of sight hole (or just run out of hole with engine idling).

CLIMATIC CONTROL (CHOKE) SETTING

Car & Carb.	Choke Setting
Buick 608S,SA,SC;609S,SA,SC	Centered (At Index)
Buick 663S, 664S	Centered (At Index)
Buick 725S,SA,726S,SA	1 Point Rich

Buick 2017S,2081S,SA,2179S	Centered (At Index)
Cadillac 595S,SA	Centered (At Index)
Cadillac 682S	1 Point Rich
Cadillac 742S	1 Point Lean
Cadillac 845S	See Modifier Note (below)
Chrysler & DeSoto (All)	Centered (At Index)
Frazer & Kaiser 685S,SA;723S	Centered (At Index)
Kaiser 2146S	Centered (At Index)
Nash 2034S	Centered (At Index)
Nash 2061S	2 Points Lean
Oldsmobile 665S	1 Point Rich
Pontiac 6 2010S	Centered (At Index)
Pontiac 8 630S,SA,SB	①
Pontiac 8 (All Others)	Centered (At Index)
Willys 2204S	Centered (At Index)

①—Centered (1st. No. 6-547S Air Horn & Climatic Control Assy., 1 Point Lean (2nd. No. 6-576S Air Air Horn & Climatic Control Assy.).

Cadillac 845S Choke Modifier Setting—Choke and modifier adjusted together: Disconnect throttle-to-choke rod. Set climatic control 1 Point Rich (loosen retainer screws, rotate cover and coil assembly until notch on cover 1 point to left of center mark on housing, tighten retainer screws). Loosen modifier arm clampscrew, rotate metal pointer until it is in line with pointer on cover, hold pointer in this position and rotate modifier arm until scribed line on face of arm is vertical, tighten clampscrew securely. Turn throttle lever stop-screw out exactly two turns, hold choke valve open, open throttle and then close throttle completely and check metal pointer alignment with pointer on cover. If both pointers do not line up, bend connector rod until alignment secured. Turn throttle stopscrew in exactly two turns (to restore original speed setting).

CHRYSLER & DESOTO SLOW CLOSING THROTTLE DASHPOT (All Models): Consists of a diaphragm type unit with a plunger which contacts an arm on the throttle valve shaft and prevents a too-rapid closing of the throttle valves when accelerator released Dashpot is a separate unit mounted on the carburetor. **Adjustment**—Check dashpot action with engine running, by shifting to Driving Range (hold car with brakes), and rapidly depressing and releasing accelerator pedal. If engine stalls, increase dashpot action by turning adjusting screw on actuating lever on throttle shaft. Maximum dashpot action is secured with screw set so that dashpot plunger can be moved inward approximately 1/16" after engine has returned to normal idle speed. If correct performance cannot be secured by adjusting dashpot, tune up engine and recheck performance

See "Chrysler & DeSoto V8 Slow-Closing Throttle" for complete data.

CHRYSLER & DESOTO KICK-DOWN SWITCH (All Models): Consists of separate unit mounted on carburetor throttle body (used for transmission control). When disassembling these carburetors, take out two mounting screws and remove switch unit. Vacuum passages for switch operation terminate at holes in mounting flange on carburetor and switch body

See "Chrysler & DeSoto V8 Kick-down Switch" in Electrical Section for complete data.

FAST IDLE SETTING

CAUTION—TWO settings (1) and (2) required as explained below.

℄—Idle Port Opening above throttle valve.

CAR STARTER SETTING

Buick Carburetors: Check switch timing on each model as follows:

Buick 1946-54)—With carburetor on the engine, place transmission selector lever in neutral, apply parking brake, make certain throttle linkage and dashpot correctly adjusted. Back off throttle stop-screw, disconnect throttle connector rod and rotate fast idle cam to slow idle position, close throttle valves. Place scale against choke unloader arm on throttle lever, make a mark on the carburetor body at the 1" point on the scale. Turn on ignition (use test lamp and battery if carburetor off engine), open throttle slowly while holding end of scale against unloader arm. Note point at which starter drive pinion just engages flywheel (or test lamp lights). Scale should read between 1 15/16" and 2 5/16" at reference mark on carburetor (15/16" to 1 5/16" travel of the arm). If switch timing too early, remove shims; if switch timing too late, add shims, on guide block under contact spring.

▷*CAUTION—Do not use less than one .018" shim (153-11), or more than three of these .018" shims plus two .006" shims (153-12).*

Buick (1955)—Place transmission selector lever in neutral and apply parking brake Back off throttle stop screw, rotate fast idle cam to slow idle position, fully close throttle valve *(NOTE (Dynaflow Cars)*—Dashpot must not interfere with full closing of throttle) Place scale against rear face of lower arm of throttle lever which contacts dashpot, with scale resting on rocker arm cover Mark rocker arm cover at front edge of scale (throttle valve fully closed) Turn "IGN" switch ON, slowly open throttle, mark cover again at point where cranking motor is energized Timing is correct if distance between marks on rocker arm cover is 29/32—1 7/16" Adjust by changing number of shims Reset idle speed to 450 RPM (engine hot) and recheck adjustment of throttle linkage and dashpot

OVERHAUL: *NOTE—On carburetors equipped with Car Starter or Dashpot, remove these units as follows:*

Car Starter Removal (Buick Carburetors)—Disconnect and tape leads on switch terminals. Take out switch terminal cap attaching screw, hold-down clip, switch cap. Withdraw return spring, guide block and contact spring assembly, switch plunger, and ball.

Dashpot Assembly—Take out attaching screws and lift dashpot assembly off carburetor.

Disassembly: Disconnect and remove throttle connector rod, disconnect fast idle rod from choke lever. Take out screws fastening air horn, lift off air horn assembly (see Air Horn disassembly below). Take out two attaching screws in dust cover, remove dust cover and gasket. Remove fuel inlet strainer cover nut and remove strainer Take out bowl cover attaching screws and remove bowl cover assembly *(CAUTION*—lift bowl cover straight up to avoid damaging parts on underside of cover). See Bowl Cover disassembly below. Remove spring from accelerating pump cylinder. On Chrysler carburetors, lift out vacuum piston, spring, and gasket from vacuum piston cylinder. On all other carburetors, remove the vacuum piston spring (piston pulls out with cover assembly). Unscrew and remove metering rod jets (use Tool T109-58 or wide bladed screwdriver which will engage both slots in jet) Take out attaching screw in pump discharge jet cluster, remove cluster and gasket. Remove pump relief valve plug assembly and gasket. Remove intake check valve retainer in bottom of pump cylinder, invert carburetor body and catch pump discharge check needle and intake ball as they drop out. Remove pump intake strainer (if used). Take out four screws attaching throttle body, lift off throttle body and gasket. See Throttle Body disassembly below. *CAUTION—DO NOT attempt to remove main Discharge Nozzles (nozzles are permanently installed in body).*

Throttle Body—On Buick carburetors, see Car Starter data (above) for removal of these parts. Remove both idle adjusting screws and springs. Remove both idle port rivet plugs (use Rivet Extractor Tool T109-43). DO NOT remove throttle valves and shafts unless replacement of parts required. To remove these parts, first mark both valves (to insure re-installation in same carburetor barrel), take out attaching screws and remove valves. Take out screw on end of throttle shaft, remove lever and washer. Remove shaft retainer ring or use rawhide mallet to tap shaft out through retainer, remove shaft and lever assembly. Remove fast idle cam and trip lever mechanism.

Bowl Cover—Unhook and remove both metering rods *(CAUTION*—use care not to bend or otherwise damage the rods), do not lose metering rod discs (when used). Unhook vacuum piston from link (on Chrysler carburetors, piston is not attached to link but it will be necessary to compress link spring and retainer, remove brass pin from end of link, then remove retainer and link spring). Lift vacuum piston link out. Push float fulcrum pin out, remove float assembly, remove intake needle from float lever (types where needle clipped to float lever). Remove fuel intake needle seat and gasket. Unscrew both low speed jets (use T109-76 wrench). Remove cover gasket. Remove hairpin clip from pump connector link, remove link, remove pump plunger assembly. If pump arm countershaft requires removal (for parts replacement), loosen screws in metering rod and pump arms, take out pin spring in end of countershaft, pull countershaft and lever assembly out and at the same time lift out the metering rod arm and pump arm.

Air Horn—Remove retainer screws and retainers, remove choke housing and coil assembly, gasket, and baffle plate. Remove lever from end of choke shaft. Take out attaching screws and remove choke valve. Rotate shaft to disengage vacuum piston from cylinder, withdraw shaft and piston assembly.

▷*CHRYSLER THERMOSTATIC COIL HOUSING CAUTION:* Thermostatic coil, heat retainer plate, and housing are serviced as an assembly. Coil and heat retainer plate can be removed from housing for cleaning by hitting assembly sharply against palm of hand with coil side down.

CONTINUED ON NEXT PAGE

CARTER "WCD"

Cleaning & Inspection: Wash all parts except thermostatic coil and housing assembly in suitable cleaning solvent. Blow out all passages and dry with air. Make certain that all gum and carbon deposits removed, particularly from carburetor barrels at throttle valves and idle ports. Inspect all parts for wear or damage.

Reassembly: Use all NEW gaskets. Install parts in reverse order of disassembly procedure and note the following important instructions:

Throttle Valve Installation—Insert throttle shaft in throttle body, install shaft retaining ring on end of shaft with prongs outward, press ring on shaft so that it is snug fit against body without endplay in shaft. Install throttle valves with trademark ("c" in circle) on idle port side and facing downward toward manifold side, insert throttle valve screws loosely. Close throttle fully, center both valves in carburetor barrels, hold valves firmly in place while supporting screw heads on a steel block.

Pump Jet Assemblies—Use loader tool T109-122U to install pump intake check ball and retainer in pump cylinder (place ball and new retainer in small end of tool sleeve, tap sleeve to seat retainer in pump cylinder recess). Place pump discharge check needle with tapered end down in passage in main body, install pump discharge cluster with new gasket, tighten screw securely. Install pump relief valve plug and gasket.

Accelerating Pump, Metering Rod & Vacuum Piston Assembly—Install vacuum piston link in bowl cover with lip at center opening pointing toward outer side of cover (*CAUTION*—use care not to distort metering rod spring). Install piston on lower end of link on all carburetors except Chrysler (NOTE—On Chrysler, install link spring and retainer on link, compress spring and install brass pin in end of link, install vacuum piston in main body). Coat pump operating countershaft with light graphite grease and insert it through hole in bowl cover and through metering rod arm and pump arm (hold metering rod arm so that it engages opening in piston link and pump arm so that it extends over pump plunger), install pin spring in groove in end of countershaft. Center pump arm over pump plunger rod and tighten setscrew temporarily, install pump link in plunger rod and pump arm with ends of link pointing toward countershaft arm and secure with pin spring. After bowl cover installed and pump connector rod installed, adjust pump stroke (see ADJUSTMENTS). Install metering rods, inserting end of each rod through hooked end of metering rod spring and entering metering rod in metering rod jet, rotate rod eye over pin on piston link, adjust metering rods (see ADJUSTMENTS).

Automatic Choke Assembly—Install choke shaft, link, and piston assembly in air horn, rotate shaft to enter piston in cylinder. Install choke valve on shaft with trademark on valve ("c" in circle) upward, install new screws loosely, then close choke valve and tap it gently to center the valve, tighten screws securely. Check for uniform clearance at edges of valve and for free operation (valve should open of own weight from closed position). Stake screws lightly while supporting screw heads on a steel block. Install baffle plate and coil housing with a new gasket, place indicator mark on cover downward and install retainers and screws loosely, then rotate housing counter-clockwise until correct setting secured (see ADJUSTMENTS), tighten retainer screws securely.

SERVICE PARTS

Gasket Sets—Carter No. 189 (595S,SA; 608S,SA,SC; 609S,SA,SC; 663S, 664S, 682S, 685S,SA; 719S,SA; 720S,SA; 722S, 723S, 2122S, 2146S), No. 190 (630S,SA, SB; 653S, 665S), No. 195A (725S,SA; 726S,SA; 882S, SA; 883S, 2017S, 2081S, SA), No. 201A (742S, 845S), No. 212D (830S, SA, SC; 931S, SA, SB, SC; 935S,SA; 884S,SA,SC), No. 230 (2034S), No. 231 (2010S), No. 237 (2039S,SA), No. 256 (2179S), No. 258 (2204S), No. 268 (2061S).

▷CHANGES, CAUTIONS, CORRECTIONS

▷Buick & Packard Carter Car Starter: All models have Car Starter (Vacuum Switch) mounted on throttle body casting for starter motor control. *Refer to Electrical Equipment Index for 'Carter Car Starter' for complete data on this unit.*

▷Hudson 6 & 8 647S, SA; 648S Carburetor Correction for Stumble on Acceleration: If this condition noted at low speeds (just off idle), check throttle connector rod for excessive play at upper end where rod linked to pump countershaft lever, correct by installing No. 136-37 Washers on pin spring side of connector rod end to remove any excessive play.

▷Hudson Six 647S Carburetor Change to correct complaint of Lean Condition at 20 MPH. On cars with later Intake Manifold (mounting carburetor in vertical position) and new No. IGS-4213A-1 Distributor, new parts listed below can be installed in 647S carburetors which will bring them up to 647SA standards (CAUTION—If air horn removed with carburetor on car, do not open throttle valve which may cause pump check needle to drop down in manifold).

Unitized Package No. 75-700U

Metering Rods (2 furnished)	Carter No. 75-686
Bypass Bleeder Screw Plugs (2 furnished)	Carter No. 11B-159
Identification Tag (647SA)	Carter No. 107-30

Intake Manifold Change—New intake manifold (as noted under 647S Carburetor change above) with changed flange angle to provide for vertical mounting of the carburetor used in production on late 1949 cars. If this manifold installed on early cars, following new parts must be installed:

	New Part No.	Superseded Part No.
Intake Manifold (Aluminum)	302459	301150
Intake Manifold (Cast Iron)	302460 (when used)	
Accelerator Cross-shaft & Lever Assy.	302515	301631
Carburetor Choke Heat Tube	302518	300674
Carburetor Air Cleaner Brace	302520	301265
Fuel Line (Fuel Pump to Carburetor)	302514	300830

▷Hudson Six Later 647SA Carburetors—Has new parts listed above for 647S carburetor and was used in production on later cars.

▷Oldsmobile 480S, 503S, 505S, 650S Change to Improve Warm Engine Starting. Use Repair Parts Package No. 1096A and install following new parts (contained in pkg.): Needle & Seat Assembly No. 25-164S, Vacuum Piston Spring No. 61-175, Metering Rod No. 75-641, and change float level to 15/64" (was 3/16").

Oldsmobile 503SA & 650SA Carburetor Note—Have new type parts and new float level setting (as recommended for 503S & 650S above).

▷Packard Eight 512S Production Changes—Various changes in specifications and settings made as follows:

Fast Idle Cam & Fast Idle Setting—Cam Assembly changed to No. 181-110S (was 181-81S) and setting changed to .030" (was .020") for improved Car Starter action. See Fast Idle adjustment instructions following. Throttle Shaft & Lever Assembly also changed to No. 3-454S (was 3-433S).

Unloader Setting Change—Setting changed to 11/64" (was 3/16"). This requires use of new gauge No. T109-166. See Unloader adjustment data.

▷Packard Eight 644S Carburetor Recommended Changes—Following parts have been changed and only new type parts should be installed: Low Speed Jet Assembly No. 11-162S (was 11-163S), Metering Rod No. 75-638 (was 75-451).

Packard 644SA Carburetor Note—Has new type parts listed for 644S above.

▷Packard 531S Choke Trip Lever and Unloader Setting Change: New No. 14-249 Choke Trip Lever should be installed on Model 531-S carburetors used on this model and Unloader should then be set at 11/64" (supersedes setting of 3/16" originally specified for this model). This 11/64" setting requires use of new gauge T109-166 (same as used on Packard 8).

▷Packard Super & Custom 8 531S Carburetor Change for Smoother Warm-up & Low Speed Performance and Increased Gasoline Mileage. Install new Metering Rods Part No. 75-616 (superseding No. 75-538). Inspect and replace Bypass Bleeder Plugs Part No. 11B-168 if plugs have been altered or replaced previously. Check automatic choke thermostatic coil and make certain that it is standard "M" type (if "G" coil found, replace with "M" type). Mark carburetor by punching round hole in brass identification tag to indicate new type metering rods

▷*NOTE—Carburetors on which above changes made at factory are marked by punched hole in brass identification tag (531SA carburetors also have these changes).*

▷Packard Custom 8 531SA Carburetor Note—Has new Metering Rods 75-616 (see 531S change above) and new Body Flange Casting & Starter Switch Assembly No. 1-563S (casting identification number 564), new Bypass Bleeder Screw Plug No. 11B-168 (supersedes No. 11B-159), and new Spring Retainer No. 63-93 (supersedes No. 63-35). NOTE—When overhauling carburetors with new No. 1-563S Body Flange Casting, use No. 3-607S Throttle Shaft & Lever Assembly and No. 63-118 Throttle Shaft Retaining Ring (install with prongs extending outward). On carburetors with first type No. 1-378S Body Flange Casting, use No. 3-445S Throttle Shaft & Lever Assy. and No. 101-69 Throttle Centering Screw.

▷Packard Super 8 643S Production Change—Body Flange Casting & Switch Assembly No. 1-537S (marked 377) changed to Part No. 1-562S (marked 561).

Packard Super Eight 643SA Carburetor Note—Has later type Body Flange Casting & Switch Assy. No. 1-562S (see 643S changes above).

DESCRIPTION: Dual barrel carburetors. Same design as Single Barrel Vacumeter type except for dual feature. Carburetor has two independent mixing chambers, main nozzles, metering rods and jets, throttle valves, and idling systems. One accelerating pump (with double discharge jets) and one economizer vacuum piston assembly used for both barrels.

IDLING ADJUSTMENT: Adjust carburetor only with engine warmed up & idling at hot or slow idling speed (choke valve wide open, fast idle inoperative). Idle adjusting screw provided for each carburetor barrel. Screws control fuel mixture and should be turned in for leaner mixture, out for richer mixture and both screws just be adjusted exactly alike. See table below for approximate settings on each car model. Idle speed controlled by throttle lever stopscrew and should be set for speed shown in table. See tune-up data on car model pages

IDLE SETTING

Car Model	Carburetor	Idle Screw Setting	Idle Speed
Hudson 6 ('41-47)	501-S	½-1½ turns open	600 RPM.③
Hudson 6 ('48-49)	647S, SA	1¼-1¾ turns open	⑨
Hudson 8 ('41-47)	502-S	½-1½ turns open	600 RPM.③
Hudson 8 ('48-49)	648S	1-1½ turns open	⑨
Oldsmobile 8 ('41-48)⑤	503S, SA	½-1¼ turns open	6 MPH.
Oldsmobile 8 ('40-47)⑥	480S, SA	½-2¼ turns open	375 RPM.
Oldsmobile 8 ('48)⑥	650S, SA	½-1½ turns open	375 RPM.
Packard 8	644S, SA	⅝-1⅛ turns open	⑦
Packard 8	531S, SA	1½-2 turns open	⑦
Packard Super 8	643S, SA	¾-1¼ turns open	⑦
Pontiac 8	548S	¼-1¼ turns open	7-8MPH.

③—7½-8MPH. (4 1/9-1 Axle), 6½-7 MPH. (4 5/9-1), 6-6½ MPH. (4 7/8-1).
⑨—540-560 RPM (Std.), 580-600 RPM (With Vacumotive Drive or Drivemaster).
④—8-10 MPH. on cars with Electromatic Clutch.
⑤—Cars with Synchro-mesh Trans. ⑥—Cars with Hydra-Matic Drive.
⑦—6 MPH (Std. Trans.), 400 RPM (With Ultramatic Drive).

ACCELERATING PUMP: High pressure type (spring operated—pump operating lever and pump arm linked by small coil spring).

Pump Seasonal Adjustment—On some models, pump arm (under dust cover) has two or three holes for pump rod link connection to provide varied pump stroke for seasonal pump requirements. See tune-up data on car model pages for recommended settings and seasonal changes.

Pump Stroke Adjustment—On models with integral air horn and dust cover, remove this assembly to expose pump countershaft and connector link (on models with separate dust cover, take out two retaining screws and remove dust cover only). Back off throttle lever stopscrew so that throttle valves tightly closed, check pump seasonal adjustment (connector link must be engaged in hole for correct stroke as shown in table below). Install Universal Pump Stroke Gauge T109-117S on rim of bowl cover at plunger shaft so that projection on gauge rests on top surface of connector link at pump shaft (see gauge note below). Note gauge reading with throttle closed, then open throttle wide and

CONTINUED ON NEXT PAGE

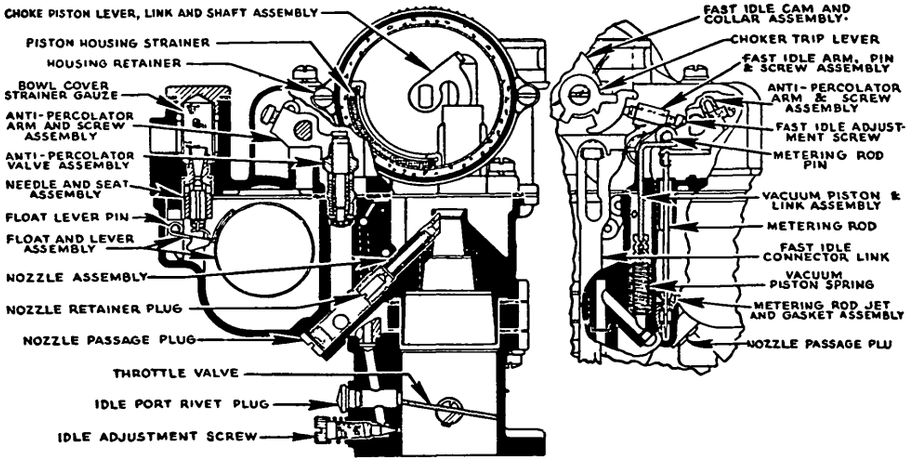
CARTER DUAL TYPE "WDO" (C ntinued)

again note gauge reading. Difference between two readings is pump stroke (in sixty-fourths of an inch) and should agree with figure shown in table below. Adjust by bending throttle connector rod at lower angle near throttle lever (use bending tool T109-75). CAUTION—Check metering rod setting and anti-percolator adjustment after adjusting pump stroke.

ACCELERATING PUMP SETTING

Car Model	Carburetor	Pump Stroke	Pump Setting
Hudson 6	501-S, 647S, SA	18/64"	Long Stroke
Hudson 8	502-S	18/64"	Long Stroke
Hudson 8	648S	14/64"	Long Stroke
Oldsmobile	503S, SA	19/64"	Non-Adj.
Oldsmobile	471S, 480S, SA; 650S, SA	19/64"	Non-Adj.
Packard 8	644S, SA	14/64"	Short Stroke
Packard 8	531S, SA	26/64"	Short Stroke
Packard Super 8	643S, SA	28/64"	Non-Adj.
Pontiac 8	548S	19/64"	Short Stroke

METERING ROD (EXC. PONTIAC): Main nozzle fuel metered by metering rod and jet (independent rod and jet for each nozzle). Metering rods operated by single vacuum piston with throttle control (stop pin on pump arm limits piston travel so that metering rod lifted in accordance with throttle opening). No adjustment provided but metering rods can be changed to secure leaner-than-standard fuel mixture to compensate for special fuel or high altitude conditions (both rods must be same size and should be changed as a unit). Check metering rod setting whenever rods removed or pump stroke adjusted.



To Remove Metering Rods—Take out screws and remove dust cover or remove air horn and dust cover assembly (where these parts integral—see Service data for removal instructions). Remove pin spring from metering rod pin and slide pin from vacuum piston link being careful not to bend metering rod spring. Lift out metering rods, remove metering rod discs (on some models, discs held by retainer (must be removed first by taking out retainer screw).

To Check Metering Rods—Back off throttle lever stopscrew so that throttle valves are tightly closed. Install metering rod gauge (see table below) in place of each metering rod making certain that tapered ends are seated in metering rod jets. Install metering rod pin in piston link. Push piston link down until metering rod pin rests lightly on shoulder of notch in each gauge. With throttle valves seated, and vacuum piston held down, bend lip on anti-percolator arm (which extends under metering rod pin) so that lip just touches pin (use adjusting tool T109-105).

METERING ROD SETTING

Car Model & Carb.	Metering Rod Gauge (& Length)
Pontiac 548S	T109-27 (2 359")
All Other Cars & Carburetors	T109-113 (2 280")

METERING ROD (PONTIAC): Metering rod operates similarly to other carburetors except that vacumeter piston is not used and rods are mounted on pump arm and positively controlled by the throttle lever. Check metering rod setting as follows:

Checking Metering Rods—Back off throttle stopscrew so that throttle valves tightly closed, loosen anti-percolator arm screw. Install metering rod gauge (see table above) in place of each metering rod, make certain that gauges seat in metering rod jets and are vertical. Install metering rod pin and pin spring in metering rod arm. Press down lightly on pump arm. Pin must rest on shoulder of notch in each gauge (bend arm as necessary to equalize), and clearance between pin and each gauge must be less than .005". Tighten anti-percolator arm screw Re-install metering rods, check anti-percolator setting

FLOAT LEVEL: To check float level, with bowl cover assembly removed, remove cover gasket, invert cover, measure from machined gasket seat on cover to top of float (check at both ends of float—settings must be alike). See table below for float level and special checking gauge for each model. To adjust, bend lip on float lever at point where it contacts valve needle (do not bend float or arm).

FLOAT LEVEL SETTING

Car Model	Carburetor	Float Level	Checking Gauge
Hudson ('41-47)	501-S, 502-S	1/8"	T109-36
Hudson 6 ('48-49)	647S, SA	3/16"	T109-28
Hudson 8 ('48-49)	648S	13/64"	T109-39
Oldsmobile	480S, 503S, 650S	②3/16"	T109-28
Oldsmobile	480S, 503S, 650S	③15/64"	T109-32
Oldsmobile	480SA, 503SA, 650SA	15/64"	T109-32
Packard 8	644S, SA	5/32"	T109-154
Packard 8	531S, SA; 643S, SA	5/32"	T109-154
Pontiac 8	548S	5/16"	T109-107

②—With 1st. type Needle & Seat Assy. No. 25-100S.
③—With 2nd. type Needle & Seat Assy. No. 25-164S (see Recommended Changes).

FAST IDLE: Consists of a fast idle lever linked to the throttle valve lever and mounted directly below the fast idle cam on the choke valve shaft. To adjust, hold choke valve tightly closed, adjust fast idle arm screw so that clearance between throttle valve and carburetor wall on side opposite idle port is correct as shown in table below (use special checking gauge inserted between throttle valve and wall to check opening).

FAST IDLE SETTING

Car Model	Carburetor	Throttle Opening	Checking Gauge
Hudson 6 ('41-47)	502-S	.045"	T109-58②
Hudson 8 ('41-47)	501S	.053"	T109-58②
Hudson 6 & 8	647S, SA; 648S	.054"	T109-193④
Oldsmobile ('41-48)	480S, SA; 503S, SA 650S, SA	.015"	T109-44
Packard 8	512S, 644S, SA	.020"①	T109-29
Packard Super 8	531S, SA	.023-.028"	T109-189③
Packard Super 8	643S, SA	.026"	T109-189③
Packard Cust. 8	531S, SA	.023-.028"	T109-189③
Pontiac 8	548S	026"	T109-189

①—Supersedes original setting of .030" on 512S.
②—Gauge T109-58 used for both .045" and .053" settings.
③—Gauge T109-189 used for .023" & .026" settings (supersedes T109-114).
④—Gauge T109-193 used for both .040" and .054" settings.

ANTI-PERCOLATOR: Plunger Type. Consists of vent above each main jet well controlled by spring-loaded plunger type valves. Valves are opened by anti-percolator arm connected to throttle when throttle valves are closed to vent nozzle and prevent any "percolating" discharge when carburetor is hot.

Buick Models (except 419-S)—These carburetors have suction type anti-percolators which are pressed in carburetor and require no adjustment. Do not remove these anti-percolators (correct tube location extremely important).

Adjustment—Make this adjustment after metering rod setting and pump stroke setting have been adjusted (use extreme care not to disturb these settings). On models with integral air horn and dust cover, remove this assembly to expose anti-percolators (on models with separate dust cover, take out two retaining screws and remove dust cover only). Back off throttle lever stopscrew so that throttle valves tightly closed. On models listed in table below, insert special gauge (or feeler gauge of thickness listed) between anti-percolator stems and lips on anti-percolator arms—do not use any gauge on other models. Adjust by bending lips on anti-percolator arms so that center of indicator line on each anti-percolator stem is flush with top of anti-percolator plug. Use extreme care to secure same adjustment on both anti-percolator units.

CONTINUED ON NEXT PAGE

CARTER DUAL TYPE "WDO" (Continued)

ANTI-PERCOLATOR SETTING

Car Model	Carburetor	Checking Gauge	Thickness
Packard 8	512S, 644S, SA	T109-72	.015"
Packard 8	531S, SA; 643S, SA	T109-72	.015"
Pontiac 8	548S	T109-72	.015"
All Others		None	None

THROTTLE VALVE SETTING: Install valves with trademark "C" toward idle port side, use new attaching screws, install screws loosely, tap valves lightly to centralize them in bore, then tighten screws securely. Check valve setting with throttle lever stopscrew backed out so that valves tightly closed. Idle port figure is distance from top edge of valve to top of idle port. Vacuum spark port figure is distance from top edge of valve to top (or bottom as noted) of vacuum spark port. Shims furnished .002" thick (2-93), .005" thick (2-94) for throttle valve setting adjustment.

THROTTLE VALVE SETTING

Hudson 6 ('40-47)	501-S	.108-.112"	③.029-.033"
Hudson 8 ('40-47)	502-S	.133-.137"	None
Hudson 6 & 8	647S, SA; 648S	.157-.163"	③.030-.040"
Oldsmobile ('41-48)	480S, SA; 503S, SA	.144-.150"	③.029-.033"
Oldsmobile ('48)	650S, SA	.144-.150"	③.029-.033"
Packard 8	644S, SA	.127-.133"	③.060"
Packard Super 8	531S, SA	.152-.158"	③.050-.054"
Packard Super 8	643S, SA	.127-.133"	③
Packard Cust. 8	531S, SA	.152-.158"	③.050-.054"
Pontiac 8	548S	.140-.146"	②.050-.054"

①—Bottom of port above top of valve.
②—Top of port above top of valve.
③—Top of port above valve: (643S) .050-.054", (643SA) .060".

UNLOADER: -Consists of a lip on throttle connector which engages the choke trip lever on the choke valve shaft so that the choke valve is opened when the throttle is wide open. To adjust, hold throttle valve wide open, bend lip on fast idle connector link so that clearance between upper edge of choke valve and air horn wall correct as shown in table below (use gauge to check opening).

UNLOADER SETTING

Car Model	Carburetor	Unloader Gauge	Clearance
Hudson 6 & 8	501-S; 502-S	T109-31	1/4"
Hudson 6 & 8	647S, SA; 648S	T109-31	1/4"
Oldsmobile	480S, SA	T109-28	3/16"
Oldsmobile	503S, SA; 650S, SA	T109-31	1/4"
Packard 8	644S, SA	T109-166	11/64"
Packard Super 8	531S, SA	T109-166	②11/64"
Packard Super 8	643S, SA	T109-166	11/64"
Packard Cust. 8	531S, SA	T109-166	11/64"
Pontiac 8	548S	T109-166	3/16"

④—Supersedes 3/16" setting (T109-28) with No. 14-219 Choke Trip Lever which should be replaced by new No. 14-249 Choke Trip Lever for which 11/64" setting given above is correct.

Choke Valve Lock:—With unloader properly adjusted, choke valve will be locked in wide open position with throttle valves wide open. Choke valve will be released when throttle valves closed.

CHOKE: -Thermostatic coil housing reference mark should be centered on mark on piston housing (for all models except those shown in table below) or should be rotated counter-clockwise (Rich), clockwise (Lean), the correct number of notches from the center mark as follows:

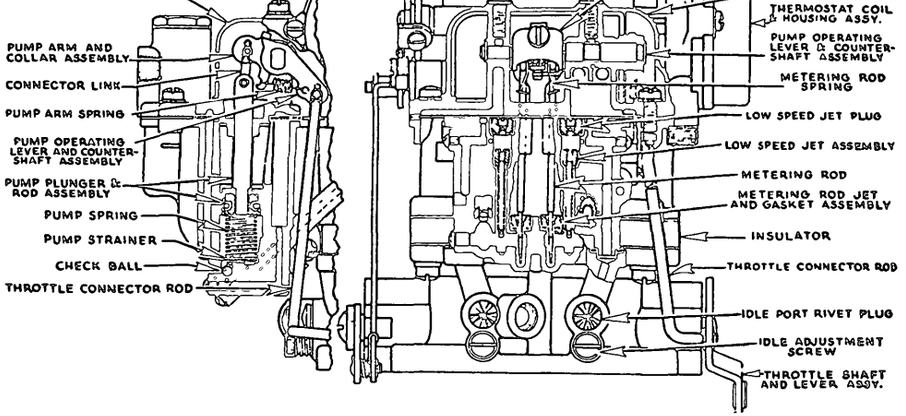
CLIMATIC CONTROL (CHOKE) SETTING

Car Model	Carburetor	Choke Setting
Hudson 6 & 8	501-S, 502-S	1 point Lean
Hudson 6	647S, SA	1 point Lean
Oldsmobile ('41-48)	480S, 650S, 650SA	2 points Rich
Packard Super & Cust. 8	531S, 531SA	②Centered
Pontiac 8	548S	2 points Rich
All Others		Centered

②—With later type No. 170M-64S Thermostatic Coil & Housing Assy.

CARBURETOR OVERHAUL: *CAUTION—When disassembling carburetor, note the following important points:*

▷Carter Car Starter Note—When disassembling carburetors which are equipped with this unit, the Car Starter which is located in the Throttle Body Casting must be disassembled as follows: Hold switch firmly against casting, remove terminal cap clip and screw, withdraw switch using care not to lose small square adjusting shims, remove switch ball. Invert casting and remove retainer ring and switch strainer. *Refer to Carter Car Starter article in Electrical Equipment Section for complete switch servicing and adjusting directions.*



Disassembly: Remove dust cover attaching screw and lockwasher, remove the dust cover (when dust cover is separate), remove fast idle arm and spring assemblies. Take out air horn attaching screws (two screws outside, one screw inside under choke valve) and remove air horn and Climatic Control assembly. Remove pin spring and pump connector link, spring retainers and springs to remove throttle connector rod, take out four flange attaching screws and lift off flange, gasket and two idle passage gaskets taking care not to lose vacuum piston spring. Disconnect piston from piston link, lift out metering rod and piston link assembly, disconnect metering rods from link. Remove four bowl cover attaching screws, remove bowl cover and body gasket. Remove metering rod disc retainer and discs, pump plunger and rod assembly, pump spring, pump inlet ball check, metering rod jets and gaskets, anti-percolators (use 13/32" socket wrench T109-68), pump jet passage plugs, pump jets, nozzle plug and gasket assemblies, nozzle retainer plugs and nozzles (nozzles pressed in, use tool No. T109-55), nozzle gaskets, low speed jet and gasket assemblies, pump outlet ball retainer plug and ball (in center of casting next to air horn retaining screw hole), throttle valve attaching screws and throttle valves, throttle centering screw, arm attaching screw, washer, and arm. Remove fast idle spring retainer, spring, connector link, connector link spring, withdraw throttle shaft assembly. Take out idle adjusting screws, remove idle port plugs.

Servicing—Clean castings and all parts with gasoline (no not immerse cork parts in gasoline), blow out all passages with compressed air, check all parts for correct specifications and replace all worn parts. Use all new gaskets when reassembling. Soak needle seat gasket, low speed jet gasket and metering rod jet gasket in alcohol for 15 minutes, install and let dry on part.

Reassembly: Reassemble in reverse order. Check throttle valves (see Throttle Valves above), make certain that low speed jets seat at both ends and are tight, install nozzles with flat side facing up. Vacuum piston is offset from link and should be installed with large side of piston toward bores. When installing flange assembly on body casting, hold body casting upside down with vacuum piston vertical, place piston spring in piston, then place flange assembly on body casting, guiding piston and spring into cylinder in flange casting. Check metering rods, anti-percolator, pump, and fast idle as directed above.

SERVICE PARTS: Gasket Sets—No. 149 (501S, 502S, 647S, SA, 648S), No. 156 (512S, 513S, 531S, 643S, SA, 644S, SA), No. 158 (480S, SA, 503SA, 650S, SA).

Repair Packages (with std. Metering Rods): No. 1092A (512S), No. 1096A (480S, SA, 503S, SA, 650S, SA), No. 1302A (501S), No. 1303A (502S), No. 1321C (531S), No. 1375B (643S, SA), No. 1376C (644S, SA), No. 1381B (647S, SA), No. 1382A (648S).

①—Replacement Pkg. (carburetor and necessary installation parts) for cars not Carter equipped.
②—See Production Change Notes below.

►**CARBURETOR MODEL IDENTIFICATION:** Individual models may be identified by Body Casting No. on face of flange: 604 (714S, SA; 849S), 615 (728S, SA), 774 (781S, 813S), 803 (767S. 784S), 836 (851S), 1236 (2231S), 1185 (2052S, SA).

►CHANGES & CORRECTIONS

►**FRAZER 813S & KAISER 781S CHANGE (to correct Stalling & Hard Starting caused by Flooding):** On carburetors before June 1950 (stamped "EO" and previous and not marked by "X" on tag) with original type No. 25-173S Intake Needle & Seat Assembly, install latest type needle and seat assembly and change float level as follows:

Intake Needle & Seat Assy. No. 25-196S—Install this new type which has SOLID needle (no spring) and longer standpipe to prevent foreign material entering carburetor. Make certain that intake needle pull clip engages float lever lip. *NOTE*—25-196S can be distinguished from second type 25-185S by solid needle (both types have longer standpipe but 25-185S also has spring-loaded needle).

Float Level—Set float level at ¼" (Float level Gauge T109-31) measured from top of float at center to gasket seat on bowl cover with assembly inverted.

►*CAUTION*—Float level setting of ¼" used only when SOLID needle (no spring) installed. Carburetors with SPRING-LOADED needle have 7/64" float level setting.

Carburetor Marking—Stamp "XX" on carburetor identification tag to indicate that above changes have been made.

Fuel Pump Pressure—Fuel pump pressure should be 3½-4½ lbs. and must not exceed 4½ lbs.

►*CAUTION*—Carburetors stamped "FO" and "GO" (June & July 1950) and also carburetors marked by an "X" on identification tag have second type No. 25-185S needle and seat assembly and need not be changed as directed above. All carburetors stamped "HO" and later (beginning August 1950) have latest type No. 25-196S needle and seat assembly and new ¼" float level setting.

►**HUDSON CARBURETOR PRODUCTION CHANGES:**

Choke Setting Change (6 Cyl. 776S)—Setting changed to 2 Point Lean (superseding original setting of 1 Point Lean).

Metering Rod Change (6 Cyl. 776S)—New Std. Rod No. 75-754 supersedes original rod No. 75-732 which is now 1 Size Lean. Original 1 Size Lean Rod No. 75-740 has been discontinued.

Intake Needle & Seat Assembly Change (6 & 8 Cyl. 776S & 773S)—New type No. 25-186S supersedes original No. 25-165S. This new 25-186S assembly has longer standpipe to lessen possibility of failure due to dirt or other foreign material in fuel and will correct starting difficulties due to flooding.

Other Parts Changes (6 & 8 Cyl. 776S & 773S)—Accelerating Pump Plunger, Rod, Spring, & Retainer Assembly No. 64-132S supersedes No. 64-129S (776S), No. 64-133S supersedes No. 64-130S (773S). New Pump Spring Retainer No. 63-149 supersedes No. 63-92 (all carburetors).

►*HUDSON "TWIN H-POWER" CARBURETION NOTE: Twin H-Power Cars have two WA1 Carburetors. See "Carter WA1 Carburetors" for data on these models.*

►*HUDSON & NASH PRODUCTION CHANGES (To correct Hard Starting):*

1) **Atmospheric Vent Valve**—This valve entered production with Car Serial No. Y-5836 (Hudson), V-8116 (Nash), and should be installed on all earlier cars. Unitized package Carter No. 118-122U, consists of Dust Cover, Screws & lockwashers. *NOTE*—Should Dust Cover strike Air Cleaner, make depression in Air Cleaner to relieve contact.

2) **Carburetor Float Level**—Float level revised starting with engine No. P-14763. *NOTE*—Check float for bind in bowl or that pin end of float lever striking bowl chamber sides.

3) **Heat Deflector**—Heat Deflector installed between carburetor & intake manifold starting with engine No. P-10050. Available for use on earlier cars under Hudson & Nash No. 5300977 (Deflector), No. 6348465 (Gaskets).

►**OLDSMOBILE 714S CHANGE (to correct starting difficulties du to Flooding):** New Intake Needle & Seat Assembly, Part No. 25-182S, should be installed on first cars (supersedes previous type No. 25-163S). Will also lessen possibility of failure due to dirt or other foreign material in fuel (needle seat has longer standpipe so that fuel drawn in at higher level). **When this assembly installed, stamp an "X" on carburetor identification tag.**

NOTE—This new 25-182S needle & seat assembly used on later production carburetors.

►**OLDSMOBILE 851S THROTTLE STICKING CORRECTION (Carburetors before February 1951):** On carburetors prior to Code date B1, Fast Idle Link Spring No. 61-443 should be installed on lower end of fast idle link (loop spring around connector clip, engage upper end on shank of fast idle link, engage lower end on end of connector rod). Spring will prevent throttle sticking in wide open position.

NOTE—Carburetors stamped "B1" and later have this spring installed in production and also have small boss on choke housing which acts as additional guide for fast idle link.

►**OLDSMOBILE REPLACEMENT CARBURETORS:** Packages listed above consist of one carburetor: 714S (Pkg. 714SU), 714SA (Pkg. 714SAU), 849S (Pkg. 849SU) together with 195-43U Installation Unit:

No. 195-43U Installation Unit—Consists of the following parts needed to install carburetors on this model: 180-49 Air Cleaner Mounting Bracket, 90-17S Air Cleaner Adapter Clamp Assy., 108-48 Air Cleaner Spacer, 105A-44 Air Cleaner Nut, 86-12 Flange Stud & Air Cleaner Lockwasher, 101-280 Bracket Capscrew, 137-59 Choke Heat Tube, 99-10 Tube Compression Coupling Cone, 156-17 Elbow Fitting.

►**PACKARD 728S & 728SA PRODUCTION CHANGE:** Model 728SA has changes in calibrations as follows: **Metering Rod (Std.)**—(728S) No. 75-679, (728SA) No. 75-707.

Main Nozzle—(728S) #38 drill I.D., (728SA), #30 drill I.D. NOTE—Nozzle is installed permanently and should not be removed.

Intake Nozzle & Seat Assembly Chang (728S & 728SA). New type No. 25-186S supersedes first type No. 25-165S. New 25-186S assembly has longer standpipe on seat to lessen possibility of dirt or other foreign material in fuel entering carburetor and will correct starting difficulties due to flooding.

►**PACKARD 767S & 784S FUEL LEAKAGE CORRECTION:** Fuel leakage at passage in main body directly below Climatic Control may be caused by loose Pump Jet & Housing assembly. To check, remove air cleaner, open throttle by hand (engine must not be running), note evidence of leakage at gasket between pump jet housing and main body casting. To correct, check gasket (replace if not in good condition), and tighten pump jet housing attaching screw using long screwdriver inserted through air horn.

►**PACKARD 767S & 784S FAST IDLE & CHOKE SETTING CHANGE:** New settings will provide slightly lower engine speed when engine is cold and will shorten period during which fast idle operates:
Fast Idle Setting—.023" (supersedes .026").
Choke Setting—1 Point Rich (supersedes 3 Rich).

►**PACKARD 784S CARBURETOR PARTS CHANGES:** New type parts used on later carburetors as follows:
Vacuum Piston Spring—No. 61-134
Accelerating Pump Lower Spring—No. 61-150

►*PONTIAC CARBURETOR FLOODING CORRECTION:* When carburetor flooding is experienced, make the following service checks in the sequence listed: Fuel pump pressure must not exceed 5 lbs. See

CONTINUED N NEXT PAGE

CARTER DUAL TYPE WGD (Cont.)

Pontiac Special Data for corrective procedure. Remove float cover and inspect for foreign material in float chamber. Install late type filter stamped No. 47, if not so equipped. Check float for alignment or binding condition and for proper float level.

▷*WILLYS 4-WHL. DRIVE UTILITY ROUGH ROAD FLOODING & STALLING CORRECTION (Carter 2052S Carburetors):* On Utility vehicles only (Truck & Station Wagon), this condition can be corrected by installing special SPRING-LOADED Intake Needle & Seat assembly as listed below and using special Float Level Setting (see Float Level). On all other models, regular SOLID Intake Needle and Seat are used.

Intake Needle & Seat Assembly

Type	Part No.	Float Level Setting
Solid (Reg. Prod.)	25-196S	9/32"
Spring-loaded (spec.)	25-173S	7/32"

DESCRIPTION

DESCRIPTION: Dual downdraft, horizontal air intake (Oldsmobile 714S, 714SA, 849S), vertical air intake (Oldsmobile 851S and all other carburetors) type with vacuum control of the metering rods (vacumeter), spring-loaded piston type accelerating pump operated by throttle lever, well type non-adjustable anti-percolator, and Automatic Choke and Fast Idle.

Fuel System: Consists of Idle (Low Speed) Fuel System, Main (High Speed) Fuel System, and Accelerating Fuel System which operate as follows (Idle & Main Fuel Systems duplicated for each barrel):

Idle Fuel System—Fuel for idling is taken from main nozzle well up through the Idle Tube which meters the fuel and is then mixed with air admitted through idle air bleed opening in air horn. Fuel mixture passes through restricted horizontal passage and additional air is admitted through idle passage bleed opening in air horn. Fuel mixture then flows down through passage to idle discharge ports at throttle edge. For closed throttle idling, all fuel is discharged through lower port below throttle and is controlled by the Idle Adjusting Screw (upper port serves as additional air bleed). As soon as the throttle is cracked open, additional fuel is discharged through upper port also. At higher car speeds idle system drops out and all fuel is discharged by main fuel system.

Main Fuel System—Fuel enters main well through metering jet and is metered by the metering rod in this jet. Fuel then flows up through main well and is discharged through Main Discharge Nozzle located in throat of primary venturi. Anti-percolator well acts as an air bleed for the main nozzle and this air bleed action is controlled by the size and location of the anti-percolator well vents so that at high speeds practically all back bleeding of air into the system is eliminated.

Anti-Percolator Well Vents—Well is vented through pocket formed by flat on nozzle in high speed passage at inner wall of primary venturi and by restricted opening in air horn at top of well. Additional side vent opening into top of idle well prevents accumulation of vapor in well resulting in rough idle at higher operating temperatures.

ADJUSTMENT & OVERHAUL

IDLING ADJUSTMENT: Adjust only with engine warmed up so that choke valve wide open and engine idling at hot or slow idle speed (Automatic Choke and Fast Idle inoperative). Set throttle stopscrew for correct idle speed, adjust both idle adjusting screws (one for each barrel) so that engine idles smoothly. Screws control fuel mixture and should be turned in for leaner mixture, out for richer mixture. See car model page for complete tune-up data.

④—400 RPM in "DR" (Hydra-Matic), in "P" (Dynaflow).

⑤—With Selector lever in "H".

ACCELERATING PUMP: No seasonal adjustment provided. Pump stroke should be checked and adjusted before adjusting metering rods. *CAUTION—Oldsmobile carburetors adjusted differently than other models.*

Adjustment (Except Oldsmobile)—Remove the dust cover by taking out two cover screws. Back off throttle lever stopscrew so that throttle valves tightly closed, wedge choke valve in wide open position. Place Pump Gauge T109-117S inverted on edge of dust cover flange, turn knurled nut on gauge until finger at end of gauge extension just touches top of pump plunger shaft. Note gauge reading (see table below). Adjust by bending pump connector rod at upper angle near countershaft lever using tool T109-41. If gauge not used, use scale to measure disance from top edge of flange to top of plunger.

Adjustment (Oldsmobile)—Remove dust cover (on bowl cover) by taking out two screws. Back off throttle lever stopscrew so that throttle valves tightly closed. Place straightedge across dust cover boss at pump arm on countershaft. Bend connector rod linking throttle lever and pump arm at upper bend in arm until upper flat surface of pump arm is parallel to straightedge.

▷*CAUTION—Check Metering Rod Adjustment after adjusting Pump.*

Packard 748S, 928S	43	32/64"
Packard 986S, 2102S	43	1/2"
Pontiac 2207S, SB	Ⓒ	
2182S, SA, SB	Ⓒ	
Willys 2052S, SA		1/2"

Ⓒ—Same as Oldsmobile Adjustment above.

▷Pump Vent Note—Pump jet cluster pocket is vented to outside of carburetor body casting to prevent pump jet discharge when engine operated at constant-throttle. If accelerator pedal is depressed repeatedly with engine not running, fuel will be forced out vent and appear on outside of carburetor.

METERING ROD ADJUSTMENT: Metering rods are controlled by a single spring-loaded vacuum piston (rods held down in jets for maximum economy by vacuum piston, and lifted out of jets by spring for acceleration and full power operation when vacuum decreases as throttle is opened). A lip on the metering rod arm (on pump countershaft which is linked to throttle lever) acts as a stop for the vacuum piston link and insures correct metering rod position for all throttle positions.

▷*CAUTION—Check accelerating pump before adjusting metering rod (pump adjustment disturbs metering rod setting). No metering rod gauge required.*

CONTINUED ON NEXT PAGE

CARTER DUAL TYPE WGD (C nt.)

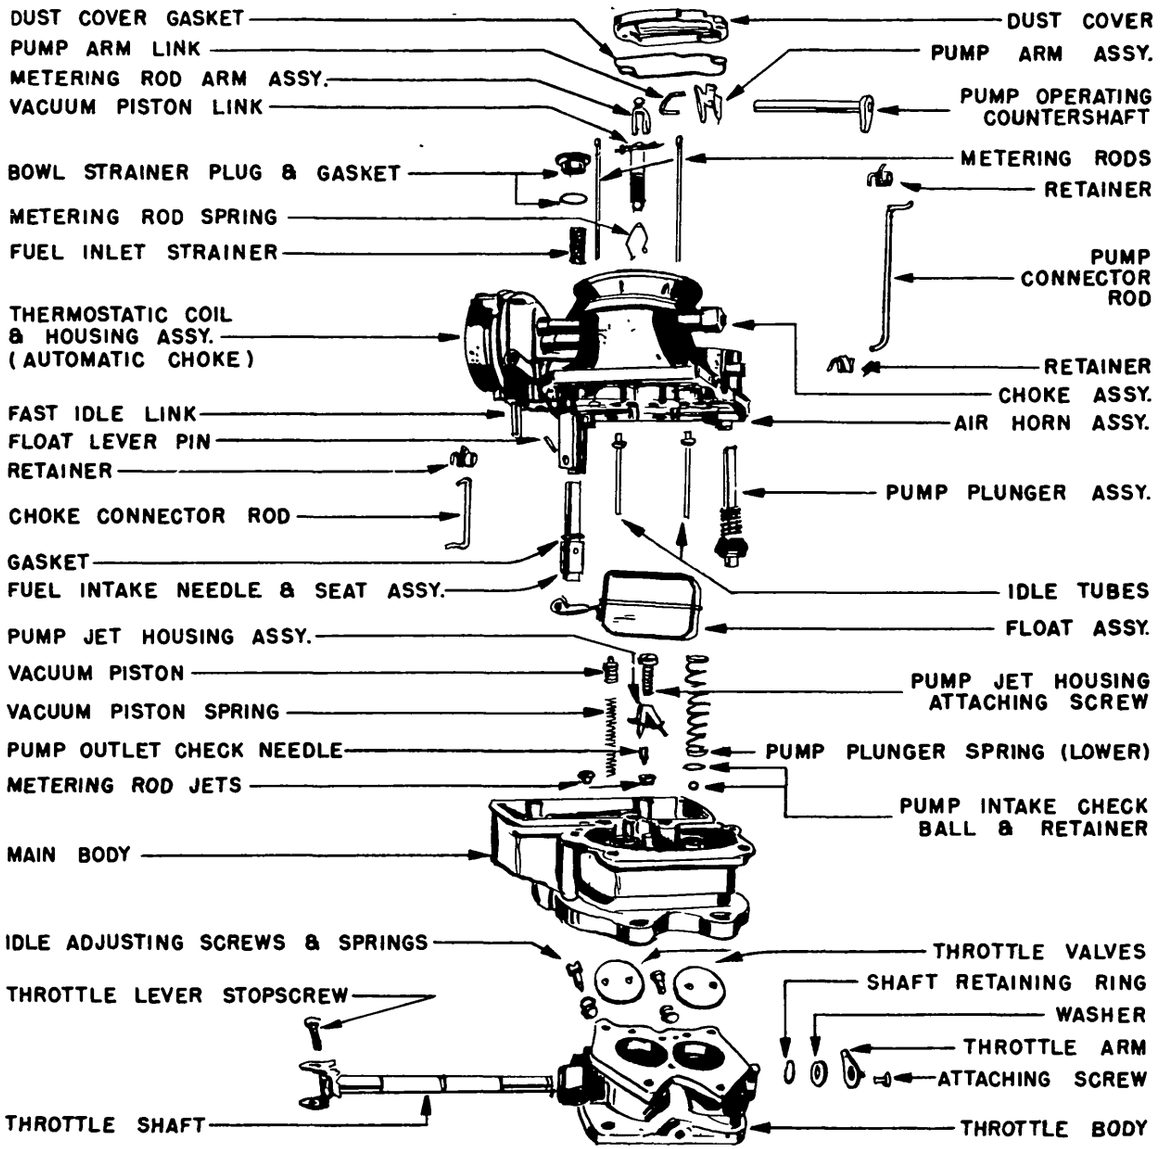
Adjustment—Remove dust cover (on bowl cover) by taking out two cover screws. Back off throttle lever stopscrew so that throttle valves are tightly closed. Loosen clampscrew on metering rod arm on countershaft, press down on vacumeter arm until metering rods just bottom in carburetor casting, hold rods and arm in this position, see that throttle valves closed, position metering rod arm so that lip on arm just contacts vacumeter arm, tighten clampscrew.

►*CAUTION—Reset throttle stopscrew for correct idling speed after metering rod adjustment completed.*

►**Countershaft Lubrication Note**—Lubricate shaft with light graphite grease through hole in center shaft support and outer dust cover screw hole before installing dust cover.

FLOAT LEVEL: Remove the bowl cover and air horn (CAUTION—use extreme care not to damage float and jets when lifting off bowl cover), remove gasket, invert cover and allow float to hang freely. Use correct checking gauge (see table below) between gasket face of bowl cover and nearest point on float (top center of float). Adjust by bending lip on float arm at pivot point. *CAUTION—do not bend float arm.*

►**Frazer & Kaiser Caution**—Do not compress spring loaded pin in intake needle when checking float level (will result in false reading). Allow float to hang freely on inverted cover assembly.



Float Level

①—With No. 25-173S or 25-185S SPRING LOADED Intake Needle & Seat Assy. (Carburetors stamped "GO" and earlier and without "XX" on tag indicating latest type 25-196S Assy. has been installed).

②—With new No. 25-196S SOLID Intake Needle & Seat Assy. (Carburetors stamped "HO" and later or with "XX" stamped on tag indicating that this assembly has been installed on earlier carburetor).

③—Supersedes earlier setting of 3/16".

CARTER TYPE WGD CARBURETORS

④—4-Wheel Drive Utility vehicles only with special Intake Needle & Seat (to overcome rough road flooding and engine stalling.

⑤—With regular solid Intake Needle and Seat 25-196S.

⑥—With Spring-loaded Intake Needle and Seat 25-173S.

FAST IDLE: *OLDSMOBILE CAUTION*—Carburetor Nos. 714S, 714SA, 849S have special fast idle mechanisms and are adjusted differently. Oldsmobile 851S and later carburetors have same design fast idle as used on other car models (except that adjustment made by turning adjusting sleeve rather than bending connector rod).

Adjustment (Oldsmobile 714S, SA; 849S Carburetors):

CAUTION—Two separate adjustments required:

Fast Idle Linkage—Back off fast idle screw on throttle lever until fast idle cam can be revolved freely with throttle valves closed. Loosen clampscrew on choke lever to which fast idle cam connected place correct feeler gauge (.018" T109-44 for 714S, SA; .015" T109-72 for 849S) between lip on fast idle cam and boss on carburetor casting, hold choke valve tightly closed, remove all slack from linkage by pressing choke lever toward closed po-

CONTINUED ON NEXT PAGE

CARTER DUAL TYPE WGD (Cont.)

sition, tighten lever clampscrew while holding lever in this position.

Fast Idle Screw—Back off throttle lever stopscrew so that throttle valves tightly closed, revolve fast idle cam until raised projection (narrow separate step) on cam lines up with fast idle screw, turn screw in or out until it just touches this projection

NOTE—This adjustment can also be made by closing throttle valves against correct .015" or .018" round feeler gauge (inserted between edge of valve and carburetor wall). Close choke valve tightly, so that high step of fast idle cam is opposite fast idle screw. Turn fast idle screw in against step on fast idle cam until feeler gauge just falls free of throttle valve (CAUTION—Carburetor must be upright and gauge free to fall out when making this adjustment).

Adjustment (Oldsmobile 851S & Other Carburetors): Remove retainer screws and retainers, thermostatic coil and housing, gasket, and baffle plate (to expose fast idle mechanism). Open throttle valve to release fast idle, then close choke valve, hold choke valve closed and close throttle valve. Invert carburetor and check clearance between edge of throttle valve and carburetor wall with correct gauge (see table below). If throttle opening not correct, adjust by bending choke connector rod at lower angle near throttle lever. Adjust Unloader.

▷*OLDSMOBILE 851S & LATER ADJUSTING NOTE:* Adjust these carburetors by loosening locknut and turning adjusting sleeve on connector rod.

Fast Idle Setting

①—Supersedes original setting of 1 Point Lean.
②—Supersedes original setting of 3 Points Rich.

UNLOADER: *OLDSMOBILE CAUTION*—Models 714S, 714SA, 849S have different Unloader mechanism and are adjusted differently than other models.

Adjustment (Oldsmobile 714S, 714SA, 849S): Hold the throttle valves in wide open position, check choke valve opening with correct gauge (¼" T109-31 for 714S & 714SA, 7/64" T109-125 for 849S). Adjust by bending lip on throttle lever using tool T109-41.

Adjustment (Oldsmobile 851S & Other Carburetors): With thermostatic coil, housing, gasket, and baffle removed, hold throttle valves wide open, close choke valve as far as possible, check choke valve opening (see table below for checking gauge and correct opening). Adjust by bending choke trip lever arm (on choke lever) using bending tool T109-214.

Buick Choke Lever Clearance—Hold choke tightly closed with fast idle cam against stop on casting, check clearance between lug on OUTER choke shaft lever and stop on INNER choke shaft lever which should be .020" (Gauge T109-29). Adjust by bending lug on outer choke shaft lever using tool T109-214.

Willys 2052S, SA	.117-.123"	.020"

①—Idle port opening above valve.
②—Top of vacuum port above valve.
③—.029-.033" on early production carburetors.
④—Bottom of Port above top edge of throttle valve.

CARBURETOR OVERHAUL: With carburetor removed from engine, disassemble, clean, and inspect all parts as follows:

Disassembly: Remove dust cover on bowl cover by taking out two attaching screws, disconnect fast idle connector rod and pump connector rod at both ends. Take out eight bowl cover and air horn attaching screws, lift air horn straight up and remove from main body casting (CAUTION—use extreme care not to damage float and jets installed in cover). Disassemble these parts as follows:

Air Horn & Bowl Cover—Remove float by taking out float hinge pin and unhooking intake needle pull clip, remove intake needle seat. Loosen setscrews on metering rod arm and pump arm, slide countershaft out of housing. Lift out metering rod arm, pump arm, pump plunger assembly, vacumeter piston and link, and metering rods, remove cover gasket. Unscrew low speed jets (Idle Tubes). Loosen clampscrew and remove choke shaft lever, take out attaching screws and remove choke valve. Take out three attaching screws, remove automatic choke cover and thermostatic coil assembly (rotate cover counterclockwise to free coil hook), remove gasket and baffle plate. Revolve choke shaft until piston clears vacuum cylinder, remove shaft and piston assembly. Take out three self-tapping screws and remove piston housing assembly from air horn casting, lift out piston housing gasket.

Main Body Casting—Take out attaching screw and remove pump jet cluster and gasket. Invert casting and catch vacumeter spring, pump discharge needle, and lower pump spring. Remove metering jets, pump relief valve assembly, and

CONTINUED ON NEXT PAGE

CARTER DUAL TYPE WGD (C nt.)

pump intake strainer. Use tool T109-56 to remove retainer ring from bottom of pump cylinder, remove pump intake check ball (under retainer ring). Take out attaching screws and remove throttle flange assembly.

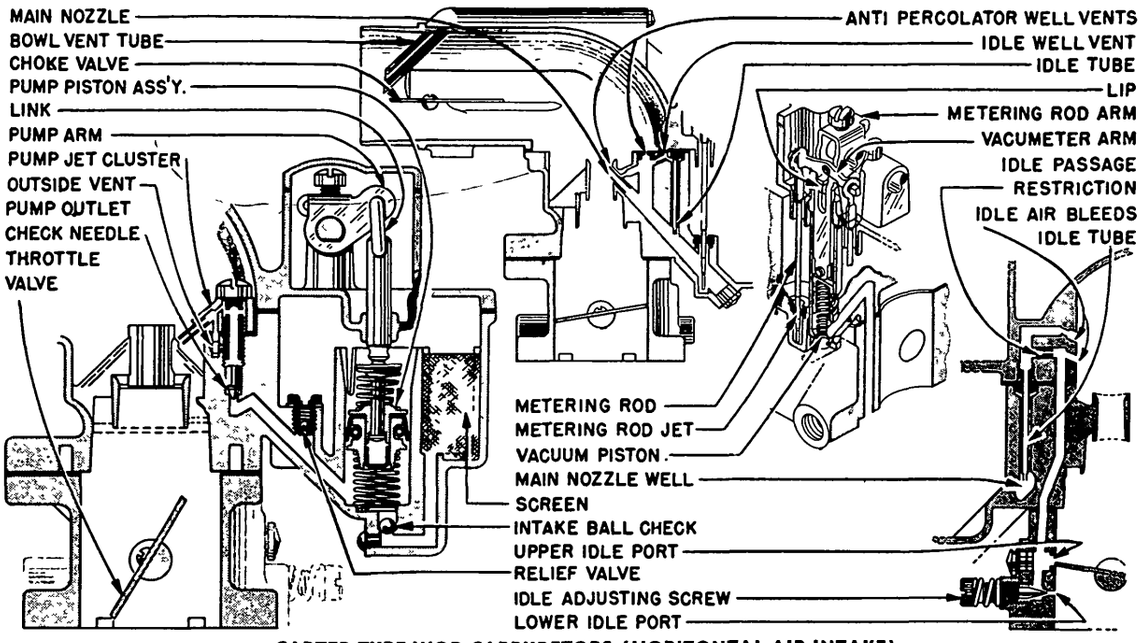
►*CAUTION—Do not attempt to remove main nozzles from body casting (permanently installed in casting).*

Throttle Flange Casting—Take out attaching screw and remove pump lever from throttle shaft, remove throttle shaft retaining ring, take out attaching screws and remove throttle valves. Slide throttle shaft and lever assembly out. Remove fast idle cam assembly. Remove idle adjusting screws and springs, and idle port plugs.

Cleaning & Inspection: Wash all parts in solvent or approved carburetor cleaner, dry with air, blow out all channels and passages with compressed air. Remove carbon from flange casting bore with sandpaper (CAUTION—do not use emery cloth). Examine vacuum cylinder in automatic choke housing for dirt and carbon accumulation (if necessary, remove welch plug from base of vacuum cylinder by drilling small hole in plug and using nozzle puller T109-178 to remove plug, install new plug after cleaning cylinder). Replace all worn or damaged parts. Use all new gaskets when reassembling carburetor.

Reassembly: Reassemble carburetor by reversing disassembly directions and note the following important instructions:

Throttle Valve Installation—Back off throttle lever stopscrew, install throttle valves with trademark (small "C") toward idle ports when viewed from manifold side of casting, insert screws loosely, hold valves firmly in place with fingers and tap valves lightly to centralize them in bores, hold lever end of shaft against flange casting boss, tighten valve screws securely. Then install new retaining ring on shaft.



Pump Jet Assembly—Install pump discharge needle first (insert with point downward), use new gasket under pump jet cluster, tighten retaining screw securely. Install pump relief valve assembly. Drop pump intake ball into recess in pump cylinder, use tool T109-122U to install retainer ring.

Pump Plunger & Arm Assembly—Assemble pump link on pump countershaft arm and install pin spring retainer. Insert pump plunger stem in place in bowl cover, slide lower end of link through hole in upper end of plunger stem and revolve ½ turn. When installing bowl cover and air horn, see that lower spring installed in pump cylinder, insert pump plunger, hold pump arm in place while inserting countershaft.

Float Assembly—Make certain that intake needle is attached to float arm with pull clip when installing float. Check float level before installing bowl cover and air horn on main body casting.

Metering Rod Jets—Do not use a gasket under these jets.

Metering Rod & Vacumeter Assembly—Install metering rod spring in vacuum piston link and install vacuum piston spring in cylinder in main body casting. Install vacuum piston link through slot in bowl cover with lip on link pointing toward air horn. Install vacumeter piston on link with pin extending toward air horn. When installing bowl cover and air horn on body casting guide vacumeter piston into vacuum cylinder in body casting. Hold pump arm in position and slide countershaft in through arm and support in casting, then hold metering arm in position with lip on arm extending through slot in vacumeter link and slide countershaft through arm. Install throttle connector rod and retainers. Install both metering rods (CAUTION—see that rods enter metering jets), connect metering rod spring. Check assembly for free movement by pressing down on vacumeter link.

CARTER TYPE WGD CARBURETORS (HORIZONTAL AIR INTAKE)

Choke Assembly—Make certain that new gasket installed in hot air passage in air horn, install piston housing assembly (CAUTION—attaching screws are self-tapping type and must be pulled down securely but with care not to strip threads). Install choke valve shaft and piston, rotating shaft to enter piston in cylinder. See that tapered edges of choke valve seat in air horn, hold valve with fingers and tap with screwdriver to centralize valve before tightening attaching screws. Check valve for free movement (valve should open freely of own weight). When assembling automatic choke mechanism, install flat baffle plate first (with choke lever prong extending through slot in plate), then install extruded baffle plate, gasket, cover and thermostatic coil assembly.

Starter Switch (not used on all Carburetors)—Install switch strainer in recess in throttle body, install switch ball, switch plunger (notch up), guide block, and "W" shaped switch contact spring (CAUTION re-install adjusting shims under contact spring). Install switch return spring, terminal cap assembly, hold-down clip and attaching screw.

CAR STARTER SETTING

Car Starter Switch Adjustment (Buick 2292S)—Connect test lamp across starter switch. Hold choke valve wide open, adjust idle speed screw until it just contacts stop lug on throttle lever when throttle fully closed. Hold scale between center of idle screw and top edge of throttle lever stop lug. Open throttle until light comes on (indicating contact). Distance from top edge of stop lug to center of idle speed screw should be between 31/64" & 11/16". Adjust by adding or removing shims located in switch guide block. Shims furnished under Carter No. 153-11 (.018"), 153-12 (.006").

Car Starter Switch Adjustment (Packard 728S, SA; 784S, 767S, 928S)—Switch must make contact within throttle opening range of 30-45°. Check with Protractor Gauge T109-155S. Adjust by adding or removing shims located in switch guide block.

►*CAUTION—Do not use less than one No. 153-11 (.018") shim or more than three No. 153-11 (.018") shims plus two No. 153-12 (.006") shims.*

See "Carter Car Starter" in Electrical Equipment Section for complete data.

REPAIR PARTS: Gasket Sets. Carter No. 193 (714S, 714SA, 849S), No. 196 (728S, 728SA, 767S, 773S, 776S, 781S, 784S, 813S, 851S, 851SA, 928S, 999S, 2015S, 2052S, SA), No. 249 (2058S, 2231S, 2252S), No. 254 (2207S, SB; 2182S, SA, SB), No. 274 (2292S).

②—Superseded by 518SA.
③—Superseded by 574S.
④—Superseded by 570S.
⑤—Rochester Carburetor also used on late cars and trucks.

CARBURETOR MODEL IDENTIFICATION: Individual carburetor models can be identified by Body Casting Number stamped on face of carburetor flange.

CHEVROLET REPLACEMENT CARBURETORS: Carter "WE" and "YF" models (with or without Climatic Control). *See Carter "WE" and Carter "YF" carburetor data.*

▷FRAZER & KAISER NOTE: This 574S carburetor used for limited production. Carter WA1 Carburetors (622S, SA, SB) and Carter WCD Carburetors (685S, SA) used on other cars.

▷PLYMOUTH NOTE: This 574S carburetor used for limited production. Carter (B&B) carburetor (D6G1) and Stromberg Model BXV-3 used on other cars.

▷CHEVROLET CHANGES, CAUTIONS, CORRECTIONS

Chevrolet Economy Model Carburetors. Have smaller venturi and jet calibration and are fitted with stop pin limiting throttle opening to half-throttle (45 M.P.H.). Pin may be removed to permit top speed where necessary by inserting hacksaw blade behind lever and cutting off pin.

▷Engine Running Backward (when key turned off) Correction: To correct this complaint, check idle speed with the engine warm and set the stopscrew for idle speed not to exceed 7 M.P.H. Check throttle valve and make certain that it is not sticking. Check manifold heat control valve thermostatic spring. Spring must be wound up only enough so that end can be slipped over manifold pin (approximately ½ turn). Excessive tension will cause poor performance.

▷Pump Connector Spring Installation on 483S, 492S, 515S, 574S Carburetors: This new type connector consists of a coiled spring with 'hairpin' type lock ends. When installing this spring, insert long end (with 90° bend) through hole in upper end of pump plunger, then insert short (straight) end of spring through hole in pump lever, finally hook the long end of the spring link over the short end so as to lock the spring in place.

▷1942 Accelerator Pedal Rod and Starter Linkage Binding Correction. Binding of these parts may be caused by misalignment between throttle cracker lug on accelerator rod and starter cross-shaft extension which may allow the extension to slip past the lug and bind the starter pedal linkage and accelerator rod. If this misalignment is not caused by either section of the accelerator rod being loose in the metal-encased rubber coupling, correct the alignment by clamping the lug in a vise and twisting lug with a wrench.

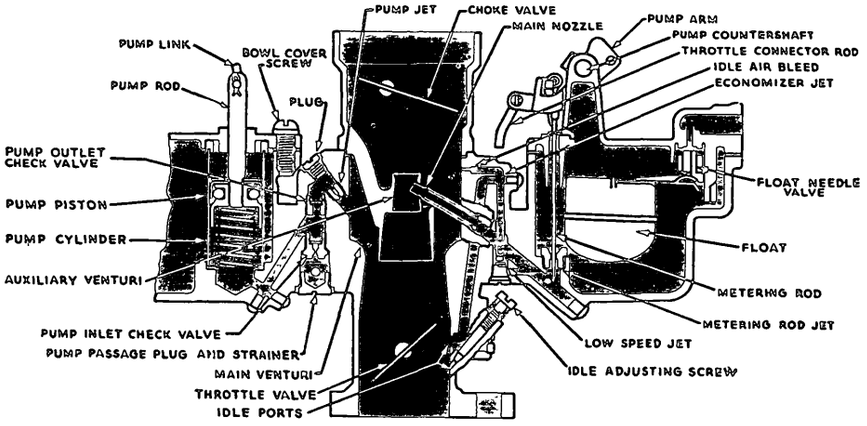
CAUTION—Do not bend accelerator rod and use care not to break lug loose from rod when making this adjustment. NOTE—Accelerator rod must be replaced if either section of rod loosens in metal-encased rubber coupling.

▷Engine "Surge" in 22-35 MPH. Range (1947 574S) Complaints: Will be noted when driving with practically constant-throttle or on slight down grades with car over-running engine and may be more evident on new, tight, engines. Check and correct surge complaints as follows (do not attempt correction on new engines until run 1000 miles or more):

Spark Plug Gaps—Must not be set at less than .040" (closer gap may affect engine surging).

Ignition Timing—Make certain that timing set exactly as recommended and not advanced beyond 5° BTDC setting. See Tune-Up data on car model page.

Carburetor Fuel Mixture—Check for lean mixture. If surging due to lean carburetion, install one step richer metering rod (Standard Metering Rod—Carter No. 75-485, One-step Rich Metering Rod—Carter No. 75-562).



DESCRIPTION

DESCRIPTION: 1941-48. "Balanced" bowl construction. The carburetor bowl is vented through system of passages in bowl cover, carburetor body, and air horn casting to air intake below air cleaner (#35 drill hole below choke valve, #27 hole above choke valve through drilled hole in shaft). This construction eliminates surging of fuel into air passages on rough roads (bowl vent located in top of countershaft dome on bowl cover) and holds air-and-fuel proportions constant under all conditions. Low speed jet well has been lowered and jet is fed through drilled passage opening through side of jet. One idle air bleed only is used (this air by-pass increased in size and second by-pass discontinued) and an additional idle discharge port is located above the throttle valve. Balance passages in air horn have been increased in size and opening above choke valve consists of brass tube pressed in casting. New type float bowl cover used with new granodized pump shaft pressed in place and lubricated by felt oil wick (not necessary to pack screw hole with graphite grease as on previous models). Accelerating pump has new rectangular plunger stem and is furnished as an assembly with shaft, guide and leather. Pump outlet check valve is a brass disc (was bakelite) and must not be interchanged with the former bakelite type. Throttle connector rod upper end is flattened for new type anti-rattle coil spring and lock (flat anti-rattle spring riveted inside dust cover not used).

1949 Carburetor: Same design as used on previous models except for new Accelerating pump and new Fast Idle mechanism as follows:

Fast Idle—Consists of a lever pivoted on the throttle valve shaft and serving as a stop for the throttle lever stopscrew. Slot at upper end of lever is engaged on pin on choke lever so that lever is "rocked" when choke valve closed for cold starting and warming up. Rocking of the lever opens the throttle valve to the fast idle position.

Accelerating Pump—New "submerged" type with short cylinder so that pump piston and seal are submerged in the gasoline in the float bowl at all times. Piston spring is placed above the piston so that the delivery stroke of the pump is spring-driven and independent of rate at which throttle is opened (pump link hole in countershaft is slotted and opening of the throttle allows the pump spring to actuate the pump piston). No seasonal adjustment of the pump is provided.

CARBURETOR ADJUSTMENT & OVERHAUL

IDLE ADJUSTMENT: Adjust only with engine warmed up so that choke valve is wide open and fast idle inoperative. Idle adjusting screw controls fuel mixture and should be turned in for leaner mixture, out for richer mixture. Idle speed is controlled by throttle lever stopscrew. Approximate settings are given in table below. See car models pages for complete tune-up data.

IDLE SETTING

Car Model	Carburetor	Idle Screw Setting	Idle Speed
Chevrolet ('41-48)	All Models	1¼-2¼ turns open	450-500 RPM
Chevrolet (1949)	All Models	1-2 turns open	450-500 RPM
Frazer & Kaiser	574S	1¼-2¼ turns open	500 RPM
Plymouth	574S	1¼-2¼ turns open	6 MPH

PERFORMANCE: Should be satisfactory if idling adjustment and accelerating pump adjustment correctly made. See Carter Jet Specification Table for standard jet calibration and recommended changes for special operating conditions

CONTINUED ON NEXT PAGE

CARTER TYPE W1 (CHEVROLET) C ntinu d

ACCELERATING PUMP: Low pressure type positively actuated by throttle lever. Fuel is drawn into pump cylinder through intake check valve and strainer when throttle is closed and is discharged through outlet check valve and pump jet in wall of mixing chamber when throttle opened for acceleration.

►***PUMP OUTLET VALVE CAUTION***—The 1941 and later outlet valve is a brass disc and must not be interchanged with bakelite type check valve used on former carburetors (use of bakelite check valve on 1941 carburetor, or brass check valve on 1940 and earlier carburetors will upset carburetor calibration).

Adjustment (1941 & Later Models). Pump stroke not adjustable and pump countershaft does not require any lubrication. Refer to the Service Notes for description and installation directions for new type pump connector spring.

METERING ROD (ECONOMIZER): Metering rod and jet assembly meters all fuel for main nozzle (stepped and tapered rod is lifted out of jet as throttle is opened to provide greater fuel flow through jet to nozzle). Metering rods can be changed for special operating conditions such as high altitudes. See Carter Jet Specification Table for standard and special lean metering rods for each model. Check and adjust metering rods whenever rods removed and replaced

Metering Rod Adjustment (All Models). Take out dust cover screw, remove dust cover, remove pin spring, turn metering rod ¼ turn to disengage it from pump arm pin, lift rod out being careful not to lose the rod spring and disc. Back off throttle stopscrew so that throttle valve tightly closed, install metering rod gauge (see table below) in place of rod using care that gauge is vertical and tapered end seats in metering rod jet. If metering rod pin does not rest on bottom of notch on gauge with pump arm connector rod centered freely in pump arm hole, remove connector rod and bend until this setting secured. Remove gauge and re-install metering rod, make certain that disc in place on rod and that pin spring properly connected.

METERING ROD SETTING

Car Model	Carburetor	Metering Rod Gauge	Length
Chevrolet	All Models	T109-25	2.795"
Frazer & Kaiser	574S	T109-25	2.795"
Plymouth	574S	T109-25	2.795"

FLOAT LEVEL: To check float level, remove bowl cover and float assembly, invert cover, remove gasket, measure from gasket seat on cover to top of float at free end. Distance should be correct as shown in table below (plus or minus 1/64"). Adjust float level by bending tip of float lever.

FLOAT LEVEL SETTING

Car Model	Carburetor	Float Level
Chevrolet ('39-49)	420S, 34S, 83S, 92S; 574S; 616S, 684S	½"
Chevrolet (Gov't Trks)	387S, 515S, 518S, 570S	⅜"
Frazer & Kaiser	574S	½"
Plymouth	574S	½"

Float Travel—Float travel from open to closed position should be ½". To check travel, measure distance from cover to top of float at free end with float hanging freely from cover. Distance should be 1". Adjust by bending two float stops slightly with small pliers.

Needle Valve & Seat—Furnished only in matched Sets as follows: Part No. 25-33S—#48 Intake Hole (All Models).

THROTTLE VALVE SETTING: When installing valves, use new attaching screws and install screws loosely, tap valve lightly to centralize it in bore, then tighten attaching screws securely.

Setting—Check with stopscrew backed off so that throttle valve tightly closed Distance from valve to top of lower idle port (Ide Port Distance) or idle port opening (below valve) and distance from top of valve to bottom of vacuum spark port is shown in table below. Shims furnished .002" thick (No. 2-93), .005" thick (No. 2-94) to correct throttle valve position.

THROTTLE VALVE SETTING

Car Model	Carburetor	Idle Port Distance	Vacuum Spark Port
Chevrolet ('41-47)	515S, 570S	.044-.048"	②.000-.004"
Chevrolet ('41-48)	483S, 92S; 574S, 616S	.044-.048"	.000-.004"
Chevrolet ('49)	684S	.044-.048"	.000-.004"
Frazer & Kaiser	574S	.044-.048"	.000-.004"
Plymouth	574S	.044-.048"	.000-.004"

②—Model 515-S only (No vacuum spark port on Model 570-S)

FAST IDLE (1949 684S): No adjustment required. Rocking of the lever when the choke is closed for cold starting opens the throttle valve to the fast idle position. Fast idle throttle opening will be correct if idling speed correctly set.

CHOKE: Choke valves are butterfly type with following special pressure relief devices:

483S, 492S, 515S, 574S, 616S, 684S. Butterfly type with offset valve seating solidly in air horn when closed to prevent possible damage caused by backfire. Choke is semi-automatic type with choke valve lever linked to operating lever by a coil spring which allows valve to be automatically positioned for correct choke action during the warm-up period.

DISASSEMBLY OF CARBURETOR: Take out screw and remove dust cover, remove lock on upper end of connector rod by pushing lock in and turning it 90°, remove lock and anti-rattle spring. Disconnect metering rod spring, remove metering rod, using care not to lose metering rod disc. Remove accelerating pump link. Take out bowl cover screws, remove bowl cover assembly, disassemble float, remove float needle valve and seat. Remove pump plunger, plunger spring, and metering rod jet. Loosen three air horn screws, remove main nozzle passage plug and nozzle screw plug. Reach down through air horn with screwdriver and press on 'D' section of nozzle to force nozzle out of 'D' section of main venturi (CAUTION—do not press on end of main nozzle). Take out air horn screws and remove air horn. Remove low speed jet, accelerating pump passage plug and pump check valves, pump jet passage plug and pump jet, idle adjusting screw and idle passage plug.

Servicing—Wash all parts in clean gasoline, blow out all passages with compressed air, check idle ports and idle air bleed for carbon deposits. Inspect metering rod, metering rod jet, low speed jet, pump jet and check valves, and pump plunger for wear or damage. See that choke valve operates freely. Inspect main nozzle for burrs on end (CAUTION—Do not dismantle nozzle assembly (inner nozzle pressed in outer nozzle). Replace all worn or damaged parts.

REASSEMBLY OF CARBURETOR: Use all new gaskets, soak the needle seat gasket and metering rod jet gasket in denatured alcohol for 15 minutes, install gaskets on parts and allow to dry before installing in carburetor. Install all parts in reverse order to disassembly directions above and note following special instructions and cautions:

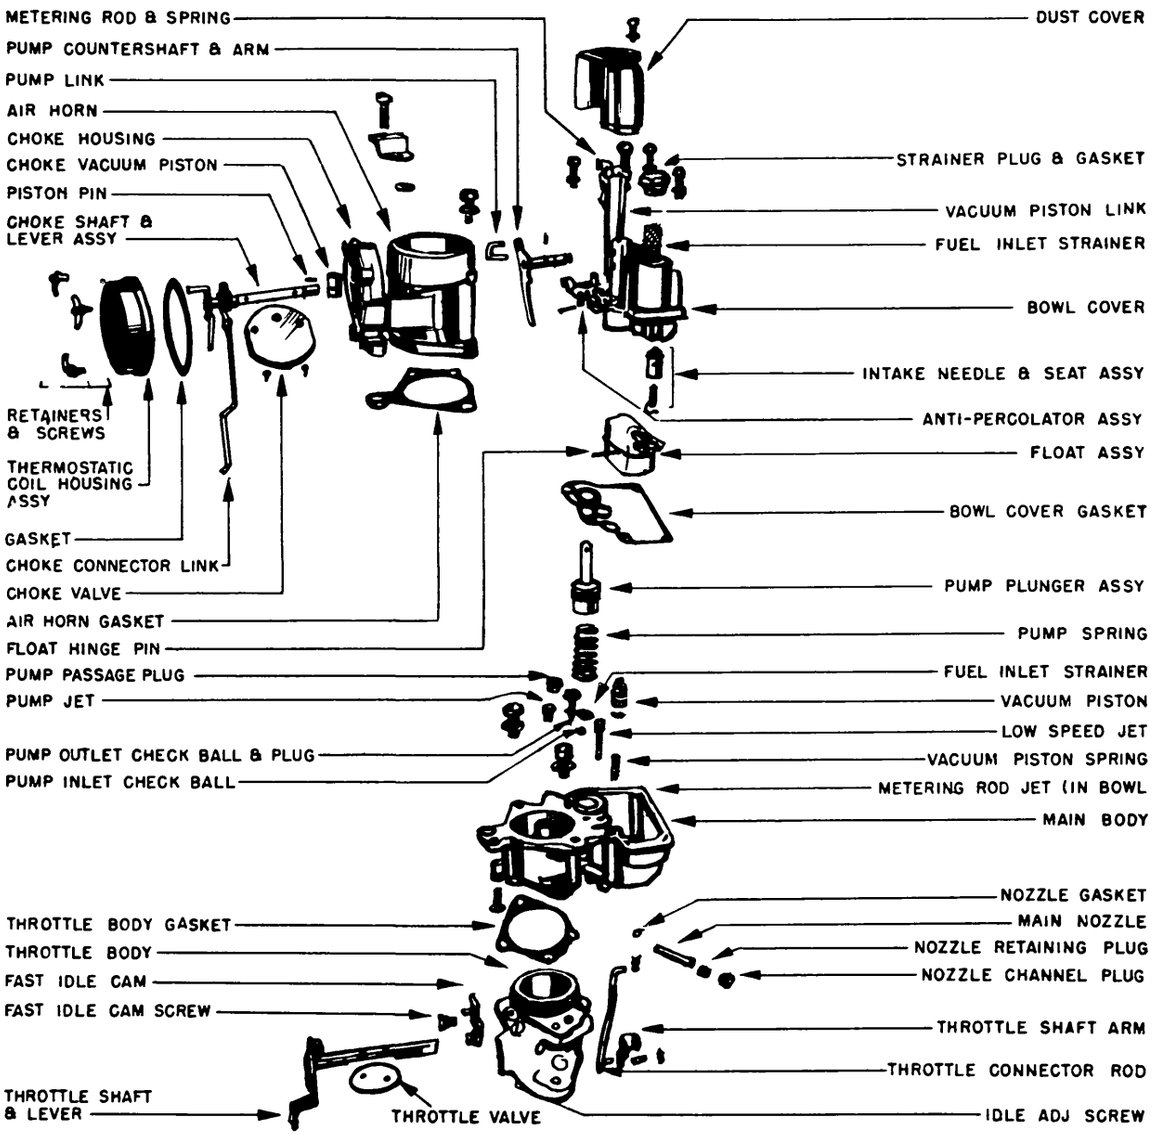
Throttle & Choke Valves—Install choke valve with trademark 'C' upward, throttle valve with trademark toward idle port side, use new attaching screws and install screws loosely, tap valve lightly to centralize it in bore, then tighten attaching screws securely.

Nozzle Assembly—Install air horn screws loosely, make certain that copper gasket in place on nozzle, invert carburetor and drop nozzle into place with flat portion of 'D' section of nozzle in line with 'D' section of primary venturi, install nozzle screw plug securely, tighten air horn screws Check nozzle position by measuring from inner diameter of primary venturi to end of nozzle. Distance should be .210-.230" and is adjusted by the copper gaskets on the nozzle.

Low Speed Jet—Jet must seat securely in casting. To check seating, install jet, then remove jet and inspect for complete bearing around top end of jet.

Air Horn—Make certain that small fibre gasket in place at balance passage when installing air horn. This gasket is very important to insure correct 'balanced' performance of carburetor.

Adjustment—Check metering rod setting, float level, and float travel (see directions above). Adjust carburetor when re-installed on engine.



SERVICE PARTS: Gasket Sets—Carter No. 110 (346S, 358S), No. 129 (391S), No. 138A (420S, 434S, 483S, 492S, 574S—Civilian use only, 616S, 684S), No. 174A (483S, 515S, 556S, 570S, 574S—Military use only).

Repair Pkgs. (with Std. Metering Rod)—Carter No. 1005C (346S), No. 1006C (319S), No. 1013E (420S), No. 1089D (483S, 574S), No. 1091B (492S, 616S), No. 1336B (483S, 515S, 570S, 574S—Military use—see Note), No. 1074B (387S, 518S, 518SA), No. 1500A (684S).

NOTE—Repair Package No. 1336 contains Metering Rod No. 75-562 (original equipment on 570-S) but this part may be used also on Carburetor Models 483-S, 515-S, 574-S (originally equipped with No. 74-485) for military use only

CARTER WA1 CARBURETOR (WITH AUTOMATIC CHOKE)

S-M—Synchro-mesh Transmission

H-D—Hydra-Matic Drive Trans

①—See Production Changes below

②—**Packard Six 530S**—This carburetor is equipped with Carter Car Starter vacuum switch for starter control *See Electrical Section*

③—See Special Idling Adjustment instructions for equalizing carburetors

⑨—Carter "YF" carburetors also used on these models

►CHANGES, CAUTIONS, CORRECTIONS

►*FRAZER & KAISER 622S CARBURETOR CONVERSION TO 622SA*· Install the new type Float & Lever Assembly, ,No 21-86S, and new type Needle & Seat Assembly, No 25-155S and change float level from 3/8" to 1/2" *NOTE*—These new parts are furnished in special Unitized Package No 21-101U

►*FRAZER & KAISER 622SA CARBURETOR CHANGES:* Following parts supersede first type parts and **only**

CONTINUED ON NEXT PAGE

CARTER WA1 (C nt.)

these parts sh uld be used on these carburetors:
Metering Rod—New Part No. 75-642 (75-55) supersedes No. 75-593.
Low Speed Jet Tube—New Part No. 11-160S (.031" or No. 68 drill size) supersedes No. 11-163S
Accelerating Pump Plunger Spring—New Part No. 61-200 supersedes No. 61-23.
Repair Package—New Part No. 1362B supersedes No. 1362A.

►*FRAZER & KAISER 622SB REPLACEMENT CARBURETOR:* Supersedes 622S and 622SA and has all new parts listed under "622S Conversion" and "622SA Carburetor Changes" as listed above.

►*HUDSON 1953 JET & SUPER JET HESITATION OR CUTTING OUT ON SHARP TURNS (With First No. 2009S Carburetor):* May be caused by momentary starving due to fuel surge in bowl. Correct by changing float setting from 1/2" to 7/16" which will have the effect of raising the fuel level in the bowl 1/16". *Also see 2009S Carburetor Conversion data following.*

►*HUDSON 1953 JET FIRST 2009S CARBURETOR CONVERSION TO LATER 2009SA:* Install all parts furnished in Unitized Pkg. No. 75-915U as listed below. Set Float Level to new specification and use new type gauge when adjusting Metering Rod. *See Adjustment Data below.*

Carter Unitized Pkg. No. 75-915U

Part Nos.	First Part (2009S)	New Part (2009SA)
Metering Rod (Std.)	75-864	75-914
Metering Rod Jet	120-15S	120-191S
Vacuum Piston Spring	61-178	61-199
Ident. Tag (2009SA)		107-45

►*CARBURETOR NO. 2009SA NOTE:* This carburetor has new type parts and later specifications as listed for 2009S conversion above.

►*NASH AMB. 683S CARBURETOR CHANGE (New Metering Rod):* Metering rod has been changed by increasing length of "power step" on rod but new rod has same part no. as original type. IDENTIFICATION NOTE—New metering rod (with increased power step) has raised dot in addition to trademark on rod flat on side opposite part number (trademark only on first rods).

►*NASH AMB. AIR CLEANER BOOT BAFFLE:* A new carburetor-to-air cleaner boot baffle, No. 3127726, has been released to prevent possibility of air turbulence in this boot restricting air flow to carburetor and causing an over-rich carburetor fuel mixture.

►*NASH RAMBLER & STATESMAN 694S & 780S CARBURETOR PARTS & SPECIFICATIONS CHANGES: Note following data when overhauling or adjusting carburetors:* **694S & 780S Parts Change**—New Choke Lever, Link, & Screw Assembly No. 14-406S supersedes first type No. 14-223S. *NOTE*—New assembly does not have lock-out lip on link and no lock-out adjustment required for this type assembly.
780S Ch k S tting Chang—Should be centered (At Index). Supersedes original setting of 2 Points Rich.

►*WILLYS (1946-48) CARBURETOR MOUNTING GASKET CAUTION:* Vacuum passage for metering rod vacuum piston extends down to face of carburetor mounting flange and special slotted type flange gasket, No. 1A-30, must be used when mounting carburetor on manifold (slot must register with vacuum passage hole). If Governor used on this engine, special gasket with four small holes must be used between carburetor and governor and slotted type gasket (above) between governor and manifold.
CAUTION—Use of plain type gasket will blank off this vacuum passage and interfere with correct operation of the carburetor. **Never use a plain (solid) type gasket with this carburetor.**

►*WHISTLING COMPLAINTS (ALL CARBURDTORS):* To correct whistle at vacuum spark port, remove vacuum passage plug (on side of main casting near idle adjusting screw, install special bushing No. 38A-35 in passage, install new plug.

DESCRIPTION: Single barrel, downdraft type. Primary and secondary venturis are mounted in main body casting (not air horn) by two streamlined struts with nozzle directly above one strut on center-line of venturis and float bowl. Float bowl has been designed to eliminate clearance between sides of bowl and float. Bowl cover extends down in bowl to eliminate air space above fuel and float is larger than W1 type. Low speed jet is installed through top of float bowl (no external plug). Anti-percolator seat is cast in bowl cover and complete anti-percolator, pump arm, vacumeter arm (vacumeter types) is mounted on top of bowl cover. Air horn contains only choke valve assembly (choke valve sides not exactly parallel and ridge in air horn serves as stop for valve in wide open position). Lower Throttle casting has main venturi and throttle valve.
Fuel System—Same as for W1 models. Metering rod is controlled by pump arm (non-vacumeter type), separate vacuum piston with stop pin on pump arm to limit travel (vacumeter type). Adjustment data for each type below.
Vacuum Passage (Willys 613S,645S)—On these models, vacuum passage for metering rod vacuum piston (Vacumeter type Carburetor) extends down to the face of the carburetor mounting flange and special slotted type flange gasket must be used when installing carburetor (See Special Service Notes).

ADJUSTMENT: *CAUTION—See special "Twin Carburetor" adjustment procedure below. Set carburetors to the following specifications.*

IDLING ADJUSTMENT: Single Carburetor—*See special Twin Carburetor adjustment procedure below.* Adjust only with engine warmed up to normal operating temperature with choke valve wide open and fast idle inoperative. Set throttle stopscrew for correct idle speed then adjust idle mixture screw for smooth idle (turn screw out for richer mixture), recheck idle speed.

►*HUDSON TWIN H-POWER IDLE ADJUSTMENT (1952-54):* The two carburetors must be adjusted exactly as follows to insure proper equalizing or balancing of the carburetor throttle valves:
1) Remove front and rear air cleaners, install Linkage Adjusting Pin J-2544-1 through accelerator pedal link bell crank lever into hole in block to lock the linkage.
2) On Wasp 5B, 5C and 5D models, adjust throttle shaft rod trunnion to 1 25/32" from top face of bracket on cylinder head to center of clevis pin hole in cross shaft lever.
3) Connect accurate tachometer to engine. Remove clevis pins from yokes at ends of both throttle shaft-to-carburetor rods. Hold fast idle cam in "OFF" position, adjust throttle stopscrew on each carburetor until they just touch cam. Set idle screw mixture adjusting screw on each carburetor 1¼ turns open (1C, 1D, 2C, 2D, 3D, 4D, 5B & 5C), 2 turns open (6B, 7B, 7C & 7D). Run the engine until it reaches normal operating temperature.
4) Adjust engine idle speed by turning throttle stopscrew on each carburetor an equal amount to secure the following idle speed: Synchro-mesh Trans. Cars—500 RPM, Overdrive Cars—575 RPM. Hydra-Matic Drive Cars—500 RPM.
5) Adjust idle mixture adjusting screw in each carburetor for maximum increase in idle speed. Reset idle speed to correct RPM. (4 Above).
6) Adjust front and rear throttle shaft-to-carburetor rod clevises so that clevis pins enter holes in clevises and cross-shaft levers freely. Connect rods. On Hydra-Matic Drive Cars, adjust Hydra-Matic throttle linkage. *See "Hydra-Matic Drive Linkage Adjustment" in Transmission Section.*
7) Remove linkage adjusting pin to free throttle linkage. Adjust length of accelerator pedal-to-bellcrank rod for clearance of 1/64 to 1/16" between pedal and pedal stop in wide open position. *NOTE*—On models without pedal stop, adjust rod for ¼" clearance between pedal and floor mat in wide open throttle position.

►*HUDSON TWIN CARBURETOR ADJUSTMENT (1955):* Remove clevis pins from throttle shaft-to-carburetor rod clevises. Connect vacuum gauge and tachometer. Hold fast idle cam in normal idle position, adjust idle screws to just seat valves in closed position. "Crack" rear throttle valve and adjust idle mixture screws (Wasp ½-1½ turns out, Hornet 1¼-2¼ turns out). Warm up engine to normal operating temperature. With front carburetor throttle valve closed, adjust rear carburetor idle speed 25 to 40 RPM less than specified below. Adjust rear carburetor mixture for best operation. Adjust front carburetor idle speed to point of 10 to 15 RPM increased idle speed, and adjust idle mixtures. Readjust rear carburetor to bring idle speed to specifications and then adjust front carburetor until a slight increase in speed is noted. Readjust idle mixture for best mixture and manifold vacuum. Adjust throttle shaft to carburetor rod clevis, retaining throttle valves in idle position and accelerator linkage in released position. Reinstall the clevis pins.

Car Model	Idle Setting Idle Scr w S tting Turns Open	Idle Sp ed (RPM)
Frazer	¾-1¾	500
Hudson (Single 749S)	½-1½	②550
Hudson (Single 2009S,SA)	½-1½	②550
Hudson (Twin 968S,2113S)	1¼-2¼	②550
Hudson (Twin 990S,2114S)	¾-1¾	②550

S-M—Synchro-mesh Transmission. **H-D**—Hydra-Matic Drive Transmission.

②—Synchro-mesh Cars only. 575 RPM (Overdrive), 500 RPM (Hydra-Matic).

⑨—Special Setting for Hydra-Matic Drive Cars—use Tachometer.

⑤—8-10 MPH on cars with Electromatic Clutch.

⑥—450-475 Engine RPM.

⑧—450-500 RPM (Synchro-mesh Trans.), 375 RPM (Hydra-Matic Drive).

⑨—With selector in "Dr" range (Hydra-Matic Drive Trans.).

ACCELERATING PUMP: Several different types of pumps used as follows:

1) Frazer & Kaiser 610S,622S,SA,SB; Nash 662S,SA; Willys 613S—Pumps are high-pressure type and are actuated by the throttle valve lever through a spring-loaded arm (pump arm and pump operating lever linked by coil spring). Frazer and Kaiser types have seasonal adjustment.

2) Nash 611S, Packard 530S—These accelerating pumps are low-pressure type and are actuated by the throttle valve lever through a spring-loaded arm (pump arm and pump operating lever linked by a coil spring). Pontiac type has seasonal adjustment (see Adjustment data below).

3) Other Models—Accelerating pumps are low pressure type and are positively operated by throttle lever through arm and countershaft assembly on bowl cover. Countershaft arm has three holes for pump link engagement to provide varied pump stroke for seasonal requirements.

►*NASH "UNIFLO JET" CARBURETORS (683S, 649S, 746S, 780S):* No separate pump discharge jet used and accelerating pump discharges fuel through the main nozzle into the primary venturi (a spring-loaded ball type check valve prevents fuel discharge except when pump in operation). Pump stroke adjustment is made in same manner as on other models.

Pump Stroke Adjustment: To check the pump plunger travel, back off throttle lever stopscrew so that throttle valve closes tightly, adjust pump connector link for correct pump stroke as shown in "Pump Setting" column of table below (see Pump Adjustment above for this connector link adjustment). Install Universal Pump Stroke Gauge T109-117S on ridged portion of bowl cover so that projecting portion of gauge rests on top surface on connector link at pump shaft. Hold gauge vertical and note reading, then open throttle wide and again note reading. Difference between these two readings is pump stroke (in sixty-fourths of an inch) and should agree with 'Pump Stroke' figure in table below. To adjust, bend throttle connector rod at lower angle near throttle lever. *CAUTION*—Check metering rod adjustment (disturbed by this adjustment).

Accelerating Pump Stroke Setting

Car & Carb.	Pump Stroke	Pump Setting
Frazer (610S,22S,22SA,22SB)	18/64"	Medium
Hudson (All Carbs.)	16/64"	Medium
Kaiser (610S,22S,22SA,22SB)	18/64"	Medium
Nash (464S)	27/64"	Long
Nash (611S)	25/64" ④	Non-Adj.
Nash (662S,SA)	25/64"	Medium
Nash (694S)	25/64" ⑥	Long
Nash (780S)	25/64"	Long
Nash (683S,746S)	27/64"	Long
Oldsmobile(481-S,504-S,651-S)	16/64" ①	Medium ⑤
Oldsmobile (709S,710S)	16/64"	Non-Adj.
Oldsmobile (763S,SA,764S)	16/64"	Non-Adj.
Packard (530S)	16/64"	Non-Adj.
Pontiac (537S)	16/64"	Medium
Pontiac (652S,717S,718S)	17/64"	Medium
Rambler (694S,780S)	25/64" ⑥	Long
Willys (613-S,645-S)	11/64"	Non-Adj.

①—Carburetors with new 53A-247S Pump Arm and Countershaft Assembly.

④—Supersedes 24/64" originally specified for this model.

⑤—Pump Stroke Non-adjustable on later models with new 53A-247S Pump Arm.

⑥—Supersedes 23/64" (Medium Stroke) originally specified for this model.

Pump Seasonal Adjustment: Three holes are provided in pump arm on countershaft for pump link connection. Inner hole provides minimum pump stroke, lower hole medium stroke, outer hole maximum stroke (adjustment accessible by removing dust cover). See tune-up data on car model pages for settings and seasonal changes.

METERING ROD (ECONOMIZER): Metering rod and jet assembly meters all fuel for main nozzle (stepped and tapered rod is lifted out of jet as throttle is opened and provides greater fuel flow through jet to nozzle). Metering rods can be changed for special conditions. See Carter Jet Specification Table.

Vacuumeter Type Note—On these types, metering rod is linked to vacuum piston stem so that rod is controlled by vacuum piston within limits determined by throttle valve opening (lug on pump arm serves as stop for lip on piston link to prevent vacuum piston pulling metering rod down in jet beyond correct point for the particular throttle opening). These models adjusted in special manner (see below).

Metering Rod Setting

Carb.	Metering Gauge & Length
2009S	T109-102 (2.468")
2009SA	T109-241 (2.548")
All other Carbs.	T109-102 (2.468")

Metering Rod Adjustment (except Vacuumeter Types)—Take out screw and remove dust cover on float bowl cover. Unhook metering rod spring, disengage metering rod from arm on pump shaft, lift out rod being careful not to lose metering rod disc. Install gauge No. T109-102 (2.468") in place of metering rod making certain that gauge seats in metering rod jet and is held vertical. Back off throttle lever stopscrew so that throttle valve tightly closed. Clearance between pin in arm on pump shaft and shoulder of notch in gauge should be less than .005" and gauge should not drag on pin. Adjust by bending arm (use extreme care not to bend lower portion of arm to which throttle connector link is attached—this will disturb pump stroke setting). Remove gauge, install metering rod and disc, connect metering rod spring.

Metering Rod Adjustment (Vacuumeter Type)—Remove metering rod (hung on pin on upper end of vacuum piston link) being careful not to lose metering rod disc. Install gauge No. T109-102 (2.468") in place of metering rod making certain that gauge seats in metering rod jet and is held vertical. Back off throttle stopscrew so that throttle valve tightly closed. Press down lightly on vacuum piston link at point directly over piston. Clearance between pin on piston link and shoulder of notch in gauge should be less than .005" and gauge should not drag on pin. Adjust by bending lip on piston link so that it contacts lug on pump arm (use special tool T109-105). Remove gauge, install metering rod and disc, connect metering rod spring.

ANTI-PERCOLATOR: Saxophone Key Type. Consists of a main nozzle vent in bowl cover controlled by a leather-faced, felt-backed metal cap which opens the vent when the throttle is closed to prevent any percolating discharge from the nozzle. The cap must be seated to close the vent when the throttle is opened.

Adjustment—Crack throttle open by inserting special gauge (see table below for gauge for each model) between edge of valve and carburetor wall on side opposite idle port. Bend anti-percolator rocker arm (use special tool T109-105) so clearance between rocker arm lip and pump arm .005-.015" (use feeler gauge)

Anti-Percolator Setting

Car & Carb.	Gauge No. & Throttle Opening
Frazer (610S,22S,22SA,22SB)	T109-29 ..... .030"
Hudson (749S,990S,2114S)	T109-29 ..... .020"
Hudson (2009S, SA)	T109-29 ..... .030"
Hudson (968S, 2013S, 2113S)	T109-44 ..... .016"
Kaiser (610S,22S, 22SA, 22SB)	T109-29 ..... .030"
Nash (464S)	T109-29 ..... .020"
Nash (683S)	T109-29 ..... .030"
Nash (746S)	T109-29 .... ①.030"
Nash (611S, 662S, SA)	T109-29 ..... .030"
Nash (694S, 780S)	T109-29 ..... .030"
Oldsmobile(481-S,504-S,651-S)	T109-29 ..... .020"
Oldsmobile (709S,710S)	T109-29 ..... .020"
Oldsmobile (763S, SA, 764S)	T109-29 ..... .020"

CONTINUED ON NEXT PAGE

CARTER WA1 (C nt.)

Anti-Percolator S tting (Cont.)

Car & Carb.	Gauge No. & Throttle Opening
Packard (530S)	T109-29 .030"
Pontiac (537-S, 652-S)	T109-29 .030"
Pontiac (717S, 718S)	T109-29 .030"
Rambler (694S, 780S)	T109-29 .030"
Willys (613S, 645S)	T109-29 .030"

①—Supersedes .020" setting originally specified for this model.

NOTE—The No. T109-29 Gauge is used for both .020" and .030" setting.

Pontiac Note—Anti-percolator can be adjusted after throttle stopscrew has been set for correct 7 MPH idle speed (turn screw in until it just contacts lowest step of fast idle cam, then turn screw in additional ½ turn) by rotating fast idle cam until stopscrew rests on highest step of cam and then bending the anti-percolator arm for clearance of .078" (No. 47 drill) between arm and pump arm.

FLOAT LEVEL: To check float level, remove float bowl cover, invert cover, measure from top edge of machined projection on cover at free end of float to top of soldered seam (see table below). Adjust by bending lip of float lever.

►*CAUTION:* On cars with spring-loaded pin in intake needle, use care not to compress the spring when checking float level (invert cover assembly and allow float to rest on intake needle of own weight. Compressing spring will cause false reading and result in incorrect float setting).

Float Level Setting

Car & Carb.	Float Level
Frazer (610-S)	5/16"
Frazer (622-S)②	3/8"
Frazer (622-S③, 622-SA, 622-SB)	1/2"
Hudson (749S, 968S, 990S, 2113S, 2114S)	1/2"
Hudson (2013S)	1/4"
Hudson (2009S)	⑨ 1/2"
Hudson (2009SA)	7/16"
Kaiser (610-S)	5/16"
Kaiser (622-S②)	3/8"
Kaiser (622-S③, 622-SA, 622-SB)	1/2"
Nash (464-S)	3/8"
Nash (683S, 694S, 746S, 780S)	1/2"
Nash (611-S, 662-S, SA)	1/2"
Oldsmobile (All)	1/2"
Packard (530-S)	3/8"
Pontiac (All)	7/16"
Rambler (694S, 780S)	1/2"
Willys (613S, 645S)	5/16"

②—With first type Float & Lever Assy. 21-70S and Needle & Seat Assy. 25-42S.

③—With second type Float & Lever Assy. 21-86S and Needle & Seat Assy. 25-155S.

⑨—Change to 7/16" (Gauge T109-81) to correct hesitation or cutting out on sharp turns (see Changes & Corrections above). Set to 7/16" when carburetor converted to 2009SA.

Fl at Trav l—Should be ½" (all models). To check travel, hold float bowl cover in normal position, note drop or free travel of float at free end. To adjust travel, bend the two small float stop lips at the hinge end of the float.

Float N edl Valv & S at—Furnished only in matched sets as follows:

Car & Carb.	Float Inlet Valve Part No.	Intake Hole Size No.
Frazer (610S, 22S, 22SA, 22SB)	25-155S①	38
Hudson (749S, 968S, 990S)	25-75S	46
Hudson (2009S,SA,2113S,2114S)	25-75S	46
Hudson (2013S)	25-162S	42
Kaiser (610S, 22S, 22SA, 22SB)	25-155S①	38
Nash (464-S, 683S, 746S)	25-34S	46
Nash (611S,662S,SA,694S,780S)	25-33S	48
Oldsmobile (All)	25-75S	46
Packard (530-S)	25-42S	38
Pontiac (All)	25-83S	38
Rambler (694S, 780S)	25-33S	48
Willys (613S, 645S)	25-94S	48

①—Supersedes No. 25-42S used on 610-S and first 622-S carburetors.

THROTTLE VALVE SETTING: When installing valves, see that trademark is up and on idle port side, install screws loosely, tap valve lightly to centralize it in bore, tighten screws securely. See that throttle valve stopscrew is backed off so that valve closes tightly, check throttle valve setting as shown in table below. Shims furnished .002" (2-93), .005" thick (2-94) to correct valve position.

Throttle Valve Setting

Car & Carb.	Idle Port Opening	Vacuum Port Hgt.
Frazer (610-S, 622-S)	②.133-.137"	①.035-.040"
Frazer (622SA, SB)	②.133-.137"	①.033-.043"
Hudson (749S)	.136-.140"	.020"
Hudson (968S, 2113S)	.178-.182"	①.049"
Hudson (990S, 2114S)	.120-.124"	①.040"
Hudson (2009S, SA)	.120-.124"	.005-.015"
Hudson (2013S)	.103-.107"	①.010-.020"
Kaiser (610-S,622-S)	②.133-.137"	①.035-.040"
Kaiser (622SA, SB)	②.133-.137"	①.033-.043"
Nash (464-S)	.137-.141"	.022-.027"
Nash (683S, 746S)	.137-.141"	.020-.030"
Nash (611-S)	.011-.015"	.021-.029"
Nash (662-S,SA)	.153-.157"	.021-.029"
Nash (694S, 780S)	.153-.157"	.021-.029"
Oldsmobile (481-S, 504-S)	.136-.140"	⑩.030-.035"
Oldsmobile (651S)	.136-.140"	.025-.035"
Oldsmobile (709S, 710S)	.136-.140"	①.050"
Oldsmobile (763S,SA;764S)	.136-.140"	①.050"
Packard (530S)	.158-.162"	.022-.027"
Pontiac (All)	.166-.170"	.022-.027"
Rambler (694S, 780S)	.153-.157"	.021-.029"
Willys (613S)	.198-.202"	①⑤.036-.044"
Willys (645S)	.198-.202"	①.036-.044"

①—Top of port above throttle valve (bottom of port all others).

②—Port opening below valve (above valve all other models).

③—Late production carburetors. .045-.055" on early production models.

⑩—For late type carburetors with slotted type (round end) port. First carburetors with .061-.064" round type port should be .022-.027".

⑤—.020-.028" on first production carburetors.

FAST IDLE: Consists of fast idle cam pivoted directly above the throttle lever so as to serve as stop for throttle stopscrew and is linked to the choke valve. Refer to Climatic Control article in Carburetion Equipment Section for Data.

Adjustment—To check, turn fast idle cam to normal or slow idle speed position, tighten throttle lever stopscrew until it just seats against cam, rotate cam until stopscrew is against first step of cam (screw must not be on step) check clearance between lower edge of choke valve and air horn wall (use gauge). If this clearance not correct as shown in table below, adjust by bending fast idle link at offset using bending tool T-109-41.

Fast Idle S tting

Car & Carb.	Choke Clearance & Ch cking Gaug
Hudson 990S, 2013S, 2114S	1/2" T109-83
All other Cars & Carburetors	5/8" T109-85

►*WILLYS 613S, 645S NOTE:* Fast Idle on these models consist of a fast idle cam linked to the choke valve lever (no Automatic Choke). Cam serves as stop for throttle lever idle speed screw and throttle is opened to fast idle position when carburetor choked for starting. Should not require adjustment.

CHOKE (All Models except Willys): Valve is offset, butterfly type linked directly to automatic choke (Climatic Control) mechanism. *See Carter Climatic Control article in Carburetion Section for complete Automatic Choke data.*

Setting—Thermostatic coil housing should be set so that reference mark centered on scale on piston housing for all models except those listed in table below, and should be rotated counter-clockwise (Rich) or clockwise (Lean) for these special models as shown. To adjust, loosen two thermostatic coil housing attaching screws, rotate housing.

Climatic Control (Ch ke) S tting

Cars & Carb.	Ch ke S tting
Hudson (749S)	Centered (At Index)
Hudson (968S, 990S, 2013S, 2113S)	1 Point Lean
Hudson (2114S, 2009S, 2009SA)	1 Point Lean
Nash (611S, 662S, 694S)	2 Points Rich
Nash (780S)	① Centered (At Index)
Pontiac (537-S,652-S,717S,718S)	3 Points Rich
Rambler (694S)	2 Points Rich
Rambler (780S)	① Centered (At Index)
All other Cars & Carburetors	Centered (At Index)

NOTE—No Automatic choke used on Willys 613S & 645S.

①—Supersedes setting of 2 Notches Rich originally specified for this model.

UNLOADER: Consists of a cam on the throttle lever which opens the choke valve (through fast idle linkage) when throttle is held wide open to correct flooding. To check, hold throttle wide open, check clearance between lower edge of choke valve and air horn wall. See table below for correct clearance and checking gauge on each model. To adjust, bend cam on throttle lever (use Tool T109-41).

CONTINUED ON NEXT PAGE

CARTER WA1 (C nt.)

Unl ad r Setting

Car & Carb.	Gauge No. & Choke Valve Clear.
Frazer (610S, 22S, SA, SB)	T109-81 .... 7/16"
Hudson (749S)	T109-80 .... 7/16"
Hudson (968S, 2113S, 990S, 2114S)	T109-84 .... 9/16"
Hudson (2009S, SA, 2013S)	T109-84 .... 9/16"
Kaiser (610S, 22S, SA, SB)	T109-81 .... 7/16"
Nash (464S, 683S, 746S)	T109-82 .... 31/64"
Nash (611S, 662S, SA, 694S, 780S)	T109-81 .... 7/16"
Oldsmobile (504S)	T109-81 .... 7/16"
Oldsmobile (481S, 651S, 709S, 763S, SA)	T109-80 .... 3/8"
Oldsmobile (710S, 764S)	T109-81 .... 7/16"
Packard (530S)	T109-81 .... 7/16"
Pontiac (537S, 652S, 717S, 718S)	T109-107 .... 5/16"
Rambler (694S, 780S)	T109-81 .... 7/16"

NOTE–No unloader used on Willys 613S & 645S.

►*CHOKE VALVE LOCK CAUTION:* On carburetors with choke valve lock (lip on lower end of fast idle link which prevents choke valve closing when throttle valve wide open), lock should be checked and adjusted as directed below. Later carburetors do not have this choke valve lock.

Ch k Valv Lock Adjustment–Bend lip at lower end of fast idle link for clearance of 1/32" between lip and throttle lever lock.

CHOKE (Willys 613S & 645S): Semi-automatic butterfly type with manual control. Choke valve lever linked to operating lever by spiral spring. Choke valve must be fully closed with button on instrument panel pulled out and wide open when button pushed in.

TROUBLE SHOOTING: P or Idling Performance – If engine stalls while idling, low speed performance is unsatisfactory, or correct adjustment cannot be secured, remove idle tube (low speed jet) and clean with compressed air or install new tube. See that tube seats tightly at shoulder. Remove idle adjusting screw and clean low speed channels with air. If idle is rich, check metering rod linkage for binding and see that rod is not rubbing on dust cover. On Vacumeter types, see that vacuum piston is clean and operates freely.

Po r Accelerati n–Check pump seasonal adjustment and pump stroke. Remove and clean or replace pump jet. Examine pump for damaged or worn plunger leather, loose plunger, corrosion or dirt in pump cylinder, ball check valves sticking or leaking. If plunger removed from cylinder, use loading tool when re-installing to avoid damaging plunger leather. On vacumeter types, see that vacuum piston clean and operates freely, check piston spring.

Carbur tor L ads Up r Performance is Poor–Check and adjust float level. See that correct type metering rod installed (replace metering rod and jet as an assembly–check metering rod setting when installed). On vacumeter types, see that vacuum piston operates freely and vacuum channel open and clean.

CARBURETOR OVERHAUL: *CAUTION–When disassembling carburetor for overhaul, note the following points:*

►*CARTER CAR STARTER NOTE:* When disassembling carburetors which are equipped with this unit, Car Starter switch parts must be removed before throttle valve shaft can be removed from body flange casting. To disassemble switch, hold switch firmly against casting, remove terminal cap, clip, and screw. Withdraw switch using great care not to lose small square adjusting washers, remove switch ball, invert casting and remove switch strainer and retainer ring. *Refer to "Carter Car Starter" in Electrical Section for complete data.*

►*WILLYS 613S & 645S NOTE:* No automatic choke or fast idle are used on this model. Disregard all data on these units when servicing these carburetors.

Disassembly: Remove dust cover attaching screw and lockwasher, remove the dust cover. Remove fast idle cam screw and fast idle cam. Take out air horn attaching screws (two screws on top, one beneath Climatic Control housing), remove air horn and gasket. Take out retainer screws, remove thermostatic coil and housing assembly, piston housing strainer. Take out choke valve screws and remove choke valve. Loosen screw on choke lever and link assembly 4 full turns, pry lip on lever away from shaft with screwdriver. Revolve choke shaft counter-clockwise to free piston from cylinder and remove assembly (*CAUTION*– Do not remove pin holding piston housing and air horn casting together–these parts line-reamed at factory and must be kept in alignment). Remove pin spring, spring retainer, and spring from throttle connector rod and remove rod. Remove pin spring and connector link from pump arm. Remove low speed passage plug and gasket assembly (located next to anti-percolator cap), Take out bowl cover screws and remove bowl cover assembly intact. On Vacumeter types, remove vacuum piston spring from cylinder in casting, disconnect piston from link by turning piston ¼ turn, remove piston link and metering rod from bowl cover and disassemble rod and link, using care not to lose metering rod disc. On non-Vacumeter types, remove metering rod and disc, using care not to lose disc or damage spring, remove pump arm and collar assembly and pump operating lever and countershaft assembly by revolving ½ turn. On all models, remove float, needle and seat assembly, strainer nut and gasket, and strainer. Take out pin and remove anti-percolator cap and rocker arm assembly and spring. Remove pump plunger and rod assembly, take out strainer and check ball in lower end of pump cylinder. Remove low speed jet assembly, nozzle passage plug, nozzle retainer plug, and nozzle (use tool T109-55). *CAUTION*–Make certain that small nozzle gasket removed from nozzle passage. Remove metering rod jet and gasket assembly. Remove pump jet passage plug and pump jet. Remove pump discharge ball retainer and check ball. Remove body flange (lower casting) gaskets and insulator, idle adjusting screw and spring, and idle port rivet plug. remove throttle shaft arm and shaft assembly, take out throttle valve screws, remove throttle valve and shaft and lever assembly.

Servicing–Wash all parts in clean gasoline (except thermostatic coil and housing assembly and cork parts), blow out all passages with compressed air, examine metering rods and jets, replace all worn parts.

Reassembly: Use all new gaskets (see Parts List below), group all the low speed circuit, high speed circuit, float, pump, and choke circuit parts together to insure correct re-installation. Install parts in reverse order of disassembly directions given above and note following special instructions and cautions: When installing throttle valve, use new attaching screws, install valve with trademark up and on idle port side of bore, install screws loosely, tap valve lightly to centralize it in bore and then tighten attaching screws. Centralize choke valve in same manner and check operation by making certain that choke valve falls open freely of own weight. When installing nozzle, make certain that new gasket used, install nozzle with flat side up. See that low speed jet seats firmly in casting at shoulder. Check and adjust metering rod, anti-percolator setting, pump stroke, float level, fast idle and choke setting, throttle valve setting as directed above. Pack dust cover attaching screw hole in bowl cover with graphite grease before installing dust cover and attaching screw (oil or grease must not be used at any other point). Adjust carburetor when re-installed.

SERVICE PARTS: Gasket Sets–No. 139A (464S, 530S, 610S, 622S, SA, SB; 662S, SA; 683S, 694S, 746S, 780S, 990S, 2009SA, 2013S, 2114S). **No. 146** (537S, 652S, 717S, 718S). **No. 157A** (481S, 504S, 651S, 709S, 710S, 763S, SA, 764S), **No. 159A** (613S, 645S). **No. 198** (749S, 968S, 2113S).

Repair Packages (with Std. Metering Jets)–No. 1065A (464-S) **No. 1095A** (610-S), **No. 1097B** (481-S, 504-S, 710-S), **No. 1320** (530-S), **No. 1360B** (613-S), **No. 1361B** (611-S), **No. 1362C** (622S, SA, SB), **No. 1366A** (537S, 717S), **No. 1379A** (662S, SA), **No. 1383B** (651S, 709S), **No. 1388** (652S, 718S), **No. 1399** (683S), **No. 1501A** (694S, 780S), **No. 1518** (746S), **No. 1535** (749S), **No. 1536** (763S, SA), **No. 1537** (764S), **No. 1723** (968S, 2112S), **No. 1736** (2009S, SA), **No. 1737** (2013S),

CARTER "WE"

CHEVROLET	Carter Model No

②—Beginning Serial No 1099741

►CHANGES, CAUTIONS, CORRECTIONS

►*STUDEBAKER CHAMPION 715S AUTOMATIC CHOKE CHANGE* New Thermostatic Coil & Housing Assembly with DIFFERENT Choke Setting used on later cars

Part	First Type	Later Type
Coil & Housing Assy	170P-77S	170U-61S
Choke Setting	Centered	1 Point Lean
Air Horn & Choke Assy	6-557S	6-727S

►*1953 STUDEBAKER CHAMPION ACCELERATION HESITATION OR STUMBLE on light acceleration at 20-25 MPH. (First 989S Carb)* Caused by delay in effective pump action at partial throttle position Correct by installing new parts (1) Pump Operating Spring, (2) Pump Plunger Expander Spring, also check pump inlet and outlet ball check valves and reseat balls if required

Parts Installation—*See Production Change Note below for new parts, When these parts installed, change carburetor marking to 989SA (add "A" on tag)*

Reseating Check Valves—Use light hammer and 5/32" brass drift to tap original ball down on seat to form new seat, then **discard** original ball and install NEW ball No 116-13 (original ball will be damaged by seating operation)

►*1953 STUDEBAKER CHAMPION 989S & 989SA CARBURETOR PRODUCTION CHANGES: Two different changes made as follows.*

(1) Carburetors code dated "B3" & Later—Metering rods changed for more uniform flow characteristics.

	Metering Rod Part No.
First Type	75-666 (046")
Later Type	75-902 (050")

(2) 989S Carburetors (Accelerating Pump Change) Pump Operating Lever Spring and Pump Plunger Expander Spring (under lip of pump plunger leather) changed to provide improved part-throttle acceleration (see Acceleration Hesitation above)

Accelerating Pump Springs

	First Typ	Lat r Typ
Operating Lever Spring	61-228①	②61-252
Plunger Expander Spring	61-143③	④61-157

①—12 coil type ②—9 coil type
③—Copper-plated ④—Cadmium-plated

NOTE—All carburetors stamped "989SA" have the above No 61-252 Pump Operating Spring installed

DESCRIPTION· Single barrel downdraft type with Carter Climatic Control (Automatic choke), Fast Idle, Anti-percolator, and throttle lever operated Accelerating Pump Models 989S, SA, 2108S and 2190S have throttle body heating system as follows

Model 2108S - Idle system has various changes (Keyhole slot idle port, reduced size economizer, air bleed, and by-pass, shorter idle tube with larger diameter metering hole). Accelerating pump plunger is longer (not interchangeable with previous type) and stroke occurs lower in cylinder which prevents entrance of air.

Model 2190S - Same design as 2108S except that different Metering Rod used. See Jet Specifications.

Throttle Body Heating—Holes provided in throttle body and intake manifold by which exhaust gases are transmitted from the exhaust manifold to the heating passages in the throttle body when the manifold heat valve is closed This prevents possibility of ice forming at the throttle valve during the engine warm-up period Heating action in throttle body diminishes as the manifold heat control valve opens

ADJUSTMENT: *Set these carburetors to the following specifications:*

IDLING ADJUSTMENT

Idle Screw Setting - ½-1½ turns open. Turn screw out for richer mixture. Adjust only with air cleaner in place and with engine at normal operating temperature (choke valve open, fast idle inoperative).

Idle Speed Setting

Car Model	Idle Speed
Chevrolet (730S)	450-500 RPM
Studebaker (All-Synchro-mesh)	①550-600 RPM
Studebaker (All—Auto Trans,)	②500-550 RPM

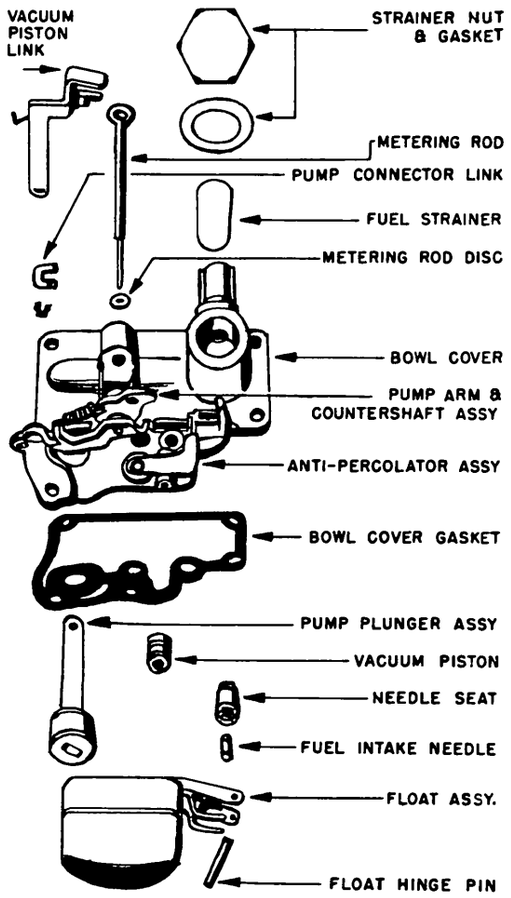
①—Or 8-10 MPH
②—With selector lever in Neutral "N" position

ACCELERATING PUMP SETTING

Pump Stroke Setting - Check pump travel after carburetor has been reassembled. Back off throttle stop-screw so that throttle valve tightly closed, remove dust cover. Install Pump Gauge T109-117S on bowl cover with lip of gauge extending over plunger shaft and gauge held vertically, turn nut on gauge until lip contacts top of plunger shaft, note gauge reading. Open throttle wide and again note gauge reading Difference in two readings should be correct as shown in table below Adjust by bending throttle connector rod at lower angle near throttle lever using bending tool T109-213

Accelerating Pump Setting

Car & Carb	Pump Stroke
Chevrolet (730S)	14/64"
Studebaker Champ (532S,661S,715S)	14/64"
Studebaker Champ (989S,SA)	14/64"
Studebaker Comm (627S SA)	20/64"
Studebaker Champ (2108S, 2190S)	14/64"



METERING ROD SETTING

Ch cking & Adjustment - Remove metering rod and install Metering Rod Gauge No. T109-102 (2.468") in place of the rod making certain that gauge seated in metering rod jet. With throttle stopscrew backed off so that throttle valve tightly closed, press down lightly on metering rod arm so that upper lip of arm contacts pin in pump arm. At this point, clearance between metering rod pin and shoulder of notch in gauge should be less than .005"and gauge should not contact pin Adjust by bending upper lip of metering rod arm using bending tool T109-105. *Then check and adjust lower (economy) lip as follows:*- Remove gauge,press down on metering rod arm until upper lip contacts pump arm pin. Clearance between pin and upper surface of lower lip should be 3/16" (Float Level Gauge T109-28 can be used). Adjust by bending the lower lip.

ANTI-PERCOLATOR SETTING

Checking & Adjustment—Crack throttle open by inserting correct gauge between edge of valve and carburetor wall on side opposite idle port (see table above for gauge and throttle opening) Check clearance between rocker arm lip and pump arm (see Clearance in

CONTINUED ON NEXT PAGE

"WE" B WL COVER ASSEMBLY

CARTER "WE" (C nt.)

table below). If clearance not correct, adjust by bending anti-percolator arm using tool T109-105.

Anti-P rc lator Setting

Car & Carb.	Thr ttle Opening	③ Clearance
Chevrolet (730S)	.025" ①	.005-.015"
Studebaker (532S,661S)	.030" ②	.005-.015"
Studebaker (715S)	.030" ②	.025"
Studebaker (627S,SA)	.030" ②	.005-.015"
Studebaker (989S,SA)	.030" ②	.025"
Studebaker (2108S,2190S)	.030" ②	.025"

①—Use Gauge T109-189.
②—Use large end of Gauge T109-29.
③—Between rocker arm lip and pump arm.

FLOAT LEVEL

Ch cking & Adjustm nt—Remove and invert bowl cover assembly so that float in closed position. Measure distance from top of projection on bowl cover to top edge of soldered seam on float using gauge (see table below). Adjust by bending lip on float lever which contacts intake needle. Then check float travel.

Float Trav l—Adjust stops on float bracket so that free end of float has ½" movement (plus or minus 1/32").

Fl at L vel Setting

Chevrolet (730S)	3/8" T109-80
Studebaker (532S)	1/4" T109-31
Studebaker (661S, 715S)	3/8" T109-80
Studebaker (627S,SA)	7/16" T109-81
Studebaker (989S.SA)	3/8" T109-80
Studebaker (2108S,2190S)	3/8" T109-80

THROTTLE VALVE SETTING

①—Top of Port above top edge of valve.
②—Port opening below valve.

Throttl Valve Installation—See *OVERHAUL data.*

FAST IDLE SETTING

Checking & Adjustm nt—With thermostatic coil housing, gasket, and baffle plate removed, crack throttle valve to allow choke valve to close, close choke valve move throttle valve toward closed position as far as possible. Check remaining throttle valve opening (see table below). If opening not correct, adjust by bending choke connector rod at lower angle using bending tool T109-213. Then adjust Unloader.

Fast Idle Setting

Car & Carb.	Throttle Opening & Gauge
Chevrolet (730S)	.046" T109-158
Studebaker (532, 661S)	.054" T109-193

CONTINUED ON NEXT PAGE

"WE" MAIN BODY & THROTTLE BODY ASSEMBLY

"WE" AUTOMATIC CHOKE ASSEMBLY

CARTER "WE" (Cont.)

OVERHAUL: Disassembly - Take out attaching screw and remove dust cover from bowl cover. Disconnect choke connector rod from fast idle link and throttle lever and remove rod. Take out air horn attaching screws and lift off air horn assembly, remove gasket. Disconnect throttle connector rod at throttle lever and pump operating lever, remove rod. Remove idle passage plug and gasket from bowl cover, take out bowl cover attaching screws, lift bowl cover assembly straight up to remove it from the bowl.

Air Horn Disassembly - Take out retainer screws, remove thermostatic coil housing and gasket. Remove baffle plate (retained by one screw), trip lever, fast idle link. Take out choke valve screws and remove choke valve. Unhook fast idle cam spring from lip on choke shaft, rotate shaft counter-clockwise until choke piston clears cylinder, withdraw shaft and lever assembly, lift fast idle cam off hub on body. Choke piston can be removed from shaft lever link by pushing out piston pin.

Bowl Cover Disassembly - Disconnect and remove pump connector link, slide pump plunger and rod assembly out, remove bowl cover gasket. Unhook vacuum piston from piston link by turning it 90°, then withdraw link and metering rod assembly from cover (*CAUTION* - do not lose metering rod disc). Unhook metering rod spring and remove metering rod from link. Remove plug and gasket at fuel inlet boss, lift out fuel strainer. Remove float lever pin, lift off float assembly and intake needle, remove needle seat and gasket using tool T109-57.

Main Body Disassembly - Lift vacuum piston spring and pump spring out. Remove pump strainer, intake check ball retainer (use tool T109-56), and check ball retainer (use tool T109-56), and check ball from pump cylinder (invert casting to drop ball out) Remove low speed jet, pump discharge passage plug and gasket, pump discharge jet, pump discharge check ball retainer plug and gasket, and discharge check ball (tilt casting to drop ball out) Remove metering rod jet and gasket using tool T109-57 Take out throttle body attaching screws, lift off throttle body and gasket Remove main discharge nozzle passage plug (tool T109-57), nozzle retainer plug (tool T109-58) and nozzle (use Extractor tool T109-55) *CAUTION*—Make certain that nozzle gasket removed from recess in body

Throttle Body Disassembly - Take out idle adjusting screws and spring. Do not disturb throttle valve and shaft assembly.

Cleaning & Inspection: Clean all castings and metal parts thoroughly with suitable carburetor cleaner, rinse in solvent, blow out all passages and dry with air. Make certain that all carbon and gum deposits removed. Remove all carbon deposits from heater holes in throttle body (heater holes in manifold should also be thoroughly cleaned). Inspect all parts for wear or damage.

Reassembly: Use all NEW gaskets. Install all parts in reverse order of disassembly procedure above and note following important points

Main Discharge Nozzle Installation - Use new copper gasket on nozzle and make certain that flat on nozzle is upward. Tighten nozzle retainer plug and passage plug securely.

Throttle Valve Installation—If valve has been removed, use new screws when re-installing Install valve with trademark up and on idle port side, install screws loosely, then close throttle fully and tap valve lightly to centralize it in bore then tighten attaching screws securely Check throttle valve location (see Throttle Valve Setting)

Idle Tube Installation—See that idle tube seats firmly against shoulder in casting When installing air horn gasket, see that idle air bleed hole in gasket is aligned with passage in body casting and air horn (air bleed extends up into air horn to point above choke valve)

Accelerating Pump Assembly—Make certain that pump intake strainer is clean, install intake ball check, retainer, and strainer in pump cylinder (use Tool T109-122U to install retainer), see that pump plunger is not worn or damaged, use loading tool to install plunger in cylinder

Pump Operating Countershaft Lubrication - Lubricate shaft with No. 3 graphite grease before assembling bowl cover parts.

Choke Valve Installation - After shaft and piston assembly installed in air horn, lock fast idle cam spring around lip of choke lever shaft. Install choke valve with trademark (small "c" in circle) upward, install new screws loosely, center valve by tapping it lightly in closed position before tightening attaching screws. Check for free operation (valve should fall open of own weight).

Thermostatic Coil & Housing Installation - After fast idle and unloader adjustment completed, install coil housing with indicator mark approximately one-quarter turn clockwise from reference mark on body, then rotate housing counter-clockwise for correct choke setting. *CAUTION* - If housing not installed as above thermostat spring may hook up on hot air tube.

Carburetor Installation—Make certain that special slotted type flange gasket is used when installing carburetor or manifold *CAUTION*—Metering rod vacuum piston passage terminates in hole on face of mounting flange and passage hole must not be covered by gasket

Carburetor Adjustments - Make all adjustments listed under ADJUSTMENT above.

SERVICE PARTS

Gasket Sets—Carter No 186A (532S, 627S, 627SA, 661S, 715S, 730S), No 235 (989S,989SA, 2108S)

Repair Pkg (with Std Metering Rod)—Carter No 1356C (532S,661S), No 1504 (715S), No 1514A (730S), No 1520 (627S, 627SA), No 1729 (989S, 989SA), No. 1746 (2108S).

CARTER TYPE WO

CROSLEY	Carter No.
1951-52 CD&VC	870S
WILLYS	
1946 Early Jeep CJ-2A	①596S
1946-48 Jeep CJ-2A	①636S, SA

WILLYS (Cont.)	Carter No.
1947-50 Jeep Trk. 2WD	①636S, SA
1947-50 Jeep Trk. 4WD	①636S, SA
1949-50 Sta. Wgn. 4x4-63	636SA
1949-53 Jeep CJ-3A	①636S, SA

①—See Field & Production Change Notes below

►CHANGES, CAUTIONS, CORRECTIONS

►**Willys 596S & 636S Carburetor Changes for Improved Performance at Transfer (Flat Spot) Point**—New Low Speed Jet, Part No. 11-186S, can be installed to supersede original No. 11-180S. NOTE—New jet furnished in Repair Package No. 1355A.

►**Willys 450SA, 507SA, 636SA Replacement Carburetor Caution**—Have new parts (non-interchangeable with like parts on previous carburetors) as follows:

Nozzle—No. 12-323 (supersedes 12-255), **Nozzle Gasket**—No. 20-45 (supersedes 20-72), **Nozzle Retainer Plug**—No 11B-164 (supersedes 11B-105).

DESCRIPTION: Single barrel, downdraft. Design same as WA-1 except as follows:

Idle System—Idle Orifice Tube (low speed jet) is located in idle well which is fed directly from float bowl (not main nozzle well as on other models) through a drilled passage in the body casting in which the Idle Well Jet is located. Idle well is vented to float bowl by drilled channel in carburetor body. Cross-channel at top of idle tube has two air bleed openings into mixing chamber above main venturi (upper air bleed hole is located ahead of economizer restriction in cross-channel (lower air bleed is beyond this point).

Venturi—Double venturi system used with small (primary) venturi located in main body casting above large (main) venturi which is integral with casting.

IDLE ADJUSTMENT: Adjust only with engine warmed up (choke valve open, fast idle inoperative). Idle adjusting screw controls fuel mixture and should be turned in for leaner mixture, out for richer mixture. Approximate settings below. See tune-up data on car model pages for complete tune-up data.

IDLE SETTING

Car Model & Carb.	Idle Setting	Idle Speed
Crosley 870S	¾-1¾ turns open	450-500 RPM
Willys 596S, 636S,SA	1-2 turns open	600 RPM

ACCELERATING PUMP:—High pressure type (spring operated). Operated by throttle lever through spring connection between pump operating lever and pump arm (under dust cover on bowl cover). Fuel is drawn into pump cylinder through strainer and inlet ball check valve when throttle is closed and is dis-

CONTINUED ON NEXT PAGE

CARTER TYPE WO (Continued)

charged through outlet ball check valve and pump jet location in side of mixing chamber above main venturi when throttle is opened for acceleration. Pump is not adjustable for seasonal changes.

Pump Stroke Adjustment—To check pump plunger travel, remove dust cover on float bowl cover, install Universal Pump Stroke Gauge T109-117S on raised portion of bowl cover so that gauge is vertical and projecting ear rests on top surface of pump shaft. Back off throttle lever stopscrew so that throttle valve tightly closed, note gauge reading. Open throttle wide and again note gauge reading. Difference between two readings is pump stroke (in sixty-fourths of an inch) and should agree with table below. To adjust, use special bending tool T109-41 to bend throttle connector link at lower angle near throttle lever. CAUTION—Check metering rod setting (disturbed by this adjustment).

ACCELERATING PUMP SETTING

Car Model & Carb.	Pump Stroke	Pump Setting
Crosley 870S	10/64"	Lower Hole
Willys 596S, 636S,SA	17/64"	Non-Adjustable

METERING ROD (ECONOMIZER):—Metering rod and jet assembly meters fuel for main nozzle and rod is operated by throttle lever in same manner as on other Carter models. Metering rod mounting on pump operating lever is new and consists of a pin locked in place in a slotted hole in the pump arm by a nut.

METERING ROD SETTING

All Carburetors.....Gauge T109-26 (2.718")

Metering Rod Adjustment—Disconnect choke linkage, take out air horn attaching screws, remove air horn and dust cover. Unhook metering rod spring, remove metering rod being careful not to lose disk on rod at bowl cover. Insert special gauge, T109-26 (2.718") in place of metering rod so that tapered end is seated in metering rod jet and gauge is vertical. Back off throttle lever stopscrew so that throttle valve closes tightly. Metering rod pin on pump operating rod should be even with shoulder of notch in gauge. To adjust, loosen pin nut, shift pin on arm, tighten nut securely (use special wrench T109-76).

▷*CAUTION*—On 539S, 596S, 636S, 636SA, metering rod spring must be engaged in hole in metering rod and spring must exert slight downward pressure on rod so that rod seats in jet when throttle valve stopscrew set for normal idle speed. Bend lower end of spring, if necessary, to secure this setting.

FLOAT LEVEL: To check, remove bowl cover and float assy., invert cover, turn gasket so that machined surface of bowl cover is exposed, measure distance from this machined surface to top of float at free end (see Caution below). Adjust by bending lip of float lever at point where it contacts valve needle (do not bend float arm).

▷*CAUTION*—Use great care not to compress spring in needle valve stem when checking float level (allow float to hang freely on inverted cover).

FLOAT LEVEL SETTING

Car Model & Carb.	Float Setting	Checking Gauge
Crosley 870S	½"	T109-83
Willys (All Carburetors)	⅜"	T109-80

Float Travel—To check, hold bowl cover and float assembly in normal position Free end of float should drop ½". Adjust by bending two small float stop lips at hinge end of float.

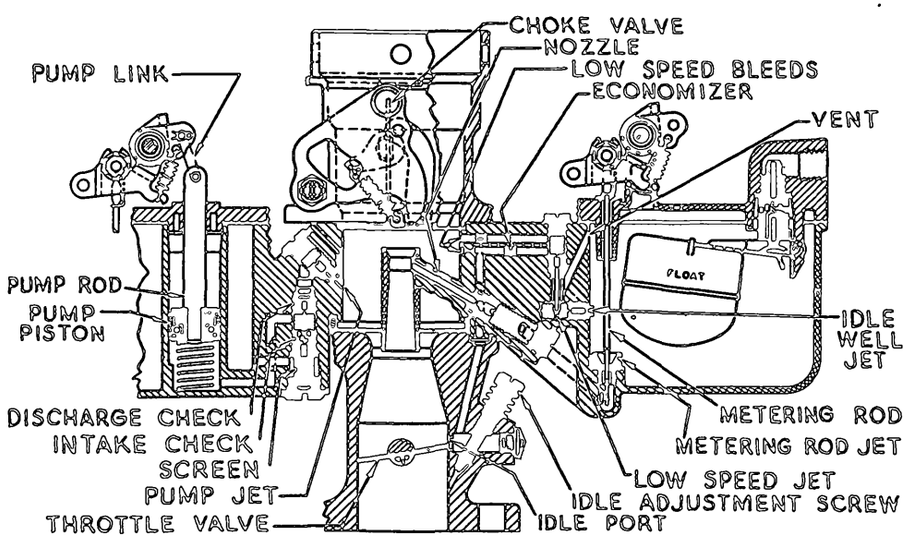
Needle Valve & Seat—Furnished in matched sets only as follows: Part No. 25-93S (All Carburetors) Intake hole is #53 drill size.

▷*CAUTION*—When installing intake needle, make certain that spring and pin are in place in needle (all carburetors have spring-loaded type needle.

CHOKE: Offset valve with poppet type relief valve. Check choke linkage to see that choke valve closed when control button on instrument panel pulled out and fully open with control button pushed in (valve spring-loaded).

THROTTLE VALVE SETTING: When installing valves, back off throttle lever stopscrew, see that trademark on valve is on idle port side, use new attaching screws and install screws loosely, tap valve lightly to centralize it in carburetor bore, tighten screws securely, check valve setting.

Setting—With stopscrew backed off and throttle valve tightly closed, idle port opening (above or below valve as noted) and height of vacuum spark port (above valve) should be correct as shown in table below. Shims furnished .002" thick (2-93), .005" thick (2-94) to correct throttle valve location.



THROTTLE VALVE SETTING

Car Model & Carb.	Idle Port Opening	③Vacuum Port Height
Crosley 870S	050- 054"①	None
Willys 596S, 636S,SA	086- 090"①	④ 056- 062"

①—Idle port opening above throttle valve
②—Idle port opening below throttle valve
③—Top of port above top edge of throttle valve
④—None on Carburetor No 596S

DISASSEMBLY OF CARBURETOR: Remove the choke connector link, take out attaching screws and remove air horn assembly. Remove idle well plug and gasket assembly, remove idle well jet. Remove throttle shaft arm and connector rod. Take out screws and remove bowl cover assembly, disassemble parts on bowl cover. Remove low speed jet plug and gasket, low speed jet, idle adjusting screw and spring, metering rod jet and gasket assembly, nozzle passage plug and gasket, nozzle retainer plug, nozzle (use tool T109-55). Take out body casting flange attaching screws, remove flange casting and throttle valve assembly. Remove pump strainer plug and gasket, strainer, inlet ball check valve assembly, outlet ball check valve assembly. Remove pump jet passage plug and gasket, and pump jet. Remove idle port rivet plug. Take out throttle valve attaching screws, remove valve, withdraw shaft and lever assembly. Remove choke control bracket assembly from air horn, take out choke valve attaching screws, remove valve, withdraw choke valve shaft and lever assembly.

Servicing:—Clean body castings and all parts in gasoline, blow out all passages in castings and all jets with compressed air, dry all parts with air before reassembling. Check all parts for wear, see that they agree with specifications.

REASSEMBLY OF CARBURETOR: Use new gaskets, soak metering jet and inlet gasket in 90 proof alcohol for 15 minutes, install on part and allow to dry before using). Reassemble by reversing disassembly directions above and note:

Nozzle Installation—Use new gasket. Use special tool T109-55 to install nozzle and make certain that flat side of nozzle is upward.

Low Speed Jet—Make certain that hole at lower end is open, work jet into seat by moving it back and forth, make certain that jet seats tightly in casting before installing low speed jet plug and gasket assembly

SERVICE PARTS: Gasket Sets—Carter No 147A (450S, SA, 507S, SA), No 175A (539S, 596S, 636S, SA), No 217 (870S)

Repair Pkg. (with Std. Metering Rod)—No 1087B (450S, SA), No 1304A (507S, SA), No 1319C (539S), No 1355C (596S, 636S, SA), No 1712 (870S)

►**CARBURETOR MODEL IDENTIFICATION:** Individual carburetors may be identified by Body Casting Number on face of flange.

►CHANGES & CORRECTIONS

►*CHEVROLET 787S & 787SA CARBURETOR CHANGES: 787S superseded by 787SA which has following changes:*

Intake Needle & Seat Assembly—787S has conventional type seat and solid needle No. 25-33S. **787SA**—Has new seat assembly with longer standpipe and new **spring-loaded needle** No. 25-195S (includes No. 61-207 Intake Needle Spring and No. 150-98 Intake Needle Pin).

Float & Lever Assembly—787S No. 21-117S. 787SA—New type No 21-122S. *CAUTION—Different float level setting required for 787SA with this new float.*

Float Level Setting—Different float settings required for 787S and 787SA. *See Float Level data.*

Accelerating Pump Discharge Valve—787S—Has flat type discharge disc No. 169-22 used with No. 63-139 Disc Retainer and No. 63-138 Disc Retainer Ring. **787SA**—Has new aluminum discharge check needle No. 17-80 installed with pointed end down in pump channel.

►*CHEVROLET & WILLYS STUMBLE ON LIGHT ACCELERATION (Caused by incorrect seating of Pump Discharge Check Valve on carburetors listed below):* On early carburetors with either Disc Check Valve or Aluminum Needle Check Valve, the original check valve (including disc retainer, and retainer ring) should be removed and discarded, and a new type aluminum check ball No. 116-25 (furnished in service pkg. listed below) should be installed:

Check Valve Pkg.

Car	Carburetor	Pkg. No.
Chevrolet	756S, 87S, 87SA, 88S, 89S.	116-26U
Willys	738S, 68S, 68SA, 832S.	116-27U

Check Valve Installation—With air horn and bowl cover removed, remove old retainer ring and discharge check valve parts (discard these parts). Form a new seat by using the ⅛" steel ball (furnished in package) by tapping on ball with 5/32" brass drift and light hammer, remove and discard this steel ball. Install new aluminum check ball (can be identified by dark color) and check seating of ball by pouring a few drops of gasoline in the channel on top of the ball. Gasoline should remain visible in the passage above the ball for approximately 60 seconds if a good seat has been formed. On Willys carburetors, install ball check weight No. 221-13 above ball, (weight not used on Chevrolet carburetors), install new No. 63-152 retainer ring.

►*NASH 757S & 824S CARBURETORS RECOMMENDED CHANGES:* First 757S and 824S carburetors can be changed for smoother engine performance up to 40 MPH. by installation of all parts contained in correct Unitized Package (different for earlier and later carburetors) as follows:

►*CAUTION—Different package (with different parts) used for first and later production carburetors.*

757S & 824S CARBURETORS stamped "FO" & "GO" (July 1950 & Earlier). Use Unitized Pkg., Carter No. 75-776U, and install all parts as listed below.

CAUTION—Do not change original Metering Rod Jet No. 120-163 used in these carburetors to any other size.

Unitized Pkg. No. 75-776U

	New Part in Pkg.	Replaced Part.
Low Speed Jet	11-202S	11-200S
Metering Rod	75-775	75-755
Bowl Cover Gasket	121-169	
Pump Diaphragm Housing	170-208S	

Carburetor Tag Note—New Identification tags (757SA & 824SA) furnished in package. **Install correct tag on carburetor to indicate above changes have been made.**

757S & 824S CARBURETORS stamped "HO" & Later (August 1950 & Later). Use Unitized Pkg., Carter No. 120-169U, and install all parts below.

Unitized Pkg. No. 120-169U

	New Part in Pkg.	Replaced Part
Low Speed Jet	11-202S	11-200S
Metering Rod	75-775	75-755
Metering Rod Jet	120-160	
Bowl Cover Gasket	121-169	
Pump Diaphragm Housing	170-208S	

Carburetor Tag Note—New Identification tags (757SB & 824SB) furnished in package. **Install correct tag on carburetor to indicate above changes have been made.**

►**NASH 757SA, SB; 824SA, SB CARBURETORS:** Have had changes made as recommended above.

►*NASH 876S & 877S CARBURETOR CHANGE:* These carburetors can be brought up to later 876SA & 877SA specifications by installation of following latest type parts and changing float level:

	First Type	Latest Type
Float & Lever Assy.	21-122S	21-117S
Intake Needle & Seat Assy.	25-195S①	②25-189S

①—Spring-loaded needle. ②—Solid needle.

Float Level Setting—½" with new type float and new **solid** type intake needle (5/16" setting used only with first type float and spring-loaded type intake needle).

CAUTION—Correct type Float and Intake Needle Assy. must be used together with correct float level setting

►**NASH 876SA & 877SA CARBURETORS:** Have latest type Float and Intake Needle & Seat Assy. and new float setting as indicated above.

►*NASH STATESMAN CARBURETOR ADJUSTMENT CAUTION:* Both carburetors must be synchronized for correct operation. See special Idle Adjustment procedure below.

►*NASH STATESMAN CARBURETOR FLOODING RECOMMENDED CORRECTION & PRODUCTION CHANGES:* Following changes were made in production and can be incorporated in earlier cars to eliminate flooding caused by (1) Vibration of Needle Valve, and (2) Dirt under Needle Valve.

(1) Carter 2098S, 2137S, & First 2137SA Carburetors—Flooding caused by vibration can be eliminated by installing Spring-loaded Needle Valve & Seat Assy. No 25-239S and Float Assembly No 21-122S, and setting float level to new specification (see Float Level below). *NOTE—Carburetor 2137SA tagdated "M3" and later have the above changes made in production.*

(2) Cars before Serial No. K-624096—Flooding caused by dirt under intake needle can be eliminated by installing Fuel Filter (Service Replace-

CONTINUED ON NEXT PAGE

CARTER TYPE "YF" (Cont.)

ment No. 3117218) at rear carburetor (use Tee No. 3140204 and attach fuel pump line to inlet side of filter using Elbow EL-204). Cars after above serial number have filter installed in production.

▷*WILLYS STUMBLE ON LIGHT ACCELERATION (738S, 768S, 768SA, 832S Carburetors):* *See Chevrolet & Willys recommended correction*

▷WILLYS 832SA, SB CARBURETOR: Have aluminum ball type accelerating pump check valve (as recommended for installation on earlier carburetors above).

▷*WILLYS 832S, SA, SB METERING ROD CHANGE:* See Carter Carburetor Jet Specification Table for latest type metering rods for these models.

▷*WILLYS 4 CYL. ACCELERATION STUMBLE OR FLAT SPOT CORRECTION (Carter 832SB & 951S):* To correct this complaint, first Tune-Up engine (Check compression, check and adjust Tappet Clearance, Spark Plug Gaps, Breaker Gap, Ignition Timing, Carburetor Idle Adjustment, Cooling System Thermostat operation). Then road test car and if stumble or flat spot still noticed, proceed as follows:

(1) Remove air cleaner and carburetor air horn, remove accelerating pump discharge ball check retainer ring, ball check weight, and ball. Disconnect pump link and remove pump diaphragm housing, diaphragm, metering rod, and pump lifter link.

(2) Check diaphragm and replace if not soft and pliable or if shaft does not slide freely in housing.

(3) Check diaphragm housing inlet hole for restrictions, blow out all passages with air. *If gum deposits noted, disassemble carburetor completely and clean with carburetor cleaner.*

(4) Install pump discharge ball check and weight. Test ball for proper seating by filling passage with gasoline. Gasoline should remain visible in passage above discharge ball for approximately 60 seconds. If not, install Parts Kit No. 116-27U.

(5) If above procedure does not correct trouble, install new parts as listed below. *NOTE—Modification may cause slight loss of economy.*

New Carburetor Parts

Low Speed Jet... .....No. 11-163S (sup. 11-161S)
Diaphragm Spring ..... No. 61-389
Diaphragm Spring Retainer ..... No. 63-92

▷*WILLYS 768S PUMP CHANGE: Late production* 768S carburetors have new type Diaphragm Housing incorporating an accelerating pump Intake Check Valve (see illustration). These carburetors can be converted to 768SA by installation of parts furnished in unitized package as follows:

Unitized Pkg. No. 170-182U (for conversion of late type 768S Carburetors to 768SA); Contains following parts which should be installed as a unit:

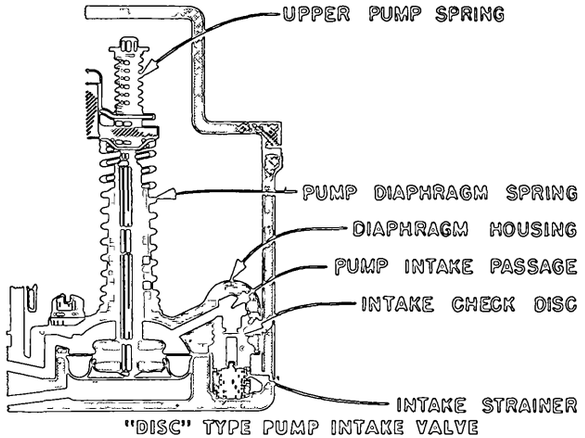
	Carter Part No.
Pump Diaphragm Housing①	170-150
Pump Intake Strainer	30-62
Metering Rod (Later Std.)	75-750

①—Without intake check valve (has #72 drill size intake hole in diaphragm housing under strainer).

▷WILLYS 768SA CARBURETOR: Supersedes 768S. Has same type pump Diaphragm Housing, pump intake and strainer as first type 768S (see late production 768S change above). Also has latest type 75-750 Std. Metering Rod.

▷*WILLYS 6 CYL. ROUGH IDLE CORRECTION (Carter 924S):* To correct this complaint, first check and correct engine idle speed (set at 550 RPM. minimum), then check carburetor for evidence of fuel dripping off end of pump jet when engine idling. If this fuel drip noted, install ball check weight, No. 221-13, above the pump discharge ball check to control the check valve (remove air horn and air horn gasket, take out pump discharge ball check retainer, install the weight).

▷*1953 WILLYS JEEP IMPROVED IDLE OPERATION UNDER STEEP ANGLE CONDITIONS (Carter 938S Carburetor):* Install all parts furnished in Unitized Pkg. No. 75-960U. Instruction sheet is included in pkg. *CAUTION—Do not make this change on later 938SA carburetor.*



Unitized Pkg. 75-960U

Part	Part No.
Metering Rod	75-959
Metering Rod Jet.....	120-155
Pump Jet Air Bleed Pin.....	150-168

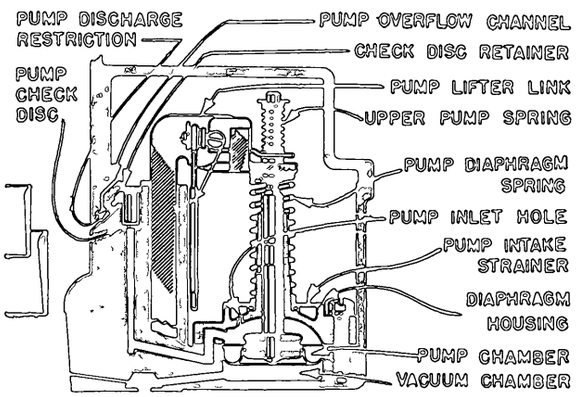
DESCRIPTION

DESCRIPTION: New design, single barrel, downdraft type with diaphragm operated metering rod (vacuum and mechanically controlled), diaphragm type accelerating pump (vacuum and mechanically controlled), Anti-Percolator, Fast Idle, and manually or automatically controlled choke (Climatic Control). Diaphragm assembly (accelerating pump and metering rod control) is new design as follows:

Diaphragm Type Accelerating Pump (& Metering Rod Control)—Consists of a spring-loaded diaphragm and plunger assembly mounted in the main body casting. Lower chamber (below diaphragm) is vacuum chamber and is connected to manifold by restricted passage opening at carburetor mounting flange with a second diaphragm bleed passage opening into the mixing chamber above the throttle valve. Upper chamber (above diaphragm) is the accelerating pump chamber. Fuel enters pump through strainer screen and restricted opening in diaphragm housing (or intake check valve on some carburetors) and is discharged through a pump jet in the carburetor wall at the side of the secondary venturi (except Nash Uni-flow carburetors).

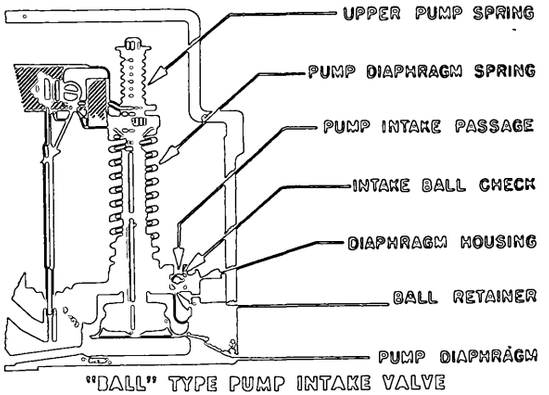
"DISC" TYPE PUMP INTAKE VALVE

▷Nash "Uni-flo" Carburetors—These models do not have separate pump discharge jet. Pump discharges through a spring-loaded ball check valve to the main nozzle.



ADJUSTMENT & OVERHAUL

IDLING ADJUSTMENT: Adjust only with engine warmed up and idling at hot or slow idle speed with choke valve wide open and fast idle inoperative. Idle adjusting screw controls fuel mixture and should be turned in for leaner mixture, out for richer mixture. See car model page for complete tune-up instructions.



▷*1951 NASH AMBASSADOR DUAL JET-FIRE IDLING ADJUSTMENT: For correct synchronization adjust as follows:*

1) Back out idle speed screw on rear carburetor to fully close throttle. Set idle speed screw on front carburetor for correct engine idle speed of 550 RPM.
2) Adjust idle mixture screw on front carburetor for best idling performance, reset idle speed screw for correct 550 RPM. idle speed.
3) Back out idle speed screw on front carburetor to fully close throttle. Set idle speed screw on rear carburetor for correct engine idle speed of 550 RPM.

CONTINUED ON NEXT PAGE

INTAKE PASSAGE TYPE PUMP

"BALL" TYPE PUMP INTAKE VALVE

CARTER TYPE "YF" (C nt.)

4) Adjust idle mixture screw on rear carburetor for best idling performance, reset idle speed screw for correct 550 RPM idle speed

5) Turn idle speed screw on front carburetor in as much as possible without increasing engine RPM This should result in balanced operation of both carburetors

Idle Mixture

Car & Carb.	Idle Screw Opening
Chevrolet (756S, 787S, SA SB)	1-2 turns
Chevrolet (788S,SA, 789S)	1-2 turns
Chevrolet (965S, 967S, 2101S)	1-2 turns
Chevrolet (964S, 966S, 2100S)	½-1½ turns
Chevrolet (2008S)	¾-1¾ turns
Henry J 4 (820S, SA, SB)	½-1½ turns
Henry J 6 (814S, 833S,SA, SB)	1-2 turns
Kaiser Darrin (2094S)	1-2 turns
Nash (892S Double Carb)	½-1½ turns
Nash Statesman (All)	½-1¾ turns
Nash (All Others)	1-2 turns
Rambler (2014S)	½-1½ turns
Willys (938S, SA, 951S)	¾-1¾ turns
Willys (All Others)	1-2 turns

Idle Speed

Car Model	Automatic—Trans.	Synchro-mesh
Chevrolet(1941-53 Pass)	450-500 RPM	①450-500 RPM
Chevrolet(1941-53 Trks)	450-500 RPM	
Chevrolet(1954)	475 RPM	④425 RPM
Henry J(1951-53)	550 RPM	
Henry J 4 (1954)	550 RPM	
Henry J 6 (1954)	500 RPM	
Kaiser Darrin	500 RPM	
Nash (1950-53)	550 RPM	②375 RPM

Nash (1955, AC)⑤	500 RPM	①500 RPM
Rambler (1950-53)	550 RPM	
Rambler (1954, No AC)	550 RPM	④475 RPM
Rambler (1954,AC)⑤	500 RPM	④ 500 RPM
Rambler (1955, No AC)	500-550 RPM	①450 RPM
Rambler (1955, AC)⑤	500 RPM	①500 RPM
Willys 4 Cyl	600 RPM	
Willys 6 Cyl	550-600 RPM	③575 RPM

①—With selecter lever in "D" position
②—With selector lever in "N" position
③—With selector lever in "DR" position
④—With selector lever in Neutral "N" position
⑤—With Air-Conditioning Compressor operating

►*1954-55 NASH STATESMAN IDLING ADJUSTMENT (Two Carburetors):* For correct synchronization adjust as follows

1)—Remove air cleaner assemblies from carburetor air horns Starting with rear carburetor, turn throttle stopscrews out until throttle valves fully seated in closed position *(CAUTION*—choke valve must be open to insure stopscrew contacting hot or slow idle speed stop of fast idle cam) Then turn stopscrews in two turns to crack throttle valves slightly

2)—Start engine and run until it is at operating temperature Attach tachometer for accurate check of engine RPM

3)—Adjust rear carburetor throttle stopscrew for for correct idle speed See table below

4)—Synchronize front carburetor with rear carburetor by adjusting the throttle linkage between the carburetors **without** disturbing position of rear carburetor throttle valve *(NOTE*—Note tachometer reading when making this adjustment, carburetors are synchronized at point where any further opening of front carburetor throttle causes an increase in RPM) When carburetors synchronized, air inlet noise of each carburetor should be identical

5)—Replace air cleaners Adjust idle mixture screw for each carburetor Start with rear carburetor, turn screw in to lean mixture until engine becomes rough, then turn screw out ½ turn (1954), ¼ turn (1955) Repeat adjustment on front carburetor

6)—Check idle speed and repeat throttle synchronization procedure (steps 3 & 4) if required (improved idle mixture may change engine speed)

METERING ROD: Metering rod and jet meters all fuel for main nozzle. Metering rod is controlled by diaphragm assembly and by throttle lever (vacuum and mechanical control) as follows:

Metering Rod Control—Rod is hooked on metering rod arm which rests on shoulder on upper end of diaphragm assembly stem (retained by upper pump spring) so that the metering rod is lifted out of the jet as the diaphragm assembly is moved upward by the pump diaphragm spring. This movement is controlled by manifold vacuum acting on the lower face of the diaphragm. Metering rod is held down in the jet for maximum economy when manifold vacuum is high, and is raised out of the jet by the spring when manifold vacuum drops off (during acceleration, high speed, pulling, or other wide open throttle operation). The pump lifter link which is connected to the throttle lever serves as a stop for the metering rod arm (eye on upper end of link slides freely on diaphragm stem below metering rod arm) so that the metering rod is positioned in accordance with throttle opening for all constant-throttle operation.

Adjustment—***No Metering Rod Gauge required.*** Air horn and bowl cover must be removed for access to metering rod. Back off throttle lever stopscrew so that throttle valve completely closed. Press down on upper end of diaphragm stem until diaphragm bottoms in vacuum chamber (tool T109-212 can be used to hold diaphragm down) Metering rod arm must contact lifter link flat surface between springs and at supporting lug under metering rod pin spring (see note below for first carburetors without this lug) and the metering rod should contact the bottom of the metering rod well at the same instant. Adjust by bending lip of metering rod arm to which metering rod is attached up or down

►**Early 738S, 768S, 768SA, 787S Carburetors Note**—These carburetors do not have lug or projection on lifter link, when adjusting metering rod, make certain **metering rod arm parallel to lifter link flat.**

ANTI-PERCOLATOR: ***No adjustment required.*** Anti-percolator on each carburetor operates as follows

Chevrolet Anti-percolator—Consists of a drilled passage from the anti-percolator well (opening from main nozzle passage) to the inside of the nozzle This passage vents the main nozzle well

Henry J. Anti-percolator—Consists of a #66 drill size well vent in body and a passage from the anti-percolator well (opening from main nozzle well) leading to a vent channel on the side of the nozzle. This passage has a #70 drill size restriction.

Nash Anti-Percolator—Consists of a 035" (757S SA, SB, 824S, SA, SB), 028" (876S, SA, 877S, SA, 892S, 2014S) diameter drilled hole in plug at top of anti-percolator well (opening from main nozzle well)

Willys Anti-Percolator—Consists of 0276" (738S), 0225" (832S, SA, 938S, SA, 951S), 0223" (768S, SA), 021" (924S, 2071S), 028" (937S) drilled hole in top of anti-percolator well plug (opening from main nozzle passage)

ACCELERATING PUMP: Diaphragm type, operated by spring, controlled by diaphragm assembly and throttle lever (vacuum and mechanical control) as described below Different types of pump valves are used as follows

Pump Intake Check Valve: ***NOTE—Early carburetors do not have any check valve (restricted intake opening in diaphragm housing directly below flat strainer screen on top of housing).***

Disc Type Intake Check Valve—Consists of disc type check valve in plug on underside of diaphragm housing with cylindrical strainer mounted on valve plug

Ball Type Intake Check Valve—Ball check valve located in intake passage in diaphragm housing Ball is retained by retainer installed in housing at lower end of intake passage

Pump Discharge Check Valve: Several different types used as follows *(See Chevrolet and Willys Stumble correction data):*

Nash (All Carbs.)—Have spring-loaded ball check valve located under plug on top face of diaphragm housing NOTE—On these models pump discharges into main nozzle passage (no pump discharge jet)

Other Carburetors—Have disc type check valve or or ball check valve at top of pump discharge passage in body casting (under bowl cover gasket) Pump discharge needle or weight may be used above the check valve and disc type valve has retainer above valve

Pump Adjustment: On Chevrolet carburetors, pump should be adjusted BEFORE adjusting Metering Rod and also whenever carburetor overhauled

NOTE—Adjustment not required on other models.

Chevrolet Pump Adjustment—With idle speed screw backed off so that throttle valves fully seated, press down on upper end of diaphragm shaft until it is bottomed in diaphragm housing (Tool T109-212 may be used to hold diaphragm shaft down in this position) In this position, metering rod arm should contact pump lifter link at outer end nearest the springs Adjust by bending pump connector link at lower angle using bending tool T109-213 ***CAUTION—Bending link at any other point may cause binding of pump lifter link.***

►**Unsatisfactory Acceleration Performance**—To correct this condition, remove pump diaphragm assembly (see Disassembly data), check for wear or damaged diaphragm, clean intake screen and inlet hole under screen or make certain that intake check valve seats properly, make certain that discharge check valve seats properly, blow out all passages with air.

CONTINUED ON NEXT PAGE

CARTER TYPE "YF" (C nt.)

FLOAT LEVEL: To check float level, remove air horn and bowl cover assembly, invert assembly allowing float to hang freely while resting against intake needle (see Caution below), measure from bowl cover to top of float (see table for setting). Adjust by bending lip which contacts intake needle—do not bend float arm.

►***CAUTION—On models with spring-loaded needle, do not compress this spring in the needle valve stem (allow to hang freely). Compressing the spring will result in false reading and incorrect float setting.***

FLOAT SETTING

Car & Carb.	Checking Gauge	Float Setting
Chevrolet 787S only	T109-83	①1/2"

Willys 938S, SA, 951S	T109-107	5/16"
Willys 924S, 937S, 2071S	T109-126	9/32"

①—**With No. 21-117S Float & Lever Assy. and No. 25-33S Intake Needle & Seat Assy. with solid needle.**

②—**With No. 21-122S Float & Lever Assy. and No. 25-195S Intake Needle & Seat Assy. with spring-loaded needle.**

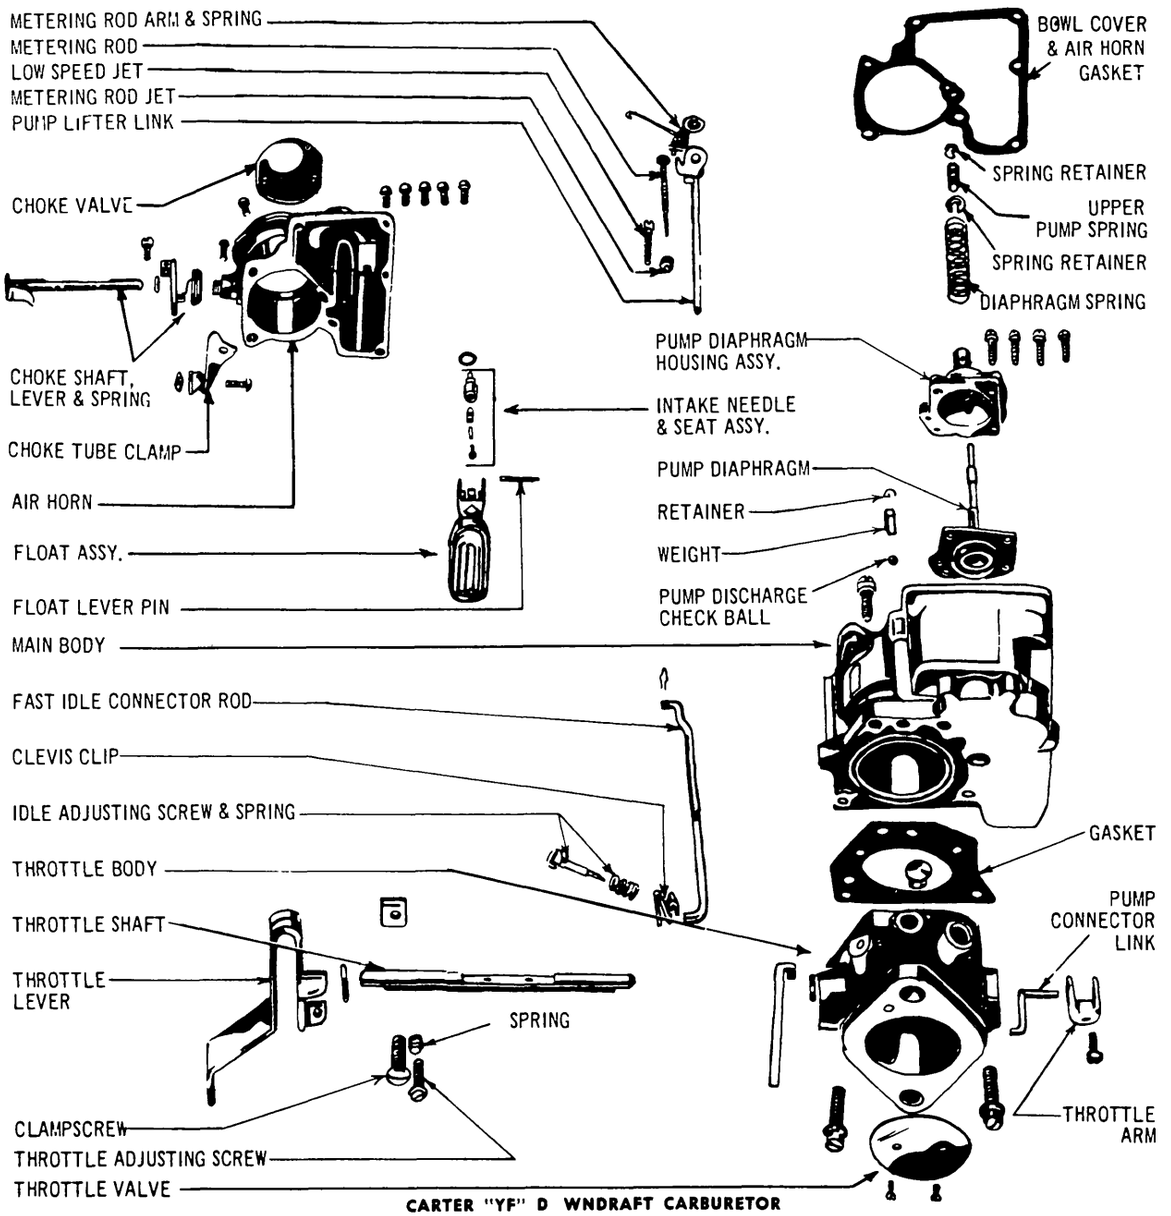
③—With No. 21-117S Float & Lever Assy. and No. 25-189S Intake & Seat Assy. (**solid** needle).

④—With original solid type Intake Needle & Seat No. 25-189S (or 25-257S on 2098S), & Float No. 21-117S.

⑤—With special Spring-loaded Intake Needle & Seat No 25-239S & Float No 21-122S to correct flooding (See Changes & Corrections above).

⑥—With production type Spring-loaded Needle & Seat No. 25-239S & Float No. 21-122S.

Float Drop (Chevrolet Carburetors) — Check travel or drop of float by holding bowl cover assembly upright and measuring from lower face of bowl cover to top of float at free end (float hanging free). Distance should be 1¼". Adjust by bending stop tabs on float arm.



FAST IDLE: ***CAUTION—Different design with special adjustment settings used on carburetors with automatic choke (Climatic Control):***

►**Carburetors with Manual Choke Control**—Fast idle mechanism consists of fast idle arm linked to the choke valve shaft lever with a lip which serves as the stop for the throttle stopscrew. Fast idle arm is rotated when choke valve closed for cold starting and opens throttle to fast idle position.

Adjustment—To check, hold choke valve in wide open position and check that lip on fast idle arm is in contact with boss on carburetor body casting. To adjust, bend fast idle arm rod at lower offset.

►**Carburetors with Automatic Choke Control**—Fast idle mechanism consists of a fast idle cam on the choke valve shaft and a trip lever and link assembly within the choke housing connected to the throttle lever by a connector rod. **Thermostatic coil housing, gasket, and baffle plate must be removed**

CONTINUED ON NEXT PAGE

CARTER "YF" D WNDRAFT CARBURETOR

CARTER TYPE "YF" (C nt.)

to check and adjust fast idle.

Adjustment: Remove thermostatic coil housing, gasket, and baffle plate. Crack throttle valve (to allow choke valve to close), hold choke valve fully closed, close throttle valve as far as possible so that choke trip lever contacts high step of fast idle cam. Check throttle valve opening or clearance between edge of valve and carburetor wall on side opposite idle port (see table for checking gauge and throttle valve opening). If opening not correct, adjust by bending rod at lower angle using Tool T109-213

FAST IDLE SETTING

Car & Carb.	Throttle Opening & Gauge
Chevrolet 756S	076"
Chevrolet 789S	.086"
Chevrolet 965S	.067" T109-234
Chevrolet 967S	.080" T109-234

Nash 892S	028"
Nash 2098S, 2137S, SA	.024" T109-189
Nash 2163S, 2258S	.024" T109-189
Nash (All Others)	.054" T109-193
Rambler (All)	.054" T109-193

►*CAUTION—Check Unloader after adjusting Fast Idle.*

UNLOADER (Carburetors with Automatic Choke): Consists of an arm on the trip lever within the choke housing which rotates the choke valve shaft when the throttle valve is opened wide. **Thermostatic coil housing, gasket, and baffle plate must be removed to check and adjust unloader.**

Adjustment—After adjusting fast idle, hold throttle valve in wide open position, move choke valve toward closed position as far as possible (CAUTION—do not force valve closed). Check choke valve opening or clearance between lower edge of valve and air horn wall (see table below for checking gauge and choke valve opening). If opening not correct, adjust by bending arm on choke trip lever using bending tool T109-213.

UNLOADER SETTING

Car & Carb.	Choke Opening & Gauge
Chevrolet 756S, 89S, 965S, 67S	3/16" T109-28
Chevrolet 2101S	1/4" T109-31
Nash 824S, SA, SB	3/16" T109-28
Nash 877S, SA	9/32" T109-126
Nash 892S	3/8" T109-80
Nash 2098S, 2137S, SA	29/64" T109-81

①—Top of port above top edge of valve.
②—Bottom of port above top edge of valve.

DISASSEMBLY: With carburetor removed from engine, proceed as follows:

1) Remove pin springs and fast idle connector rod springs, remove fast idle connector rod. Take out air horn and bowl cover attaching screws, remove choke tube clamp, lift off air horn and gasket.

2) Take out pump disc check valve retainer ring (when used), lift out retainer and pump check valve disc or pump discharge needle. Then remove throttle shaft arm assembly from end of throttle shaft (pump connector link, shaft seal spring, dust seal washer, felt dust seal). Unscrew four pump diaphragm housing attaching screws, lift out entire pump and metering rod assembly.

3) Disassemble pump by removing attaching screws, pin spring, metering rod, upper pump spring retainer, upper pump spring, metering rod arm, pump lifter link, diaphragm spring retainer, diaphragm spring, and diaphragm housing. Remove intake strainer from housing (use knife tip to lift flat type strainer out of housing recess). On carburetors with disc type intake check valve, remove valve plug assembly. On Nash carburetors, take out plug on upper side of diaphragm housing and remove discharge check valve spring and ball.

►*PUMP DIAPHRAGM CAUTION*—If old diaphragm is to be re-used, store the diaphragm in gasoline. Diaphragm will shrink and stiffen if allowed to dry out for more than one hour.

4) Remove metering rod jet from body casting. Remove Low Speed Jet assembly.

►*CAUTION—Do not attempt to remove pressed-in parts such as Nozzle, Pump Jet and Anti-percolator Air Bleed.*

5) Take out three body flange (throttle body) attaching screws, remove throttle body from main body casting.

6) Remove idle adjustment screw and spring, idle port rivet plug, throttle lever assembly and washer, fast idle arm. Take out throttle valve attaching screws, lift valve out, remove throttle shaft, remove shaft seal by prying out seal retainer.

►*CAUTION—Do not attempt to remove vacuum passage orifice restriction which is pressed in.*

7) Remove float pin, lift out float, remove needle and seat assembly from air horn casting.

8) On carburetors with manual type choke control, take out choke valve screws, lift choke valve out, unhook choke spring, slide choke shaft out of housing. If necessary to replace choke lever assembly, pry off choke lever retainer ring (in end of shaft), remove lever assembly from shaft.

►*CAUTION—Do not attempt to remove balance vent tube.*

CLEANING & INSPECTION: Wash all parts in carburetor cleaning solution (CAUTION—do not immerse diaphragm assembly, pump check disc, or seals in the solution). Inspect all parts for wear or damage, replace if necessary. Blow out all passages with compressed air.

REASSEMBLY: Use all new gaskets. Assemble by reversing the disassembly order as given above and note the following important points:

Throttle Valve Installation—Install valve with trademark (c) toward idle port when viewed from manifold side of flange. Install screws loosely, tap valve and then hold with fingers to insure it being centralized in bore, tighten screws securely.

Metering Rod Jet Installation—NO gasket used

Pump Diaphragm Assembly Installation—Before tightening attaching screws, make certain that diaphragm is flat and edges are not wrinkled, then tighten screws evenly.

Pump Linkage—Check pump linkage to make certain that it does not bind in any position. If binding noted, loosen throttle arm clampscrew and adjust throttle arm, retighten clampscrew.

Float Intake Needle & Seat Assembly—Soak new gasket in 90 proof alcohol for 15 minutes, install and let dry on needle seat before installing this

CONTINUED ON NEXT PAGE

CARTER TYPE "YF" (Cont.)

part. When installing float, make certain that shoulder on float pin is on side away from carburetor bore.

Choke Valve Installation—Install the attaching screws loosely, center valve by tapping on valve lightly and hold in this position with fingers while tightening screws securely.

Fast Idle Linkage (Manual Choke Carburetors): Install connector rod with offset end upward, and with pin spring on outside.

Fast Idle Linkage (Automatic Choke Carburetors): Install connector rod with angle end down toward throttle lever and open ends of rod in toward carburetor body.

▷*CARBURETOR INSTALLATION CAUTION*—Special slotted type flange gasket must be used to install carburetor on engine. Diaphragm type metering rod and accelerating pump control will not function if this gasket not used.

REPAIR PARTS: Gasket Sets—Carter No. 200 (738S, 937S), No. 206A (768S, SA; 787S, SA, SB, 832S, SA, SB; 924S; 938S, SA; 951S; 964S; 2008S; 2071S), No. 208A (756S, SA; 757S, SA, SB; 824S, SA, SB; 965S), No. 209B (789S, SA; 967S), No. 210B (788S, SA; 966S), No. 211 (814S, 820S, SA, SB; 833S, SA, SB), No. 216 (876S, SA; 877S, SA; 892S; 2014S), No. 240 (2101S), No. 241 (2100S), No. 206S (2071S), No. 216 (2098S, 2137S, SA; 2163S).

Repair Pkgs. (with Std. Metering Rods): Carter No. 1546B (738S), No. 1557A (768S, SA); No. 1559C (832S, SA, SB; 938S, 951S), No. 1570B (757S, SA, SB; 824S, SA, SB), No. 1571 (833S, SA, SB; 937S), No. 1572 (820S, SA, SB), No. 1590A (876S, SA; 877S, SA, 2014S), No. 1706 (787S, SA, SB), No. 1707 (756S, SA), No. 1708 (788S, SA), No 1709 (789S, SA), No. 1715 (924S, 2071S), No. 1720 (964S, 2008S), No. 1721 (966S), No. 1741 (965S), No. 1742 (967S), No. 1715 (2071S), No. 1767 (2137S, SA), No. 1760 (2163S).

CARTER "YH" HORIZONTAL

CHEVROLET	Carter Model No.
1953-54 Corvette 6	Three 2066S or 2066SA
1955 Corvette 6	Three 2066SA
NASH	
1952-53 Amb. 5260, 5360	895S, SA
1952-53 Amb. Dual Jetfire	(Front) 973S (Rear) 974S
1954-55 Amb. 6 Jetfire	895SA
1954-55 Amb. 6 Dual Jetfire	(Front) 973S (Rear) 974S
NASH-HEALEY	
1953-54 Models①	973 (Front), 974S (Rear)

①—Beginning 1953 Serial No. NH-2310 (102" WB), NH-3024 (108" WB).

▷CHANGES, CAUTIONS, CORRECTIONS

▷*CHEVROLET CORVETTE CAUTION:* THREE carburetors used per engine with interconnected linkage. CARBURETORS MUST BE ADJUSTED AS SHOWN BELOW.

▷*NASH 895S CARBURETOR CHANGES:* Following parts and setting changes were made in production

Parts Change:	First—Part No.—	Later
Intake Needle & Seat Assy.	25-208S	25-228S
Diaphragm Spring Retainer	63-149	63-178
Metering Rod (Std.)	75-831	75-852
Choke Piston	160-35①	②160-116S

①—One-piece type piston.
②—Two-piece type piston & bushing assy.
Choke Setting Change—DIFFERENT setting required for each type choke piston. *See Choke Setting*

▷*NASH DUAL JETFIRE & NASH-HEALEY 973S & 974S THERMOSTATIC COIL ASSY. & SETTING CHANGES FOR IMPROVED HOT STARTING PERFORMANCE:* Thermostatic Coil Assy. Change: First "N" type No. 170N-250S Assy. superseded by later "P" type No. 170P-250S with DIFFERENT CHOKE SETTING. *See Choke Setting data below.*

Fast Idle & Unloader Setting Changes: *See Fast Idle & Unloader Setting data below.*

▷*NASH DUAL JETFIRE & NASH-HEALY CAUTION:* TWO carburetors used per engine with interconnected throttle linkage. CARBURETORS MUST BE ADJUSTED AS SHOWN BELOW.

▷*NASH AMBASSADOR HARD STARTING OR PERCOLATION CORRECTION (Jetfire & Dual Jetfire Models):* Following production changes were made to improve carburetor operation when hot and can be installed on earlier cars as detailed below.

Heat Deflector—Nash No. 3141499 (Jetfire starting Eng. No. A-262326), No. 3141496 (Dual Jetfire starting Serial No. R-736465) heat deflector used in production beginning with above numbers. Installation—Remove and discard battery heat shield. Install deflector on upper exhaust pipe clamp studs on top of present stud nuts, use check nuts No. NU-819 to retain deflector. See that deflector does not contact exhaust pipe clamps. On Overdrive Cars, mount Kick-down Switch on deflector (holes provided for attaching screws).

Insulated Fuel Line—Nash No. 3142006. Used in production beginning Engine No. 262585. Installation—Interchange elbow fitting on front carburetor and Tee fitting on rear carburetor. Connect fuel line between fuel pump and front carburetor.

Carburetor Drain Tube & Hole—Drain tube installed in carburetor air horn drain hole beginning with Serial No. R-734366 & RC-22771. Package No. 3117368 is furnished for installation on earlier cars.

Installation—Carburetor need not be removed from engine. Remove air cleaner, boot, tee, and adapter. Remove pipe plug from drain hole in bottom of air horn. Enlarge existing drain hole to 5/16" diameter (drill from below, using small ¼" electric drill), remove all metal particles from inside of air horn. Install drain tube, nut, and connection (furnished in package).

DESCRIPTION: "YH" type horizontal carburetors are similar to "YF" models with modifications as required for horizontal operation.

ADJUSTMENT: *Make all adjustments exactly as follows:*

▷*IDLING ADJUSTMENT CAUTION—Models with TWO carburetors (Nash Dual Jetfire & Nash-Healey) or THREE carburetors (Chevrolet) must be adjusted exactly as detailed below for proper synchronization and correct performance.*

Idle Setting: If initial adjustment required to start and warm up engine, set idle mixture adjusting screw (see table below). When engine at normal operating temperature so that choke valve wide open and fast idle inoperative, set throttle stop-screw for correct idling speed (see table below), adjust idle mixture screw so that engine runs smoothly (turn screw out for richer mixture, in for leaner mixture), recheck idle speed.

Idle Mixture Setting

Car & Carb.	Idle Screw Opening
Chevrolet Corvette 2066S, SA	½-1½ turns
Nash Amb. 895S, SA	½-1½ turns
Nash & Nash-Healey 973S, 74S	¾-1¾ turns

Idle Speed Setting (RPM)

②—With selector lever in "N" position
③—No Air Conditioning, 500 RPM Air Conditioner operating, (All Trans. in Neutral)
S-M Synchro-mesh Trans., A-T Automatic Trans

▷*CHEVROLET CORVETTE IDLE ADJUSTMENT (Three-Carburetor installation):*

Throttle Valve Synchronizing: (Preliminary)—With engine turned off and all three choke valves in wide open position, remove the throttle lever stop screw and spring from each carburetor. Loosen the fillister head screws on carburetor shaft universal which secures couplings to throttle shaft at forward end of both center and rear carburetors. Snap accelerator pedal several times to allow couplings to find their normal position so there is no end pressure on throttle valves. Then tighten the fillister head screws. Loosen the two Allen head screws at front end of rear carburetor (NOTE—Clearance provided for throttle valve adjustment by holes in flexible couplings being larger than Allen head screws). Manually close throttle valve in rear carburetor, hold it tightly closed and then tighten the two Allen head screws on rear carburetor flexible coupling. Loosen the two Allen head screws at front end of center carburetor and manually close throttle valve in FRONT carburetor. Hold valve tightly closed and tighten the two Allen head screws on flexible coupling on front of center carburetor.

Checking Throttle Valve Synchronization: Throttle valves must be checked separately and in the following sequence and manner.

CONTINUED ON NEXT PAGE

CARTER "YH" (C nt.)

Rear Carburetor—Check closing off of **rear** throttle valve by twisting (in closing direction) the rear lever of **rear** carburetor. ***There should not be any noticeable signs of rotating on front end of REAR carburetor throttle shaft.*** If rotation is noticeable, loosen Allen screws on rear of **center** carburetor and hold throttle valve in **rear** carburetor closed and tighten Allen screws. If rotation is still noticeable, loosen Allen screws at front of **rear** carburetor and hold **rear** carburetor throttle valve closed and tighten Allen screws.

Front Carburetor—Check closing off of **front** throttle valve by twisting (in closing direction) front lever of **front** carburetor. ***There should not be any noticeable signs of rotating on rear end of FRONT carburetor throttle shaft.*** If rotation is noticeable, loosen Allen screws rear of **front** carburetor and hold throttle valve in **front** carburetor closed and tighten Allen screws. If rotation is still noticeable, loosen Allen screws on front of **center** carburetor and hold throttle valve in **front** carburetor closed and tighten Allen screws.

Center Carburetor—Check **center** carburetor throttle valve as follows: Disconnect accelerator rod at **center** carburetor. Close throttle valve in **rear** carburetor manually at rear end of **rear** carburetor. Hold closed and press throttle lever on **center** carburetor and check for rotation of center throttle shaft at front end. ***There should not be any noticeable signs of rotating on front end of CENTER carburetor throttle shaft.*** If rotation noticeable, correct by the Allen screws between **center** and **rear** carburetors. Close throttle valve in **front** carburetor manually at front end of **front** carburetor and check as outlined above. Correct by the four Allen screws between **center** and **front** carburetors.

Idle Speed & Mixture Adjustment: Assemble throttle lever stop screw and spring on center carburetor only, and adjust so throttle valves are slightly open. Set Idle adjustment (mixture) screws ¾ turn open. Start engine and run until warm. Pull hand brake lever on and move transmission selector lever to "P" (Park) position. Adjust throttle lever stop screw on center carburetor for 475 engine RPM. Turn idle mixture screw on **rear** carburetor **⅛ turn—no more,** whichever increases the RPM or manifold vacuum. If no change, leave adjustment at ¾ turn. Repeat same with center and front carburetors. If RPM changed, correct speed adjustment on center carburetor. Repeat this adjustment more than once to make sure engine RPM or manifold vacuum remain at their highest point. Assemble throttle lever stop screws and spring in front and rear carburetors. Turn front and rear throttle lever stop screw until engine speeds up slightly, then back off screw at least one turn. The center throttle lever stop screw is the only one which should control idle speed.

►***NASH DUAL JET FIRE & NASH-HEALEY ENGINE IDLE ADJUSTMENT (Two-carburetor installations):***

1) Remove air cleaner boots and "Tee" from carburetor air horns.

2) Adjust throttle stopscrew on **rear** carburetor as follows: Hold choke valve open, back off throttle stopscrew until throttle valve is just closed, then turn screw in approximately 2 turns to crank throttle valve slightly. Adjust **front** carburetor similarly.

3) Start engine and allow it to idle until normal temperature reached. Attach Tachometer.

4) Adjust rear carburetor stopscrew for minimum idle speed of 550 RPM.

5) While noting idle speed, synchronize front carburetor by adjusting connecting throttle linkage between carburetors, opening front carburetor throttle just to the point where a further opening begins to increase engine speed. At this point, air suction noise in both carburetors should be identical.

6) Replace air cleaner boots and "Tee" connections.

7) Adjust idle mixture on rear carburetor by turning adjusting screw in (to lean mixture) until engine begins to be rough, then turn screw out ¼ turn. Adjust idle mixture for front carburetor similarly.

8) Recheck idle speed. If not within limits of 550-650 RPM., repeat throttle synchronization (1 thru 5).

Accelerating Pump: No seasonal adjustment provided and pump stroke does not require adjustment.

METERING ROD SETTING

Car Model	Checking Gauge & Length
Chevrolet Corvette	T109-104 (2 312")
Nash (All Models)	T109-104 (2 312")

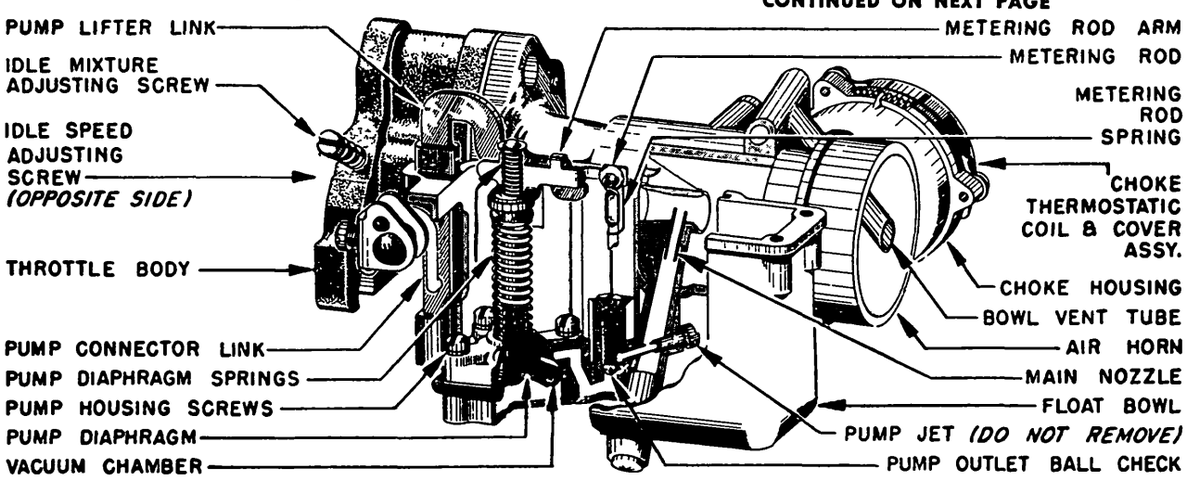
Metering Rod Setting: ***CAUTION—Gauge required for this setting.*** Back off throttle stopscrew so that throttle valve fully seated, remove bowl cover assembly, unhook metering rod spring from rod and **remove metering rod,** insert correct gauge in place of rod and make certain tapered end is seated in metering rod jet (hold gauge vertical to insure correct seating in jet). Press down on diaphragm shaft until metering rod arm contacts lifter link at diaphragm stem. At this point, metering rod pin should rest lightly on metering rod gauge. Adjust by bending metering rod arm at undercut point using bending tool T109-22. Make certain that metering rod arm contacts lifter **at diaphragm shaft and at outer end of lifter link.** Remove gauge and re-install metering rod. Reset idle speed.

FLOAT SETTING

Car & Carb.	Float Setting	Checking Gauge
Chevrolet 2066S, SA	⅜"	T109-80
Nash 895S, SA	⅜"	T109-80
Nash 973S, 974S	7/16"	T109-81

Float Level: Remove bowl cover and float assembly and remove cover gasket. Invert cover so that float hangs freely. Check float height at highest point on float by inserting gauge between float and cover. Adjust by bending float lever.
CAUTION—Do not compress spring in intake needle which would cause incorrect setting.

Float Drop—Check by holding bowl cover assembly in upright position so that float drops to limit of travel. Distance from float seam at free end of float to underside of bowl cover should be 2". Adjust by bending stop tab on float arm.



FAST IDLE SETTING

Car & Carb.	Throttle Opening & Gauge
Chevrolet 2066S, SA	020" T109-29
Nash 895S, SA	③.030" T109-29
Nash 973S, 974S	④.015" T109-44

③—Supersedes 033" setting on 895S, SA
④—Supersedes .030" setting on 973S, 974S.

Fast Idle Setting: ***NOTE—Chevrolet carburetor has manual choke and fast idle adjusted differently.***
Chevrolet—Hold choke valve tightly closed, measure throttle valve opening or clearance between edge of valve and air horn wall on side opposite idle port. If opening not correct (see table below), adjust by bending offset portion of choke connector link using bending tool T109-213.
Nash—Remove thermostatic coil housing gasket, and baffle plate (for access to fast idle cam located within choke housing). Open throttle valve partially (to free fast idle linkage), close choke valve fully, close throttle valve. Hold choke valve tightly closed, apply slight tension to throttle lever to remove play from linkage, check throttle valve opening (clearance between edge of valve and carburetor bore on side opposite idle port). If clearance not correct, adjust by bending throttle connector link at lower angle using tool T109-213. Check Unloader.

CONTINUED ON NEXT PAGE

CARTER "YH" HORIZONTAL CARBURETOR

CARTER "YH" (C nt.)

UNLOADER SETTING

NOTE—No Unloader used on Chevrolet 2066S, SA.

Car & Carb.	Choke Opening & Gauge
Nash 895S, SA	⑨1/2" T109-83
Nash 973S, 974S	⑩5/8" T109-85

⑨—Supersedes 3/16" & 1/4" settings on 895S, SA.
⑩—Supersedes 1/2" settings on 973S & 974S.

Unloader: After making fast idle adjustment (above), hold throttle valve in wide open position and close choke valve as far as possible *(CAUTION—do not force valve beyond point where it is held open by unloader arm).* Check choke valve opening (clearance between lower edge of wall and air horn wall). If clearance not correct, adjust by bending choke shaft unloader arm using tool T109-105.

CHOKE SETTING

NOTE—Choke on Chevrolet 2066S, SA is manual type.

Car & Carb.	Choke Setting
Nash 895S (1st choke piston) ⑤	1 Point Lean
Nash 895SA (Later choke piston) ⑥	1 Point Rich
Nash 973S, 74S (First "N" Coil) ⑦	1 Point Lean
Nash 973S, 74S (Later "P" Coil) ⑧	2 Points Lean

⑤—One-piece Choke Piston No. 160-35.
⑥—Two-piece Choke Piston No. 160-116S.
⑦—"N" Coil No. 170N-250S.
⑧—"P" Coil No. 170P-250S.

THROTTLE VALVE SETTING: *See OVERHAUL data for throttle valve installation.* With valve correctly installed, Idle Port Height (top of port above top edge of valve) and Vacuum Spark Port (bottom of horizontal port above top edge of valve) with throttle valve tightly closed should be:

THROTTLE VALVE SETTING

Car & Carb.	⑪Idle Port	Vacuum Spark Port
Chevrolet 2066S, SA	.124- 128"	⑫ 026-.036"
Chevrolet 2066SA⑬	.124-.128"	⑪.016-.026"
Nash (All)	.124- 128"	⑫.026-.036"

⑪—Top of port above top edge of valve.
⑫—Bottom of port above top edge of valve.
⑬—Late production carburetors.

OVERHAUL (With Carburetor removed from engine):
Disassembly: Remove bowl strainer nut and gasket, take out inlet screen. Remove bowl cover assembly (bowl cover, float, intake needle and seat). Remove choke connector rod, throttle shaft arm assembly, and pump connector link. Take out throttle valve screws, remove valve, remove throttle shaft by carefully tapping it through shaft retaining ring. Take out attaching screws and remove body flange assembly (throttle body) and gasket. Unscrew idle mixture adjusting screw and spring. Use tool T109-210 to remove idle passage rivet plug. Take out four diaphragm housing attaching screws, lift out entire diaphragm and metering rod assembly, disassemble this unit. Remove pump intake passage plug and ball check from diaphragm housing. Remove metering rod jet, pump discharge check plug, spring, ball, and low speed jet. Take out attaching screws and remove climatic control and housing assembly, remove gasket, baffle plate, and fast idle link. Take out choke valve attaching screws, remove choke valve, revolve choke shaft counter-clockwise until piston clears cylinder, remove choke shaft, fast idle cam, and piston as an assembly. Take out attaching screw and remove choke piston housing assembly and gasket. Remove all passage plugs.

►*CAUTION—DO NOT remove Nozzle, Bowl Vent, Tube, Economizer, Passage Bushings, or Pump Jet.*

Cleaning & Inspection: Wash all parts except climatic control coil and housing assembly in cleaning solution. Remove all carbon from flange bore, blow out all passages with compressed air. If choke piston is not free in cylinder, remove welch plug from bottom of housing and clean out all carbon and dirt from cylinder walls and grooves. Install NEW welch plug **air tight.** Inspect all parts for wear or damage.

Reassembly: Use all NEW gaskets. Reassemble parts by reversing order of disassembly procedure (above) and note the following points:

Throttle Valve & Shaft Installation—After throttle valve shaft installed in body, back off throttle stopscrew, install throttle valve with trademark (c in circle) toward idle port when viewed from manifold side of body, insert screws loosely, tap valve lightly to center it in bore before tightening screws. *See Throttle Valve Setting (above).* Install throttle centering washer (prongs outward) while pressing on shaft at lever end, press washer tight against casting (use drive end of 3/8" drive 1/2" socket to press washer in place). Check throttle shaft for free operation after centering washer installed.

Pump Diaphragm Installation—Make certain that discharge hole in diaphragm is aligned with passage in diaphragm housing, install the four attaching screws through housing holes and diaphragm so that it is held smoothly against housing. After baffle plate installed in fuel bowl, install diaphragm assembly in the bowl and tighten the attaching screws evenly. Check for free operation.

Climatic Control Installation—After choke piston housing and gasket installed on body, install choke shaft, fast idle cam, and piston assembly in air horn and check for free operation (if shaft binds loosen housing attaching screws and align housing). Install choke valve so that trademark (c in circle) is visible when valve closed, use new attaching screws, tap valve lightly before tightening screws.

SERVICE PARTS: Gasket Sets—Carter No 223 or 227 (895S, SA, 973S, 974S), No. 248 (2066S, SA).

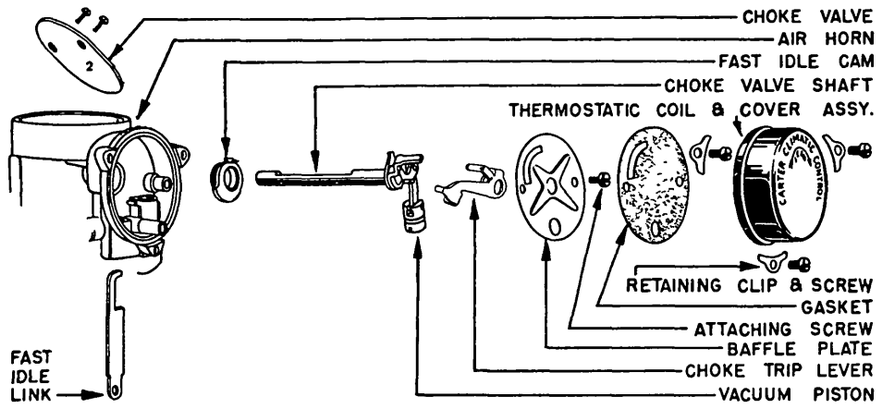
Repair Pkg. (with Std. Metering Rod)—Carter No 1713 or 1719 (895S, SA), No. 1754 (973S, 974S), No 1771 (2066S, SA).

CARTER CLIMATIC CONTROL (AUTOMATIC CHOKE)
(SINGLE BARREL W1, WA1, WE, YH, YF, & B&B CARBURETORS)
OVERHAUL

►*CAUTION—Choke mechanism on different carburetor models are not all of same design. See SEPARATE servicing data for different types following.*

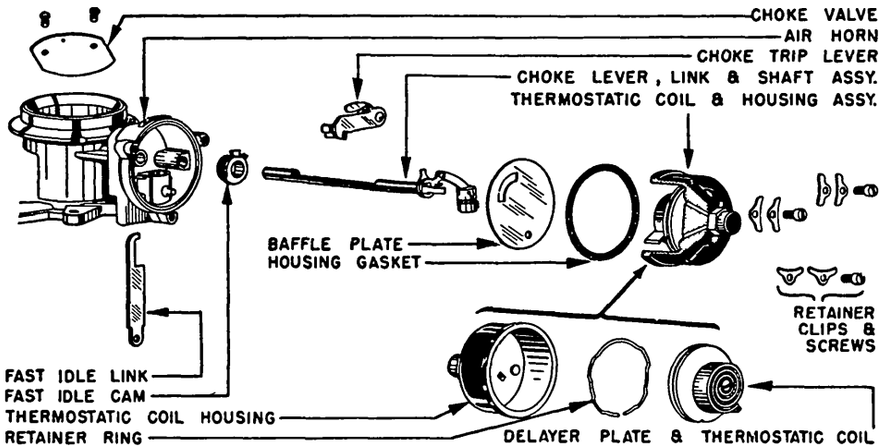
W1 & WA1 TYPE: Disassembly. Take off three attaching screws and retainers on rim of piston housing plate which holds thermostatic coil housing in place. Turn thermostatic coil to right or clockwise to disengage coil hook from prong, lift assembly off. Remove strainer screen (when used). Take out choke valve screws, lift choke valve out. Loosen clamp screw on fast idle link and lever assembly, bend lip under screw with screwdriver (see Unloader adjustment when reassembling) so that it will clear portion of choke valve shaft which is not flat, revolve the choke shaft so that piston clears cylinder edge, remove choke shaft, piston, piston lever and link as an assembly. Remove suction passage gasket from air horn. Do not remove piston housing plate from air horn.

Reassembly. Install the choke piston lever, piston and link, and shaft assembly in air horn and see that choke lever pin and screw assembly correctly located on shaft. Tighten screw on choke lever and see that these parts work freely. Install choke valve using new valve screws. Turn screws down loosely, then close choke valve and tap lightly to centralize valve in air horn, tighten screws securely, see that choke valve operates freely without binding in air horn. Install strainer in housing (when used) and new suction passage gasket in air horn (do not use old gasket). Install air horn assembly on carburetor, tightening screws securely. Install attaching screw and lockwasher under piston housing plate. See that the cork insulating strip on thermostatic coil housing is in good condition and has not shrunk, turn housing so that word 'Climatic' is at bottom, install in this position, turn counter-clockwise until center mark on piston plate housing is in line with reference mark on housing, install retainers and tighten attaching screws which hold housing in place.



WE, YH, & YF TYPE: Disassembly. Remove screws and retainer clips around thermostatic coil housing assembly, lift this assembly and gasket off. Remove screw retaining baffle plate, lift baffle plate out. Remove choke trip lever and slide fast idle link out. Take out mounting screws and remove choke valve. Unhook fast idle cam spring from lip on choke shaft, rotate shaft and lever counter-clockwise until vacuum piston is clear of cylinder, then withdraw lever, link, and shaft assembly from air horn (*CAUTION*—do not lose small pin retaining vacuum piston on link). Remove fast idle cam and spring from hub in choke body. Vacuum piston can be removed from link by taking out pin in link.

►*CAUTION—Do not attempt to remove thermostatic coil from cover.*



Reassembly—Install fast idle cam and spring assembly on hub in choke body, insert choke lever, link, and shaft assembly in air horn, rotate shaft until piston enters cylinder, then lock fast idle cam spring around lip on choke shaft. Install choke valve with trade mark up, install screws loosely, then close valve and tap it lightly to centralize it in air horn, tighten valve screws securely. Check assembly to make certain that valve operates freely and falls open of own weight. After air horn installed on carburetor body, install fast idle link, install choke trip lever, connect throttle shaft connector rod. Install baffle plate and attaching screw. Install cover gasket. Hold choke valve in open position, install thermostatic coil and cover assembly turned so that coil hook is approximately one-quarter turn counter-clockwise from prong on choke lever, rotate assembly clockwise until mark on cover is aligned with center graduation of scale on housing (*CAUTION*—use care not to catch coil hook in hot air tube connection), install retainer clips and tighten screws.

"B&B" CARBURETOR TYPE: Disassembly. Remove screws and retainer clips around rim of thermostatic coil housing assembly, lift this assembly and gasket off. Remove choke trip lever and slide fast idle link out. Take out mounting screws and remove choke valve (CAUTION—these screws are staked). Rotate choke shaft counter-clockwise and press in on fast idle cam until vacuum piston is clear of cylinder, withdraw lever, link, and shaft assembly from air horn (*CAUTION*—do not lose small pin retaining piston on link). Unhook fast idle cam spring from choke shaft lever, slide cam and spring assembly off shaft. Vacuum piston can be removed by taking out small piston pin in link. Do not attempt to remove thermostatic coil from retainer plate (see Caution below).

►*THERMOSTATIC COIL CAUTION*—Thermostatic coil is mounted on heat retainer plate in cover and this assembly can be removed by striking the cover sharply with the hand. *Do not attempt to remove coil from heat retainer plate.*

CARTER WE, YH, & YF AUTOMATIC CHOKE & FAST IDLE

CARTER (B&B) AUTOMATIC CHOKE & FAST IDLE

Reassembly—Install fast idle cam and spring assembly on choke shaft, hook spring end on anchor on shaft lever. Install vacuum piston on shaft link by inserting piston pin. Insert lever, link, and shaft assembly in air horn, rotate shaft clockwise until piston enters cylinder (CAUTION—make certain that fast idle cam is against boss in housing). Install choke valve using new screws, install screws loosely, then close valve and tap it lightly to centralize it in air horn, tighten screws securely and stake screws by squeezing with pliers. Check assembly to make certain that valve operates freely and does not bind (valve should fall open of own weight). After air horn installed on carburetor body, install fast idle link and trip lever (CAUTION—arm on trip lever must engage slot in link), connect throttle lever connector rod. Make fast idle and Unloader adjustments (see separate data following). Hold choke valve shut, install baffle plate (CAUTION—plate must be centered on pin in housing), install new gasket. Make certain that thermostatic coil properly installed in cover (see Note below), install assembly with indicator mark straight up and down, install retainer clips and screws loosely, rotate assembly counter-clockwise until indicator mark on cover is in line with center graduation of scale on housing, tighten retainer screws securely.

►*INSTALLATION CAUTIONS*—When installing carburetor on engine, note the following important points:

Tightening Heat Tube Connection (Carter B&B Carburetors)—Use two wrenches and hold heat tube fitting in choke cover from turning while tightening heat tube coupling. **Use car not to turn or distort chok housing.**

CLIMATIC CONTROL (AUTOMATIC CHOKE)
(DUAL WDO, WCD, WGD, & BBD CARBURETORS)
OVERHAUL

▷*CAUTION—Choke mechanism on different carburetor models are not all of same design. See SEPARATE servicing data for different types following.*

WDO & WCD TYPES: Disassembly. With air horn assembly removed from main body, remove fast idle lever from choke valve shaft (opposite end from choke housing), remove attaching screws and retainers around rim of thermostatic coil and housing assembly, rotate housing clockwise to disengage coil hook from lever prong, lift off housing assembly, remove gasket and baffle plate. Take out choke valve attaching screws, remove valve. Rotate shaft until vacuum piston is clear of cylinder, then withdraw shaft and lever assembly with piston attached. Remove piston from link by taking out piston pin. On early WDO carburetors, remove strainer screen.

Cleaning & Inspection—Clean all parts with carburetor cleaner or suitable solvent, dry with compressed air (CAUTION—support thermostatic coil with fingers to prevent air blast distorting coil). Examine vacuum piston and cylinder for burrs and scores, make certain that slots or grooves in cylinder and piston are clean and free from carbon deposits (welch plug in end of cylinder can be removed for inspection and cleaning of the cylinder by drilling a small hole in the plug and prying it out).

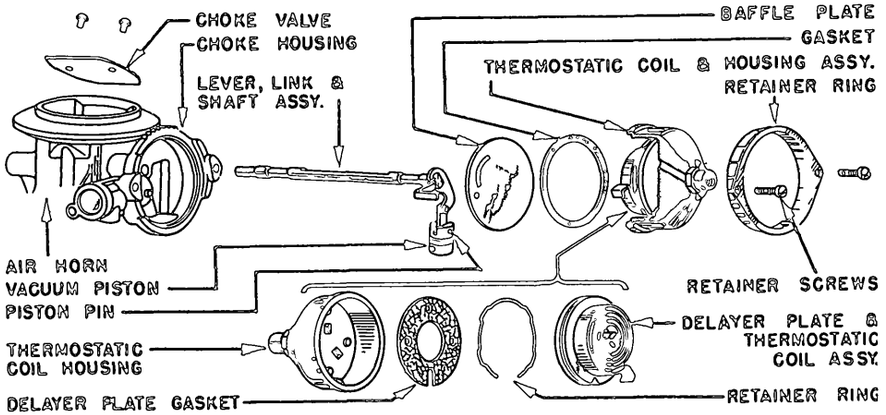
▷*CHRYSLER CARBURETOR THERMOSTATIC COIL CAUTION:* Thermostatic coil is mounted on heat retainer plate in housing and this assembly can be removed by striking the housing sharply with the hand. When reassembling, use new gasket under heat retainer plate, make certain that notch in plate is aligned with lug in housing and that assembly seated firmly in housing. Do not attempt to remove coil from heat retainer plate.

Reassembly: Reverse disassembly directions given above. See that choke valve operates freely without binding or rubbing on carburetor after screws have been tightened securely. Replace cork insulator strip inside control housing, if old insulator not in good condition, to insure tight seal. Install thermostatic coil and housing assembly with label down, insert attaching screws and lockwashers loosely, then rotate housing counter-clockwise one-half turn until pointer on piston plate housing and notch in coil housing line up and tension can be felt on choke valve, tighten attaching screws. Check setting.

Installing Carburetor on Engine. Make certain that hot air flexible tubing is properly connected at both ends (air leaks will interfere with choke operation). Thermostatic coil setting as given above is standard. If operation is unsatisfactory, see Adjustment directions below.

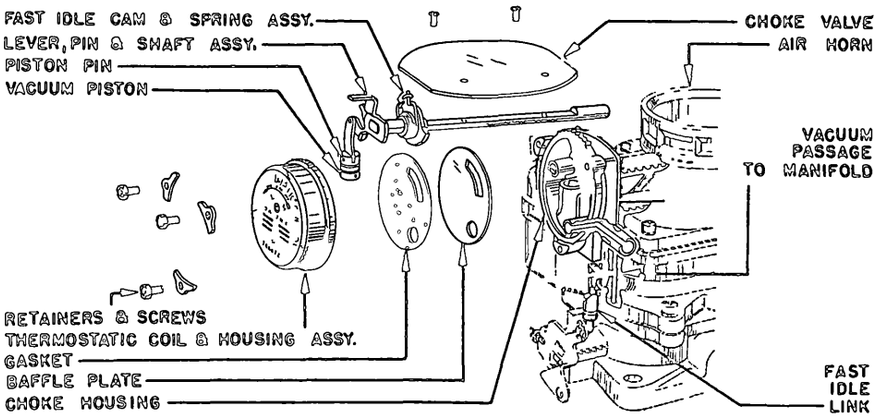
Choke Valve Installation—When installing choke valve, it must be correctly aligned in air horn so that it does not drag or stick in the closed position which will interfere with correct choke operation. Install valve with trademark upward, use new attaching screws and install screws loosely, then centralize valve by tapping it lightly in the closed position before tightening screws securely.

▷*CHRYSLER CARBURETOR CAUTION:* Use care not to distort or rotate choke housing when tightening heat tube connection. Hold tube fitting in housing with one wrench while tightening connection with second wrench.



WGD & BBD TYPES: Disassembly. With air horn removed from the main body, remove attaching screws and retainers on rim of thermostatic coil and housing assembly, rotate housing clockwise to disengage coil hook from lever prong, lift off housing assembly, remove gasket and baffle plate. Remove choke trip lever, slide fast idle cam out. Take out attaching screws and remove choke valve. Unhook fast idle cam spring from choke lever, rotate choke shaft until vacuum piston is clear of cylinder, withdraw lever, link, and shaft assembly from air horn with the piston attached (CAUTION—do not lose small pin linking piston on lever, piston can be detached by taking out this pin). Lift out fast idle cam and spring assembly. Choke housing can be removed from air horn casting by taking out three self-tapping screws (CAUTION—remove air passage gasket from air horn and use new gasket when re-installing housing).

Cleaning & Inspection—Wash all parts except thermostatic coil and housing assembly with carburetor cleaner or suitable solvent, dry with compressed air. Examine vacuum piston and cylinder for burrs and scores, make certain that slots or grooves in cylinder and piston are clean and free from carbon deposits (welch plug in end of cylinder can be removed for inspection and cleaning of cylinder by drilling small hole in plug and prying it out). Replace all worn or damaged parts.



▷*DE SOTO BBD CARBURETOR THERMOSTATIC COIL CAUTION:* Thermostatic coil is mounted on heat retainer plate in housing and this assembly can be removed by striking the housing sharply with the hand. When reassembling, use new gasket under heat retainer plate, make certain that notch in plate is aligned with lug in housing and that assembly is seated firmly in housing. Do not attempt to remove coil from heat retainer plate.

Reassembly—Install new air passage gasket in air horn, install choke housing and tighten the three self-tapping screws securely. Install fast idle cam and spring assembly in housing, insert choke shaft and piston assembly, rotate shaft until piston enters cylinder, engage fast idle cam spring on choke valve lever. Install choke valve with trademark upward, use new attaching screws and install screws loosely, then centralize valve by tapping it lightly in the closed position and tighten screws securely. Check assembly for free operation without binding (valve should close of own weight). Install fast idle link, choke connector rod and retainers, and trip lever. Adjust Fast Idle and Unloader (see data following). Install baffle plate and new gasket. Install thermostatic coil and housing assembly with the index mark at the bottom, revolve housing clockwise until index mark on housing is aligned with center graduation of scale on choke housing, install retainers and attaching screws and tighten securely. Check setting (see Adjustment data).

▷*DE SOTO BBD CARBURETOR CAUTION:* Use care not to distort or rotate choke housing when tightening heat tube connection. Hold tube fitting in housing with one wrench while tightening connection with second wrench.

(1) Supersedes Part No. 11-163S.
(2) Cars with PowerFlite Trans.
(3) Supersedes No. 75-811 (used on first 935S, 2039S, 992S).
(5) .0635" on early 1948 Production.
(6) Inner (Screw) Nozzle No. 31 or .120", Outer (Slip) Nozzle .110"
(8) Nozzle Assembly (Inner & Outer Nozzle).
(9) Three Sizes Lean. Part No. 75-625
(10) Nozzle Installed Permanently - DO NOT REMOVE.
(12) Closed Tip. Top hole .028" or No. 70 (45° Angle), Lower hole .0635" or No. 52 (60° Angle).
(15) Inner Nozzle .120", Outer Nozzle .125".
(16) Three Sizes Lean, Part No. 75-629.
(19) Three Sizes Lean, Part No. 75-476.
(20) Supersedes Part No. 48-143S.
(23) Supersedes No. 75-813 (used on first 935S, 2039S, 992S).
(24) Supersedes No. 75-875 (used on first 935S, 2039S, 992S).
(25) Supersedes No. 75-817 in 931S, SA; and No. 75-855 in 931SB, SC; when modified with Unit Pkg No. 75-870U.
(29) Superseded by 75-769 when modified to 830SB.
(31) Supersedes No. 48-180.
(35) One Size Rich No. 75-841 and Two Sizes Rich No. 75-842.
(36) Closed Tip. Top Hole .021" (45° Angle), Lower hole .0945" (70° Angle).
(40) .0635" (Early Production), .061" (Later Production).
(41) Supersedes No. 11-215S.
(45) Three Sizes Lean No. 75-714.
(46) Three Sizes Lean No. 75-742.
(47) Three Sizes Lean No. 75-746.
(48) Three Sizes Lean No. 75-858.
(49) Three Sizes Lean No. 75-532.

① Closed Tip. Top hole No. 75 (45° Angle), Lower hole No. 47 (70° Angle).
② Supersedes No. 11-163S.
③ Supersedes No. 75-593.
④ Supersedes No. 75-612.
⑥ Inner (Screw) Nozzle No. 31 or .120", Outer (Slip) Nozzle .110"
⑧ Nozzle Assembly (Inner and Outer Nozzle).
⑩ Nozzle Installed Permanently - DO NOT REMOVE.
⑪ Nozzle Assembly, Inner Nozzle No. 31 (.120"), Outer Slip Nozzle .110".
⑭ Supersedes 75-864 (used on first 2009S).
⑮ **Inner Nozzle .120". Outer Nozzle .125".**
⑯ Supersedes No. 120-15S (This Jet part of Kit No. 75-915U).
⑰ Three Sizes Lean No. 75-906.
⑲ With 232" Engine (No. 2115S with 262" Engine).
⑳ Twin H-Power Cars (Two Carburetors).
㉚ Closed Tip. Top hole .021" (45° Angle), Lower hole .081" (70° Angle).
㉜ Three Sizes Lean No. 75-922.
㉝ Three Sizes Lean No. 75-906 (use 75-1137 for Sports Car "Italia").
㉞ Three Sizes Lean No. 75-976.
㉟ Three Sizes Lean No. 75-863.
㊱ Closed Tip. Top hole .021" (45° Angle). Lower hole .0945" (79° Angle).
㊴ Closed Tip. Top hole .021" (45° Angle), Lower hole .081" (70° Angle).
㊺ Three Sizes Lean No. 75-714.
㊻ Closed Tip. Top hole .021" (45° Angle), Lower hole .076" (70° Angle).
㊼ Supersedes No. 75-534.
㊽ Three Sizes Lean No. 75-858.
㊾ Supersedes No. 48-143S.
㊿ Use only latest type (identified by raised dot above trade mark).

(5) Three Sizes Lean No. 75-511.
(6) Inner Nozzle No. 31, Outer Nozzle .110".
(8) Nozzle Assembly (Inner & Outer Nozzle).
(10) Nozzle Installed Permanently - DO NOT REMOVE.
(13) Supersedes No. 75-486.
(14) Supersedes No. 75-1111.
(15) Supersedes No. 120-155 (.091").
(16) Supersedes No. 75-845.
(17) Three Sizes Lean No. 75-514.
(18) Used only on cars with Hydra-Matic or Self-Shifting Trans.
(19) Supersedes No. 75-845.
(20) "Dual Jet Fire" Installation (Two Carburetors).
(21) First Cars (Two Carburetors of Same Type).
(22) Later Cars (Two Carburetors of Same Type).
(23) Latest Cars (Two Carbs.) can be used to replace 2098S or 2137S, SA.
(24) Dual Jet Fire Engine (Two Carbs. 973S Front, 974S Rear).
(25) Supersedes No. 11-176S.
(35) Supersedes No. 75-890.
(38) Super Powerflyte (Two Carburetors).
(40) Supersedes No. 75-831 (used on first 895S Carburetors).
(41) Supersedes No. 11-163S.

② Closed Tip. Top hole No. 75 (45° Angle), Lower hole No. 52 (60° Angle).
③ Supersedes No. 11-163S.
⑦ Closed Tip. Top hole .028" (45° Angle), Lower hole .0635" (70° Angle).
⑧ Nozzle Assembly (Inner and Outer Nozzle).
⑩ Nozzle Installed Permanently - DO NOT REMOVE.
⑫ Closed Tip. Top hole No. 70 (45° Angle), Lower hole No. 52 (60° Angle).
⑭ Supersedes No. 75-541.
⑮ Inner Nozzle .120", Outer Nozzle .125".
⑱ Use only on cars with Hydra-Matic Drive.
⑲ Closed Tip. Top hole .0292" (45° Angle), Lower hole .0635" (60° Angle).
⑳ Supersedes No. 75-873.
㉒ Supersedes No. 75-538.
㉕ Used on first Synchro-mesh Trans. Cars.
㉘ Closed Tip. Top hole .037" (45° Angle), Lower hole .071" (60° Angle).
⑯ Jet Installed permanently in carburetor - DO NOT REMOVE.
㊽ Closed Tip. Top hole .020" (45° Angle), Lower hole .070" (60° Angle).

(1)—Supersedes Part No. 120-192 (used on first 2053S carburetor). (2)—Superseded by 11-260S on later carburetors. (3)—Supersedes No. 75-995 used on first carburetors. (4)—1 Size Rich No. 75-1123. (5)—Metering Rod & Jet Unit. (6)—Except No. 75-994 (1952), No. 75-937 (1953 Dynaflow Cars). (7)—Supersedes No. 11-243S. (8)—Supersedes No. 75-941 used on first carburetors. (9)—Supersedes No. 120-185. (10)—Nozzle is installed permanently. DO NOT REMOVE. (11)—High Altitude only. (12)—Size #67 for Carburetors No. 894S. (13)—No metering rod used on secondary side. (14)—No idling system used in secondary side of carburetor. (15)—Supersedes Part No. 48-169S. (16)—Air-conditioned Cars. (37)—75-1156U 3 size lean (rod & jet unit). (18)—Installed permanently. DO NOT REMOVE. (35)—Superseded by 75-1136. (39)—75-919 3 size lean. (39)—Synchro-mesh Transmission Cars. (40)—Automatic Trans. (Hydra-Matic). (41)—75-1201U Metering Rod & Jet Unit (for altitude use), consists of 1-61-246, 2-75-1199, 2-120-194.

⑧—With "Throttle Restrictor"
⑨—Early 1954 cars only. (See Carter "BBS" for later cars).

NOTE: Chrysler Eight C39 & C40 (1946-48)—Stromberg Model AAVS-2 carburetor also used. See Stromberg Model AAV-2 & AAVS-2 article for complete data.

Dodge Models (1946-51)—Stromberg Models BXV-3 and BXVD-3 or BXVES-3 also used on these cars. See Stromberg data.

Plymouth Models (1946-48)—Carter W1 574S and Stromberg BXV-3 carburetors also used on these cars. See Carter W1 (Chevrolet) and Stromberg BXV-3 data.

►CHANGES, CAUTIONS, CORRECTIONS

►**Chrysler 6 & 8 and DeSoto EG1, EV1, E7A1 Carburetor Change to Improve Dashpot Action:** Original Dashpot Valve Cage Assembly, Part No. 149-73S, changed to new type, Part No. 149-102S.

►**CHRYSLER 6 & DE SOTO E7L1 & E7L2 PRODUCTION CHANGE:** Model E7L1 carburetor used on first cars, superseded by E7L2. These carburetors alike except for new **Air Horn Assembly** (No. 6-622S superseding No. 6-608S) with changes in idle system as follows: **Idle Passage Air Bleed (in Air Horn)**—(E7L1) .0531" (E7L2) .0465"; **Restriction in Body**—(E7L1) .0531", (E7L2) .0452". **Body Flange Assy. (both)**—No. 1-629S superseded by 1-687S. **Air Horn Assembly**—(E7L1) 6-608S, (E7L2) 6-622S. NOTE—Unitized Pkg. No. 195-42U furnished to bring Kick-down Switch up to later standards (E7L1 & L2).

►**CHRYSLER 6 & DE SOTO E7L3 & E7L4 PRODUCTION CHANGE:** Model E7L4 supersedes E7L3 and earlier carburetors. These models similar to E7L2 (above) except for following changes: **Body Flange Assy.** No. 1-687S, **Throttl Shaft & Arm Assy.** No. 3-671S. **Pump Jet** No. 48-167. **Pump Link** No. 117-141, **Dash Pot Pick-up Arm Spring** No. 61-393, **Dash Pot Valve Cage Assy.** (E7L4 only) No. 149-108S, **Valve Plunger Rod & Plate Assy.** (E7L4 only) No. 49-173S, **Kick-down Switch Terminal Block** No. 184-52 or 184-53S (with Clip Assy.).

NOTE—Accelerating pump on these models does not require adjustment other than to see that lifter arm link is at right angles to lifter link shaft.

►**CHRYSLER 8 E7J1 & E7J2 PRODUCTION CHANGE:** Model E7J1 carburetor used on first cars, superseded by E7J2. These carburetors alike except for new **Air Horn Assembly** (E7J1) No. 6-592S, (E7J2) No. 6-619S, and new **Body Flange Assembly** (E7J1) 1-600S, (E7J2) 1-631S, with changes in idle system as follows: **Idle Passage Air Bleed** (E7J1) .063", (E7J2) .0531", **Restriction in Body** (E7J1) .053", (E7J2) .057", **Kickdown Switch Terminal Block** (E7J1) No. 184-26, (E7J2) No. 184-52.

►**CHRYSLER 8 E7J3 & E7J4 PRODUCTION CHANGES:** Model E7J4 supersedes E7J3 and earlier carburetors. These models similar to E7J2 (above) except for following changes: **Body Flange Assy.** No. 1-688S (supersedes 1-631S), **Valve Plunger Rod & Plate Assy.** (E7J4 only) No. 49-173S, **Dash Pot Valve Cage Assy.** (E7J4 only) No. 149-108S, **Step-up Jet & Gasket Assy.** (E7J4 only) No. 149-110S.

►**CHRYSLER 6 & DE SOTO 1951 CARBURETOR PRODUCTION CHANGE:** E9C used on first cars, superseded by E9C1. Following parts not interchangeable between these models:

	E9C Carb.	E9C1 Carb.
Air Horn & Climatic Control Assy.	6-754S	6-739S
Air Horn Assy.	6-768S	6-769S
Body Gasket (main body-to-air horn)	121-177	121-194

►**CHRYSLER 6 & DE SOTO E9A1 AUTOMATIC CHOKE CAUTION:** See Automatic Choke data for special choke Removal & Installation instructions to avoid breakage of thermostatic coil housing.

►***PLYMOUTH 1953 ENGINE SURGE (during light acceleration at 20-25 MPH):*** If not corrected by careful engine tune-up, this condition can be corrected by installing slightly richer Main Metering Jet and leaner Step-up Power Jet:

	Original Part No.	New Part No.
Main Metering Jet	224-11S	224-15S
Step-up Power Jet	149-41S	149-50S

►**Carburetor Mounting Flange Gasket Caution (For all Models):** Step-up jet vacuum piston vacuum passage terminates at carburetor mounting flange and special slotted type gasket must be used when mounting carburetor on manifold CAUTION—Use of plain or solid type gasket will shut off vacuum passage and cause excessive fuel consumption complaints.

►**Engine Stalling while Idling Correction**—Check idle setting (see below). Check slow-closing throttle adjustment (first type only) as directed in article on Chrysler Slow-closing Throttle in Carburetion Equipment Section. Remove Idle Orifice Tube and Plug Assembly and clean tube and passages with compressed air. Remove idle adjusting screw and blow out idle ports with air.

CONTINUED N NEXT PAGE

CARTER (B&B) DOWNDRAFT TYPE (Cont.)

▷Carburetor Loading Up Complaints—Check and adjust float level.

▷Engine Stalling or Stumbling when Throttle Opened—May be caused by accelerating pump leakage (worn or wrinkled pump leather, inlet or outlet ball check valves not seating). To check pump for leakage, remove bowl cover, float, pump outlet ball check valve plug, and pump assembly. Fill pump cylinder with gasoline and re-install pump plunger, taking care not to wrinkle or damage pump leather. Hold outlet ball check valve firmly on seat (use brass rod inserted through valve plug hole), press down on pump plunger. Leakage will be evidenced by gasoline at inlet or outlet ball check valves or above pump plunger. If pump plunger can be pushed all the way down and all gasoline discharged from the cylinder, replace pump plunger or reseat ball check valves by tapping on ball with a brass rod. Install new ball (original ball will be flattened by reseating operation) and repeat check. Repeat reseating operation if necessary. remove pump jet and clean with compressed air or install new jet.
CAUTION—Ball check valves are relatively soft (inlet ball Monel, outlet ball Stainless Steel) and any ball used in reseating operation should be replaced for service.

▷Poor Gasoline Mileage (Economy) Complaints—Check float level. See that the main metering jet is correct type and not worn (special lean metering jets available for special service such as high altitudes or high test fuel). See that step-up jet tight on seat and not leaking, make certain that step-up valve rod and piston clean and not binding or sticking, check step-up piston spring (replace spring if weak or damaged). Check for clogged main vent tube (will cause excessive richness and poor gasoline mileage at speeds above 50 MPH.).

DESCRIPTION

DESCRIPTION: Plain tube, downdraft type with balanced bowl vent (bowl vented through tube cast in air horn), throttle operated accelerating pump, and vacuum controlled step-up jet or power orifice. Some models have special features:

Throttle Restrictor (D6N1, D6N2, E7V1, E7W1)—Restrictor consists of a hemispherical casting bolted on top and bottom of throttle valve (special studs used instead of regular throttle valve mounting screws) to provide control similar to a governor action. *See Throttle Valve Setting (below).*

Automatic Choke (E9A1, B1, C, C1)—Carter Climatic Control assembled on carburetor air horn (has integral fast idle mechanism and unloader). *See adjustment data below and also "Carter Climatic Control"*

Fuel System (Idling):—Fuel taken from main nozzle well up through Idle Orifice tube (metered by restriction in tube) to cross-channel in which it is mixed with air admitted through idle air bleed opening in carburetor wall above venturi. From this point fuel mixture is taken down through channel to discharge ports at throttle edge.

Driving Range—Fuel for main nozzle metered by main metering jet in float bowl. Main nozzle air bled by main vent tube in upper end of nozzle which connects with air vent leading to bowl vent. Lower end of nozzle closed by rivet.

High Speed & Wide Open Throttle Operation—Vacuum piston, which is normally at lower end of stroke with piston spring compressed, will be forced up by spring when manifold vacuum falls off, raising the step-up rod or needle and opening the valve, permitting additional fuel to flow through the power orifice (step-up jet) to the main nozzle.

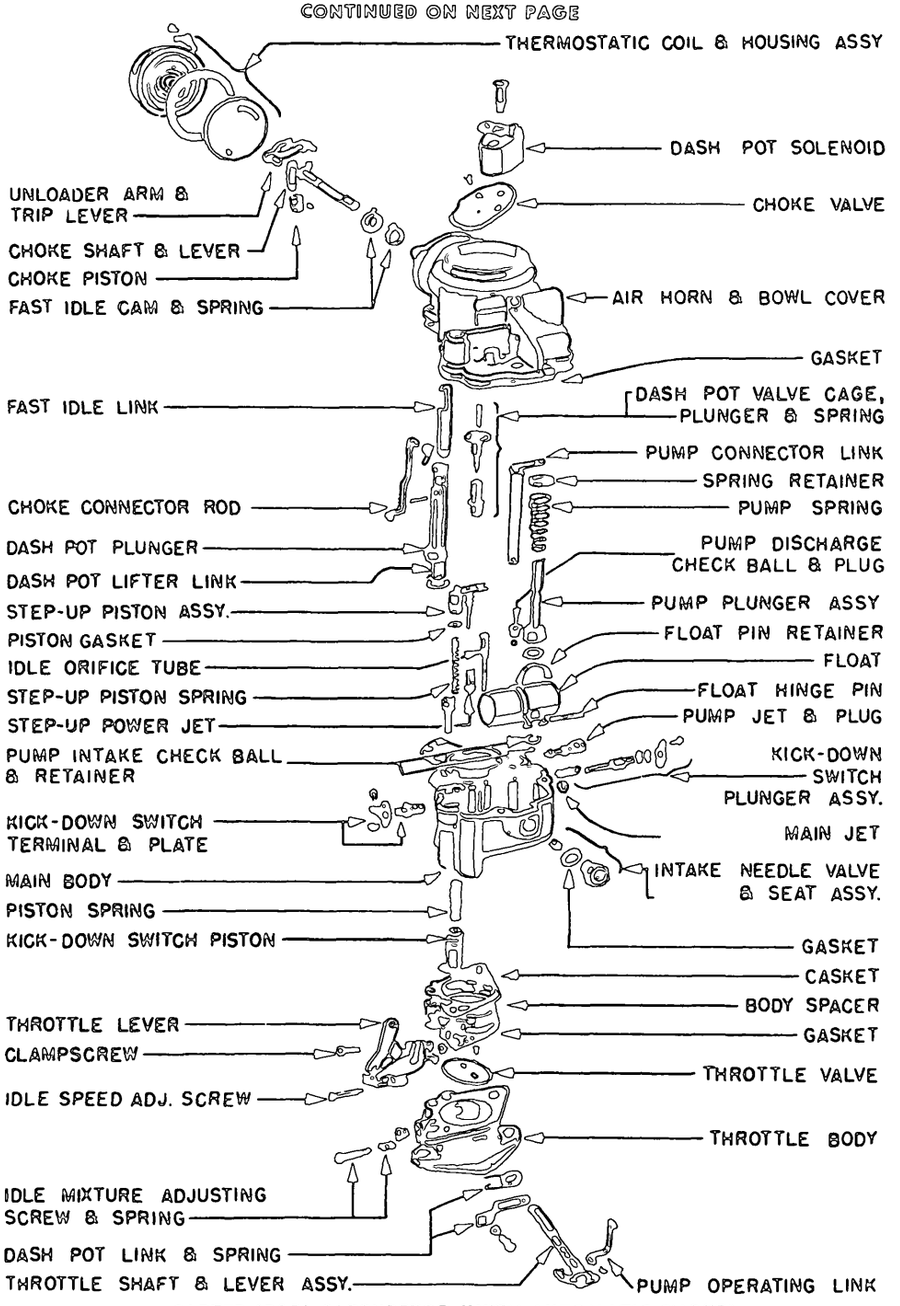
ADJUSTMENT & OVERHAUL

SLOW-CLOSING THROTTLE (DASHPOT): On carburetors used on cars with Fluid Drive or automatic transmissions (Vacamatic, Simplimatic, Tip-toe Shift, Prestomatic, etc.). *NOTE—Two types of dashpot used:*

ADJUSTABLE TYPE

Dashpot is mechanical type with adjusting screw located on bowl cover (this screw regulates plunger travel). *See "Chrysler, DeSoto, Dodge Slow-closing Throttle" and adjust this unit as follows:*

Adjustment—Turn adjusting screw in or clockwise fully, then back screw out 5 turns (all carburetors except D6P2, V1, E9U1), 4½ turns (D6P2, V1, E9U1). This will provide correct dashpot action. *NOTE—Turning screw out further will provide additional retarding action.*



NON-ADJUSTABLE (MAGNETIC) TYPE

Dashpot has by-pass check valve controlled by solenoid connected in automatic transmission control circuit. No adjustment is provided.

See "Chrysler, DeSoto, Dodge Slow-closing Throttle"

THROTTLE KICK-DOWN SWITCH: *TWO DIFFERENT TYPES used as follows:*
Automatic Transmission Control Kick-down Switch (All Cars with Automatic

CONTINUED ON NEXT PAGE

CARTER (B&B) CARBURETOR (WITH AUTOMATIC CHOKE)

CARTER (B&B) DOWNDRAFT TYPE (C nt.)

Transmission)—This switch is built-in the carburetor and does not require attention in service. No adjustment is provided. See "Chrysler, DeSoto, Dodge Kick-down Switch" in Electrical Equipment Section.

►**Kick-down Switch Change for Improved Performance**—*See "Chrysler, DeSoto, Dodge Kick-down Switch" in Electrical Equipment Section.*

Overdrive Control Kick-down Switch (E9N1, D6U1, D6V1): Switch is separate unit mounted on the carburetor and actuated by a lever on the throttle valve shaft. Adjust as directed below. NOTE—On other Overdrive Cars, Kick-down switch is mounted separately and is not part of the carburetor assembly.

Adjustment—Adjust switch position on bracket (loosen one mounting nut on switch stem, tighten opposite nut) for clearance of 1/64-3/64" with throttle valve in wide open position. *CAUTION—Throttle lever must have sufficient over-travel to operate switch.*

VACUUM STEP-UP (ECONOMIZER): No adjustment required but setting should be checked when carburetor reassembled after servicing to insure step-up valve closing. To check, push vacuum piston down in cylinder to end of stroke, check clearance between piston plate and head of step-up valve needle stem. Clearance should be 1/64-1/32". To adjust, bend piston plate slightly.

Vacuum Step-Up Spring—When servicing carburetor, make certain correct type Step-Up Spring installed as follows:

Part No. — Used On:

61-135—513S, D6A2, D6C2, D6G1, D6H1, D6H2, D6M1, D6P1, D6P2, D6R1, D6U1, D6V1, E6N3, E6P5, E6S1, E6S2, E6S3, E6T1, E6T2, E6U1, E6U2, E6W1, E7L1, E7L2, E7L3, E7L4, E9A1, E9C, E9C1, EE1, EG1, EG2, EL1, EU1, EV1, EV2, EX1, EX1R, EX2, EX2R, EX3, EX3R.

61-134—B6P1, B6R1, B6T1, B6U1, B6V1, B6W1, D6J1, D6N1, D6N2.

61-146—E7A1, E7J1, E7J2, E7J3, E7J4.

IDLING ADJUSTMENT: Idle adjusting screw controls fuel discharge through lower idle port and should be turned in for leaner mixture, out for richer mixture. Approximate idle screw settings given in table below. Adjust only with engine warmed up so that choke valve is wide open and fast idle inoperative. Idle speed controlled by throttle lever stopscrew. See tune-up data on car model pages for complete tune-up data on each car model.

IDLE SETTING

Car Model	Carburetor	Idle Setting	Idle Speed
Chrysler 6①	EX1, 1R, 2, 2R, 3, 3R	½-1½ turns open	6 MPH.
Chrysler 6①	EV1	¾-1¼ turns open	450-475 RPM.
Chrysler 6④	E7L1, L2, L3, L4	½-1½ turns open	450-475 RPM.
Chrysler 6①	E9C, E9C1	½-1½ turns open	6 MPH.
Chrysler 6④	E9B1, E9A1	½-1½ turns open	475-500 RPM.
Chrysler 8④	E7A1	¾-1¼ turns open	450-475 RPM.
Chrysler 8④	E7J1, J2, J3, J4	½-1½ turns open	450-475 RPM.
DeSoto①	EX1, 1R, 2, 2R, 3, 3R	½-1½ turns open	6 MPH.
DeSoto①	EL1	½-1½ turns open	6 MPH.
DeSoto④	EV1	¾-1¼ turns open	450-475 RPM.
De Soto④	E7L1, L2, L3, L4	½-1½ turns open	450-475 RPM.
De Soto⑤	E7V1, E7W1	½-1½ turns open	6 MPH.
DeSoto①	E9C, E9C1	½-1½ turns open	6 MPH.
DeSoto④	E9B1, E9A1	½-1½ turns open	475-500 RPM.
Dodge①	D6H2, J1, P1, P2, U1, V1	½-1½ turns open	6 MPH.
Dodge④	D6M-1	½-1½ turns open	475-500 RPM.
Dodge①	E9N1, E9T1	½-1½ turns open	6 MPH.
Dodge④	E9U1, E9V1	½-1½ turns open	475-500 RPM.
Plymouth	D6G1	½-1¼ turns open	6 MPH.
Plymouth	D6H1, H2, N1, N2, R1, U1	½-1½ turns open	6 MPH.
Plymouth⑥	D6P1, D6P2	½-1½ turns open	450-500 RPM.

①—Cars with Standard Transmission.
④—Cars with Hydraulically Controlled Transmission & Fluid Drive.
⑤—Special City Traffic. ⑥—Hy-Drive Transmission Cars

FLOAT LEVEL: To check float level, remove air horn (integral with float bowl cover), use special gauge (see Note), placing gauge on top edge of bowl with lugs extending down toward float on either side of soldered seam. Press lip of float lever against needle valve, float should contact both lugs on gauge. Adjust by bending float lever lip slightly at point where it contacts valve needle (do not bend float arm. If gauge not used, measure from top edge of bowl to top of float (not soldered seam). This measurement should be 5/64" for all models except those listed in table below. Float level figures are plus or minus 1/64".

FLOAT LEVEL SETTING

Car Model	Carburetor	Float Level	Checking Gauge
Chrysler 6	EV1, 2	1/16"	T109-49
Chrysler 8	E7A1	1/16"	T109-49
DeSoto	EV1, 2	1/16"	T109-49
Dodge	E9U1	1/16"	T109-49
ALL OTHERS		5/64"	T109-50

►**D6U1, V1, E9B1, N1, U1, V1 FLOAT SETTING CAUTION:** Remove the float pin retainer, hold lip of float arm against seated intake needle and make certain float pin is at the bottom of its guide slots.

Float Needle Valve and Seat—Triangular type. Furnished only in matched sets as follows:

FLOAT INLET VALVE

Car Model	Carburetor	Part No.	Intake Hole Siz
Chrysler 8	E7A1	25-63S①	#38
Chrysler 8	E7J1, J2, J3, J4	25-44S	#38
DeSoto Taxicab ('46-47)	EL1	25-102S	#44
DeSoto City Traffic	E7V1, E7W1	25-102S	#44
Plymouth Econ.	B6V1	25-104S	#48
ALL OTHERS		25-82S	#44

①—**Supersedes No. 25-82S (#44) used on first carburetors.**

ACCELERATING PUMP: Delayed action type (spring operated pump plunger).

Seasonal Adjustment—Three holes provided in throttle lever for connector link engagement. Inner hole provides minimum stroke, center hole medium stroke, outer hole max. stroke. See car model pages for recommended settings.

Pump Stroke Adjustment—To check, remove air horn and float bowl cover assembly, back off throttle stopscrew so that throttle valve closes tightly, connect pump connector link in correct hole of throttle lever (see table below), install Universal Pump Stroke Gauge T109-117S on bowl so that indicator lip on gauge rests on top of pump plunger shaft. Note gauge reading, then open throttle wide and again note gauge reading. Difference between two readings is pump stroke (in sixty-fourths of an inch) and should agree with table below To adjust, bend horizontal portion of pump connector link

►*EX3, EX3R, E7L3, E7L4, E7W1 (some), E9A1, E9C, E9C1 NOTE*—No pump stroke adjustment required on these models. Make certain that horizontal portion of pump lifter link is at right angles to pump lifter link shaft (bend arm if necessary) using bending tool T109-41.

ACCELERATING PUMP SETTING

Car Model	Carburetor	Pump Stroke	Pump Setting
Chrysler 6 ('46-48)	EU1, 2; EV1, 2	26/64"	Medium Stroke
Chrysler 6 ('46-48)	EX1, 1R; EX2, 2R	20/64"①	Medium Stroke
Chrysler 6 ('46-50)	EX3, EX3R		See Note (above)
Chrysler 6 ('49)	E7L1, E7L2	20/64"	Medium Stroke
Chrysler 6 ('49-50)	E7L3, E7L4		See Note (above)
Chrysler 6 ('51- 54)	E9A1, E9C, E9C1, E9B1		See Note (above)
Chrysler 8	E7A1	26/64"	Medium Stroke
Chrysler 8	E7J1,2,3,4	26/64"	Medium Stroke
DeSoto ('46-48)	EV1, EV2, EL1	26/64"	Medium Stroke
DeSoto ('46-48)	EX1, 1R; EX2, 2R	20/64"①	Medium Stroke
DeSoto ('46-50)	EX3, EX3R		See Note (above)
DeSoto ('49)	E7L1, E7L2	20/64"	Medium Stroke
DeSoto ('49-50)	E7L3, E7L4		See Note (above)
DeSoto ('49-50)	E7V1, E7W1②	26/64"	Medium Stroke
DeSoto ('49-51)	E7W1③		See Note (above)
DeSoto ('51-54)	E9A1, E9B1, E9C, E9C1		See Note (above)
Dodge	D6J1	24/64"	Medium Stroke
Dodge	D6H2, M1, P1, P2, U1, V1	22/64"	Medium Stroke
Dodge	E9N1, E9T1, E9U1, E9V1		See Note (above)
Plymouth	D6G1	24/64"	Medium Stroke
Plymouth	D6H1, H2, D6N1, N2	22/64"	Medium Stroke
Plymouth	D6P1, P2, R1, U1	22/64"	Medium Stroke

CONTINUED ON NEXT PAGE

CARTER (B&B) DOWNDRAFT TYPE (Cont.)

①—26/64" on early production carburetors.

②—Early production with No. 3-459S or 3-452S Throttle Shaft & Arm Assy., No. 117-62 Pump Lever, and No. 48-145 Pump Jet.

③—Later Production with No. 3-728S Throttle Shaft & Arm Assy., No. 117-141 Pump Lever, and No. 48-167 Pump Jet.

THROTTLE VALVE SETTING: When installing valves, insert attaching screws loosely, back throttle stopscrew off, tap valves lightly to centralize in bore, then fasten screws securely.

▷*D6N1, D6N2, E7V1, E7W1 CAUTION*—These models have hemispherical throttle restrictors bolted on upper and lower faces of throttle valve. First install valve in usual manner using No. 101-286 Throttle Restrictor Screws (studs) instead of usual valve attaching screws, then install restrictors on studs and use special No. 105A-45 Throttle Restrictor Nuts to retain the restrictors.

Setting—With throttle stopscrew backed off so that valve tightly closed, distance from top edge of valve to top of upper idle port should agree with 'Idle Port' figure in table below, and distance from top of valve to top of vacuum spark port should agree with 'Vacuum Spark Port' figure (except as noted).

THROTTLE VALVE SETTING

Car Model	Carburetor	Idle Port Height	Vacuum Spark Port
Chrysler 6	EX1, 1R, 2, 2R; EV1, 2	.088-.092"	①.052-.058"
Chrysler 6	EX3, EX3R	.118-.122"	①.052-.058"
Chrysler 6	E9A1, E9C, E9C1	.118-.122"	①.012-.018"
Chrysler 8	E7A1	.088-.092"	①.052-.058"
Chrysler 8	E7J1	.125-.129"	①.052-.058"
Chrysler 8	E7J2, J3, J4	.130-.134"	①.052-.058"
DeSoto	EX1, 1R, 2, 2R; EV1, 2	.088-.092"	①.052-.058"
DeSoto	EX3, EX3R	.118-.122"	①.052-.058"
DeSoto	E7L1, L2, L3, L4	.118-.122"	①.052-.058"
DeSoto	E7V1	.093-.097"	①.052-.058"
DeSoto	E7W1	.118-.122"	①.052-.058"
DeSoto	E9A1, E9C, E9C1	.118-.122"	①.012-.018"
DeSoto Repl. Carb.	E6P5	.088-.092"	①.052-.058"
Dodge	D6H2, M1, P1, P2, U1, V1	.118-.122"	②.021-.027"
Dodge	D6J1	.118-.122"	②.003-.009"
Dodge	E9N1, E9T1, E9U1, E9V1	.118-.122"	
Plymouth	D6A2, D6C2, D6G1	.118-.122"	②.003-.009"
Plymouth	D6H1, H2, D6N1, N2	.118-.122"	②.021-.027"
Plymouth	D6P1, P2, R1, U1	.118-.122"	②.021-.027"

①—Top of port above top of valve. ②—Bottom of port above top of valve.

CHOKE (EXCEPT E9A1, B1, C, C1): Offset type with poppet type relief valve. Control on Plymouth models (without Automatic Choke) is semi-automatic (spring-loaded). Sisson Automatic Choke is standard on all models (Optl. on Plymouth before 1949). *See "Sisson Automatic Choke"*

CHOKE MODELS E9A1, B1, C, C1): Carter Climatic Control on carburetor air horn. *See "Carter Climatic Control"*

CHOKE SETTING

Car Model	Carburetor	Choke Setting
Chrysler 6 & DeSoto	E9A1, E9B1, E9C, E9C1	Centered (At Index)

▷*THERMOSTATIC COIL & HOUSING REMOVAL & INSTALLATION CAUTION*—When servicing carburetor or air cleaner, observe the following precautions to avoid breaking or otherwise damaging the coil housing:

1) Use two wrenches when removing or replacing the heat tube on the housing cover (hold fitting on cover with one wrench while turning coupling nut). Align heat tube with cover fitting to prevent strain on cover.

2) Make certain that gasket installed between air cleaner and carburetor air horn to insure proper clearance.

3) Install air cleaner with indention on underside in line with automatic choke heat tube to provide adequate clearance at this point.

▷*THERMOSTATIC COIL ASSY. CAUTION*—Thermostatic coil is mounted on "Delayer Plate" within housing (delayer plate provides longer choke operation during warm-up and prevents choke closing too rapidly after engine stopped). It should not be necessary to remove the coil assembly from the housing for choke servicing, and coil must not be removed from delayer plate.

FAST IDLE (EXCEPT E9A1, B1, C, C1): Consists of throttle shaft dog pivoted below the throttle shaft and linked to the choke valve lever so that throttle opened to fast idle position when choke valve closed for starting (dog acts as stop for throttle lever idle speed screw).

No adjustment required.

FAST IDLE (MODELS E9A1, B1, C, C1): Consists of throttle shaft dog pivoted assembly mounted on the choke valve shaft within the Climatic Control housing and linked to the throttle valve lever.

▷*CAUTION—Thermostatic Coil Housing, Gasket, and Baffle Plate must be removed to check or adjust the fast idle and unloader.*

Adjustment—To check fast idle setting with thermostatic coil housing, gasket, and baffle plate removed, back out throttle stopscrew so that throttle valve tightly closed. Crack throttle valve, close choke valve completely, then close throttle valve (this will allow fast idle cam to assume fast idle position). Check throttle valve opening or clearance between edge of valve and carburetor wall on side opposite idle port (see table). Adjust by bending choke connector rod at lower angle near throttle lever using tool T109-41. *Check and adjust Unloader before reassembling choke.*

FAST IDLE SETTING

Car Model	Carburetor	Checking Gauge	Throttle Opening
Chrysler 6 & DeSoto	E9A1, E9B1, E9C, E9C1	T109-44①	.015-.019"

①—Double-ended gauge (.015" and .018").

UNLOADER (MODELS E9A1, E9C, E9C1): Consists of an arm on choke trip lever in the choke housing which engages a lug on the choke lever and opens the choke valve when the throttle valve is held wide open.

Adjustment—To check unloader with thermostatic coil housing, gasket, and baffle plate removed, hold throttle valve wide open, close choke valve as far as possible (CAUTION—do not force valve closed), measure choke valve opening or clearance between upper edge of valve and air horn wall (see table). Adjust by bending arm on choke trip lever using bending tool T109-187.

UNLOADER SETTING

Car Model	Carburetor	Checking Gauge	Choke Valve Opening
Chrysler 6 & DeSoto	E9A1, E9B1, E9C, E9C1	T109-154	5/32"

OVERHAUL: *DISASSEMBLY CAUTION—Automatic Choke, slow-closing throttle dashpot, and kick-down switch not used on all carburetors. Disregard data on these units when overhauling carburetors on which they are not used.*

Disassembly: 1) Remove dashpot magnet from air horn by taking out attaching screw (carburetors with magnetic dashpot only).

2) On carburetors with automatic choke, disengage fast idle rod from throttle lever, remove choke thermostatic coil housing (take out screws and remove retainer ring on housing), remove gasket and baffle plate. Remove choke trip lever, slide fast idle link out. Remove choke valve (*CAUTION*—screws are staked, remove carefully to avoid stripping threads or breaking screws). Rotate shaft counter-clockwise and push in on fast idle cam to disengage choke piston from cylinder, withdraw shaft, lever, and piston (*CAUTION*—do not loose piston pin).

▷*THERMOSTATIC COIL HOUSING CAUTION*—Thermostatic coil, heat retainer plate, and housing are serviced as an assembly. Coil and heat retainer plate can be removed from housing for cleaning by hitting assembly sharply against palm of hand with coil side down. *DO NOT ATTEMPT TO SEPARATE COIL FROM HEAT RETAINER PLATE.*

3) Take out five air horn screws (one screw underneath choke housing), lift off air horn assembly, remove air horn gasket. Remove fulcrum pin retainer, remove fulcrum pin, lift off float assembly. Remove fuel inlet needle and needle seat assembly. Remove pump operating link after freeing hairpin clip, lift out pump lifter, plunger, and spring assembly.

4) Take out dashpot connector link screw, lift out dashpot lifter and plunger assembly, dashpot valve cage plunger and spring, and dashpot valve cage.

5) Unscrew idle orifice tube, remove tube with step-up piston, plate, and rod assembly. Remove step-up piston spring and gasket, unscrew step-up jet.

6) Unscrew main metering jet, remove pump jet plug, unscrew pump discharge jet (*CAUTION*—use narrow blade screwdriver). Unscrew pump discharge check ball plug, remove ball check by inverting carburetor.

7) Take out three screws attaching main body to throttle body and separate these parts. If kick-down switch used, remove screws and retainer plates, pull out plunger and spring, carefully pull out terminal assembly to release kick-down limit piston and spring. Unscrew idle mixture adjusting screw and spring. Do not disturb throttle valve assembly.

CONTINUED ON NEXT PAGE

CARTER (B&B) DOWNDRAFT TYPE (C nt.)

Cleaning & Inspection: Wash parts in suitable cleaning solvent, blow out all passages with compressed air and dry parts with air. Remove all carbon deposits paying particular attention to throttle bore in vicinity of throttle valve and idle ports. Thoroughly clean choke piston cylinder and slots and grooves in choke piston. Inspect all parts for wear or damage.

►*THROTTLE SHAFT REPLACEMENT CAUTION*—It is recommended that throttle body assembly be replaced if throttle shaft or bearing points in body are worn.

Reassembly: Use all NEW gaskets. Install all parts in reverse order of disassembly procedure and note the following special instructions:

Step-up Piston Assembly—Make certain that step-up rod enters step-up jet, tighten idle orifice tube snugly. Check assembly by pressing the step-up piston down onto its seat. In this position clearance between head of rod and plate should be .010" minimum. Adjust by bending plate slightly.

Accelerating Pump & Dashpot Plungers—Plunger leather must be in good condition (replace if shrunk or hard). Carefully roll leather back, return it to original position (to flare the leather), work leather between thumb and forefinger until soft and pliable. *NOTE*—Treat new plungers similarly.

Pump Ball Check Valves (Testing)—After pump assembly, test check valves for good seating as follows: Fill bowl to depth of ¼" with clean gasoline, operate pump several times to expel air, then operate pump while holding discharge ball check down with small brass rod. There should be no fuel discharge through either the inlet ball check or discharge ball check valves. If leakage noted, remove parts and clean thoroughly.

Automatic Choke Assembly—Insert choke shaft and piston assembly in air horn, rotate shaft until it is possible to insert piston in cylinder, turn shaft clockwise to enter the piston. Make certain that fast idle cam is centered on boss on air horn. After installing choke valve (below), check assembly for free operation (valve should open freely of own weight from closed position). Make fast idle and unloader adjustment before installing baffle, gasket, and coil assembly (see ADJUSTMENT). Make certain that baffle plate engages locating pin in housing, install new gasket, then install coil housing assembly with indicator mark on rim **downward**, install retainer ring and screws loosely, then rotate coil housing counter-clockwise until indicator mark lines up with center graduation on air horn, tighten retainer screws securely.

Choke Valve Installation—Use new screws and turn screws in loosely, then hold valve in closed position and tap valve gently to center it in bore, tighten screws securely, stake screws by squeezing with pliers.

Carburetor Adjustments—*See ADJUSTMENT section above.*

SERVICE PARTS: Gasket sets and Repair Packages furnished as follows:

Gasket Sets: Carter No. 136 (D6G1, D6H1, D6N1), No. 137A (E7V1, E7W1, EX1, EX1R, EX2, EX2R, EX3, EX3R, E9N1, E9T1), No. 164A (E7A1, E7L1, E7L2, E7L3, E7L4, E9V1), No. 187 (D6J1, D6P1), No. 194A (E7J1, E7J2, E7J3, E7J4), No. 199 (D6M1), No. 203 (D6H2, D6N2, D6R1, D6U1, D6U2), No. 213A (E9A1, E9B1), No. 214 (E9C1), No. 215 (D6P1, D6P2, D6V1), No. 242 (E9U1).

Repair Pkg. (with Std. Metering Rod): Carter No. 1311C (EL1), No. 1323C (D6G1), No. 1367C (EV1, EV2), No. 1368 (D6J1), No. 1348 (E7A1), No. 1510A (E7L1, E7L2), No. 1511A (E7J1, E7J2, E7J3, E7J4), No. 1513A (D6H1, D6H2, D6U1, D6R1, D6R2), No. 1526A (D6P1, D6P2), No. 1527 (D6M1), No. 1528 (E7L3, E7L4), No. 1540 (E7V1), No. 1541A (E7W1), No. 1543 (D6N1, D6N2), No. 1578 (E9C1), No. 1579 (E9A1, E9B1).

SISSON "AC-600" & "AC-700" SERIES

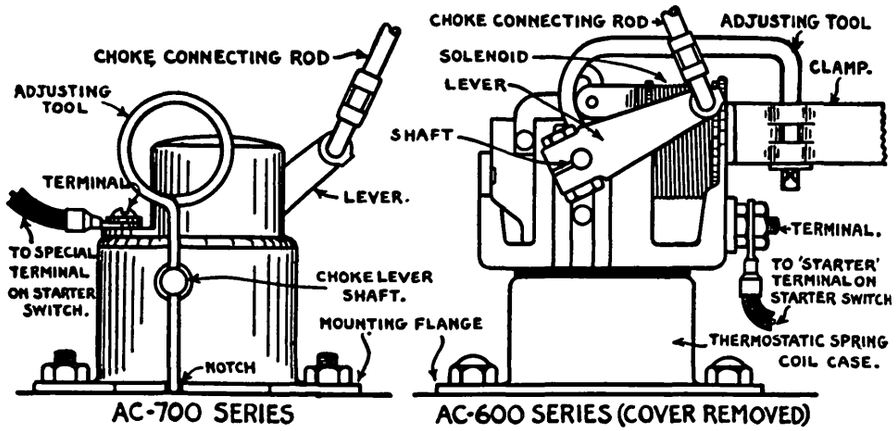
Car Model	Sisson Model
Chrysler Six, All Models (1939-50)	AC-758B
Chrysler Eight, All Models (1939-48)	AC-600
Chrysler Eight, All Models (1949-50)	AC-758B
DeSoto, All Models (1939-50)	AC-758B
Dodge 6, All Models (1939-53)	AC-758B
Plymouth, All Models (1939-54)	AC-758B

DESCRIPTION: The Sisson Automatic Choke is a separate unit mounted on exhaust manifold and connected to the carburetor choke valve lever by a connector rod. A solenoid within the choke case is connected to the starter side of the starting switch so that the solenoid is energized while the starter is operating. A thermostat is also mounted within the choke case and the solenoid and thermostat operate together to close the choke valve for cold starting and to control the choke valve during the warming up period. The AC-700 Series (AC-751, AC-751B, AC-758B) and AC-600 Series operate in the same manner.

OPERATION: When the starter is operated to crank the engine, automatic choke solenoid is energized, attracting the armature, and rotating the choke lever, which is attached to the choke valve lever through a control rod so that the choke valve is closed if the engine is cold. When the engine is warm this armature movement does not take place and no choking action results. When the engine begins to fire and the starting switch is opened, the solenoid circuit is broken. The choke lever is then controlled entirely by the thermostatic spring within the choke case which tends to rotate lever and open choke valve as engine warms up. At normal operating temperature, choke valve is wide open.

ADJUSTMENT: **Model AC758B.** Remove air cleaner, open throttle approximately ¼. Move choke lever until hole in automatic choke shaft (opposite end from lever) lines up with slot in bearings, insert special tool, Sisson No. C-723, through hole in shaft and push tool down so that lower end engages slot in choke base mounting flange. Loosen clampscrew on choke lever, press up on lever until choke valve is closed tight (sight down air horn), hold lever in this position and tighten clampscrew. Remove tool.

Model AC-600—Remove air cleaner, open throttle approximately ¼, take off automatic choke cover. Clamp special adjusting tool, Sisson No. AC-620, in place on choke so that end of tool enters and lines up hole in armature and hole in magnet core, move flat bar on tool so that armature is locked tightly against magnet core. Loosen clampscrew on choke lever, move lever until choke valve is closed tight (sight down air horn), hold lever in this position and tighten clampscrew. Remove tool and replace automatic choke cover.



CAUTION—When replacing air cleaner, make certain that clamp not tightened excessively which may cause choke valve to bind. See that choke valve does not bind or stick and that entire choke mechanism and fast idle linkage operate freely with throttle partly open. See car model page for Throttle Cracker.

SERVICING: If Trouble Shooting data below does not correct faulty operation, remove Automatic Choke Unit and test operation on test fixture such as Sisson Model AC-753. Replace units which are defective. Do not oil any part of choke mechanism. When installing choke, make certain that heat insulating gasket is in place between exhaust manifold and choke case. Do not use a terminal screw on AC-758B models which is longer than original screw (Caution—a longer terminal screw will interefere with correct operation).

TROUBLE SHOOTING: If engine does not start or warm up properly, and for hard starting complants due to faulty choke operation, check following points

Hard Starting with Cold Engine:

1. Check fast idle mechanism to see that it is free and not binding at any point (fast idle connector rod usually connected to choke valve lever).
2. See that choke rod connecting Automatic Choke lever and choke valve lever does not bind in levers.
3. Examine carburetor choke lever, Automatic Choke lever, and fast idle mechanism and remove all paint, grease, or dirt which might cause binding.
4. Check carburetor choke valve, see that edges are smooth and that valve does not rub against air horn walls or bind in any position. See that air cleaner does not interfere with choke valve and that mounting screw is not tightened excessively which will distort air horn and bind choke valve (check choke valve operation with air cleaner in place).
5. Check electrical connections at Automatic Choke and starter switch. Examine wire for short-circuits and breaks.
6. Check Automatic Choke ground (unit grounded through case). See that mounting screws are tight and that manifold under mounting flange is clean.
7. Check throttle cracking linkage (see Tune up instructions on car model page). This is important to insure correct throttle opening for starting and to place automatic choke in operation (on some cars with fast idles, fast idle will prevent choke closing until throttle valve opened to free fast idle cam.
8. Check Automatic Choke adjustment (see instructions above). If Automatic Choke does not function after above points checked, replace the unit.

Hard Starting with Hot Engine:

1. Check for rich mixture or flooding caused by percolating discharge of carburetor when engine stopped. To check, remove air cleaner immediately after stopping engine, note whether gasoline dripping into manifold from carburetor nozzle (this overflow should show up within 3-5 minutes after engine is stopped). Correct by installing special size Float Valve Needle and Seat Assembly and checking float level. See Carburetor article in Carburetor Section.
2. Check carburetor for High Float Level. See Carburetor article in Carburetor Section for Float Level specifications and adjusting directions.

Engine Stalls while Cold:

1. Check Manifold Heat Control Valve. See Manifold Heat Control data on car model page for directions.
2. Check carburetor Fast Idle setting. See Carburetor article in Carburetor Section for directions.

INSTALLATION (PLYMOUTH): Mounting pad is provided on the exhaust manifold for the automatic choke. Position choke on mounting pad with operating lever pointing toward carburetor, drill two 3/16" holes in line with mounting holes in base flange, tap with ¼x20 USS. tap, use studs furnished to mount choke on manifold. Take off all hand choke linkage, replace with control rod linking choke valve lever and choke operating lever.

DESCRIPTION & OPERATION: *CAUTION—Two different types used:*

Adjustable (First) Type—This first type slow-closing throttle consists of dashpot built in the carburetor float bowl with the dashpot piston linked to the throttle lever. When the throttle valve is opened, dashpot piston is lifted up in cylinder and cylinder fills with fuel which flows in through the fuel passage and past the check ball. When the accelerator pedal is released to close the throttle, the check ball moves up to close the large fuel passage and the fuel trapped in the cylinder prevents the dashpot piston moving down so that the throttle is prevented from closing. The fuel in the cylinder is allowed to escape through the restricted fuel passage and this allows the piston to descend slowly and the throttle valve to close slowly. The first type slow-closing throttle has an adjustment screw located in the carburetor casting directly above the upper end of the dashpot piston stem. This screw should be adjusted as directed below. Second type slow-closing throttle does not have this adjustment screw

Magnetic (Second) Type—The dashpot fuel control valve is a separate unit (valve built in dashpot plunger stem on first type) with a spring-loaded solenoid operated valve plunger directly above the fuel passage check ball. At car speeds below 8 MPH (First or Second Gear), 15 MPH. (Third or Fourth Gear), solenoid is energized and the valve plunger is drawn up so that the check ball is free to seat and shut off the large fuel passage so that fuel forced out of cylinder is required to flow through restricted fuel passage which retards closing of throttle valve and provides correct slow-closing throttle action. At car speeds above 8 MPH. (First or Second Gear), 15 MPH. (Third or Fourth Gear), solenoid is not energized and spring forces valve plunger down which prevents check ball seating. Fuel is then free to escape from cylinder through upper large fuel passage and throttle closes promptly without slow-closing throttle action.

Solenoid Wiring Note—Solenoid has two terminals. Either terminal can be connected to the terminal on the 'Kick-down Switch' on the carburetor and the other terminal should be connected to the 'SF' terminal on the Transmission Control Relay (see wiring diagram on car model pages for the complete transmission wiring diagram). With these connections, solenoid is energized with the Governor Switch contacts closed, and inoperative with the Governor Switch contacts open (at speeds above 8 or 15 MPH. as detailed above).

ADJUSTABLE TYPE — NON-ADJUSTABLE (SOLENOID) TYPE

ADJUSTMENT: First "Adjustable" Type. Adjusting screw should be turned out correct number of turns as shown in table below. To adjust, turn screw in as far as possible, then back screw out correct number of turns. Check operation If engine tends to stall when throttle is closed, retarding action is insufficient and screw should be turned out slightly. If automatic upshift is retarded (too slow throttle closing will delay synchronizing of gears and delay shifting), turn screw in slightly.

DASHPOT ADJUSTING SCREW SETTING

Car Model	Carburetor	Adjusting Screw Setting
Chrysler	E6T1, E6U1, EA1, EF1	5 full turns
DeSoto	E6U1, E6V1, EB1, EF1	5 full turns
Dodge	D6J1, D6P1	5 full turns
Dodge	D6P2, D6V1	4½ full turns
Plymouth	D6P1	5 full turns
Plymouth	D6P2	4½ full turns

Second "Non-adjustable" Type—No adjustment provided.

►CHANGES, CAUTIONS, CORRECTIONS

►**Carburetor Flange Gasket Installation Caution**—When installing the carburetor on engine, use special slotted flange gasket 1A-41 and make certain that vacuum power cylinder port in carburetor mounting flange opens into this slot. If this port covered, mixture will be rich and gasoline consumption high.

►**Engine Stalling or Unsatisfactory Idling Complaints**—Check idle adjusting screw and idle speed setting (below). If engine stalls, remove idle passage tube idle tube, and idle adjusting screw; blow out passages with air.

►**Acceleration Unsatisfactory**—Check pump setting. Remove the main metering jet, pump jet, and check valve assemblies and clean with compressed air. See that check valves are tight in carburetor casting. Examine pump spring.

►**Carburetor Loading Up Correction**—Check and adjust float level.

►**Excessive Fuel Consumption (Poor Gas Mileage) Complaints**—See that vacuum piston operates freely and does not stick in cylinder. Examine vacuum piston spring (replace spring if weak or damaged). Make certain that correct flange gasket used at manifold, that vacuum port opens into gasket slot and that vacuum passage is clean. See that step-up valve is tight in carburetor casting and seats properly (disassemble and clean valve and power jet assembly). Check vacuum piston pushrod for free operation. Check jet calibration.

►**ACCESS TO CARBURETOR (for Adjustment or Removal): Forward Control Models**—Remove toe pan attaching screws, disconnect wires at stop light switch, disconnect accelerator pedal rod from throttle control rod, remove toe pan.

Cab-Over-Engine Models—Remove rear half of left fender skirt.

DESCRIPTION

DESCRIPTION: Plain tube type with throttle operated accelerating pump and vacuum operated 'step-up' or economizer. Fuel for main nozzle is metered by main metering jet in carburetor body casting (see illustration), and by power orifice or step-up jet (wide open throttle or high speed). Idling adjustment and accelerating pump seasonal adjustments are provided.

NOTE—Model 2075S is same design as 871SB and differs only in size and jet calibration. *See "Carter (BB) Updraft Carburetor Jet Specifications.*

ADJUSTMENT & OVERHAUL

IDLE ADJUSTMENT: Idle adjusting screw controls fuel discharge from upper (closed throttle) idle discharge port and should be turned in for leaner mixture, out for richer mixture. Approximate setting is ½-1½ turns of the screw out from inner seated position and should be adjusted only with engine warmed up and idling at hot or slow idle speed with choke valve wide open. Idle speed controlled by throttle lever stopscrew and should be set for 450-500 RPM. idle speed. See tune-up data on car model pages for complete instructions.

IDLE SETTING

Idle Screw Setting—½-1½ turns open (turn out for richer mixture).

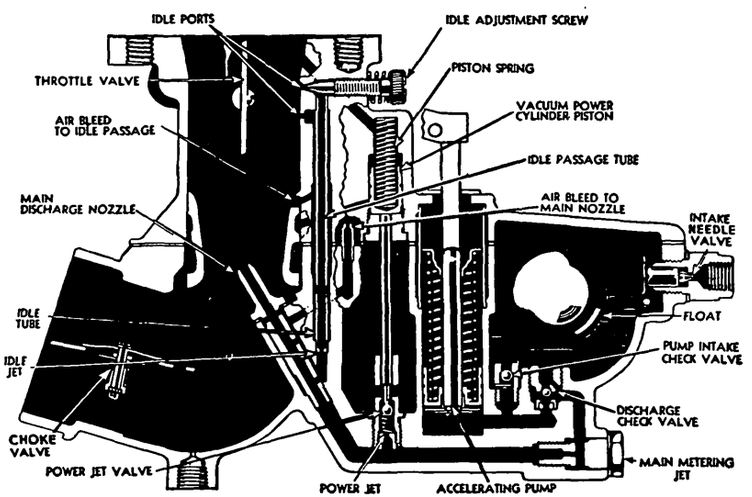
Idle Speed—450-500 RPM with engine at operating temperature (Std. Trans.), 400-450 RPM (Auto. Trans. in Neutral).

PERFORMANCE: Should be satisfactory if idling adjustment and accelerating pump setting correct. Main metering jet is fixed type and special Lean or Rich jets furnished for special operating conditions. *See Carter (B&B) Updraft Carburetor Jet Specifications.*

ACCELERATING PUMP: Low pressure, delayed action type. Operated by throttle lever. Pump piston is positioned on pump plunger stem by a spring which is compressed when throttle is closed and pump piston is drawn upward in cylinder, the cylinder then being filled by fuel from the bowl flowing through the pump intake check valve. When throttle is opened for acceleration, spring forces piston down on stem, discharging fuel through main nozzle.

ACCELERATING PUMP SETTING

Pump Stroke—Short stroke (9/16") secured with connecting screw in holes in pump link and throttle lever nearest throttle shaft, long stroke (1") with screw in holes farthest from shaft.



Adjustment—Two holes provided in throttle lever and pump link to provide seasonal adjustment. Inner Hole (Summer) provides minimum discharge and Outer Hole (Winter) maximum. See car model page for settings.

VACUUM STEP-UP (ECONOMIZER): Consists of a step-up valve assembly controlled by a vacuum piston. Vacuum piston is normally held at top of stroke by manifold vacuum so that valve is closed. At high speed or when engine operated with wide open throttle with reduced manifold vacuum, spring above piston forces piston and push rod down so that step-up valve is opened and additional fuel is allowed through the valve directly to the main nozzle. This fuel is metered by power orifice (step-up jet) and not by main metering jet.

►*STEP-UP VALVE CAGE ASSY. & POWER ORIFICE PRODUCTION CHANGE & REPLACEMENT PARTS CAUTION:* Step-up Valve Cage Assembly and power orifice (First type below) used in production on 745S & 871S carburetors has been superseded by later type (listed below). This later type was used in production on 871SA & 871SB carburetors. *Use LATER TYPE PARTS when overhauling carburetors.*

	First Type	Later Type
Step-up Valve Cage Assy	149-44S	149-112S
Power Orifice (Part No. & Size)	162-17 (.0394")	162-27 (.040")

Vacuum Step-up Piston Spring—No. 61-60 (all models).

FLOAT LEVEL: To check float level, remove bowl cover and gasket, use checking gauge or measure from straightedge across top of bowl vertically down to top of float with needle valve seated. To adjust float level, bend float lever lip slightly (do not bend float lever).

FLOAT LEVEL SETTING

Carburetor Model	Float Level	Checking Gauge
517S, 699S	1/32" to 1/16"	T109-49
745S, 871S, SA, SB	Flush to 1/32"	

NOTE—Gauge T109-49 is Chevrolet No. J-818-13A.

Needle Valve & Seat—Part No. 25-44S. Triangular type. Furnished as matched set only. Intake hole size #38.

CONTINUED ON NEXT PAGE

CARTER (B&B) UPDRAFT TYPES (Cont.)

THROTTLE VALVE SETTING: When installing valves, insert attaching screws loosely, back throttle stopscrew off so that valve closes tightly, tap valve lightly to centralize it in bore, then tighten screws securely.

Setting—With throttle valve tightly closed, distance from lower edge of throttle valve to top of idle port and to top of vacuum spark port should be as shown in table below. NOTE—Throttle valve is notched at idle port.

THROTTLE VALVE SETTING

Carburetor	①Idle Port	②Vacuum Spark Port
All Models	005- 009"	000- 004"

①—Top of lower port below valve. ②—Top of port below valve.

CHOKE: Choke valve is butterfly type with poppet type relief valve. Check choke linkage and see that choke valve is closed with choke button on instrument panel pulled out and fully open when button pushed in.

DISASSEMBLY OF CARBURETOR: Take out screws and remove bowl cover and accelerating pump assembly. Compress pump spring, take out connector pin, disassemble and remove pump spring, retaining spring, and piston from pump rod and plate assembly. Take out vacuum piston plug, remove vacuum piston and spring. Remove idle adjusting screw and idle passage tube, pump sleeve, power jet pushrod, float lever pivot pin, float, and needle valve. Remove pump intake check valve, pump discharge check valve, and power jet from bowl. Remove main nozzle air bleed jet, idle jet, main nozzle, and main metering jet (on side of carburetor).

Servicing—Wash all parts in clean gasoline, blow out all passages in carburetor and all jets with compressed air. See that idle ports, air bleed passages, vacuum spark port, and throttle bore are free from carbon. See that vacuum piston cylinder is clean and that piston moves freely, clean vacuum passages thoroughly. (CAUTION:—Sticking of piston may cause power jet to be open at low speeds which will cause excessive fuel consumption and poor economy). Disassemble power jet valve and clean valve and power jet thoroughly. Clean and inspect pump check valves, idle jet, main nozzle, metering jet and air bleeds. Replace all worn or damaged parts.

REASSEMBLY OF CARBURETOR: Use all new gaskets. Soak needle seat gasket in denatured alcohol for 15 minutes, install on needle seat and allow to dry in place before needle and seat assembly is installed. Assemble carburetor in reverse order to disassembly directions above and note following special instructions and cautions: If throttle valve removed, make certain that notch on edge of valve is placed on vacuum port side and set throttle valve as directed above. Install accelerating pump sleeve with holes in end of sleeve downward. When installing carburetor upper body, see that accelerating pump enters pump cylinder properly and that vacuum piston pushrod is in place. Check float level and adjust carburetor when re-installed on engine.

CAUTION—When installing carburetor, make certain that correct flange gasket is used and that slot in gasket uncovers vacuum spark port on carburetor flange. If this port covered, gasoline consumption will be excessive.

SERVICE PARTS: Gasket Sets—Carter No 153 (489S), No 170A (517S, 699S), No 202 (745S, 871S, SA, SB)
Repair Pkg. (with Std. Metering Jet)—Carter No 1090 (489S), No 1327B (517S), No 1529 (699S), No 1539A (745S, 871S, 871SA)

①—Synchro-mesh Transmission.
②—Synchro-mesh Trans. & Overdrive.
③—Fluid Drive or PowerFlite Transmission.
④—Hy-Drive or PowerFlite Transmission.

►CHANGES, CAUTIONS, CORRECTIONS

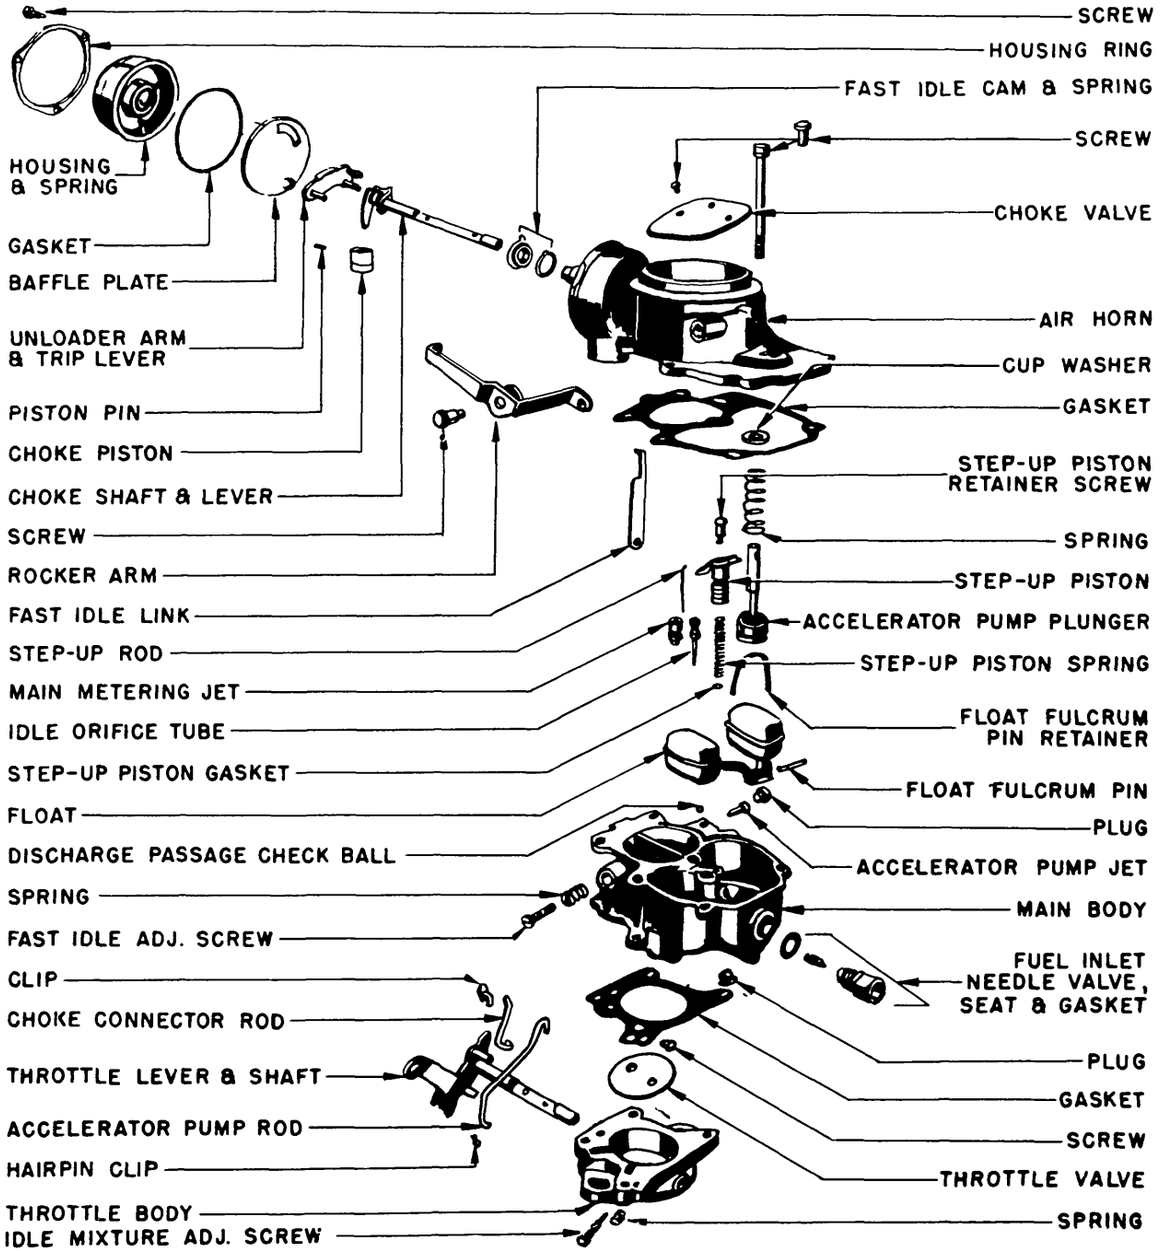
►*PLYMOUTH METERING JET PRODUCTION CHANGE (Carburetor Nos. 920S, 993S, 994S): See "Carter BBS & BBD Jet Specifications" for later type jets.*

►*PLYMOUTH CARBURETOR INSTALLATION CAUTION (To prevent air leaks at intake manifold):* Due to use of Intake Manifold Diffuser (between manifold and carburetor), first type Flange Gasket No. 1A-80 will not provide air-tight mounting unless a larger bore gasket (1A-24, 1A-31, 1A-69, 1A-70) is also used between the regular flange gasket and the manifold. If necessary, back out manifold studs slightly to accommodate the extra gasket thickness. *NOTE*—Later type Gasket No. 1A-94 has undercut on lower face to clear diffuser and will provide satisfactory sealing. This gasket will be furnished in later Gasket Sets and Repair Packages.

DESCRIPTION: Single barrel downdraft type with automatic choke. Carburetors have low over-all height and are similar to previous B&B design with the following new features:

Float System—Concentric bowl with twin floats. Floats pivot on a single float lever pin in the carburetor main body and are checked in the same manner as previous types except that both floats must be adjusted to same height.

Metering Jet & Step-up Mechanism—Jet is fixed type located in fuel bowl and has a metering wire (step-up rod) in the jet which is controlled by the vacuum step-up piston. During normal operation, when manifold vacuum holds the piston down at the lower end of its stroke, fuel flow through the jet is restricted by the step-up rod. For full power or acceleration, when manifold vacuum is low, the vacuum piston lifts the step-up rod out of the jet and allows an increased fuel flow to the nozzle.



Accelerating Pump—Similar to previous B&B design except that pump is operated by an idler lever or walking beam on the bowl cover (see Pump Production Change Note below). Pump discharge jet in the venturi is vented by an air bleed passage in the air horn connected to the carburetor bowl vent tube which prevents fuel being drawn through the pump jet during high speed operation. A calibrated vent passage in the pump plunger prevents fuel vapor pressure building up in the pump circuit due to heat.

►**Pump Production Change**—On first carburetors, pump plunger stem was positively connected to the pump arm by a pin. On later carburetors, the pump arm engages a slot in the end of the stem and the plunger stroke is actuated by the pump spring.

Automatic Choke & Fast Idle—Similar to type used on B&B and BBD carburetors. Fast idle cam and unloader mechanism is located within the choke housing.

Throttle Restrictor (Plymouth 2203S & 2215S "City Traffic" Carburetors)—Provides greater economy on these models. *NOTE*—Unitized Pkg., Carter No. 195-57U, can be used to convert standard 920S carburetor to 2203S City Traffic carburetor.

CONTINUED ON NEXT PA E

CARTER "BBS" SINGLE CARBURETOR

CARTER "BBS" (C nt.)

ADJUSTMENT: Make adjustments in order as listed below.

NOTE—Slow-closing Throttle Dashpot and Kickdown Switch used on some carburetors only.

Idle Setting: Adjust only with engine warmed up to normal operating temperature with choke valve wide open and fast idle inoperative. Use tachometer to set engine idle speed, adjust idle mixture screw for smooth engine operation and highest vacuum reading. See car model page for complete tune-up data.

Idle Setting

Car Model	Idle Screw Opening	Idle Speed
Dodge (All)	½-1½ turns	①450-500 RPM
Plymouth (All)	½-1½ turns	①450-500 RPM

①—With gearshift lever in Neutral.

Accelerating Pump Setting: Check Pump Stroke when overhauling carburetor, change Seasonal Setting as required for best performance.

Seasonal Setting—Three holes provided in throttle lever for connector rod engagement. Provides varied pump stroke as follows:

Center Hole—Medium stroke and normal setting.

Upper Hole—Minimum stroke (less fuel delivery).

Lower Hole—Maximum stroke (more fuel delivery).

Pump Stroke Setting—Connect pump rod in correct hole of throttle lever (see table below), back off throttle stopscrew and make certain that throttle valve fully closed (choke valve must be open). Use scale placed on bowl cover adjacent to pump plunger to measure height of top edge of plunger (not pump arm). If height not correct, adjust by bending connector rod at lower angle near throttle lever, using bending tool T109-213.

Pump Stroke Setting

Car & Carb.	Plunger Height	Connector Rod
Dodge (All)	54/64"	Center Hole
Plymouth (2203S)	51/64"	Upper Hole
Plymouth (2215S)	49/64"	Upper Hole
Plymouth (All Others)	54/64"	Center Hole

Fast Idle Setting: Remove thermostatic coil assembly, gasket, and baffle plate for access to fast idle mechanism (within choke housing). Back out throttle stopscrew. Crack throttle valve open, hold choke valve in fully closed position, then close throttle valve. This will place fast idle cam in fast idle position. Measure throttle valve opening by inserting gauge (see table below) between throttle valve edge and bore on side opposite idle ports. If the throttle opening is not correct, adjust by bending choke connector rod at lower angle, using bending tool T109-213. ***Adjust Unloader before reassembling choke.***

Fast Idle Setting

Car & Carb.	Clearance & Checking Gauge
Dodge (All)	.022-.026" T109-29
Plymouth (920S, 93S, 94S)	.019-.023" T109-29
Plymouth (2062S, 2063S, 2116S)	.022-.026" T109-29
Plymouth (2203S, 2215S)	.019-.023" T109-29
Plymouth (2249S)	.022-.026" T109-29

Unloader Setting: After fast idle adjusted (above), hold throttle valve wide open, close choke valve as far as possible without forcing. Measure choke valve opening by inserting gauge (see table below) between upper edge of choke valve and air horn wall. If choke valve opening not correct, adjust by bending arm on choke trip lever (within choke housing) using bending tool T109-214. Then reassemble and adjust automatic choke.

Unloader Setting

Car & Carb.	Clearance & Checking Gauge
Dodge & Plymouth (All)	9/64" T109-34

Automatic Choke Setting: After unloader adjusted (above), install baffle plate, gasket, and thermostatic coil housing assembly. Make certain that hook on coil picks up choke shaft lever, rotate cover until mark is in line with longer center graduation of scale on housing (centered setting), tighten retainer screws.

Automatic Choke Setting

Car & Carb.	Setting
Dodge & Plymouth (All)	Centered (At Index)

Slow-closing Throttle Dashpot (Carburetor Nos. 994S & 2116S): To check setting, close throttle valve fully, measure distance dashpot plunger can be moved inward (hold plunger in and measure clearance between end of plunger and throttle lever with a feeler gauge). This clearance should be 3/32" for maximum dashpot action. Adjust by loosening locknut and turning dashpot in or out of mounting bracket.

Kickdown Switch (Carburetor Nos. 993S & 2062S): Hold throttle valve in wide-open position, check clearance between kickdown lever on throttle shaft and end of switch stem guide (after switch plunger has moved inward to kickdown position). This clearance should be 1/64-3/64". Adjust by moving switch up or down on bracket (loosen one mounting nut, tighten opposite nut).

Float Level: Float level must be checked with bowl cover gasket and float pin retainer removed. To check float level, remove air horn and bowl cover assembly, remove gasket. Remove float pin retainer. Hold lip on float arm against seated intake needle and see that **float pin is at bottom of guide slots.** Place checking gauge squarely on top edge of bowl with gauging lugs directly over centers of floats. Gauge lugs should just touch tops of floats. Adjust by bending float arm to equalize floats, bend lip on float arm if both floats require same adjustment.

►*CAUTION*—Floats must not rub against inner wall of float bowl. Bend float arm as required to provide clearance on all sides of floats.

Float Level Setting

Car & Carb.	Float Setting	Checking Gauge
Dodge (All Models)	7/32"	①T109-139
Plymouth (All Models)	7/32"	①T109-139

①—Gauge used for both 7/32" & 9/32" settings.

OVERHAUL: BBS carburetors are overhauled in same manner as BBD models except that they are single barrel rather than dual carburetors.

SERVICE PARTS: Gasket Sets—Carter No. 247 (920S, 993S, 994S), No. 247A (2203S, 2215S), No. 252 (2062S, SA; 2063S, SA; 2116S, SA).

Repair Pkg. (with Std. Metering Jet)—Carter No. 1753 & 1753A (920S, 993S, 994S), No. 1766 (2062S, SA; 2063S, SA; 2116S, SA).

③—Has Slow Closing Throttle Dashpot
④—With 192-34U (Kickdown Switch) less Dashpot for Overdrive Trans, Less Dashpot for Synchro-mesh Trans

►CHANGES, CAUTIONS, CORRECTIONS

►***IMPROVED ACCELERATION CHANGE (Carter BBD First 901S, 5S, 6S Carburetors with single-hole accelerating pump plunger):*** Use Unitized Pkg. No. 64-149U and install new parts and make changes as follows:

1) Remove air cleaner and carburetor from engine, remove air horn.
2) Remove the two pump discharge ball checks and retainers by applying air pressure to pump cylinder.
3) Remove intake ball check retainer using tool T109-173 (5/16" hexagonal socket) over top of retainer and prying sideways and pulling upward to loosen retainer (long-nosed pliers can be used if tool not available). Remove pump intake ball check by applying air to intake passage.
4) Install NEW intake ball check (use vacuum step-up spring to guide ball into its seat), install NEW pump intake check retainer.

1952-54 CARTER "BBD" DUAL DOWNDRAFT CARBURETOR

5) Install two NEW pump discharge ball checks but do not re-install discharge check retainers.
6) Install NEW pump plunger. *NOTE*—this new type plunger can be identified by TWO holes in upper end of plunger shaft.
7) Install the wire vacuum piston retainer over the boss between the pump and vacuum cylinders, position retainer over the step-up piston so that the step-up rods (metering wires) are held in the jets. ***OTHER CHANGES—When carburetor disassembled, examine head of step-up piston passage screw and if screw is ROUND HEAD type, make "Rough Idle Correction" as outlined below.***
8) Reassemble carburetor.
9) Check pump adjustment. ***See adjustment data below.***

►***ROUGH IDLE CORRECTION (Carter BBD 901S, 5S, 6S Carburetors with ROUND HEAD Step-up Piston Passage Screw):*** Use Unitized Pkg. 121-239U and install new parts and make changes as follows:

1) Remove air cleaner and carburetor from engine, remove air horn assembly and gasket.
2) Remove two venturi cluster screws, remove venturi cover, cluster and nozzle assembly, and gasket.
3) Remove step-up piston spring and gasket.
4) Remove float retainer and float assembly.

CONTINUED ON NEXT PAGE

CARTER BBD DUAL (C nt.)

5) Remove step-up piston passage screw.

6) Remove body flange assembly and gasket.

7) Remove pump discharge retainers (used on first carburetors only), remove pump discharge check balls.

OTHER CHANGES—If first type pump plunger used (with one hole in pump plunger shaft), make "Improved Acceleration Change" as outlined above.

8) Check mating surfaces of venturi cluster and nozzle assembly, body flange, and main body. If these surfaces not flat and free from burrs, clean up surfaces as follows: Use a fine-cut file to take a small amount off each surface, true up surfaces to remove all high or low spots which show up, finish surfaces with fine sandpaper on a surface plate. Chamfer top edge of each side of step-up piston passage screw lug on throttle body back 1/32" from edge.

9) Thoroughly clean all parts of carburetor and blow out all filings with compressed air.

10) Install throttle body on main body casting using NEW gasket, install NEW TYPE Hexagonal-head Self-sealing Type Piston Passage Screw WITHOUT ANY GASKET, tighten this screw **finger-tight** (screw will be finally tightened later).

11) Install float assembly, pin, and retainer. Adjust float level. See Float Level Setting below.

12) Install step-up piston gasket, spring, piston plate and rod assembly, and retainer.

13) Install gasket, venturi cluster and nozzle assembly, gasket, venturi cover, and venturi cluster screws WITHOUT ANY GASKETS.

CAUTION—Use new gaskets between castings as outlined above but DO NOT USE GASKETS UNDER HEADS OF SELF-SEALING CLUSTER SCREWS.

14) Install both pump discharge ball checks, pump plunger, spring, and retainer.

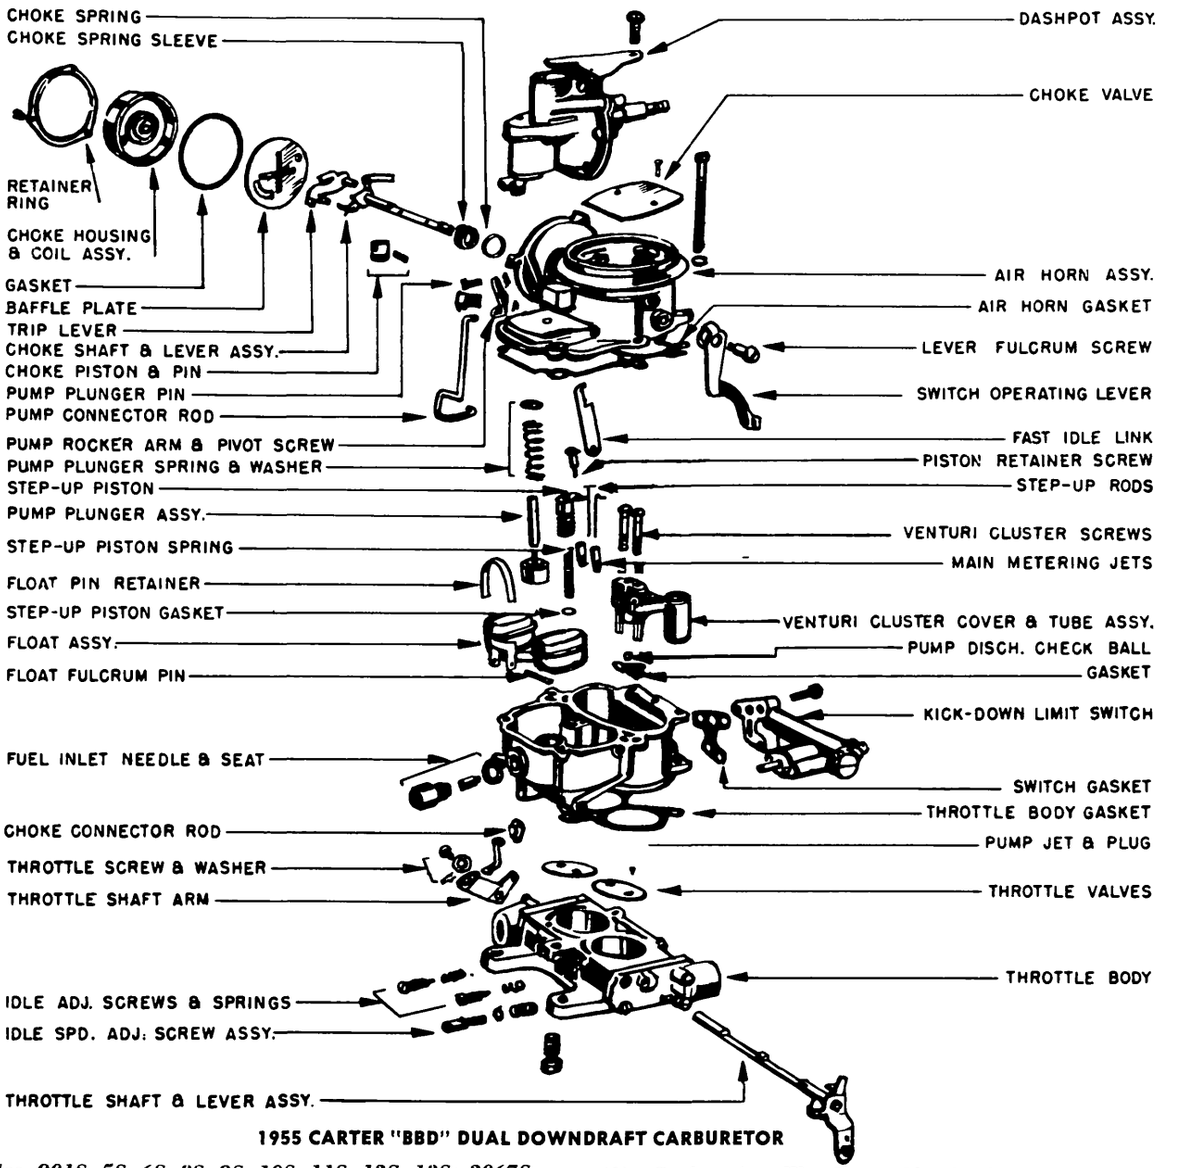
15) Install gasket and air horn assembly. Tighten the two long screws **finger-tight** (screws will be finally tightened later).

16) Install new identification tags as follows:
901S—Install new COPPER tag.
905S, 906S—Install new Copper tag UNDER original Brass tag.

17) Tighten the hexagonal-head step-up piston passage screw securely, then tighten the two long body attaching screws securely.

18) Connect throttle connector rod and choke connector rod.

19) Check and adjust pump stroke. See Accelerating Pump Adjustment below.



20) Disassemble climatic control (automatic choke) mechanism, blow out with air pressure and examine for evidences of corrosion or varnish-like deposits, remove all deposits. Set climatic control for Centered (At Index) setting when reassembling.

►***CAUTION***—Check pump for installation of latest type pump plunger with TWO HOLES in upper end of plunger shaft. ***See "Improved Acceleration Change"***

►***FLOAT LEVEL SETTING CAUTION (Later 911S, 912S, 913S Carburetors)—TWO DIFFERENT types of floats (flat top and curved top) used on these models and DIFFERENT FLOAT SETTING used for each type float.***

►***1952-54 DE SOTO V8 HESITATION OR STALLING ON ACCELERATION WITH HOT ENGINE (Carburetor Nos. 901S, 5S, 6S, 8S, 9S, 10S, 11S, 12S, 13S; 2067S, 68S 70S):*** May be noted on warm days when accelerating after prolonged idling or in heavy traffic. Caused by percolation or boiling of gasoline in carburetor bowl due to use of very volatile fuel and high under-the-hood temperatures. ***Correct by installing parts furnished in Carter Unitized Kit No. 195-58U as directed below AFTER FOLLOWING DIAGNOIS PROCEDURE TO MAKE CERTAIN TROUBLE NOT CAUSED BY OTHER CONDITIONS:***

DIAGNOSIS OF TROUBLE: Check following points first to make certain that trouble is caused by fuel percolation in carburetor:

1955 CARTER "BBD" DUAL DOWNDRAFT CARBURETOR

(1) **Carburetor Flooding**—Check float level. Examine fuel bowl for dirt or foreign material particularly around intake needle and seat. Check for worn intake needle and seat, leaking float, or sticking float pivot.

(2) **Excessive Fuel Pump Pressure**—Check pump pressure. Normal pressure is 3½-5 lbs.

(3) **Manifold Heat Control Valve Operation**—Valve must operate freely throughout entire travel. ***See "Manifold Heat Control" in DeSoto Special Data.***

(4) **Automatic Choke Operation**—Check automatic choke for free operation. See that valve is not stick-

CONTINUED ON NEXT PAGE

CARTER BBD DUAL (C nt.)

ing and that hot air system is tight so that warm air is drawn into choke housing for correct opening of the choke valve as the engine warms up.

(5) Ignition Interruption—Check automatic transmission switches and wiring to make certain that ignition is not being interrupted incorrectly.

REWORKING CARBURETOR (Nos. 901S, 5S, 6S, 8S, 9S, 10S, 11S, 12S, 13S): Remove carburetor from engine, disconnect choke connector rod, remove pump arm and pump connector rod, remove slow-closing throttle dashpot. Remove air horn. Remove following pump parts: plunger spring retainer, spring, plunger, intake check retainer, intake ball check, discharge checks. Take out two venturi cluster screws, remove venturi cover, cluster, nozzle assembly, and gaskets. Remove needle and seat, hinge pin retainer, and float assembly. Examine fuel bowl for excessive accumulation of foreign material and clean thoroughly with compressed air *(NOTE*—installation of filter at fuel inlet is recommended if dirt found in bowl). Install new parts and reassemble carburetor as follows:

(1) Install NEW Nylon pump intake check ball No. 116-29 and new retainer, NEW vented pump plunger No. 64-171S, and NEW pump discharge check balls No. 116-30 (two). Check pump system as follows: Partially fill float bowl with gasoline, press down lightly on pump discharge balls, using two pieces of ⅛" rod and press down on pump plunger while watching for fuel leaks. If fuel noted at discharge or intake check balls, reseating of the balls is indicated. Use a 5/32" steel ball to reform seats, tapping ball lightly with a hammer (use ⅛" rod as a drift). Re-install the regular check balls and repeat test. Then install two pump discharge check ball retainers No. 63-179.

(2) Drill out metered hole in top of vent tubes (two used) to 1/32" diameter. Use drill furnished in kit with grease on end of drill to collect metal chips. Clean venturi cluster thoroughly, install venturi cluster with new gasket No. 121-237, and venturi cover with new gasket No. 121-238 *(CAUTION*—make certain that venturi cluster and cover mating surfaces are clean and flat), tighten cluster screws securely.

(3) Install intake needle and seat and float assemblies. Adjust float level. *See ADJUSTMENTS below.*

(4) Drill two 3/16" outside vent holes in bowl cover and air horn assembly, working from bottom face of bowl cover and locating one hole at each end of rectangular area in which lower end of inside vent terminates, plug this inside vent by inserting No. 11B-228 rivet plug (furnished in pkg.) in upper end of vent tube *(CAUTION*—DO NOT PLUG kickdown Vent Tube on opposite side of air horn). Clean bowl cover and air horn assembly thoroughly with compressed air.

(5) Re-install pump spring and retainer, install air horn, using new body gasket No. 121-203, install slow-closing throttle dashpot. Install NEW pump lever No. 53A-373 and NEW pump connector rod No. 115-191. Connect pump rod in outer (long stroke) hole. Check pump stroke and adjust to 57/64". *See ADJUSTMENTS below.*

(6) Install carburetor on engine, using new gasket No. 1A-71 on **each side** of insulator No. 183-82 *(NOTE*—If necessary, mounting studs can be backed out slightly to accommodate insulator thickness).

(7) Remove water hose or metal tubing water connectors at intake manifold and chain case cover, install pipe plugs at these points. THERE SHOULD BE NO WATER CIRCULATION THROUGH CARBURETOR AFTER THIS MODIFICATION IS MADE.

(8) Adjust carburetor after engine reaches normal operating temperature. Set idle speed at 500 RPM minimum (may vary up to 525 RPM but must not be less than 500 RPM).

(9) Check and adjust slow-closing throttle dashpot. *See ADJUSTMENTS below.*

(10) Check and adjust automatic choke. Choke should be set at index (Centered) but setting can be varied up to 2 Points Lean to compensate for any tendency to load up during warm-up.

REWORKING CARBURETOR (Nos. 2067S, 2068S, 2070S): On 1954 DeSoto V8 before Engine No. S19-18341, if stumbling, stalling, or loading up is experienced, rework carburetors in same manner as earlier models listed above EXCEPT do not install new pump operating lever on air horn and do not install new pump connector rod.

►*CHRYSLER WINDSOR HESITATION OR LAG ON LIGHT ACCELERATION (PowerFlite Cars with First 2162S Carburetor):* This condition occurs at 10-20 MPH during warm-up in cold weather. Correct by installing all parts furnished in Unitized Pkg Carter No. 195-59U as follows: Step-up Spring No 61-549, Step-up Rods No. 75-1140, Pump Plunger No. 64-184S. Venturi Cover & Tube Assy. No. 118-117S.

►*CHRYSLER WINDSOR CARBURETOR PRODUCTION CHANGE (Carter 2162SA, SB, 2180SA, SB):* These carburetors have later type parts as listed above for "Hesitation or Lag on Light Acceleration" correction installed in production.

►*CHRYSLER WINDSOR CARBURETOR CHANGE FOR IMPROVED GASOLINE ECONOMY (All Carburetors):* Carburetors may be modified for slightly leaner mixture by installation of parts furnished in Unitized Pkg. Carter No. 195-66U (BBD 2162S & 2180S), or No. 195-65U (BBD 2162SA, SB; 2180SA, SB) as listed below. *CAUTION—This change should only be made to correct gasoline mileage complaints. If installed in carburetors which are on lean limit, some surge or leanness may be experienced.*

Installation Note—Choke Restriction Bushing should be installed in upper end of choke suction passage in main body. Install brass tag OVER original tag on carburetor. *NOTE*—Car should be carefully tuned up to secure best results from this change.

Unitized Pkg. 195-65U & 195-66U

Part	Part No.
Main Metering Jet (2 used)	120-213S
Step-up Jet Rod (2 used)	75-990
Choke Restriction Bushing	158-76
Venturi Cluster Screw①	101-413
Venturi Housing Gasket①	121-252
Venturi Cover Gasket①	121-253
Body Gasket	121-254
Brass Tag	107-48

①—Not furnished in Pkg. 195-66U (use original Venturi Cluster Screw).

►*PLYMOUTH 167 HP ENGINE CARBURETOR PRODUCTION CHANGES):* Several changes have been made in carburetors in production as listed below. *See also "Plymouth 167 HP Engine Carburetor Improved Gasoline Mileage Change" below.*

1) Carter 2259SA, 2260SA, 2261SA Carburetors—These carburetors have "2nd. Type" parts and specifications as listed below to improve Cold Starting, Part Throttle Loading, and Road Load Economy. *When making this change on earlier 2259S, 2260S, 2261S carburetors (with "1st. Type" parts), refer also to Improved Gasoline Mileage change below.*

Carter "S" & "SA" Carburetor Parts Changes

Part	Part No. & S tting 1st. Type	2nd. Type
Step-up Rod (2 used)	75-1168①	②75-1182
Venturi Cluster Screws (2)	101-401	③101-404
Choke Piston & Lever Assy.	14-503S	④14-515S
Automatic Choke Setting	2 Pts. Lean	Centered

①—.018" diameter ②—.019" diameter.
③—Has different Air Bleed Hole calibration
④—Has different vacuum piston

2) Carter 2259SB, 2260SB, 2261SB, 2274SA Carburetors—*These carburetors have all parts listed under "Plymouth 167 HP Engine Carburetor Improved Gasoline Mileage Change" (below) installed in production.*

►*PLYMOUTH 167 HP ENGINE CARBURETOR IMPROVED GASOLINE MILEAGE CHANGE (Carter Carburetors 2259S, SA; 2260S, SA; 2261S, SA; 2274S):* Carburetors can be modified for slightly leaner mixture by installation of all parts furnished in Carter Unitized Pkg 195-62U as listed below and by modifying Distributor Vacuum Unit for increased vacuum advance. *CAUTION—This change should only be made to correct gasoline mileage complaints. If installed in carburetors which are already on lean limit, some surge or leanness may be experienced.*

Carter Unitized Pkg. 195-62U

Part	Part No.
Main Metering Jet (2 used)	120-212S
Step-up Rod (2 used)	75-1168
Venturi Cluster Screw (2 used)	101-364
Venturi Housing Gasket	121-252
Venturi Cover Gasket	121-253
Body Gasket	⑤121-274
Brass Tag⑥	107-48

⑤—Supersedes No. 121-254 furnished in first kits
⑥—Install over original tag.

Distributor Vacuum Unit Change—Replace original Vacuum Diaphragm Assembly with new part, Plymouth No 1439671 or Auto-Lite No. IAZ-2023RA, transferring the spring calibration washers, sealing washer, and nut from the original diaphragm assembly to the new part. This change will increase maximum vacuum advance to 25° (engine) at 17" of vacuum (was 23°). *NOTE*—Spark plug gap should be changed to .040" (was .035").

DESCRIPTION: Dual or double barrel downdraft type with automatic choke control. BBD carburetors are similar to single barrel BB design with the following special features:

Venturi Cluster (Main Nozzl) Assembly—This assembly consists of the secondary venturis, main nozzles, main vent tubes, and idle tubes which are mounted as a unit in the main body (attaching screws are hollow with calibrated restriction at upper end and serve as Idle Air Bleeds).

Metering Jets & Step-up Mechanism—Metering jets are fixed type located in bottom of bowl. Each jet has a metering wire (step-up rod) in the jet which is controlled by the vacuum step-up piston. For normal operation, when manifold vacuum holds

CONTINUED ON NEXT PAGE

CARTER BBD DUAL (Cont.)

vacuum piston down, fuel flow through the jets is restricted by the metering wire. For full power or acceleration, when manifold vacuum drops off, the vacuum piston is moved upward by the step-up piston spring and lifts the metering wires out of the jets allowing increased fuel flow to the nozzles.

Accelerating Pump—Similar to other pumps except that pump plunger is operated through idler lever or walking beam mounted on side of air horn. Pump discharge jets are vented to carburetor bowl through passage in air horn to prevent fuel being discharged through these jets during high speed operation when a vacuum exists at the jets.

Automatic Choke—Same design as used on "BB" carburetors on other Chrysler and De Soto cars.

"Water-jacketed" Throttle Body—Water connections at carburetor throttle body and water passages in body casting are used to circulate engine coolant water around throttle valves. This provides sufficient heat to prevent ice formation around throttle valves at idling speed which might cause stalling of engine during warming up period (vaporizing of fuel has refrigerating effect sufficient to cause ice formation at temperatures below 65°F.).

INSTALLATION CAUTION—Water tubes must be properly connected and coupling nuts tightened to prevent water leaks when carburetor installed.

Slow-closing Throttle Dashpot & Transmission Kick-down Switch—Separate units mounted on carburetor. See data below.

ADJUSTMENT: Make adjustments in order as listed below (except for Idling and Pump settings).

IDLE ADJUSTMENT

Idle Screw Setting—Adjust only with engine warmed up to normal operating temeprature so that choke valve wide open and fast idle inoperative. Make a preliminary setting by turning both idle screws out 1 turn from inner seated position. Set idle speed at 475-500 RPM. (use tachometer). Then turn both idle screws in or clockwise 1/8 turn for leaner mixture, if engine speed increases and engine is smoother, turn both screws in an additional 1/8 turn, reset idle speed and adjust each screw separately in or out not more than 1/8 turn for smoothest performance and highest RPM. If first leaning of the mixture (when both screws turned in 1/8 turn) causes engine speed to drop off or engine is rougher, reverse the above procedure by turning the screws out or counter-clockwise for richer mixture.

Idle Speed—475-500 RPM (Chrysler & DeSoto), 450-500 RPM (Plymouth) Shift lever in neutral

ACCELERATING PUMP

▷*PUMP STROKE SETTING CAUTION (901S, 5S, 6S CARBURETORS)*: DIFFERENT settings required for earlier and later carburetors (except where earlier carburetors modified as directed under "CHANGES & CORRECTIONS" above).

Pump Stroke Setting—Carburetor Nos. 901S, 5S, 6S code dated "G2" and earlier and NOT modified (with SINGLE hole in plunger shaft): See that pump rod engaged in center hole of throttle shaft arm, open throttle to wide-open position, measure distance from top of bowl cover to top of plunger shaft (NOT pump arm). This distance should be 33/64". Adjust by bending pump connector rod at lower angle using bending tool T109-213.

Pump Stroke Setting—Carburetor Nos. 901S, 5S, 6S code dated "H2" and later, and earlier MODIFIED Carburetors (with TWO holes in plunger shaft): Check and adjust pump stroke in same manner as later carburetor models (following).

Pump Stroke Setting (Carburetor Nos. 908S, 909S, 910S, 911S, 912S, 913S): Make certain that pump rod connected in throttle shaft arm outer hole and that pump arm pin in top hole of plunger shaft. Back out throttle speed adjusting screw and see that choke valve open so that throttle valves are in fully closed position. Measure distance from top of bowl cover to top of plunger shaft (not pump arm). This distance should be 57/64" (all carburetors) Use Tool T109-213 to bend arm at lower angle to alter distance (2067S, 2068S, 2070S, 2129S, 2130S, 2131S, 2180S, SA, SB; 2141S, 2154S), Upper angle (2162S, SA, SB; 2155S, 2262S).

Recommended Setting—Center Hole for normal conditions. Inner hole provides minimum stroke, outer hole provides maximum stroke.

FLOAT LEVEL

▷*FLOAT SETTING CAUTION:* FLAT TOP top floats take different setting than CURVED TOP floats. See table below for correct float setting

Carb. No.	Float Level	Checking Gauge
901S, 905S, 906S	5/16"	②T109-230
908S, 909S, 910S	9/32"	T109-230
911S, 912S, 913S	①	T109-239
2067S, 68S, 70S	①	T109-239
2129S, 30S, 31S	①	T109-239
2141S, 2154S, 55S	7/32"	T109-239
2162S, SA, SB	7/32"	T109-239
2176S, SA, 77S, SA	7/32"	T109-239
2178S, SA, 80S, SA, SB	7/32"	T109-239
2259S, SA, SB	7/32"	T109-239
2260S, SA, SB	7/32"	T109-239
2261S, SA, SB	7/32"	T109-239
2262S, 2274S, SA	7/32"	T109-239

①—Set FLAT TOP floats at 9/32", CURVED TOP floats at 7/32" (same gauge for both settings)
②—PLUS 1/32" (use feeler gauge with T109-230).

Float Level Setting—Take off air horn and bowl cover, remove bowl cover gasket. Remove float pin retainer. Hold lip of float arm firmly against intake needle with the needle seated and make certain that float pin is at the bottom of its guide slots. Place correct gauge (see table) squarely on top edges of float bowl with gauging legs directly above center of each float. Each float should just touch gauge. If float heights not equal, adjust by bending one float arm, then adjust float height by bending lip on float arm.

Float Clearance Setting—Floats must not rub on inner walls of float bowl at any point throughout their entire travel. Adjust by bending float arms slightly for clearance on all sides of floats.

CAUTION—Both floats must be set alike and floats must be adjusted vertically (for correct float level) and laterally for clearance in bowl (to prevent floats dragging on sides of bowl).

▷*AIR HORN INSTALLATION CAUTION*—When air horn removed for float level setting, spring will lift step-up piston so that step-up rods will pull out of metering jets. Install air horn exactly as follows: Press step-up piston down and guide rods into metering jets, place thin steel rule across bowl to hold piston down. AFTER air horn replaced, slide rule out.

FAST IDLE

Carb. No.	Throttle Opening	Checking Gauge
All Models	.015-.019"	T109-44

Checking & Adjustment—Remove thermostatic coil housing assembly, gasket, and baffle plate (fast idle mechanism located in choke housing). Crack throttle valve to allow fast idle mechanism to operate, close choke valve fully, then close throttle valve. Check throttle valve opening or clearance between edge of valve and bore on side opposite idle ports using Gauge T109-44 (double end gauge, .015" & .018"). Adjust by bending choke connector rod at lower angle using bending tool T109-213. Then check and adjust Unloader.

UNLOADER

Carb. No.	Choke Opening	Checking Gauge
901S, 905S, 906S	9/64"	T109-34
908S. 909S, 910S	9/64"	T109-34
All Others	1/4"	T109-31

Checking & Adjustment—After fast idle adjusted (above), hold throttle valves wide open, close choke valve as far as possible *(CAUTION*—do not force valve closed). Check choke valve opening or clearance between upper edge of valve and air horn wall using correct gauge (see table above). If choke opening not correct, adjust by bending arm on choke trip lever, using tool T109-214. Assemble thermostatic housing, gasket, and baffle plate, adjust automatic choke.

AUTOMATIC CHOKE

Setting—Mark on choke cover and proper line of scale on choke housing as follows:

Car & Carb.	Setting
Chrysler & DeSoto (All)	Centered
Plymouth (157 Eng)	2 Points Lean
Plymouth (167 Eng) 2259S, 60S, 61S, 74S	2 Points Lean
Plymouth (167 Eng) Others	Centered

SETTING CAUTION—Heat tube connection on cover must be loosened to remove or adjust choke cover. When tightening heat tube coupling, hold connection on cover with second wrench to prevent rotating or distorting cover.

SLOW-CLOSING THROTTLE DASHPOT
(Tip-Toe Shift & PowerFlite Cars)

See "Chrysler, DeSoto, Dodge V8 Slow-Closing Throttle Dashpot" in Carburetion Equipment Section for data.

Checking & Adjustment—Check dashpot action with engine running by shifting to Driving Range (use brakes to hold car) and rapidly depressing and releasing accelerator pedal. If engine stalls, increase dashpot action by turning adjusting screw on end of dashpot plunger. Maximum dashpot action is secured with adjusting screw set so that dashpot plunger can be moved inward approximately 1/16" after engine has returned to normal idle speed. If correct action cannot be secured by adjusting dashpot, tune up engine and recheck performance.

KICK-DOWN SWITCH

CAUTION—Kick-down Switches for Automatic Transmission Control and for Overdrive Control are different:

Automatic Transmission Control

Adjustment—*See "Chrysler, DeSoto, Dodge V8 & Plymouth V8 Kickdown Switch" in Electrical Section.*

CONTINUED ON NEXT PAGE

CARTER BBD DUAL (C nt.)

Overdrive Control

Adjustment—Two settings: (1) With throttle valves seated in carburetor bore, hold kick-down switch lever against stop on switch bracket, bend lip on throttle lever until it just contacts kick-down lever; (2) With throttle valves in wide-open position, adjust switch position (turn mounting nuts on switch stem) for 1/64-3/64" clearance between kick-down lever and switch stem guide.

THROTTLE VALVE SETTING

Carb. No.	①Idle Port	②Vacuum Spark Port
901S, 5S, 6S	.101-.105"	.017-.023"
908S, 9S, 10S	.101-.105"	③ .021-.023"
911S, 12S, 13S	.101-.105"	③ .021-.023"
2067S, 68S, 70S	101- 105"	021- 023"
2129S, 30S, 31S	101-.105"	.021-.023"
2141S, 54S, 55S	.133-.137"	.030-.040"
2176S, SA, 77S, SA	.102-.106"	.035-.045"
2178S, SA	.102-.106"	.035-.045"
2180S, SA, SB	.102-.106"	.035-.045"
2259S, SA, SB	.148-.152"	.035-.045"
2260S, SA, SB	.148-.152"	.035-.045"
2261S, SA, SB	.148-.152"	.035-.045"
2262S	.133-.137"	.030-.040"
2274S SA	.148-.152"	.035-.045"

①—Opening above upper edge of valve.
②—Top of port above upper edge of valve.
③—.017-.023" on early production carburetors.

OVERHAUL: ***NOTE—Slow-closing Throttle Dashpot and Kick-down Switches (both types) can be serviced separately without otherwise disassembling carburetor.***

Disassembly: First remove Dashpot unit (take out two screws in bracket), Overdrive Kick-down Switch (take out two screws in bracket), or Kick-down Limit Switch (three screws in bracket) and remove assemblies from carburetor. Proceed as follows: (1) Disconnect accelerator pump plunger rod and pump link from rocker arm, disconnect link from throttle shaft arm and remove the link. Disconnect choke connector rod from fast idle link and throttle shaft arm and remove rod.
(2) Take out screws attaching air horn and bowl cover to main body, lift air horn straight up and off carburetor, remove air horn gasket.
(3) Take out choke thermostatic coil and housing retaining screws and retaining ring, lift off coil and housing assembly, remove gasket and baffle plate. Slide unloader arm and trip lever out and away from fast idle link, slide link down and remove from below. Take out choke valve screws *(CAUTION—these screws are staked)*, remove choke valve. Turn choke shaft counter-clockwise until choke piston clears the cylinder, then slide choke shaft and piston assembly out of the air horn. Drill a 3/16" hole in center of expansion plug closing end of choke piston cylinder, pry plug out carefully.

►***THERMOSTATIC COIL HOUSING CAUTION***—Thermostatic coil, delayer plate, and housing are serviced as an assembly. Coil and delayer plate can be removed from housing for cleaning by removing retainer ring from within housing and rapping assembly sharply against palm of hand with coil side down. ***DO NOT ATTEMPT TO SEPARATE COIL FROM DELAYER PLATE.***

(4) Remove step-up piston and rods as an assembly *(CAUTION—use care not to damage the rods)*. Lift out step-up spring, remove small gasket from bottom of step-up cylinder. Remove accelerator pump plunger and plunger return spring *(CAUTION—keep plunger immersed in jar of gasoline to prevent the leather from drying out)*.
(5) Remove float fulcrum pin retainer, lift out float assembly and fulcrum pin.
(6) Invert carburetor and allow two pump passage filler plugs and check balls to drop out.
(7) Remove fuel inlet valve seat and gaket.
(8) Remove two plugs from accelerator pump jet passage (Tool T109-43), then remove the two pump jets (use narrow-blade screwdriver).
(9) Loosen venturi cluster screws, lift out venturi cluster cover and tube assembly with screws and gaskets.
(10) Remove main metering jets and gaskets.
(11) Invert carburetor and remove step-up passage screw and gasket. Separate throttle body from main body by taking out attaching screws, discard gasket.
(12) Remove idle mixture adjusting screws and springs.

CAUTION—Do not remove throttle valves or shaft unless replacement required by wear or damage.

Cleaning & Inspection: Thoroughly clean all metal parts with carburetor solvent or denatured alcohol. Blow out all passages with compressed air. Examine all parts for wear or damage and replace as required.

Reassembly: Reverse the disassembly procedure as given above and note following important points: **Throttle Valve or Shaft Replacement**—***Manufacturer recommends replacement of Throttle Body Assembly rather than installation of new shaft in old body.*** If necessary to rework old throttle body, proceed as follows: Mark each valve to insure re-installation in same barrel (if valve to be re-used). Take out valve attaching screws and remove valves *(CAUTION—these screws are staked)*. Take out screw and washer attaching throttle arm to throttle shaft, pull arm off shaft, slide shaft off of body. ***CAUTION—DO NOT remove water jacket end plates—plates are sealed against water leakage and MUST NOT BE REMOVED AT ANY TIME.*** Install throttle shaft in body (no bushing used), install throttle valves (trademark "C" in circle toward idle port when viewed from bottom or manifold side of throttle body) using NEW screws but do not tighten screws. Back off throttle stopscrew so that throttle lever is against the stop, hold throttle valves closed and tap lightly with a screwdriver to seat them in the bore, tighten screws securely while holding them from moving. Stake screws by squeezing them with pliers. Make certain that throttle lever tight on shaft (lever must be silver-soldered or brazed—do not attempt to tighten lever by peening shaft). Open throttle valves fully, slide throttle shaft arm over end and onto flats on shaft with long stroke hole pointing upward, secure arm with screw and washer.

Venturi Cluster Assembly & Installation: ***CAUTION On Early 901S, 905S, 906S Carburetors, see ROUGH IDLE CORRECTION under Changes & Corrections for revised cluster Assembly using new type self-sealing screws used without gaskets. Proceed as follows:***
Slide the two venturi cluster retaining screws in place in cluster cover *(CAUTION—these screws contain idle air bleed and idle restriction holes which are calibrated and screws must be handled carefully —make certain that passages are clean)*. Slide a new gasket over cluster cover tubes and screws, then slide cluster cover and tubes into venturi cluster *(CAUTION—idle orifice tubes and main vent tubes MUST NOT BE REMOVED from the cover—make certain that all passages are clean)*. Install new cluster gasket over tubes and screws on underside of venturi cluster, install complete assembly in carburetor main body and tighten screws securely.
Step-up Piston Assembly Installation—Make certain that step-up rods properly installed on piston plate (rods must hang true and be free to move on either side of the vertical position). Install new gasket in cylinder, then install step-up piston assembly and guide rods into metering jets. ***DO NOT INSTALL STEP-UP PISTON SPRING UNTIL AFTER THROTTLE BODY INSTALLED. See Throttle Body Installation.***

Accelerator Pump Check—After pump parts installed (pump plunger and piston, discharge jets, and discharge check balls), test pump action as follows: Fill carburetor bowl approximately ½" deep with clean gasoline, raise pump plunger and press lightly on plunger shaft to expel air from pump passage. Use small brass rods to hold each check ball firmly on its seat, press pump plunger down. If fuel leakage noted at intake or discharge passages, clean passages carefully and install new discharge check balls.

Air Horn Installation—Install new gasket on main body (CAUTION—gasket must clear choke suction hole), lower air horn down on main body aligning pump shaft with air horn opening. Install two air horn attaching screws (on side nearest choke) but DO NOT tighten until after Throttle Body installed. See Throttle Body Installation following.
Throttle Body Installation—With main body inverted, install new gasket (CAUTION—gasket must clear choke suction and spark control passages), install throttle body. Install step-up piston spring in step-up passage, install the step-up passage screw (self-sealing type used without gasket except on first carburetors—see Note below) but DO NOT tighten this screw. Carefully invert carburetor and install the two long air horn screws, install dashpot or overdrive kick-down switch (if used), on air horn with two mounting screws, then securely tighten all six air horn attaching screws and step-up piston passage screw evenly.

►***STEP-UP PASSAGE SCREW NOTE***—Gasket used only on Early 901S, 905S, 906S carburetors with first type ROUND HEAD screw. See ROUGH IDLE CORRECTION under Changes & Corrections for installation of HEXAGONAL HEAD screw used without gasket (this type screw used on modified 901S, 905S, 906S carburetors and all later models).

Choke Valve & Shaft Installation—Make certain that all parts of choke assembly clean and free from any trace of dirt or grit, see that slots in choke piston cylinder and groove in piston are clean and entirely free of carbon deposits. Install new expansion plug in piston cylinder (seat plug with a drift and hammer—this plug must be tight). Insert choke shaft, piston, and fast idle cam assembly into air horn and turn shaft so that piston enters cylinder (CAUTION—fast idle cam must fit over shoulder on choke shaft boss). Install choke valve and start NEW screws, hold valve closed and tap lightly with screwdriver to center the valve, then

CONTINUED ON NEXT PAGE

CARTER BBD DUAL (Cont.)

tighten screws securely and stake screws by squeezing with pliers. Check valve operation—valve should open freely of own weight with carburetor upright.

Automatic Choke Installation—After choke valve and shaft installed, slide fast idle link up into position, install unloader arm and trip lever and engage fast idle link. Install choke connector rod and install retainer clips. Adjust Fast Idle and Unloader (see Adjustments). Install baffle plate and new gasket, install choke housing and retainer ring with indicator mark straight down, turn assembly clockwise until indicator mark is in line with center mark of scale on housing, tighten retainer screws securely.

Carburetor Adjustments—*See ADJUSTMENT section above for all carburetor adjustments.*

CHRYSLER, DE SOTO, DODGE V8 SLOW CLOSING THROTTLE

CHRYSLER	Carburetor Model
1951 V8	Carter WCD 830S, SA, SB
1951-52 V8	Carter WCD 931S, SA, SB, SC
1953 V8	Carter WCD 935S, SA
1953 V8	Carter WCD 992S
DE SOTO	
1952 V8	Carter WCD 884S, SA. SC
1952 V8	Carter BBD 901S
1952-53 V8	Carter BBD 908S
1953 V8	Carter BBD 911S
DODGE	
1953 V8	Stromberg WW Code 3-106

DESCRIPTION: This slow-closing throttle device is a separate unit mounted on a bracket on the carburetor with the dashpot plunger contacting an actuating arm on the throttle. Unit is spring-loaded diaphragm type with magnetic solenoid control.

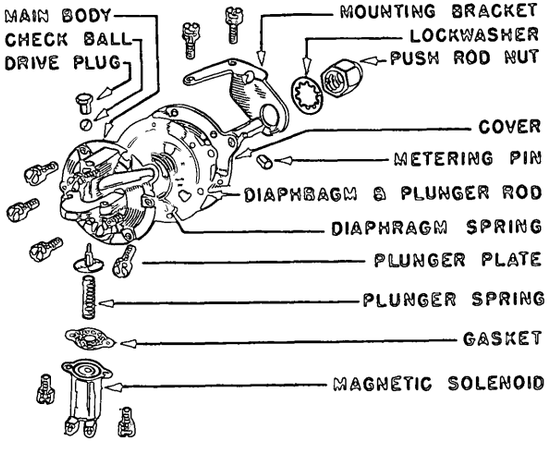
ADJUSTMENT: After carburetor adjustments completed, turn dashpot travel adjusting screw (On actuating arm on Chrysler & DeSoto, in end of dashpot plunger on Dodge), so that plunger has only 1/16" overtravel with throttle in normal idle position. This will provide maximum retarding action.

TESTING: First test unit on the car, then remove unit and disassemble for additional tests as necessary.

Testing on the Car:

1) Turn ignition on and off rapidly. Dashpot action should be audible. If action cannot be heard, disconnect both wires at magnetic solenoid terminals and connect test light between these two leads. Lamp should light when ignition turned on. If lamp does not light, check circuit for shorts, broken wires, or poor contact at terminals.

2) Run engine, place gear shift lever in Driving Range, hold car with brakes. Depress and release accelerator pedal rapidly. Engine should not stall when pedal released. If engine stalls and dashpot adjustment does not correct trouble, disassemble unit and make further tests as follows:



Testing off the Car: *See Disassembly data below for procedure in disassembling unit for following tests.*

1) With magnetic solenoid removed from housing, hold dashpot unit with mounting bracket down, press plunger in and note plunger resistance. Rotate unit one-half turn so that mounting bracket up, press plunger in and compare plunger resistance with that noted in first test. Resistance should be noticeably greater with bracket in down position. If no resistance noted, make test (2).

2) Install dashpot plunger plate, hold dashpot unit with mounting bracket down and plunger plate in upward position. Press plunger in. Plunger should move freely with no resistance. Allow plunger plate to drop down slightly and again press plunger in. Resistance to plunger travel should be noticeable. If resistance noted, check electrical circuits (test 3). If no resistance noted, diaphragm unit is at fault and unit should be completely disassembled for cleaning and inspection.

NOTE—If plunger plate does not drop freely from upward position when making above test, install new plunger plate and repeat test.

3) Connect test lamp across two leads disconnected from solenoid terminals. Turn ignition switch on. Lamp should light. Run engine in neutral and increase engine speed. Lamp should go out as speed increased indicating that governor contacts opening properly. If not, check governor and entire transmission control circuit. Remove test lamp and connect leads to solenoid terminals, repeat above tests. A definite magnetic attraction should be noted at low speed and should not be noted at higher speeds above governor contact opening point. If this action not correct, replace solenoid.

SLOW CLOSING THROTTLE DASHPOT ASSEMBLY (CHRYSLER, DE SOTO, DODGE V8)

DISASSEMBLY: With dashpot unit off carburetor, take out two screws attaching magnetic solenoid, lift solenoid off housing (*CAUTION*—do not lose or damage plunger plate and plunger spring). On Dodge only, remove adjusting screw and spring from outer end of the diaphragm plunger Take out screws around diaphragm flange, separate cover and body, lift out diaphragm compression spring, remove diaphragm assembly (*CAUTION*—do not lose small brass metering pin in hole in side of plunger shaft).

Cleaning & Inspection: Clean all parts thoroughly and dry with compressed air. Blow out channels with air. Check diaphragm for leaks or ruptures, check mating surfaces of body and cover for burrs, or scores which might cause leaks. Check plunger shaft for wear and scores.

REASSEMBLY: Install small brass metering pin in hole in side of plunger shaft, insert plunger and diaphragm assembly in housing and align screw holes in diaphragm and housing. Install compression spring on diaphragm, then install housing cover and all cover screws and lockwashers (*CAUTION*—hold diaphragm flat by pressing in on plunger while starting screws and use great care not to wrinkle or tear diaphragm). With diaphragm in flexed position (plunger pushed out by compression spring), tighten all cover screws evenly and securely. Install dashpot plunger plate, gasket, spring, and solenoid unit. Tighten solenoid screws securely. Test and adjust dashpot unit after installation on carburetor.

⑤—Supersedes 120-213S used on 2259S & SA, 2260S & SA, 2261S & SA & 2274S.

⑥—Used with Step-Up Piston Rod (metering wire) No. 75-798 (.022" diam.).

⑦—Used with Step-Up Piston Rod (metering wire) No. 75-876 (.022" diam.).

⑧—Supersedes No. 75-876.

⑨—Part No. 48-187.

HOLLEY (FORD) 6 CYL. UPDRAFT TYPE

FORD C-O-E & PARCEL DLVRY. TRK. Carb. No.
1948-51 F3 Parcel Del. ("H" Eng.) . 7HW-9510-A
1948-51 F5, 6 C-O-E ("H" Eng.). . . .7HW-9510-A
1950-52 F6 C-O-E ("M" Eng.) 8MWH-9510-A

DESCRIPTION: Single barrel, plain tube, updraft type with throttle operated accelerating pump and vacuum controlled power valve or economizer.

Idle System—Fuel for idling is taken from main jet well up through a channel to discharge ports at the throttle edge. This fuel is controlled by the Idle Discharge Needle. This system operates for closed throttle idling and slow speed operation.

Main (Driving Range) System—At intermediate speeds, fuel metered by main metering jet at bottom of main jet well is discharged through the main nozzle in the venturi throat.

Power System—Consists of a spring-loaded power jet controlled by a spring-loaded vacuum piston. At normal operating speeds and throttle openings, piston is held up at upper end of stroke by manifold vacuum and power jet is closed. At wide open throttle, or whenever throttle opened for acceleration, drop in manifold vacuum allows piston to move down, opening power jet and permitting greater fuel flow to main nozzle (this fuel metered by power jet and by-passes main metering jet).

Accelerating System—Pump cylinder and piston located in float bowl, operated by inverted "L" shaped pump rod linked to a second rod which is linked to the throttle valve lever. Fuel is drawn into pump cylinder through ball check valve in lower end of cylinder when throttle is closed and is discharged past outlet check valve needle when throttle opened for acceleration.

IDLE ADJUSTMENT: Idle adjusting needle valve controls idle fuel mixture. Adjust only when engine thoroughly warmed up so that choke valve wide open and throttle kicker inoperative. See car model page for complete tune-up instructions.
Idle Mixture Setting—Turn idle adjusting needle in until engine runs unevenly, then turn screw out until engine runs unevenly, finally turn screw in just enough so that engine runs smoothly.

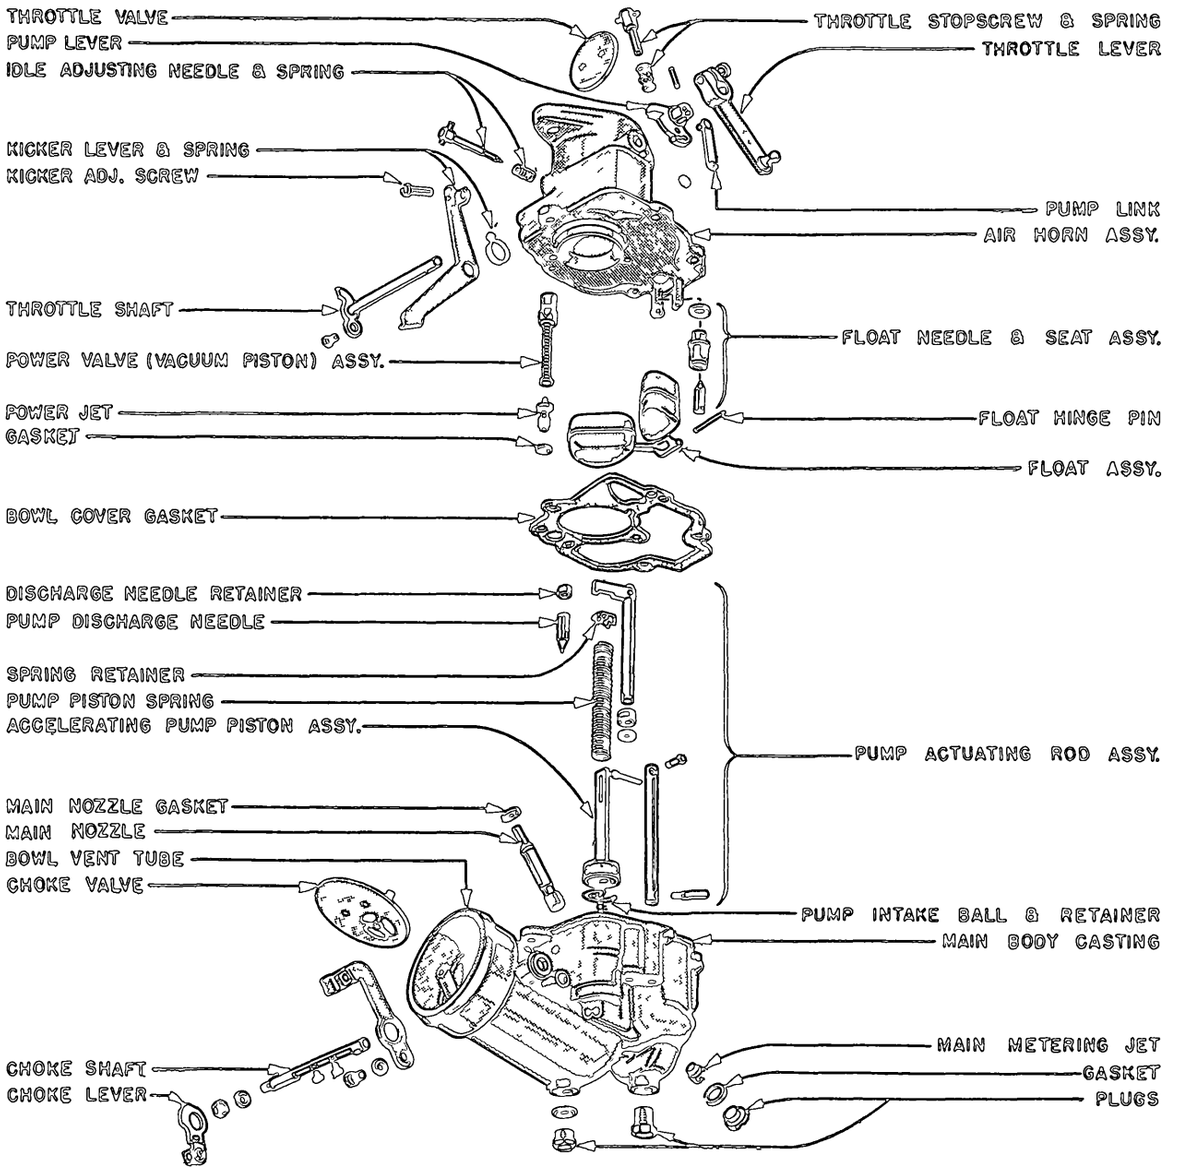
ACCELERATING PUMP: Throttle lever has three holes for actuating rod link connection as follows:
Inner (Upper Hole)—Min. stroke for hot weather.
Center (Lower) Hole—Medium stroke for average operating conditions.
Outer Hole—Maximum stroke for cold weather.

POWER VALVE (ECONOMIZER): No adjustment.

MAIN METERING JET: Non-adjustable type located at lower end of main nozzle well. Accessible by removing plug below float bowl. See Holley (Ford) Updraft Carburetor Jet Specifications.

FLOAT LEVEL: Fuel Level—Fuel level in bowl should be .500" (½") plus or minus .032" (1/32") below top edge of bowl with needle valve seated.

Float Level Setting: To check setting, remove air horn and float assembly from carburetor, invert assembly, use float gauge (Holley 82R-9-2) to measure from face of cover to bottom of float. Should be 1.180-1.200" (All)



Adjustment—Use bending tool to bend float arm.

▷*CAUTION—Both floats must be set alike and floats must not be twisted to avoid possibility of floats rubbing on sides of bowl.*

THROTTLE KICKER: Consists of a spring-loaded lever on the side of the carburetor which rides on a cam surface on the choke valve lever and has an adjustable screw at the upper end which contacts lever on throttle valve shaft.
Adjustment—Should not be required if adjusting screw at upper end of kicker lever not disturbed.

CHOKE: Offset type butterfly valve with poppet type relief valve. Adjust linkage so that valve closed when choke button pulled out fully.

REPAIR PARTS: Separate kits furnished (one for jets, one for other parts) containing all necessary parts for carburetor overhaul as follows:
Repair Kit (Metering Jets)—Ford No. 7HW-9995 contains one 5GA-9533-A Main Metering Jet, one 7HA-9594 Power Jet and necessary gaskets.
Repair Kit (Other Parts)—Ford No. 7HW-9590.
Gasket Sets—Ford No. 7HW-9502.

HOLLEY (FORD) UPDRAFT CARBURETOR

HOLLEY (FORD) SIX CYL. DOWNDRAFT TYPE

②—Replaced by 8HA-9509-A (Carb. Assy. less choke lever).

►**ANTI-STALL DASHPOT (1HA-9510A CARB.):** Used on cars with Fordomatic Transmission. See Description and Anti-stall Adjustment below.

DESCRIPTION

DESCRIPTION: Plain tube, downdraft type with throttle operated accelerating pump and vacuum controlled economizer (power jet). Carburetor is similar to dual types used on Ford V8 models except for single barrel and new type economizer as described below.

Anti-stall Dashpot (1HA-9510A Carb.)—Consists of a diaphragm type dashpot with spring loaded plunger which engages a screw on the throttle lever as the lever moves toward the closed position and slows the throttle lever movement (controlled by rate of air bleed from dashpot) to prevent the engine stalling.

►**1947 & Later Carburetors with Vacuum Control for Distributor Advance**—Carburetors have two ports (one in venturi, one in carburetor throat above throttle. edge) terminating in distributor vacuum line connection to provide vacuum for operation of advance on new "Loadomatic Distributor."
See "Ford & Mercury Distributor" in Electrical Equipment Section for checking of these vacuum ports and passages.

Fuel System (Idling):—Fuel for idling taken from main jet well up through Idle Tube (which meters the fuel) to cross-passage in main nozzle bar where it is mixed with air admitted through Idle Air Bleed drilled passage in top of nozzle bar. Fuel mixture flows from this cross-passage down through channel to idle ports at throttle edge. For closed throttle idling, all fuel discharged through lower idle port (below throttle) and controlled by Idle Adjusting Needle. As soon as throttle opened, additional fuel is discharged through upper port also.

Driving Range—At intermediate speeds, fuel metered by metering jet at lower end of main jet well flows through cross-passage in main nozzle bar to antechamber at center where it is mixed with air admitted through air bleed opening in side of cross-channel and through Nozzle Air Bleed Plug which is screwed in top of nozzle bar. Fuel mixture is then discharged through main nozzle opening below nozzle bar into throat of venturi.

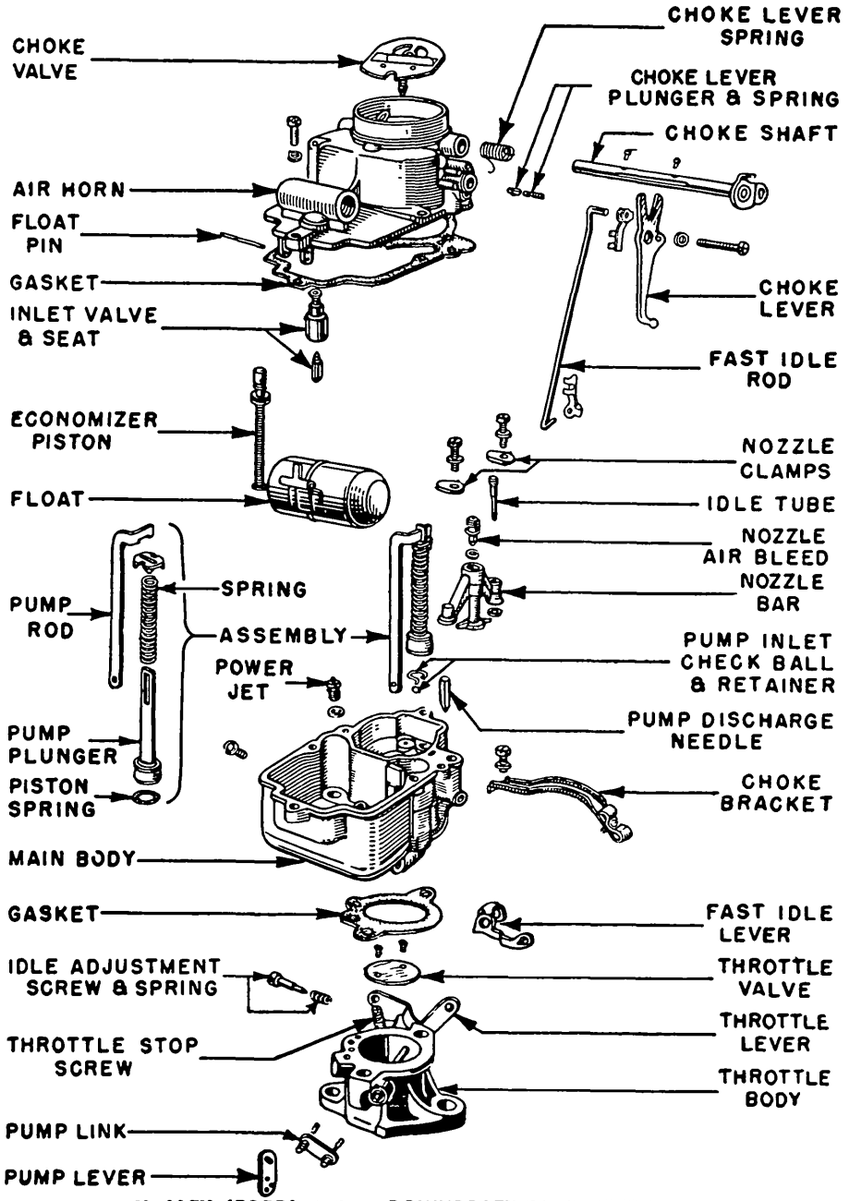
High Speed & Wide Open Throttle Operation—At high speed or whenever throttle opened sufficiently so that vacuum decreases, economizer valve spring opens economizer valve allowing additional fuel to flow directly from float bowl to main jet well (by-passes metering jet). This fuel metered by economizer restriction which is small drilled passage at well end of economizer fuel channel.

ADJUSTMENT & OVERHAUL

IDLING ADJUSTMENT: Idle adjusting needle or screw controls fuel discharge from lower (closed throttle) idle discharge port. Settings given below. See car model pages for complete tune-up instructions.

IDLE SETTING

Idle Screw S tting—Preliminary setting 1 turn open. After engine warmed up to normal operating temperature (choke valve wide open, fast idle inoperative), adjust screw for highest steady vacuum reading. If vacuum gauge not used, turn screw out until engine begins to roll, then turn screw in until engine speed falls off, finally turn screw out to smooth idling position.



Idle Speed (Synchro-mesh Trans. Cars)—475-500 RPM.

Idle Speed (Fordomatic Trans).—425 RPM. (selector lever in neutral "N").

►***NOTE—Check Anti-stall setting on cars with Fordomatic Transmission.***

ANTI-STALL DASHPOT (1HA-9510-A CARB.): Consists of a separate diaphragm type vacuum unit mounted on bracket bolted on carburetor with diaphragm plunger engaging an adjustable screw on the throttle lever. Check dashpot setting after adjusting carburetor idle speed.

CONTINUED ON NEXT PAGE

H LLEY (FORD) 6 CYL. DOWNDRAFT CARBURETOR

HOLLEY (FORD) SIX CYL. DOWNDRAFT TYPE (C nt.)

Setting—.038-.040" clearance between dashpot plunger and head of adjusting screw on throttle lever with throttle valve closed and dashpot plunger bottomed in dashpot. To adjust, hold throttle lever in closed position, loosen adjusting screw locknut, turn screw out (counter-clockwise) until dashpot plunger bottoms in dashpot, then turn screw in (clockwise) 1¼ turns, tighten locknut. This will give correct clearance of .038-.040".

METERING JET: Main Meteringjet is non-adjustable type located in float bowl and accessible by removing float bowl cover. Jet should be changed only to compensate for special operating conditions such as high altitudes. See Holley (Ford) Jet Specification Table.

ECONOMIZER: Consists of a spring-loaded vacuum piston located in the air horn and float bowl cover casting with the piston stem extending down so as to contact the power jet valve located in the main body casting. Vacuum piston is normally held up at the top of its stroke by manifold vacuum (vacuum passage drilled in carburetor castings and opens into carburetor throat below throttle valve) so that power jet valve is held closed by the spring on the valve stem. when manifold vacuum decreases, spring forces the piston down and opens the p wer jet valve. Fuel then flows from float bowl through valve to main jet well directly without passing through main metering jet.

S tting—Valve opens when manifold vacuum drops to approximately 6½-7½". No adjustment is required.

ACCELERATING PUMP: Pump assembly is located in float bowl, operated by inverted 'L' shaped pump rod linked to throttle lever. Fuel is drawn into pump cylinder through inlet ball check valve at lower end when throttle is closed and is discharged through outlet check valve and pump discharge nozzle when throttle opened for accelerating (nozzle is located at upper edge of venturi). Pump piston connection to pump rod is through a driving spring on the piston stem which prevents loading up engine when throttle opened suddenly and also prolongs pump discharge (spring compressed at beginning of piston travel, expands at end of travel).

Seasonal Adjustment—Engage pump link in proper hole in throttle lever (holes numbered 1-2-3 from throttle shaft outward):
#2 (center)—normal. #1 (inner)—hot weather. #3 (outer)—cold weather.

NOTE—Pump link is locked in lower end of pump rod by a spring-loaded snap lock. To disengage lock, pull link shaft out of pump rod.

FLOAT LEVEL: Use Ford 9550-A Float Position Gauge to check float level. With bowl cover and float assembly removed, remove gasket, invert cover so that float weight holds needle valve closed, place gauge on bowl cover with gauging arm extending over float (CAUTION—check both ends of float). "Go" end of gauge should clear float and "No Go" end should not clear (with "No Go" end of gauge resting on float, base of gauge should clear bowl cover at gauging arm end).

FLOAT LEVEL SETTING

Carburetor Model	Checking Gauge	"Go"—Height—"No Go"
All except 8MTH-9510-A	9550-A	1.353" — 1.322"
8MTH-9510-A only	T52L-9510-AHD	1.315" — 1.283"

Adjustment—Use 9550-C bending tool to bend float arm using extreme care to keep float level (recheck float at both ends). Make certain that float has sufficient travel to drop to bottom of float chamber (travel controlled by stop on float arm.)

Fuel Level: With correct float setting, level of fuel in float bowl (below top edge of bowl) should be:

FUEL LEVEL SETTING

Car Model	①Fuel Level Setting
Ford 6 Cyl. (exc. 8MTH-9510 Carb.)	.687" (11/16")
Ford 6 Cyl. (8MTH-9510 Carb.)	.720" (23/32")

①—Plus or minus .032" (1/32").

Float Needle Valve & Seat: Furnished only in matched sets as follows:
Part No. 78-9564—(1GA-9510-A & 5GA-9510-A Carburetors).
Part No. 7HA-9564—(7HA-9510A, 7HT-9510A, 8HA-9510A, 8MTH-9510A Carbs.).

CHOKE: Offset type with poppet type relief valve to prevent over-choking.

THROTTLE KICKER (STARTING): Consists of spring loaded lever pivoted on side of carburetor casting so as to contact cam on choke lever at upper end and throttle lever at lower end (through throttle stopscrew which is mounted on this starting lever). Lever is rotated by ch ke lever cam when choke valve closed for starting and opens throttle slightly. No adjustment required.

DISASSEMBLY OF CARBURETOR: Remove choke lever screw, lever, plunger, and spring (disconnect lever from connector link). Take out throttle kicker screw and remove throttle kicker. Take out air horn screws and lift off air horn assembly being careful not to damage float or power jet (economizer) vacuum piston assembly. Disconnect accelerating pump link, lift out pump plunger and rod assembly. Remove main metering jet (use screwdriver with blade that fits jet snugly) and power jet from float bowl. Remove nozzle bar screws and clamps, remove Idle Tube and air bleed from nozzle bar, lift out nozzle bar gaskets. Remove check valve retainer from bottom of pump cylinder (use small rod with hooked end), invert main body casting and remove pump discharge needle and check ball (these parts will drop out). Remove throttle body attaching screws and washers, lift throttle body off. Remove idle adjusting screw and spring, take out float hinge pin and remove float assembly from air horn, remove fuel inlet needle valve and seat assembly and gasket.

Servicing—Clean all carburetor parts and make certain that all corrosion removed from float bowl. Examine all parts for wear and replace all worn or damaged parts. Use new gaskets when reassembling carburetor.

Accelerating Pump—When installing check ball in bottom of pump cylinder, seat the ball by tapping lightly with a brass drift rod, then install retainer using a wooden or fibre dowel to press retainer down in place. When installing pump discharge needle, tap needle lightly with a brass drift to insure that it seats properly. Check pump action when completely assembled, a good stream should be apparent at the pump discharge nozzle when throttle valve is opened (bowl must be filled with gasoline when making this test).

Float Inlet Valve & Seat—Keep needle valve and seat together as a set, rinse in cleaning solution and wipe off with clean cloth; if re-installed in carburetor, polish float lever end of needle valve with #320 'wet or dry' paper.

Choke Valve—Check valve tightness by holding air horn assembly against light and noting light around edge of valve. Check poppet relief valve and replace choke valve assembly if relief valve spring weak or broken. Check choke lever boss on air horn for wear using new choke lever, replace air horn if boss worn. Check choke lever for wear at ball end and in 'V' opening which engages choke shaft lever. Clean out choke lever pawl hole.

Float Assembly—See that float lever firmly soldered to float, examine float for leaks (immerse float in water heated just below boiling point, bubbles indicate that float leaks). Polish needle valve contact point on float arm with #320 'wet or dry' paper. Check float level and travel (use 9550-A gauge) as directed under Float Level (above) when float re-installed.

Throttle Valve Assembly—Check valves for tightness in same manner as choke valve (above). Replace complete assembly if valves worn, shaft worn or loose, throttle valve lever loose on shaft, or if pump link hole in throttle lever worn. If throttle valves replaced, stake attaching screws securely (use 9518-C anvil and 9518-D punch). Check throttle valve position using gauge (which gauges distance from valve to idle ports with valve closed).

Vacuum Economizer:—Vacuum piston is located in air horn and float bowl casting and will be removed when air horn is taken off. Power valve is screwed in place in main body casting and can be removed with air horn off and vacuum piston removed. When removing and installing jets, use screwdriver which just fits jet slots and take care not to damage jets and fuel orifices, see that gaskets are in good condition and in place when jets installed.

Pump Discharge Nozzle—Nozzle is a drilled passage in the main body casting and is not removable. A metering restriction is installed in the nozzle passage.

REASSEMBLY OF CARBURETOR: After cleaning and inspecting parts for wear (see Servicing above), reassemble carburetor by reversing disassembling directions. Adjust carburetor after re-installation on engine.

TROUBLE SHOOTING: See Ford V8 carburetor data.

SERVICE PARTS: Repair Kits. Kits listed below contain all necessary parts (gaskets, jets, etc.) required for carburetor overhaul.

►*REPAIR KIT NOTE—Jets furnished in kits are correct size for use in altitude range*

Carburetor	Repair Kit Part No.
8HA-9510A (Up to 5000 ft.)	7HA-9590A
8HA-9510B (5000 to 10000 ft.)	7HA-9590B
7HT-9510A (Up to 5000 ft.)	7HT-9590A
7HT-9510A (5000 to 10000 ft.)	7HT-9590B
8MTH-9510A	8MTH-9590

Gasket Sets—Ford No. 7HA-9502 (8HA-9509A, 8HA-9510A, 7HT-9510A Carb.), No. 8MTH-9502 (8MTH-9510A Carb.).

FORD 6 "VISI-FLO"

FORD 6 CYL. CARS	Carburetor No.
1952 (Synchro-mesh)	①EAA-9510-D
1952-53 (Synchro-mesh)	①EAA-9510-G

1954-55 Fordomatic Trans.	EBP-9510-B

①—Replaced by No. EAA-9510-L.
②—Replaced by No. EAA-9510-M.

►CHANGES, CAUTIONS, CORRECTIONS

►*1952 LEAKAGE CORRECTION (Leaks at Vent Hole):* May be caused by gasoline seeping or "wicking" out through edge of power jet main well spacer gasket and leaking out through pump vent chamber vent hole on first carburetors where gasket installed between main body and accelerator pump piston assembly. Correct by reversing the location of the gasket by installing parts in following order: Install Pump Piston Assembly first **against** carburetor main body, then install the gasket, finally install main well body assembly.

NOTE—Later carburetors have parts installed in this order and this leakage should not be encountered.

►*1952 FLOAT BOWL CHANGE (To prevent breakage and provide better seal):* Kit No. CPA6-99521-A has following new parts which will prevent fuel bowl breakage and provide better seal against leakage:

Float Bowl No. EAN-99521-A—Identified by word "Holley" in ¼" high letters in lower left hand corner. Bowl is thicker and is deeper to provide more float clearance. Mounting flange is thicker and incorporates a sealing rib.

Float Bowl Gasket No. EAN-9561-A. Granular cork type with synthetic rubber binder to prevent gasoline-soaking and possible leakage.

Float Bowl Retainer Gasket No. EAA-99589-A—This gasket acts as a cushion to prevent cracking bowl from over-tightening or uneven-tightening.

Float Bowl Retainer Spacers No. EAA-99590-A—Must be used with old Retainer Clamp No. EAA-99562-A to compensate for additional thickness of new parts.

►*1952 DASHPOT PRODUCTION CHANGE (Fordomatic Cars):* Dashpot No. EAA-99560-A used on cars beginning late October, 1952. Dashpot has neoprene dust shield or boot on plunger to protect plunger from dirt which might interfere with proper operation.

►*METERING JET SPECIFICATION CHANGES: See "Holley (Ford) Downdraft Carburetor Jet Specifications" for production changes and latest jet specifications.*

►*FLOAT INTAKE NEEDLE & SEAT PRODUCTION CHANGE & REPLACEMENT PARTS NOTE:* New design Needle Valve & Seat Assembly No. EAA-9564-B (steel needle with brass seat insert in seat casting) used in later 1953 production and can be installed in previous 1952-53 carburetors to replace first type No. EAA-9564-A assembly (nylon needle valve and seat assembly).

DESCRIPTION: This "Visi-flo" carburetor has very low over-all height, side-opening glass fuel bowl, diaphragm type accelerating pump, and a special "Main Well & Power Valve Body" sub-assembly in which all of the calibrated metering parts (Main Jet, Power Valve, Pump Inlet and Outlet Check Valves and Fuel Inlet Valve) are mounted. This sub-assembly can be removed as a unit.

ADJUSTMENT: For tune-up on the car, adjust as follows:

Idle Mixture: With engine at normal operating temperature and choke valve wide open (so engine runs at slow idle speed), use vacuum gauge and adjust idle mixture adjusting screw for highest steady vacuum. If gauge not used, turn screw out to enrich mixture until engine begins to roll, then turn screw in to lean mixture until engine slows down, finally turn screw out until engine idles smoothly. Re-adjust idle speed screw.

***NOTE*—If initial adjustment required to warm up engine, turn screw in until lightly seated, then back screw out one turn and start engine.**

Idle Speed:	Synchro-mesh	Fordomatic
1952-54	475-500 RPM	440-460 RPM
1955	475-500 RPM	①450-475 RPM

①—With selector lever in "N" Neutral position.

NOTE—If anti-stall Dashpot adjusting screw holds throttle open and prevents proper idle adjustment, loosen locknut, turn Dashpot screw clockwise until idle speed can be adjusted, then readjust Dashpot setting, see below.

CAUTION—Set idle speed only with engine warm and choke valve wide open.

Accelerating Pump: Inner hole for normal or hot weather, outer hole for cold weather operation (holes located in throttle lever, shift pump link as required).

Float Level: *Fuel level can be checked through glass bowl cover without disturbing carburetor.*

Fuel Level—Flush to 1/16" below top edge of float hinge bracket in bowl. To adjust, remove bowl cover, bend float tab which contacts float needle spring.

Float Level—Can be checked with Gauge No. T52L-9550-AEE (Gauge, Bending Tool, and Dummy Fuel Bowl), or with cardboard gauge (furnished in repair package) as follows:

Using Gauge 9550-AEE—Remove regular carburetor fuel bowl, install dummy fuel bowl (with open top) using regular fuel bowl gasket and three of the retaining screws. Remove power valve cover and diaphragm assembly, install fuel gauge No. T52L-9550-AEE in this opening. Fuel in bowl should touch tip of "LOW" gauge pin, but should not touch tip of "HIGH" gauge pin. Adjust by bending float arm tab using special slotted bending tool.

Using Cardboard Gauge (in Repair Pkg.)—With fuel bowl removed, invert carburetor so that float hangs down in valve-closed position. Install gauge over edge of bowl opening. Float should not touch gauge at free end of float. Adjust by bending tab on float arm. *This is approximate setting only and fuel level should be checked after carburetor has been assembled.*

Dashpot (Fordomatic Cars & Trucks): After engine idle speed adjustment completed, turn ignition off, loosen dashpot adjusting screw locknut (on dashpot operating lever), hold throttle in closed position and turn adjusting screw out or counter-clockwise until the head of the screw pushes the dashpot rod up to the limit of its travel, then turn adjusting screw in or clockwise 1½-2 turns, tighten locknut.

This will provide correct clearance of .045-.064" between dashpot rod and adjusting screw (apparent only when rod bottomed in dashpot).

OVERHAUL: Carburetor consists of three main sub-assemblies (Main Body, Main Well & Power Valve Body, and Throttle Body) which are removed and disassembled as follows:

Disassembly: With carburetor off engine, disconnect pump link at pump operating lever, take out throttle body screws and separate main body from throttle body, disassemble each part as follows:

Main Body—Remove fuel inlet fitting. Remove glass fuel bowl and gasket (four retainer screws and clamps). Remove fuel inlet seat screw and gasket, then remove fuel inlet valve and float assembly and gasket. Remove power valve diaphragm by taking out three cover screws on top of main body *(NOTE*—If diaphragm defective, separate cover and discard diaphragm and stem assembly). Take out five main well and power valve body screws, lift this assembly out. Remove pump diaphragm return spring from seat on diaphragm disc, pull diaphragm and rod assembly straight out of main body *(CAUTION*—do not rotate assembly while removing it). Press pump rod sleeve toward diaphragm to allow sleeve retainer ball to drop out *(CAUTION*—do not lose this ball), remove sleeve. Spread notch in pump operating lever retainer, pry retainer off stud and remove the pump operating lever. Remove pump discharge nozzle screw (visible at side of choke valve when looking down on carburetor), lift discharge nozzle out. Remove retainer in distributor vacuum passage, remove ball from passage. If necessary to remove choke valve or shaft, first drive distribution pin out of shaft (support shaft with piece of tubing and drive pin down in tubing using a small punch), take out valve attaching screws *(CAUTION*—clean up staked ends of screws with a file first to avoid damaging threads in shaft holes), remove valve, then drive shaft retainer pin out of boss in main body and remove choke shaft and lever. Remove choke lever bracket.

Main Well & Power Valve Body—Unscrew main metering jet using special tool T52L-9594-AAD. Unscrew pump inlet and discharge check valve retainer plugs, invert body to allow inlet check ball, discharge check ball, and pump discharge valve weight to fall out. Do not attempt to remove power valve from the body.

Float Disassembly—Remove float shaft retainer and slide shaft out to release the float. Slide fuel inlet needle assembly off float lever tab, remove the wire clip, spring, and plunger from the fuel inlet needle.

Throttle Body—Remove idle adjusting needle and spring, remove pump link by taking out cotter pin. Do not remove throttle valve or shaft.

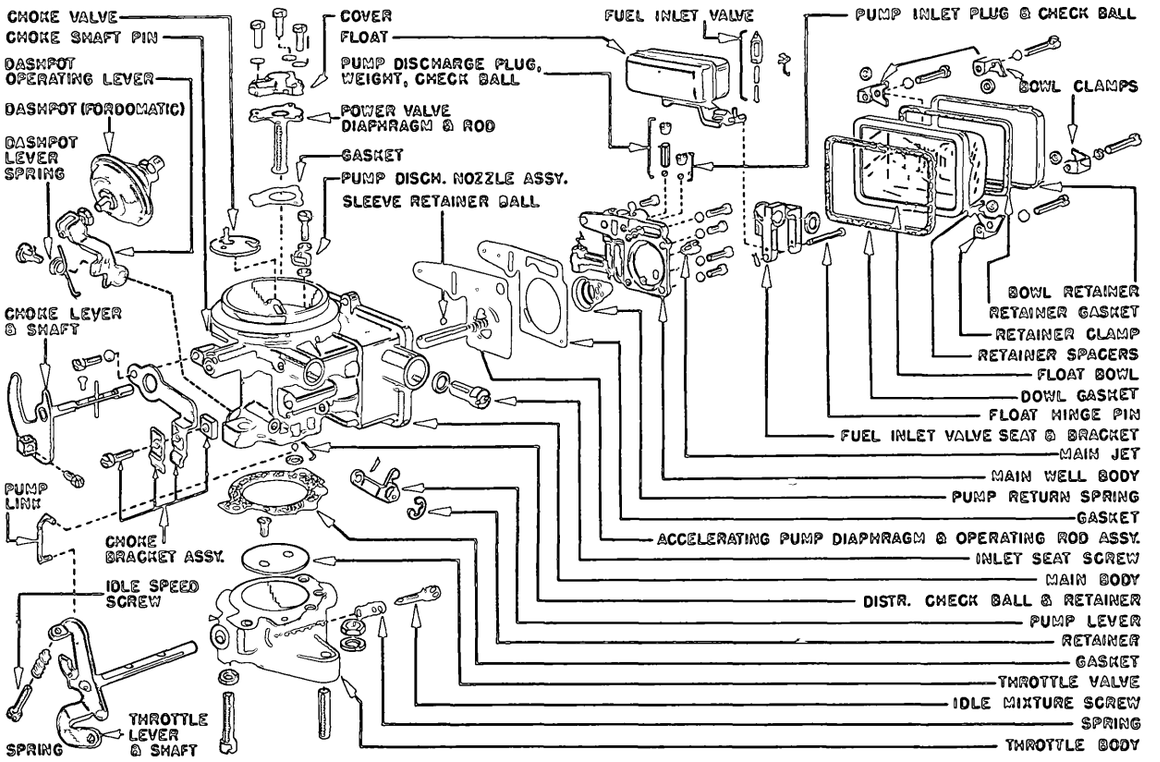
Cleaning & Inspection: Soak all metal parts in carburetor cleaning solvent, carefully clean off all carbon and gum deposits, blow out all passages and dry parts with air. Inspect all parts for wear and dam-

CONTINUED ON NEXT PAGE

FORD 6 "VISI-FLO" (Continued)

age. Replace throttle body if valve edges nicked or if protective plating damaged so that casting metal exposed. Replace main body if protective plating damaged. Replace choke valve if bent, nicked, or if poppet relief valve does not operate freely.

Reassembly: Use all NEW gaskets. Assemble parts in reverse order of disassembly procedure above and note these important points:



Pump Discharge Nozzle Installation—Use new gasket on each side of nozzle, insert screw through grooved side of nozzle, allow nozzle to turn clockwise until stopped by edge of recess in main body when tightening the screw.

Choke Valve & Distribution Pin Installation—After choke shaft installed and retainer pin driven into hole in top of choke shaft boss, turn lever so that swivel is directly beneath choke shaft and insert choke valve in shaft slot with relief poppet valve spring on top of valve (*CAUTION*—use care not to damage main nozzle which fits in slot in valve). Install two valve attaching screws and tighten just enough to hold valve (*CAUTION*—Filister head screw must be installed in hole nearest lever end of shaft). Install distribution pin by driving pin in through hole in shaft and valve (*CAUTION*—support shaft with piece of tubing and drive pin down into tube), position pin so that clearance at each end is uniform when choke valve wide open. Hold choke valve in fully closed position and tighten attaching screws securely. Check choke valve for free operation and, if no bind exists, stake screws.

Accelerating Pump Installation—First assemble pump by installing spring and sleeve on pump rod and pressing the sleeve on to compress the spring until the retainer ball can be dropped into the hole in the sleeve. Then position pump assembly in main body so that diaphragm bears directly against the main body, then install main well body spacer gasket (this gasket can be slipped over main well body attaching screws and installed with the main well body if desired), finally install main well body.

▷*CAUTION—Above position of pump piston assembly and gasket is reversed over original assembly on first carburetors and will prevent leakage through vent hole. Later carburetors were assembled in this order.*

Main Well Body Installation—After spacer gasket and pump diaphragm assembly installed in main body, seat large end of pump return spring in pump diaphragm disc, install main well body exactly as follows: Insert power valve end of main well body into main body first, apply pressure against protruding end of pump rod sleeve to fully compress pump return spring while pressing main well body

FORD 6 "VISI-FLO" CARBURETOR

into position, tighten all five main well body screws BEFORE releasing pump sleeve. *NOTE*—Two long screws should be placed in center top and bottom holes, shorter screws in remaining three holes.

Float Assembly Installation—Install a new gasket on the fuel inlet seat screw, insert screw through fuel inlet fitting boss on main body, install second gasket on threaded end of screw, install float and fuel inlet valve assembly in position to engage the screw, align float hinge bracket by placing bar section of float gauge under bracket (between lower end of bracket at float shaft and face of main body casting), tighten inlet seat screw securely before removing gauge.

Float Bowl Installation—Install new gasket in recess in rim of fuel bowl, place bowl in position on main body, install retainer gasket, retainer, and all retainer clamps with spacers and screws (use lock-washers under screw heads).

Tighten attaching screws exactly as follows: (1) Tighten screws finger-tight in following sequence—Lower—Upper—End, (2) Use a proper size screwdriver to tighten screws in same sequence additional ¾ to 1 full turn, (3) Finally tighten all screws in same sequence to final tightness of approximately 8-10 in. lbs. torque.

▷*CAUTION—DO NOT overtighten fuel bowl screws and make certain screws tightened evenly to avoid danger of cracking glass bowl.*

Carburetor Adjustments—Make all adjustments as listed in ADJUSTMENT section above.

SERVICE PARTS: Gasket Sets—Ford No. B2A-9502-A (1952-53), No. B2A-9502-C (1954-55).

Repair Kit (with Std. Metering Jet)—Ford No. B2A-9590-A (1952-53), No. B4A-9590-B (1954-55).

④—Replaced by 8RT-9510-F.
⑤—"A" type replaced by "E" type.

▷CHANGES, CAUTIONS, CORRECTIONS

▷*"HIGH-LIFT" NOZZLE BAR CARBURETORS (Models 8RT-9510-E, F, G; EAB-9510-C, D, F):* Nozzle bar assemblies are different design than assemblies used on other carburetors and these "High-Lift" Nozzle Bar carburetors require SPECIAL FLOAT SETTING. See Float Level data below.

▷*"HIGH-LIFT" NOZZLE BAR NON-INTERCHANGEABILITY CAUTION (V8 Passenger Car & Truck Carburetors):* TWO types of High-Lift Nozzle Bars used with different Idle Air Bleed locations. THESE NOZZLE BARS MUST NOT BE INTERCHANGED:

1) Pass. Car & Fordomatic Truck Carburetors Nos. 8RT-9510-G, EAB-9510-C, D, F): Ford Part No. EAB-9920-B & EAB-9921-B. Air bleed is drilled in Idle Tube (screwed in top of nozzle). Some nozzles may have three apparent holes drilled in flat surface of nozzle adjacent to idle tube passage but these holes are BLANK and not drilled through.

2) Trucks (except Fordomatic Models) Carburetors Nos. 8RT-9510-E, F: Ford Part No. EAB-9920-A & EAB-9921-A. Air bleed consists of drilled hole in nozzle bar casting on flat surface adjacent to idle bleed passage (NO bleed hole in Idle Tube). Some nozzles may have three apparent holes drilled on flat surface of nozzle, in this case, CENTER hole will be drilled through to idle passage and is the air bleed.

▷*1954 V8 239" ENGINE CARBURETOR PRODUCTION CHANGE & REPLACEMENT PARTS CAUTION:* Later carburetors (identified by "2" stamped on mounting flange opposite throttle lever (have different Nozzle Bars with bleed hole in idle cross-over passage drilled through one wall only (nozzle bars on early carburetors have bleed hole drilled through both walls). Repair Kit No. B4A-9590-F has two sets of Idle Jets and correct type should be used for each carburetor as follows:
Early Carburetors—Use Jet No. EBU-9542-B (stamped "68"). Later Carburetors—Use Jet No. B4A-9542-A (stamped "54"). *See recommended correction following.*

▷*1954 V8 239" ENGINE CARBURETOR STALLING CORRECTION & IMPROVED ECONOMY: See Production Change above.* To correct stalling on early carburetors, install new nozzles furnished in Nozzle Bar Replacement Kit No. B4A-9920-D in conjunction with Repair Kit No. B4A-9590-F (CAUTION—Use Idle jets stamped "54" with these new nozzles). To improve economy (and correct stalling), on all carburetors, install new Throttle Body furnished in Throttle Body Replacement Kit No. B4A-9510-B.

▷*1954 CARBURETOR IDLE ADJUSTING NEEDLE PRODUCTION CHANGE & REPLACEMENT CAUTION:* Idle adjusting needle changed from 15° included angle tip to a 40° included angle tip. New 40° needle can be used to replace former 15° needle in pairs only.

▷*ANTI-STALL DASHPOT (FORDOMATIC CARS):* Consists of a diaphragm type dashpot with spring-loaded plunger which engages a screw on the throttle lever as the lever moves toward the closed-throttle position. This slows the throttle lever movement (controlled by rate of air bleed from dashpot) and prevents the engine stalling. An adjustment is provided. *See Adjustment data below.*

▷*DASHPOT PRODUCTION CHANGE:* Dashpot No. EAB-99560-A (used in production after November, 1952) has neoprene dust shield or boot on control plunger to protect plunger from foreign material which might interfere with proper operation.

▷FORD V8 & MERCURY CARBURETOR POWER VALVE CHANGE (No. 78-9904 Carburetor Economizer or Power Valve). Diaphragm material changed from Neoprene to Fairprene to prolong life of this part. Parts may be identified by color of power valve cover as follows:

First Type (Neoprene Diaphragm)—Silver (cadmium plated).
Later Type (Fairprene Diaphragm)—Black (oxidized).

▷FORD V8 ('49) ACCELERATOR ASSY. INTERFERENCE CORRECTION. To correct complaints of interference between acelerator assembly (levers and cross-shaft on dash) and accelerator rod assembly (linking accelerator and carburetor) and which may cause linkage to come apart, grind or file off the end of the accelerator assembly at the accelerator rod connection to provide clearance and prevent accelerator assembly contacting the clip locking the two assemblies together (interference at this point forces tines on clip off and allows the rod to disengage from the accelerator).

▷THROTTLE BODY GASKET CAUTION—New type gasket, No. 7RA-9516, with hole for distributor control vacuum passage must be used on all carburetors with distributor vacuum line connection. *Previous type gaskets must not be used on these carburetors.*

DESCRIPTION

DESCRIPTION: Dual (double barrel), plain tube, downdraft types with throttle operated accelerating pump and vacuum controlled economizer (power jet). All models are similar except for following special features:

▷Ford 1948 & Later Carburetors with Vacuum Control for Distributor Advance—Carburetors have two ports (one in venturi, one in carburetor throat above throttle edge) terminating in distributor vacuum line connection to provide vacuum for operation of advance on new "Loadomatic Distributor."
See "Ford & Mercury Distributor" in Electrical Equipment Section for checking of these vacuum ports and passages.

▷1954-55 Spark Control Valve: Consists of a spring-loaded diaphragm controlled valve which controls the opening of the distributor advance control vacuum channel terminating at the throttle edge. The valve remains open under normal operating conditions but closes under acceleration (with drop in manifold vacuum) cutting off manifold vacuum to distributor and retarding the spark advance. The valve likewise closes when the throttle is wide open to prevent venturi vacuum bleeding back into the manifold.

Fuel System (Idling):—Fuel for idling taken from main jet well up through Idle Tube (which meters the fuel) to cross-passage in main nozzle bar where it is mixed with air admitted through Idle Air Bleed drilled passage in top of nozzle bar. Fuel mixture flows from this cross-passage down through channel to idle ports at throttle edge. For closed throttle idling, all fuel discharged through lower idle port (below throttle) and controlled by Idle Adjusting Needle. As soon as throttle is opened, additional fuel is discharged through upper idle port also. Independent idle system used for each carburetor barrel.

Driving Range—At intermediate speeds, fuel metered by metering jet at lower end of main jet well flows through cross-passage in main nozzle bar to antechamber at center where it is mixed with air admitted through air bleed opening in side of cross-channel and through Nozzle Air Bleed Plug which is screwed in top of nozzle bar. Fuel mixture is then discharged through main nozzle opening below nozzle bar into throat of venturi.

High Speed & Wide Open Throttle Operation—At high speed or whenever throttle opened sufficiently so that vacuum decreases, economizer valve spring opens economizer valve allowing additional fuel to flow directly from float bowl to main jet well (by-passes metering jet). This fuel metered by economizer restriction which is small drilled passage at well end of economizer fuel channel

CONTINUED ON NEXT PAGE

HOLLEY (FORD) V-8, LINCOLN, MERCURY (C nt.)

ADJUSTMENT: Set these carburetors to following specifications:

IDLING ADJUSTMENT

Idle Mixture Setting—***CAUTION—See Idle Screw Production Change above.*** Make an initial adjustment by turning both screws in until they are lightly seated (*CAUTION*—do not turn screws hard against seats which will groove points and make adjustment impossible unless screws replaced), then back each idle screw out approximately 1 turn (1946-53), 1½ turn (1954-55). Run the engine at a fast idle speed until it is at normal operating temperature. Then adjust as follows: If vacuum gauge used, adjust both screws equally for highest steady vacuum reading. If vacuum gauge not used, turn each adjusting screw ⅛ turn at a time until smoothest idle position secured. Final setting should not exceed ½ turn difference between setting of both screws. Recheck idle speed and adjust stopscrew for correct speed as listed below.

►***PASSENGER CAR STALLING CORRECTION:*** If car tends to stall at idle speed or when brakes applied with idle setting made as above, modify idle setting as follows: After Idle Mixture and Idle Speed have been set to above specifications, turn each idle mixture adjusting screw out ⅛ turn at a time until engine speed has been reduced a total of 25 RPM., then readjust idle speed stopscrew for correct idle speed. This will provide a slightly richer idle mixture which will prevent stalling.

►***NOTE—Check Anti-stall setting on Fordomatic cars.***

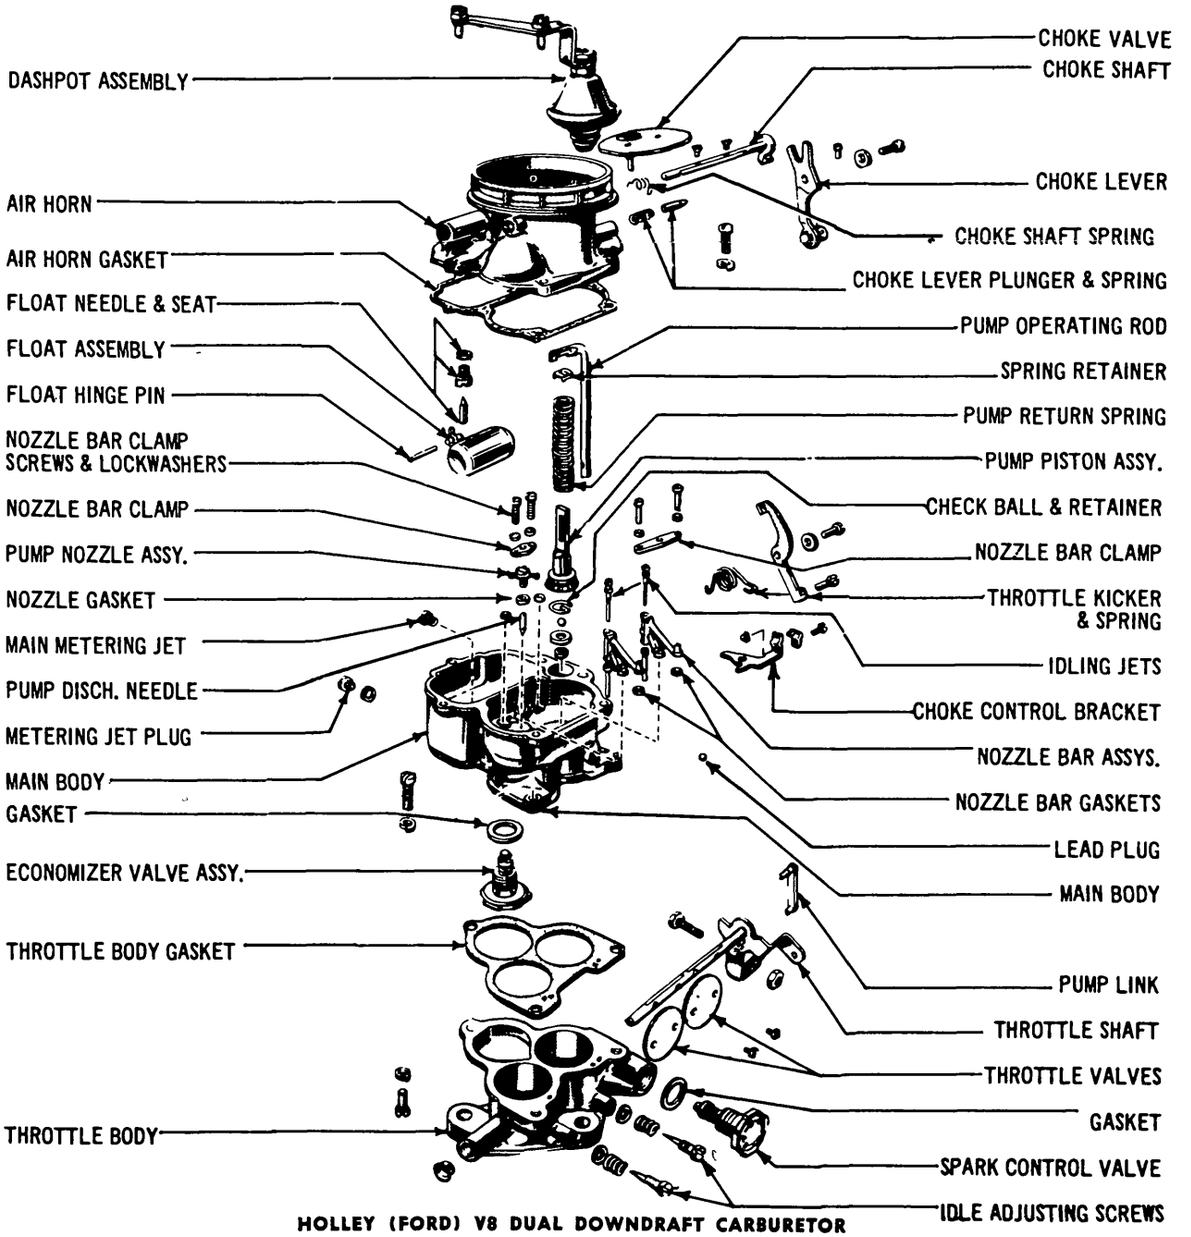
Idle Speed Setting

Car Model	Idle Speed
Ford (All—Synchro-mesh)	475-500 RPM
Ford (1951-53 Fordomatic)	①425 RPM
Ford (1954 Fordomatic)	①445-455 RPM
Ford (1955 Fordomatic)	①450-475 RPM
Lincoln & Mercury	500 RPM

①—With selector lever in Neutral "N" position.

ANTI-STALL DASHPOT SETTING

Setting—After idle speed adjusted (above), turn off ignition, loosen locknut on dashpot adjusting screw stud, turn screw out or counter-clockwise until screw pushes dashpot rod up to the end of its travel, then turn screw in or clockwise 1½-2 turns and tighten locknut. This will provide correct clearance of .045-.064" between dashpot rod and adjusting screw (when rod bottomed in dashpot).



VACUUM SPARK CONTROL VALVE

No adjustment required. Calibrating spring in valve is set to allow valve to operate at 6½-7½" of manifold vacuum. If operation not satisfactory, remove and inspect valve for free movement of the valve stem and inspect passage in adapter screw.

ACCELERATING PUMP SETTING

Seasonal Adjustment (Except B5A-9510-A)—Engage pump in Center hole for Normal operation, Inner hole for Hot weather, Outer hole for Cold weather.

Seasonal Adjustment (B5A-9510-A)—Accelerating pump links stamped "C" or "D" on side of body Pump nozzles are identified by numerals "69" or "70" in top center of nozzle. Set linkage as shown in table below.

HOLLEY (FORD) V8 DUAL DOWNDRAFT CARBURETOR

B5A-9510-A Pump Setting

Transmission	Nozzle No.	Link Setting
Std. & Overdrive	"69"	①#3 hole
Std. & Overdrive	"70"	①#3 hole
Fordomatic	"69" or "70"	#2 hole

①—Farthest hole from shaft.

C NTINUED ON NEXT PA E

HOLLEY (FORD) V-8, LINCOLN, MERCURY (Cont.)

ECONOMIZER (POWER VALVE)

Opens at 6-6½" manifold vacuum (1946-54), 7.9-9.0" manifold vacuum (1955). No adjustment is provided.

FLOAT LEVEL

►***FLOAT GAUGE NOTE***—**Use Gauge No. T52L-9510-AHD for all "High Lift" Nozzle Bar Carburetors.**

Float Level Setting

Car Model	"Go" — "No Go"
Ford (Std. Nozzle Bar)	①1.535" — 1.322"
Ford (Hi-Lift Nozzle Bar)	②1.305" — 1.275"
Lincoln	③1.290" — 1.260"
Mercury	①1.353" — 1.322"

①—Float Checking Gauge 9550-A.
②—Float Checking Gauge T52L-9510-AHD.
③—Float Checking Gauge 9550-H.

Float Checking Gauge Note—When checking float level with gauge, invert cover assembly with gasket removed, mount gauge on cover. The "GO" end of the gauge should pass over the bottom of the float while the "NO GO" end of the gauge should not. Check both ends of the float and adjust so that both ends are same height.

Fuel Level—Fuel level in bowl can be checked with a sight level indicator or other means and should be as follows:

Fuel Level Setting

Car Model	①Fuel Level
Ford (Std. Nozzle Bar)	11/16"±1/32"
Ford (Hi-Lift Nozzle Bar)	5/8"±1/32"
Lincoln	19/32"±1/32"
Mercury	11/16"±1/32"

①—Below top edge of bowl.

THROTTLE KICKER (STARTING)

Spring-loaded lever on side of carburetor contacting cam on choke lever at upper end and throttle lever at lower end. Opens throttle to starting position when choke closed for starting. No adjustment required.

OVERHAUL: Disassembly—Take out screw and flat washer attaching choke lever to air horn, remove lever, lift choke lever plunger and spring from air horn recess. Remove screw and washer attaching throttle kicker to main body, lift off throttle kicker and spring. Disconnect pump link from pump rod and throttle shaft lever and remove link. Take out throttle body attaching screws and remove throttle body gasket. Take out air horn attaching screws and remove air horn assembly and gasket.

Air Horn Disassembly—Take out float pivot shaft, remove float and inlet needle valve. Remove inlet needle valve seat. Do not remove choke valve unless parts replacement required. To remove valve, take out valve attaching screws, remove valve from shaft, slide choke shaft and lever assembly out.

Main Body Disassembly—Lift accelerating pump plunger assembly out. Remove attaching screws in each nozzle bar clamp, lift pump discharge nozzle and both nozzle bar assemblies out, remove gaskets. Invert body to drop out pump discharge needle. Remove access plugs and gaskets on side of body, use jet wrench T52L-9594-AAD to remove main metering jets. Remove pump inlet check ball retainer from bottom of pump cylinder, invert body to drop out the check ball. Remove idle jet tubes from both nozzle bar assemblies.

Throttle Body Disassembly—Remove both idle adjusting screws and springs. DO NOT remove throttle valves or disturb throttle assembly. ***NOTE*** Replace throttle body if valves or shaft worn.

Cleaning & Inspection: Clean all parts except Power Valve in cleaning solvent, make certain that all carbon deposits and gum or varnish completely removed, blow out all passages and make certain they are clean and not restricted. Inspect all parts for wear or damage. Replace throttle body if valves not snug fit or wear of looseness evident.

Reassembly: Use all NEW gaskets. Install parts in reverse order of disassembly procedure above and note the following important points:

Choke Valve Installation—Install choke shaft in air horn with tension spring properly positioned on shaft and engaged in slot in air horn so that valve will remain in closed position, install valve in shaft, install new screws loosely. Close valve and centralize it by tapping lightly, hold valve in position while tightening screws securely, stake screws. Check valve assembly for free operation. After air horn installed on main body, make certain that plunger and spring installed in air horn recess before installing choke lever.

"High Lift" Nozzle Bar Installation—Use two new gaskets for each nozzle bar, position nozzle bars in main body with high end of bar toward float bowl, install nozzle bar clamps, install nozzle bar clamp screws inserting the two **long** screws at the pump discharge side, tighten all screws evenly.

SERVICE PARTS

Gasket Sets—Ford No. B2A-9502-B (All 1946-53 Carbs.), No. B4A-9502-A (All 1954 Carbs.), No. B5A-9502-A (1955 Pass. Car & 239" Trk.), No. B5T-9502-A (1954-55 256" Trk.—supersedes No. B2Q-9502-B).

Repair Kit—Ford No. 8BA-9590-A (1946-51 Pass. Cars & 1946-52 Trks.), No. B2A-9590-C (1952-53 Pass. Cars), No. B2C-9590-A (1952-53 Trks.), No. B4A-9590-A (1954 Pass. Cars), No. B4C-9590-D (1954 239" Trks.—supersedes No. B4C-9590-A), No. B5A-9590-A (1955 Pass. Cars except Carb. No. B5A-9510-P), No. B5A-9590-B (1955 Pass. Cars with B5A-9510-P Carb.), No. B5C-9590-A (1955 239" Trks.), No. B4T-9590-B (1954-55 256" Trks.).

①—Replaced by Carburetor No. 8HA-9509-A.
②—Power Jet B4C-9590-C.
③—Use No. 1GA-9533-B (.062") for 5000-10000 ft. altitude.
Use No. 1GA-9533-C (.060") for 10000-15000 ft. altitude.
④—Power Jet Part No. 1GA-9494.
⑤—Power Jet B4A-9590-B.
⑥—Power Jet B4C-9590-D (1954), B5C-9590-A (1955).
⑦—Use No. 5GA-9533-B (.063") for 5000-10000 ft. altitude.
⑧—Use No. 59A-9533-B (.049") for 5000-10000 ft. altitude.
Use No. 59A-9533-C (.047") for 10000-15000 ft. altitude.
⑨—Use No. 8EL-9533-B (.053") for 5000-10000 ft. altitude.
Use No. 8EL-9533-C (.051") for 10000-15000 ft. altitude.
⑩—Main Metering Jets:

	Carb. 8CM-9510-A, B, C	Carb. 8CM-9510-D, E, F
0-5000 ft. Altitude	.048" 8CM-9533A	.049" 8CM-9533D
5000-10000 ft. Alt.	.046" 8CM-9533B	.047" 8CM-9533E
10000-15000 ft. Alt.	.044" 8CM-9533C	.045" 8CM-9533F

⑪—Main Well Tubes (Carb. marked "10-48" and later). No. 8CM-9991A used on carburetors marked "9-48" and earlier. Not interchangeable.
⑫—Power Jet Part No. 7HA-9594.
⑬—Supersedes Nos. 8EL-9904A & 8EL-9904B. Power Jet No. 8EL-9594.
⑭—No. 8CM-9904A used prior to 8-48. Power Jet No. 8CM-9594.
⑮—Main Well Tubes (Carb. marked "10-48" and later). No. 8CM-9991C used on carburetors marked "9-48" and earlier. Not interchangeable.
⑯—See carburetor for various models used.
⑰—Replaced by No. 7HA-9920.
⑱—Has 7/16" diameter base. No. 7HA-9920 (3/4" diam. base) also used.
⑲—Use No. M91A-9904 for 5000-10000 ft. altitudes.
⑳—Supersedes No. 1GA-9904A. Power Jet No. 7HA-9594.
㉑—Use No. 59A-9533-B (.049") for 5000-10000 ft. altitude.
Use No. 59A-9533-C (.047") for 10000-15000 ft. altitude.
㉒—Has 3/4" diameter base.
㉓—No. 5GA-9533-A (.065") used on 1949 and early 1950 cars.
㉔—Use No. 8CM-9533-E (.047") for 5000-10000 ft. altitude.
Use No. 8CM-9533-F (.045") for 10000-15000 ft. altitude.
㉕—Power Jet B4T-9590-B.
㉖—Use No. EAD-9533-B (.059") for 5000-10000 ft. altitude.
Use No. EAD-9533-C (.057") for 10000-15000 ft. altitude.
㉗—Use No. EAC-9533-B (.054") for 5000-10000 ft. altitude.
Use No. EAC-9533-C (.052") for 10000-15000 ft. altitude.
㉘—Jet & Main Well Assembly No. EAA-9594-A.
㉙—Power Jet No. EAD-9594-A.
㉚—Power Jet No. EAC-9594-A.
㉛—Power Jet No. 8MTH-9594-A.
㉜—Use No. 1GA-9533-B (.062") for 5000-10000 ft. altitude.
Use No. 1GA-9533-C (.060") for 10000-15000 ft. altitude.
㉝—Use No. 78-9533-A (.050") for 5000-10000 ft. altitude.
Use No. 78-9533-B (.048") for 10000-15000 ft. altitude.
㉞—Use No. 5GA-9533-B (.063") for 5000-10000 ft. altitude.
㉟—Use Part No. M91A-9904 (stamped "AM") for over 5000 ft. altitudes.
㊱—Main Well Tube Assy. EAM-9991-A. Secondary Tube Assy. EAD-99594-A.
㊲—Main Well Tube Assy. EAM-9991-A (supersedes No. EAD-9991-A).
㊳—Use IGA 9533-A (.064") for 5,000-10,000 ft. altitudes.
Use IGA 9533-B (.062") for 10,000-15,000 ft. altitudes.
㊴—Use .054" jet for 5,000-10,000 ft. altitudes.
Use .052" jet for 10,000-15,000 ft. altitudes.
㊵—Use B4T-9533-A (.055") for 5,000-10,000 ft. altitudes.
Use B4T-9533-B (.053)" for 10,000-15,000 ft. altitudes.
㊶—Use B4T-9533-B (.053") for 5,000-10,000 ft. altitudes.
Use 59A-9533-B (.051") for 10,000-15,000 ft. altitudes.
㊷—Main Well Tube Assy. B4T-9991-A.
㊸—Power Jet Part No. EBP-9594A.
㊹—Use 5GA-9533-A (.065") for 5,000-10,000 ft. altitudes.
Use 5GA-9533-B (.063") for 10,000-15,000 ft. altitudes.
㊺—Use 26H-9533 (.057") for 5,000-10,000 ft. altitudes.
Use B4T-9533-A (.055") for 10,000-15,000 ft. altitudes.
㊻—Power Jet No. B5T-9590-A.
㊼—Stamped "84" for identification.
㊽—Nozzles stamped "68" or "70" both used.

①—Manufacture date stamped on top of air horn.
②—Have modified Main Well Tubes (cannot be installed on earlier models). Beginning 1-49, have Float Control Spring (can be installed on earlier carbs.—see "Carburetor Float & Spring Change").
③—Have original Main Well Tubes & Main Metering Jets (see "Mercury Carburetor Jet Change").
④—Have new type Main Well Tubes (cannot be installed on earlier carbs.) and second type Main Metering Jets. Beginning 1-49, have Float Control Spring (can be installed on earlier carbs.—see "Carburetor Float & Spring Change" below).
⑤—Carburetors with SEPARATE Choke Control.

▷CHANGES & CORRECTIONS

▷LINCOLN & MERCURY FLOAT NEEDLE VALVE CHANGE (Orig. Production Carb. stamped 8-50 & Later): New type Float Needle & Seat Assy. used. Float needle has wire clip which hooks over float arm so needle is positively actuated by float.

INSTALLATION CAUTION—Make certain that wire clip on needle is hooked over float arm.

▷LINCOLN & MERCURY REPLACEMENT FLOAT NEEDLE VALVE: Use new type Float Needle & Seat Assy. (see Production Change Note above) for replacement on ALL carburetors. This assembly is Part No. 1CM-9564A (Steel Needle) or 1CM-9564B (Nylon Needle).

▷Erratic Engine Performance Correction (Erratic Idle speed, poor gasoline mileage, and mis-firing)—May be caused by automatic choke opening late or not opening fully due to air leak in hot air tube between manifold and choke housing if 5/16" fitting used instead of correct 1/4" type. See that correct fitting used and that all connections are tight.

▷Lincoln & Mercury Carburetor Float & Spring Change to improve float level stability—On carburetors prior to date 1-49 (stamped on top of air horn directly above accelerating pump), install new Float and Float Spring, as furnished in Carburetor Float Kit Part No. 8CM-99525, as follows:

Float & Float Spring Installation—Completely disassemble and clean carburetor (see Disassembly data) and when reassembling carburetor, install new float and spring as follows: Insert float needle valve and see that needle move freely, tilt carburetor to prevent needle dropping out. Place straight end of float spring in hole in arm of float and lever assembly, position float in carburetor main body so that free end of spring drops over rounded boss in bottom of bowl, insert hinge pin through bowl and float lever hinge, screw pin securely in place. Check to see that float and needle move freely and that spring is properly positioned. Change stamping date on carburetor to 1-49 (Carbs. dated 10-48 to 12-48—do not stamp this date on Mercury carburetors dated 9-48 and prior unless Kit 8CM-99524 also installed).

▷Lincoln & Mercury Carburetor Flooding Correction See Float & Spring installation (above). Flooding and unsatisfactory performance may also be caused by clogged channels or excessive fuel pump pressure (must not exceed 4 lbs.).

▷Mercury Carburetor Jet Changes to Correct Flat Spot or Stumble on Acceleration—On carburetors prior to date 10-48 (stamped on top of air horn directly above accelerating pump), install new Main Well Tubes and Main Jets, furnished in Carburetor Kit, Part No. 8CM-99524 for Mercury carburetors only. To install these jets, disassemble and clean carburetor (see Disassembly data), discard old parts and install new parts. Change stamping date on carburetor to 10-48.

IDENTIFICATION NOTE—For new type parts:

Main Well Tubes—Marked by letter "S" stamped on top. Side holes are 66 (upper), 70 (lower) and both holes are 3/32" lower than corresponding (68 upper and lower) holes on old type main well tube.

Main Jet—Marked "49" on side (was "48").

▷Lincoln & Mercury Carburetor Acceleration Stumble Correction—See Mercury jet changes (above). May also be caused by dirt restricting carburetor channels or improper seating of accelerating pump intake ball check or discharge needle valve (clean all channels and reseat ball check and needle).

▷Carburetor Fuel Inlet Screen (All Carburetors stamped 3-49 & Later)—Have fine-mesh cylindrical screen in fuel inlet on carburetor bowl. When installing screen, install coil spring first, and seal fuel inlet fitting with washer on inlet boss (no washer used at this point on first carburetors). Clean this inlet screen frequently.

▷Lincoln & Mercury Fuel Filter Change—First type (copper screen) filter in combination fuel-and-vacuum pump should be replaced by later "Edge Type Filter" when servicing carburetor.

FILTER PARTS KIT—New "Edge Type Filter" furnished in kits containing strainer and cork gasket Lincoln—#8EL-99360, Mercury—#8CM-99360.

▷ADAPTING LATE TYPE CARBURETORS TO EARLIER MERCURY MODELS: Later type carburetors with production changes listed above, require some linkage and fitting modifications for installation on earlier cars as follows:

1) Carburetors dated 3-49 & Later—These carburetors have fuel screen in inlet boss and are designed for flared or flanged type fuel inlet pipe connection. If used on earlier cars with compression type fuel inlet pipe connection, this fuel inlet pipe must be replaced by Part No. 8CM-9369-B (flared type), or adapter plug at carburetor inlet boss must be changed to Part No. 8CM-9224-A (compression type).

2) Carburetors dated 8-49 & Later—These carburetors have increased length throttle arm and new trunnion type throttle rod-to-throttle arm connection. If this carburetor used on earlier cars with ball joint type rod connection, a special ball fitting may be installed in the throttle arm if available (not furnished by Mercury—may be available from carburetor vender) to enable the old throttle rod to be used, or special Throttle Rod Assy. Part No. 8M-9747-C may be installed to connect carburetor throttle arm to old style carburetor linkage "Z-bar."

CAUTION—Regular production throttle rod (as used with new carburetor CANNOT be used on earlier cars (entire throttle linkage changed when this new rod entered production).

▷MERCURY "1CM" SERIES CARBURETOR: These carburetors have new vacuum system for distributor control and new non-interchangeable parts as listed below. These changes cannot be made on prior carburetor models and "1CM" carburetors cannot be used for replacement on earlier models.

Distributor Control Vacuum System (1CM Carbs. stamped 6-50 & Later): Plug at bottom of vacuum passage in carburetor replaced by screw pin with loose Nylon ball in passage above pin. When vacuum at venturi port (upper end of passage) reaches a sufficiently high point as at nearly wide open throttle and high speed, the Nylon ball travels to the top of the passage and cuts off the bleed effect of the port at the throttle valve. This results in higher vacuum at distributor and maintains maximum spark advance.

New 1CM Carburetor Parts: Following parts not interchangeable on prior carburetors: Throttle Shaft & Lever. 1CM-9927, Fast Idle Cam 1CM-9597.

DESCRIPTION

DESCRIPTION: These "Dual Concentric" carburetors are plain tube, dual (double barrel), downdraft types with automatic choke and fast idle control. Air intake is on side of air horn and circular float bowl (main body) is mounted on throttle body casting within air horn so that air flow is directed around the bowl to cool the fuel. All metering jets are located in this main body casting and air bleeds and vents consist of openings in the main body cover plate which open into the air horn.

▷Automatic Choke Control (OEL-9510-A, B, C & 1CM-9510-N, P, R Carburetors)—Part No. OEL-9851. Separate unit mounted on the intake manifold and linked to the carburetor choke valve shaft by a connector rod. Choke assembly is similar to previous type mounted on the carburetor air horn.

▷Anti-Stall Dashpot (Mercury Carbs. on Merc-O-Matic Trans. Cars)—Consists of a diaphragm type dashpot with a spring-loaded plunger which engages a screw on the throttle lever as the lever moves toward the closed position. This slows the throttle lever movement (controlled by rate of air bleed from the dashpot) to prevent engine stalling. Screw on throttle lever is adjustable.

Fuel System: Operates as follows:

CONTINUED ON NEXT PAGE

LINCOLN & MERCURY DUAL CONCENTRIC (C nt.)

Idle Fuel System—Fuel for idling is taken from main jet well up through the Idle Tube which meters the fuel and is mixed with air admitted through Idle Air Bleed (hole in cover plate above channel). Fuel mixture is then taken down through a channel in the throttle body casting to idle discharge ports at the throttle edge. For closed throttle idling (400 RPM), all fuel is discharged through lower idle port (below throttle valve) and is controlled by the Idle Adjusting Screw. As throttle is opened, additional fuel is discharged through upper port also (begins at 700 RPM) and fuel flow through both ports is at maximum at approximately 850 RPM. Above this speed, idle port discharge gradually drops off.

Main Fuel System—Fuel for main nozzle is metered by Main Metering Jet in bowl (at lower end of main jet well) and is taken up through (and around) Main Well Tubes where it is mixed with air admitted through Main Air Bleed (hole in cover plate above Well Tube and above nozzle passage). Fuel mixture is then taken down through nozzle passage and discharged into secondary venturi throat. Main nozzle begins to operate at approximately 850 RPM., blending with the idle system discharge. At 950-1050 RPM. idle system drops out and all fuel is discharged through the main nozzles.

Power Fuel System—Consists of a power valve controlled by a vacuum piston assembly which bypasses fuel directly from the bowl to the main jet well when the valve is open. This fuel is metered by a High Speed Restriction in the fuel channel. Valve is normally closed (piston held up against spring tension by manifold vacuum). At high speed or for wide open throttle operation, when vacuum drops to 7-5", spring forces piston down, opens valve, and permits additional fuel flow to main nozzles.

Accelerating Fuel System—Pump arm and plunger stem are positively operated by throttle lever (pump piston is spring-loaded on plunger to prolong discharge on sudden throttle openings). Fuel is drawn into pump cylinder through intake ball check in bottom of cylinder when throttle is closed and is discharged past discharge valve needle and through twin discharge jets on bottom of main body when throttle is opened. Pump stroke is adjustable.

ADJUSTMENT & OVERHAUL

IDLING ADJUSTMENT: Idle adjusting screws control fuel mixture discharge from lower idle ports and should be turned out for richer mixture. Adjust only when engine warm (automatic choke and fast idle inoperative) and set for highest steady vacuum reading. If gauge not used, set for smooth idle (turn screws out for richer mixture). See car model pages for complete Tune-up data.

Idle Speed Setting

All (Synchro-mesh Trans.) .....400-450 RPM.
Lincoln (Hydra-Matic) .....375 RPM.
Mercury (Merc-O-Matic) .....Max. 425 RPM.

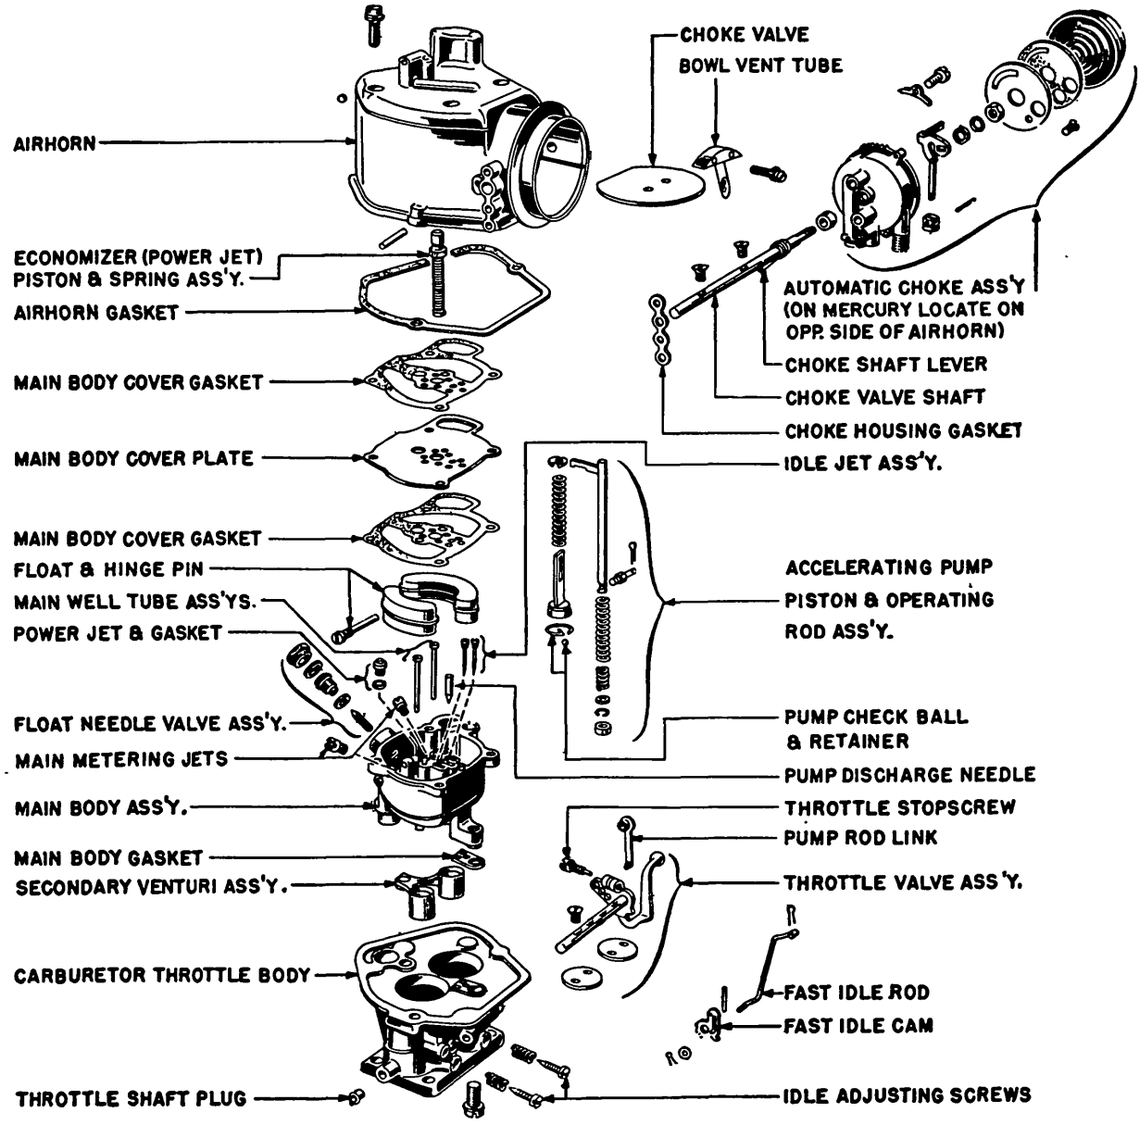
►*Check Dashpot Setting on Merc-O-Matic Trans. Cars after making idling adjustment.*

ANTI-STALL DASHPOT (Mercury Carburetors on Merc-O-Matic Cars): Check and adjust after completing the idling adjustment on these cars.

Setting—To adjust dashpot (with engine not running), first turn adjusting screw on throttle lever in to limit of adjustment, hold throttle valves fully closed and turn idle speed adjusting screw until it just contacts lowest step (hot or slow idle speed position) of fast idle cam. Turn dashpot adjusting screw out against the dashpot plunger until throttle valves begin to open (idle speed screw will begin to leave fast idle cam), finally **turn dashpot screw in one complete turn for correct plunger clearance.**

►*CAUTION—Reset Idle Speed after completing dashpot adjustment.*

METERING JETS: All jets are fixed non-adjustable type. See Holley (Ford) Jet Specification Table.



►*CAUTION—See Mercury Carburetor Jet Change data under "Field & Production Changes" above.*

POWER VALVE (ECONOMIZER): Valve remains closed in the normal speed range and is opened by the vacuum piston spring (when manifold vacuum falls off).

Setting—Valve opens when manifold vacuum decreases to 5-7" of mercury.

ACCELERATING PUMP: Positively operated by throttle lever with spring-loaded piston for prolonged discharge. Stroke is adjustable by engaging pump rod link in correct hole of throttle shaft lever

CONTINUED N NEXT PAGE

LINCOLN DUAL CONCENTRIC CARBURETOR (MERCURY SIMILAR)

LINCOLN & MERCURY DUAL CONCENTRIC (Cont.)

Center Hole—Normal operation (medium stroke).

Inner Hole—Extreme hot weather (min. stroke).

Outer Hole—Extreme cold weather (max. stroke).

NOTE—Accelerator link length decreased 1/16" (Lincoln), 1/32" (Mercury) beginning 10-48.

FLOAT LEVEL: Fuel Level. ½" ± 1/32" (.500" ± .023") below top edge of main body with fuel pump pressure of 3½-4½ lbs.

Checking Fuel Level—Use Gauge 9550-B with air horn and bowl cover assembly, gaskets, and cover plate removed. Place gauge on top edge of main body with gauging pins extending down into bowl. Fuel level should be at least even with longer "GO" pin, but should not be as high as shorter "NO GO" pin on the gauge.

Adjustment—Bend tab at rear of float which contacts intake needle down to raise float level, or up to lower float level.

CAUTION—Double floats are used and must be set alike.

Intake Needle, Seat & Gasket Assy.—Use only new type No. 1CM-9564A (Steel Needle) or 1CM-9564B (Nylon Needle) with wire clip for attachment to float lever (CAUTION—see that wire clip hooked over float lever).

NOTE—Above type assembly supersedes previous type and should be used on all carburetors.

AUTOMATIC CHOKE: Assembly consists of thermostatic coil and a vacuum piston unit in a housing mounted on the air horn (first carburetors) or a separate assembly mounted on the intake manifold and linked to the carburetor choke valve lever (later carburetors).

Setting—Centered with mark on cover in line with longer center line of scale on housing. Setting can be varied not more than 1 graduation Rich or Lean for special operating conditions.

FAST IDLE: Consists of a fast idle cam linked to the choke valve and serving as a stop for the throttle stopscrew (idle speed adjusting screw). With choke valve closed, cam is rotated to position with throttle stopscrew on highest step for fast or cold idle.

CARBURETOR OVERHAUL: With carburetor removed from engine, proceed as follows:

▷Carburetors with Separate Choke Control—On models with separate choke control unit, disconnect connector rod at choke valve lever and disregard data below on the automatic choke disassembly.

Disassembly: Disconnect fast idle connector rod at fast idle cam. Take out five screws and lockwashers on top of air horn, carefully lift air horn off carburetor bowl. Remove main body cover plate and both gaskets from top of bowl. Invert carburetor (place hand over bowl to prevent parts falling out), take out both Main Well Tubes and Pump Discharge Needle. Unscrew float hinge pin, lift out float assembly and intake needle. Remove Main Jets, Idling Jets, and Power Jet Valve assembly. Remove accelerating pump piston assembly, spring retainer and pump check valve ball from cylinder.

▷*CAUTION—Do not remove power valve piston unless new piston being installed (cannot be re-installed).*

Cleaning & Inspection: Clean out all passages and blow out with air (CAUTION—Do not use wire to clean jets and passages or wire brush to clean parts). Inspect all parts for wear or damage, note following

Bowl & Cover Plate Mating Surfaces—These surfaces must not be burred or scratched (will permit leaks between drilled passages). Do not file these surfaces (if surfaces not smooth and flat, replace bowl). Check cover plate for correct type. Each plate stamped with number indicating size of air bleed holes above main wells (.073" Lincoln, .087" Mercury).

Main Jet & Well Jet Tubes—Check for correct size.

See Mercury Carburetor Jet Change data under "Field & Production Changes" above.

Accelerating Pump Check—Should be checked for leakage. Install pump discharge needle, pump check ball and spring retainer, and pump piston assembly. Fill bowl with fuel to normal level (½" below top). Hold discharge needle on seat with a blunt tool, operate pump and check for leakage at the following points:

(1) At Pump Discharge Needle. Fuel leakage at this point can be corrected by reseating needle (tap lightly using a brass drift and light hammer).

(2) At Pump Piston. Leakage past the piston indicates worn or damaged piston leather or loose pump rod. Inspect piston and replace if required.

(3) At Pump Intake Ball Check. Leakage at this point permitting fuel to flow back into bowl can be corrected by reseating ball. Tap ball lightly using a brass drift and light hammer.

CAUTION—Do not use steel drift which will flatten ball and permit leakage.

Float & Float Spring—*See Lincoln & Mercury Carburetor Float & Spring Change under "Field & Production Changes" above for parts and instructions.*

Reassembly: Install Main Jets, Idling Jets, accelerating pump check ball and spring retainer, pump piston (CAUTION—use care not to damage piston leather), float needle, float and spring assembly, main well tubes. Then install carburetor on engine and crank engine to fill bowl with fuel. Check float level (see Float Level data). Install bowl cover plate using new gaskets below and above plate. Place new air horn gasket on throttle body flange, use two Aligning Pins, No. 9524, to install air horn. Tighten air horn screws securely.

SERVICE PARTS: *CAUTION*—Jets furnished in Metering Jet Kits listed below are Std. (for 0 to 5000 Ft. Altitudes). Use same kit for other altitudes but CHANGE MAIN METERING JET to correct type as listed below.

Metering Jet Kits

Lincoln—No. 8EL-9995A (8EL-9510-A, B, C Carbs.), No. 8EL-9995D (8EL-9510-D, E, F, G, H, J & OEL-9510-A, B, C Carbs.). This kit has No. 8EL-9533-A Main Metering Jet. Use same kit for other carburetors but substitute different jet on other carburetors as follows:

Carburetor	Main Metering Jet
8EL-9510-A, D, G; OEL-9510-A	①8EL-9533-A
8EL-9510-B, E, H; OEL-9510-B	8EL-9533-B
8EL-9510-C, F, J; OEL-9510-C	8EL-9533-C

①—Furnished in Kit No. 8EL-9995A & 8EL-9995D.

Mercury—No. 8CM-9995-A (8CM-9510-A, B, C Carbs.); No. 8CM-9995D (8CM-9510-D, E, F, G, H, J; 1CM-9510-G, H, J, K, L, M, N, P, R Carbs.). These kits have No. 8CM-9533-A or 8CM-9533-D Main Metering Jet. Use these kits but substitute different jet on other carburetors as follows:

Carburetor	Main Metering Jet
8CM-9510-A	②8CM-9533-A
8CM-9510-B	8CM-9533-B
8CM-9510-C	8CM-9533-C
8CM-9510-D, G; 1CM-9510-G, K, N	③8CM-9533-D
8CM-9510-E, H; 1CM-9510-H, L, P	8CM-9533-E
8CM-9510-F, J; 1CM-9510-J, M, R	8CM-9533-F

②—Furnished in Kit No. 8CM-9995-A.

③—Furnished in Kit No. 8CM-9995-D.

Repair Parts Kits

Lincoln—No. 8EL-9590-A (8EL-9510-A, B, C Carbs.), No. 8EL-9590-B (8EL-9510-D, E, F Carbs.).

Mercury—No. 8CM-9590-A (8CM-9510-A, B, C Carbs.), No. 8CM-9590-B (all other carburetors).

NOTE—These kits contain all necessary overhaul parts other than gaskets and metering jets.

Gasket Sets

Lincoln & Mercury—No. 8CM-9502 (all carburetors).

FORD LINCOLN & MERCURY "CENTRI-FLO" TYPE

FORD V8 TRUCKS	Carburetor No.

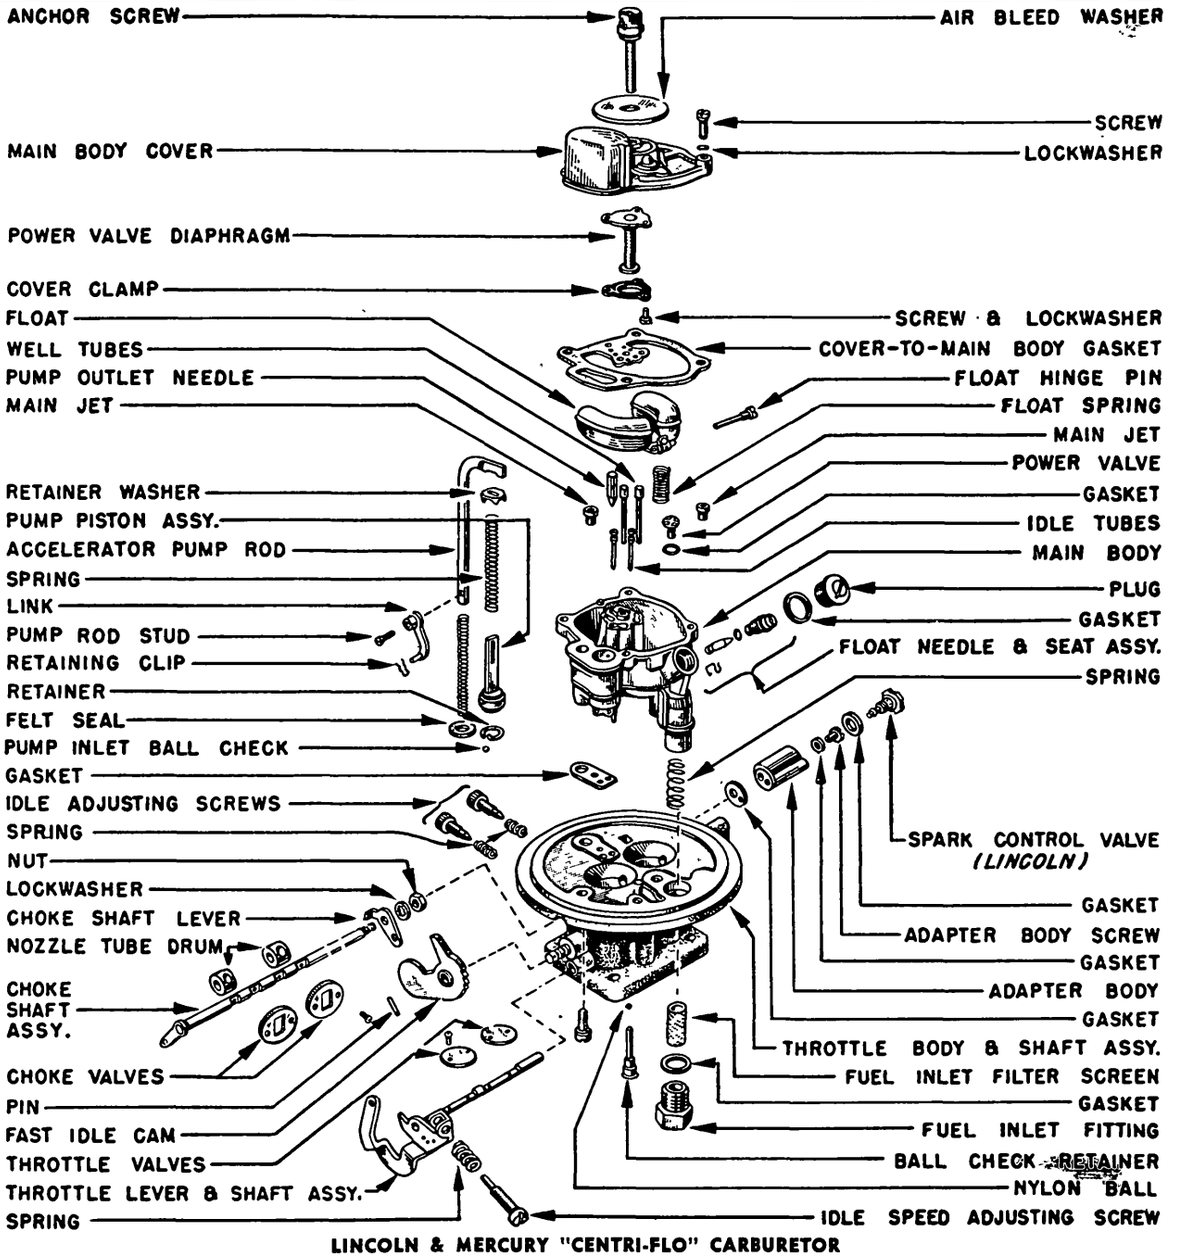
1952 Repl. Carb.	④EAD-9510-L
MERCURY	
1952-53 Std. (Synchro-mesh)	EAC-9510-E
1952-53 Alt. (Synchro-mesh) ①	EAC-9510-F
1952 Std. (Mercomatic) ⑤	EAC-9510-G
1952-53 Std. (Mercomatic) ⑤	EAC-9510-G
1952-53 Alt. (Mercomatic) ①	EAC-9510-H

①—For 5000-10000 ft. alt.—not furnished for service. See High Altitude Carburetor Note below.
②—Replaced by No. EAD-9510-L.
③—EAD-9510-B (without Vacuum Spark Control Valve used on first 450 cars. Use EAD-9510-D (with Spark Control Valve) for replacement).
④—This carburetor has Revised Main Body Cover & Plugs Assy. (See Changes & Corrections below).
⑤—See 1952 Mercury Dashpot Production Change below.
⑥—See Hesitation Detonation Correction below.



►CHANGES & CORRECTIONS

►*1952 ENGINE HESITATION & LOSS OF POWER AT 30-35 MPH. (All Lincoln & Mercury Carburetors):* Check and correct the following points: Remove air cleaner. Check all four main body cover screws for looseness and tighten these screws evenly and securely. Tighten air cleaner anchor screw to 6-9 ft. lbs. torque—**do not over-tighten.** Tighten Spark Control Valve (Lincoln only) securely. Install air cleaner and tighten wing stud nut finger-tight (do not tighten with pliers or wrench).

►*1952 LINCOLN ENGINE SURGE AT 20-25 MPH. (Lincoln Carburetor before Mar. 26, 1952):* This condition caused by a momentarily lean mixture at point where main fuel system comes in. Correct by installing new type Idle Jet Tubes No. EAD-9542-A (replacing original type No. 8CM-9542). Make this installation as follows: Remove carburetor air cleaner, anchor screw, four cover screws, and carburetor main body and gasket. Use Tool 9544 to remove original idle tubes. Install NEW TYPE No. EAD-9542-A Idle Tubes (Identified by figure "68" stamped on outer circumference of tube head), reassemble carburetor, adjust idle mixture and idle speed. *NOTE—See Engine Hesitation Correction (above) for cautions to be taken when reassembling carburetor.*

►***CARBURETORS PRODUCED AFTER MARCH 26, 1952 have the new type EAD-9542-A Idle Tube Jets and will not require the above correction.***

►*EARLY 1952 THROTTLE STICKING (Lincoln & Mercury Carburetors):* May be caused by accelerator pump rod (with lubrized finish) sticking in carburetor throttle body or in opening in main body. Correct by removing pump rod and polishing with crocus cloth or fine emery cloth. Lubricate rod when re-installing it in carburetor.

LINCOLN & MERCURY "CENTRI-FLO" CARBURETOR

►*1952 LINCOLN IMPROPER AUTOMATIC CHOKE ACTION:* Due to exhaust gas leaks in heat chamber in manifold (heat chamber consists of Iconel Tube extending down into exhaust crossover passage in intake manifold and leakage may occur at mating face of outlet hole on side of tube and drilled outlet passage in manifold). If following troubles noted, test for leaking tube and replace tube if necessary: (1) Engin may backfire into carburetor during warm-up period (due to lean mixture caused by rapid choke release), (2) Choke action erratic (due to carbon formation and heat damage in choke con-

C NTINUED ON NEXT PAGE

FORD, LINCOLN, MERCURY "CENTRI-FLO" (C nt.)

trol housing), (3) Carbon formation in choke control housing at air inlet opening.

Gas Leakage Test—Remove air cleaner, carburetor, intake manifold assembly. Remove choke control unit from manifold. Tighten fresh air tube jam nut. Hold finger over hot air outlet hole, blow smoke into fresh air tube. If smoke noted in manifold heat riser port, defective Iconel tube seal is indicated.

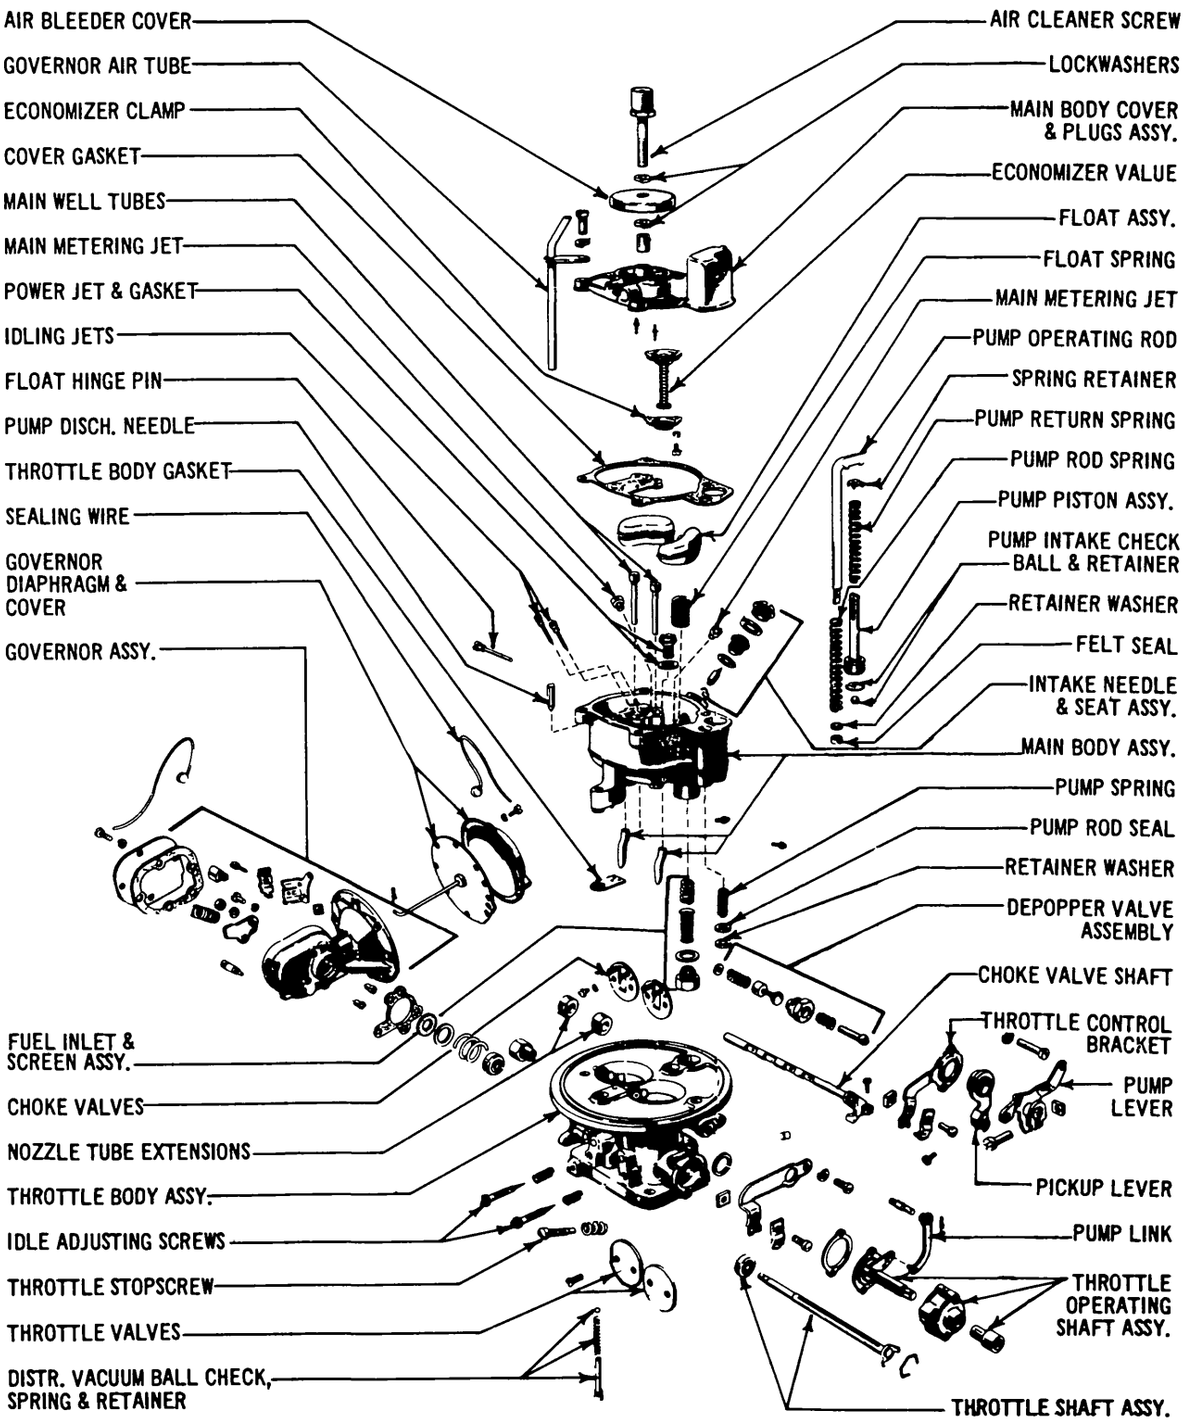
Replacement f Iconel Tube—Use ⅝"-18 tap or Easy-out to remove old tube. Thoroughly clean manifold recess with solvent, remove all corrosion and carbon deposits. Inspect tube recess in manifold for tool marks or damaged surfaces in vicinity of air outlet hole and replace manifold if good tube seal cannot be obtained. Coat tube recess sealing area with 8M-19554 Perfect Seal Sealer *(CAUTION*—this sealer has necessary sealing ability at high temperatures—do not use substitutes). Insert new tube with outlet hole aligned with drilled passage in manifold, use special driver (see Note) to fully seat tube in manifold recess *(CAUTION*—drive tube in gently with tool held vertically to avoid side thrust which may damage tube). Check alignment of fresh air outlet hole and passage in manifold *(CAUTION*—**do not** rotate tube to correct alignment—a misaligned tube should be removed and a **new** tube installed). Install fresh air tube assembly, coat jam nut lightly with graphite grease and tighten nut to approximately 15 ft.lbs. torque. Test assembly for leakage (see Gas Leakage Test above). Replace Choke Control Unit No. EAD-9850-A with new part (do not re-use old part if tube has been leaking), reassemble engine and check choke operation.

Iconel Tube Driver Note—Driver can be made from piece of ¾" x 5" round bar stock by reducing diameter at one end to .540" for distance of ¾".

►*DISTRIBUTOR CONTROL NYLON BALL CAUTION: Different size balls were used in Lincoln & Mercury carburetors and balls must not be interchanged* (incorrect size ball will impair accelerating and high speed performance of engine). This ball is located in vacuum passage in carburetor to cut off bleed action of throttle valve port at high speeds or with wide open throttle. Balls can be identified by diameter as listed below. Later production Lincoln ball will be colored RED (Mercury ball remains natural color).

	Nylon Ball Diameter	Part No.
Lincoln	.15625" (5/32")	EAD-99547-A
Mercury	.125" (1/8")	1CM-99547

►*HIGH ALTITUDE CARBURETOR NOTE*—"High Altitude" carburetors not furnished for service but can be made up by modifying std. carburetor by installation of correct metering jet as follows:



Lincoln Carburetors

Main Metering Jet:	Size	Part No.
Sea Level (0-5000 ft.)	.061"	EAD-9533-A
Alt. (5000-10000 ft.)	.059"	EAD-9533-B

Mercury Carburetors

Main Metering Jet:	Size	Part No.
Sea Level (0 to 5000 ft.)	.056"	EAC-9533-A
Alt. (5000-10000 ft.)	.054"	EAC-9533-B
Alt. (10000-15000 ft.)	.052"	EAC-9533-C

CONTINUED N NEXT PAGE

HOLLEY (FORD) FORD V8 TRUCK "CENTRI-FLO" CARBURETOR

FORD, LINCOLN, MERCURY "CENTRI-FLO" (Cont.)

Jet Identification—Jets stamped with last two figures of "size" indicated above.

►*1952 LINCOLN MAIN BODY COVER & PLUG ASSEMBLY CHANGE (To Improve Power Valve Action):* New Main Body Cover & Plugs Assy. No. EAD-99983-C available for installation on these cars. This assembly has brass bushing pressed in anchor screw stud opening so that power valve vacuum passage in cover is entirely independent of stud opening.
Cover Identification Note—New Cover Assy. No. EAD-99983-C (above) can be identified by stamped or etched number "2" on top of cover.

►*1952-53 MERCURY MAIN BODY COVER & PLUG ASSY. CHANGE (To minimize complaints of Lean Mixture at Off-Idle or Transfer Speeds):* New Main Body Cover & Plugs Assy. No. EAC-99983A (superseding previous Assy. No. EAD-99983A) available for installation on 1952-53 cars. This assembly has slightly smaller idle air bleed holes (.070" superseding .073") providing slightly richer mixture in transfer range. *NOTE*—New cover has brass bushing pressed in anchor screw stud opening so that power valve vacuum passage in cover is entirely independent of stud opening.
Cover Identification Note—New Cover Assy. No. EAC-99983A (above) can be identified by stamped or etched number "1" on top of cover.

►*COVER INSTALLATION CAUTION:* When installing new cover assy. (above), use ¼" lockwashers, one above and one below, bleeder plate washer. *See Overhaul Data below.*

►*1952 LINCOLN EXTERNAL VENTING OF CARBURETOR TO IMPROVE HOT STARTING (To correct abnormally rich fuel-air mixture):* Install new parts listed and modify carburetor as directed below. This modification will create a passage between the bowl chamber and the pump chamber and provide an external vent for fuel vapors originating in the bowl when a hot engine is not operating and throttle valves are closed (external vent is provided for in the new hollow pump piston rod).

Installation Procedure—*See OVERHAUL data for disassembly instructions preliminary to making the following changes:*

1) With main body cover off and pump operating rod and piston assembly removed, increase size of existing 1/16" hole in wall between float bowl and pump chamber to 1/8" using extreme care to prevent metal chips and other foreign material entering carburetor chambers and passages. *NOTE*—Use drill with reduced included angle of drill point (sharper point) so that drill pilots in existing hole. Clean carburetor carefully to remove all metal chips.

2) Rework NEW Carburetor Accelerator Pump Piston Operating Rod (see Parts List below) by tapping the pump rod link hole (lower hole) with an 8-32 starting tap to provide the necessary threaded connection for the stud.

3) Install NEW Accelerator Pump Rod Packing and Washer (see Parts List below) in packing recess at upper end of pump rod hole in main body. *NOTE*—This packing necessary to seal rod and maintain correct relationship between pump rod upper vent hole and bushing.

4) Reassemble carburetor using reworked pump operating rod and new bowl cover gasket. Tighten air cleaner anchor screw to 4-5 ft. lbs. torque.

5) Check choke valve location in closed position. Top edge of valves should be 1/16" down from top edge of venturi. Adjust by bending choke cam retainer on choke cam lever pin.

6) It is recommended that new type Automatic Choke Assembly No. EAD-9850-D be installed to minimize cold starting difficulty. *See also External Vent Seasonal Adjustment below.*

7) After carburetor installed, check and adjust choke connector rod. *See Automatic Choke data under ADJUSTMENTS below.*

External Vent Parts List

New Part	Part No.
Bowl Cover Gasket	EAD-9985-A
Pump Rod Assembly	EAD-9531-B
Pump Rod Packing	EAD-9535-A
Packing Washer	351336-S8

►*1952 LINCOLN INSTALLATION OF SEASONAL ADJUSTMENT FOR EXTERNALLY VENTED CARBURETORS:* On carburetors modified for external venting (above), a spring type clip, Part No. EAD-99608-A, can be installed on pump rod directly above link stud at lower end to provide a means of closing off vent holes for winter operation. This will improve cold starting. *See Seasonal Adjustment of External Vent under ADJUSTMENTS below for recommended settings.*

►*1952 LINCOLN AUTOMATIC CHOKE CHANGE TO IMPROVE COLD STARTING:* New assembly, Part No. EAD-9850-B, can be installed on cars where carburetor modified by external venting (above). **Choke Identification** Choke cover stamped "B" under directional arrow OR cover has **three** counter-clockwise arrows each marked "Lean" spaced equally around cover.

►*1952-53 MERCURY CARBURETOR-TO-MANIFOLD AIR LEAKAGE CORRECTION:* If air leakage into manifold noted at this point (dashpot vacuum control passage may overhang manifold flange allowing air leaks at unsupported flange gasket), install parts furnished in Repair Kit No. EAC-99576-A as follows:
1) Remove carburetor and discard mounting gasket. Remove and discard the four carburetor-to-manifold mounting studs. Install new longer studs.
2) Install new gaskets and spacer (spacer between two gaskets). *CAUTION*—Make certain that "De-icer" heat passage holes are not obstructed. Reinstall carburetor.
3) Check and adjust carburetor choke rod (may be thrown out of adjustment by raising of carburetor on manifold). See Choke Adjustment below.

Repair Kit No. EAC-99576-A

Gasket (Carb-to-manifold) 2 reqd.	1CM-9447-A
Spacer (Carb-to-manifold)	EAC-9603-A
Mounting Studs (4 reqd.)	88391-S

►*1952 MERCURY DASHPOT PRODUCTION CHANGE & REPLACEMENT PARTS CAUTION (Mercomatic Cars):* On late 1952 cars, Dashpot Assembly No. EAC-99560-B (with nylon check ball, spring, and retainer incorporated IN DASHPOT) used with Carburetor No. EAC-9510-J (WITHOUT check ball, spring, and retainer). IF LATER TYPE DASHPOT INSTALLED ON FIRST TYPE CARBURETOR (EAC-9510-G), check ball, spring, and retainer must be removed from carburetor throttle body.

►*1953 MERCURY RECOMMENDED REMOVAL OF AIR CLEANER HOLD-DOWN BOLT SPEED NUT (To prevent nut falling down and entering engine):* On first cars with this nut installed on lower end of oil bath type air cleaner hold-down bolt (to facilitate removal of silencer from oil receptacle compartment), it is recommended that nut be removed and discarded. *NOTE*—This nut not used on later cars.

►*1954 FORD TRUCK HESITATION OR DETONATION WHEN ACCELERATING FROM SLOW SPEEDS (Engines with Camshaft No. B4T-6250-A):* Correct by installing the "New" parts listed below in the original carburetor No. EBZ-9510-C OR by installing Replacement Carburetor No. B4T-9510-A. These parts furnished in Kit No. B4R-9590-B. *NOTE*—This replacement carburetor has the new parts and should be installed if carburetor replacement is required.

Kit B4T-9590-A Carburetor Parts

Carburetor Part	New Part No.
Main Well Tube Assembly	①B4T-9991-A
Vacuum Ball Check Valve Spring	②B4T-9606-A

①—Supersedes Part No. EBZ-9991-A.
②—Supersedes Part No. EAM-99515-B.

DESCRIPTION: These "Centri-flo" models are similar to previous type "Dual Concentric" carburetors with following new features:

Air Horn Eliminated—No air horn casting used and air cleaner fits down around main body to form the air intake passage resulting in lower over-all height.

New Discharge Nozzle & Choke Valve Assy.—Main discharge nozzles consist of two drums mounted concentrically on the choke valve shaft (one drum mounted within each choke valve—valves are cut out to clear drums and rotate around them). Choke valve assembly is mounted in venturi throat in throttle body and no secondary venturis are used.

Diaphragm Type Pow r Valve—Diaphragm type power valve is mounted in main body cover to eliminate possibility of leakage which was possible with previous piston type valve.

De-icing Feature—Consists of two drilled passages in manifold riser, spacer, and slot in base of main throttle body to permit warmed manifold air to heat area around idle jets and passages and prevent condensation and freezing of moisture in idle system.

Vacuum Spark Control Valve (Lincoln only)—Consists of vacuum operated spark control valve assembly on carburetor throttle body (see illustration) which prevents excessive spark advance when engine accelerated (used on all except first 450 cars).

New Vacuum-operated Dashpot (Mercury Merc-O-Matic Cars)—Mounted on carburetor throttle body and operates pick-up lever which opens throttle valves independently of the throttle linkage to prevent engine stalling.

CONTINUED ON NEXT PAGE

FORD, LINCOLN, MERCURY "CENTRI-FLO" (Cont.)

▷*NOTE*—Truck carburetors have main body enclosed in air cleaner horn on Cab Forward models and in the air cleaner on other models, plus the following special features:

Governor Assembly—Governor unit is mounted on throttle body and linked directly to end of throttle valve shaft. Throttle body is modified for governor mounting and throttle valve shaft is special type for governor connection.

Depopper Valve—Consists of a spring-loaded piston type valve built in the throttle body. This valve controls a by-pass through which part of the idle air supply passes around the closed throttle valves (a conventional idle system with idle mixture adjusting screws is used to supply the engine idling fuel supply in the usual manner). Valve is normally open during engine operation but closes when manifold vacuum rises to 22" (when throttle is closed). Closing of the valve enriches the idle fuel mixture to the point where it will not support combustion in the engine or exhaust system thus eliminating any "popping." An adjusting screw is provided for Depopper adjustment. See ADJUSTMENTS below.

Choke Control—Convention manual type (automatic choke not used).

ADJUSTMENT: Make all adjustments as follows:

Idle Setting—Turn adjusting screws in to lightly seat and back off each screw ½ turn. Run engine until operating temperature is obtained, then adjust each screw ⅛ turn in the direction which gives smoothest idle at a high steady manifold vacuum. Final position of both screws should not vary more than ½ turn. Reset idle speed. *See depopper valve adjustment below.*

IDLE SPEED SETTING

Lincoln (Hydra-Matic)	400-425 RPM.
Mercury (Synchro mesh Trans.)	400-450 RPM.
Mercury (Merc-O-Matic Trans.)	425 RPM. max.
Ford Trucks	475-500 RPM

▷*NOTE*—On Trucks, engine speed should be controlled by adjusting throttle stop screw and not by depopper valve positioning screw.

Vacuum Dashpot (Merc-O-Matic Cars): After setting engine idle speed (above), check clearance between end of dashpot rod and adjusting stud on dashpot pickup lever using a feeler gauge. (If this clearance not .020" (.020-.025"—see New Car Caution below), adjust by loosening locknut and turning adjusting stud up or down as required.

▷New Car Caution—For first 500 miles of operation of new cars, dashpot clearance is set at .040-.050" to eliminate excessively high engine idle speed and possible "galloping" of engine after deceleration. After 500 miles, setting should be changed to .020-.025".

Seasonal Adjustment for Externally Vented Carburetors (Lincoln): See "Changes & Corrections" above for installation of spring clip on pump rod for vent control. Adjust clip as follows to provide best Hot & Cold Starting performance:

Summer (Temp. above 50°F.)—Slide clip up on pump rod so that vent holes are exposed.

Winter (Temp. below 50°F.)—Slide clip down on pump rod to close off vent holes.

Vacuum Spark Control Valve (Lincoln): No adjustment required. Calibrating spring in valve is permanently set to allow valve operation at 9½-10½" of manifold vacuum. If operation not satisfactory, remove and inspect valve for free movement of the valve stem. Also inspect passage in adapter screw.

Float (Fuel) Level: 1/2" ± 1/32" below top edge of bowl with fuel pump pressure of 3½-4½ lbs. Use Fuel Level Gauge 9550-B to check fuel level placing gauge squarely on top edge of main body so that gauging pins extend down into bowl. Fuel should be at least as high as longer GO pin but must not touch shorter NO GO pin. Adjust by bending tab on float lever which contacts intake needle.

CAUTION—Both floats should be set to same height and floats must not contact float bowl walls.

Depopper Valve Adjustment—Adjust throttle screw to close throttle plates to where they will not bind in bores. Turn depopper valve adjusting screw inward (clockwise) until valve seated (closed). CAUTION—Do not force valve against seat. Turn depopper valve adjusting screw outward (counter clockwise) ⅜-½ turn. Make Idle Setting & Idle Speed Adjustment as given above. If engine fails to run when throttle released, increase idle speed sufficently (Idle stop screw) to maintain operation of engine. If popping is evident after high road speed or maximum engine RPM, upon deceleration without brake action, check depopper valve piston actuating spring as follows:

Depopper Piston Spring Test—Use Tool No. T54T-9976-A to check calibration of spring and proceed as follows: Remove air cleaner, depopper retainer and valve adjusting screw from throttle body. Install screw adapter in throttle body, install sleeve on screw adapter until pointer reads approximately 16 ounces. Pull back runner (rod protruding from gauge) and release gently. Then push runner forward. NOTE—The pointer will move indicating that valve is not seated. Screw sleeve in until pointer reads 16½ ounces. Repeat step of pulling runner back, releasing runner gently and pushing runner forward in ½ ounces increments until pointer will not move when pushed forward. The pointer should then read within 21.0-21.5 ounces. NOTE—If reading is not within specifications of 21.0-21.5 ounces, adjust depopper piston spring tension adjusting screw and repeat above procedure. Turn adjusting screw clockwise to increase tension and counter clockwise to decrease tension.

Alternate Method (Tool not available)—This will give approximate adjustment for emergency operation. Connect vacuum gauge to intake manifold. Increase engine speed manually to approximately 2000 RPM. Close throttle quickly and notice vacuum reading when hissing sound of air is first heard in carburetor. This is point when depopper valve opened. If vaccum reading was not between 22.5-23.5 inches of mercury, the piston spring tension adjusting screw should be turned until correct vacuum reading is obtained.

▷*DEPOPPER CLEANING NOTE:* If necessary to clean depopper valve with carburetor on engine, apply light grease to center section of spring tension washer to hold it in place on end of tension adjusting screw during assembly. Add light application of grease to end of spring to hold it in valve recess so valve and spring can be installed together without dislodging washer from end of adjusting screw.

Accelerating Pump: Seasonal adjustment provided by three holes in throttle shaft lever for pump link engagement:

Center Hole—Normal operating conditions.

Outer Hole—Extreme Cold weather.

Inner Hole—Extreme Hot weather.

Automatic Choke: *NOTE—Choke is separate unit mounted on side of intake manifold and linked to choke valve lever by a rod.* Mark on cover should be in line with center mark of scale on choke housing. Adjust by loosening three cover retainer screws and rotating cover assembly.

Choke Setting—Centered.

Choke Rod Adjustment—With rod disconnected from choke valve lever, hold choke valves closed, raise rod to upper limit of travel. If rod end does not enter hole in lever freely, adjust rod length by bending it at the offset. Connect rod and check entire choke linkage for free movement without binding.

Fast Idle: No adjustment required (fast idle cam operated directly by lever on choke valve shaft). Fast idle speed will be correct if throttle stopscrew correctly set (Idle Speed setting above).

OVERHAUL: Work on carburetor will be facilitated by use of Holding Fixture 9510-C (hinged fixture which can be clamped in a vise).

Disassembly: Remove air cleaner anchor screw and air bleed washer from top of main body cover, remove four attaching screws and lockwashers holding main body cover on main body, remove cover and gasket. Remove pump rod stud from lower end of pump rod, disconnect and remove pump link while holding pump rod and piston assembly down against spring tension, lift out pump piston and rod assembly.

Main Body Disassembly—Remove float needle seat plug, unscrew float needle seat with tool 9564, remove inlet needle. Unscrew and remove float hinge pin, lift float and float spring out. Remove power valve using tool 9510-AA. Remove main metering jets using tool 9533. Remove idle jet tubes using tool 9544. Take out accelerating pump ball check retainer spring using needle-nose pliers. Tip carburetor up and catch pump discharge needle, pump ball check, main well tubes which will fall out of main body. Take out two screws and lockwashers holding main body on throttle body, lift off main body and gasket.

Throttle Body Disassembly—Remove idle adjusting needles and spring, then remove governor plate, gasket and spring. Remove cotter pin from vacuum rod and push rod from governor lever. Remove governor lever nut, lockwasher and lever. Remove governor retaining screws, governor housing and diaphragm. Remove depopper valve adjusting screw assembly, but DO NOT remove adjusting screw from nut. Remove depopper valve, tension spring and spring washer, DO NOT remove tension spring adjusting screw from throttle body. Remove throttle shaft seal, retainer and spring. Throttle plates and

CONTINUED ON NEXT PAGE

FORD, LINCOLN, MERCURY "CENTRI-FLO" (Cont.)

shaft should not be removed from throttle body. If necessary to remove choke plates and shaft, file off tips of choke plate screws and choke plates. Slide shaft out of body. Identify plates so they can be installed in original positions. Clean and inspect all parts for justifiable replacement.

Power Valve Diaphragm—DO NOT remove assembly from main body cover unless tests indicate that replacement is necessary. Remove by taking out three attaching screws and lifting off cover clamp and diaphragm assembly.

Distributor Control Nylon Ball—Remove retaining pin and remove nylon ball from vacuum passage in throttle body.

Cleaning & Inspection: Wash all parts except those noted below in clean solvent *(CAUTION*—Do not use solvent on pump piston leather, power valve diaphragm, spark control valve, nylon fuel inlet needle valve, or nylon distributor passage ball). Blow out all passages in castings with dry air, dry all parts with air. Inspect all parts for wear and damage with particular attention to the following: Inspect castings and main body cover for cracks or leaks, inspect main well tubes, metering jets, and idle tubes for wear or clogged passages *(CAUTION* —clean with air, do not use drills to clean out calibrated openings). Replace all worn or damaged parts (nicked or burred gasket surfaces can be stoned lightly but parts should be replaced if stoning does not clean up surfaces).

Reassembly: Use all NEW gaskets. Install parts in reverse order of disassembly procedure (above) and note the following important points:

Distributor Passage Nylon Ball Caution—If new ball installed, make certain that correct size used.

Throttle Valve Installation—Valves have depression on one side and must be installed with this depressed side down. After valves installed, check for free operation and if binding noted, correct by loosening screws and retightening while valves held closed. Stake screws with staking pliers 9586 after installation completed.

Choke Valve Installation—Slide choke shaft in through body and install nozzle tube drum on shaft as it enters each venturi *(CAUTION*—rounded opening on drum must face inlet side of carburetor and tapered side of hole must face downward). Install choke valves and tighten attaching screws while holding valves closed and applying pressure on threaded end of shaft. Check valves for free operation and make certain that nozzle drums rotate freely within choke valves.

Throttle Body Assembly—Install control shaft and housing on throttle body with new gasket. A correctly installed throttle shaft and lever will close plates but will not open them. Install spring, retainer and throttle shaft seal with seal shoulder inside retainer. Install governor housing using new gasket. Install governor lever, lockwasher and nut on shaft. Install diaphragm rod through lever and secure it with cotter pin. Install governor spring. Install depopper spring tension washer properly centered on adjusting screw. Install spring, depopper valve, and adjusting screw assembly with new gasket. Turn valve adjusting screw "IN" until just seated. See depopper adjustment while on engine, above. Install governor plate with new gasket. Install fuel needles and springs. Close needles gently against seats, then back out ½ turn for preliminary adjustment.

Main Body Assembly—Install main well tubes, idle jet assemblies and main jets. Install power valve with new gasket. Install float valve seat and plug with new gasket. Install float spring, float, inlet needle valve and secure float with hinge pin. Install accelerating pump piston and operating rod. Install pump discharge needle. Install power diaphragm assembly in cover with edge of diaphragm visible all around to insure against leakage. Hold cover in position on bowl with new gasket in place and install center screw and plate. Install retaining screws. NOTE—One of retaining screws also secures the governor air vent tube which seats in the throttle body when sub-assemblies are reassembled.

Main Body & Throttle Body Assembly—Install main body and new gasket on throttle body, aligning rounded opening of each nozzle drum with its discharge nozzle, and properly positioning choke opening lever on fast idle cam as main body is seated on throttle body, install attaching screws and lockwashers from underside of throttle body flange.

Diaphragm Assembly Installation—***Assembly must be installed as follows to properly s at diaphragm on main body cover:*** Place cover clamp over diaphragm stem, compress spring and wind rubber band tightly around stem and spring to hold spring compressed while assembly being installed. Position assembly on main body cover, tighten three attaching screws securely, then remove rubber band and check for free operation by pressing on diaphragm stem. Action must be absolutely free.

Accelerator Pump Installation & Check—Use care not to damage piston leather when installing pump piston and rod assembly. Pump system can be checked after bowl filled with fuel as follows: Use blunt instrument (small drift, etc.) to press down on discharge needle while pressing pump piston down in cylinder. If fuel forced past discharge needle, clean needle and seat and reseat needle by tapping needle lightly using a brass drift and light hammer. Replace needle if leakage continues. Also while pressing on pump piston, note if fuel level rises in bowl or if bubbles evident at pump intake hole in base of bowl indicating leakage at pump intake ball check. If leakage noted, remove ball retainer, clean ball and seat and reseat ball by tapping ball lightly using a brass rod and light hammer. If leakage continues, examine seat for foreign material or imperfections and replace ball.

Main Body Cover & Plug Assy. Installation: Tighten air cleaner anchor screw to 4-5 ft.lbs. torque (this supersedes 6-9 ft. lbs. previously recommended). When installing new type Cover Assembly (see Changes & Corrections above), use ¼" lockwasher **above** and **below** the bleeder plate washer (one at each point).

Carburetor Adjustments—Make all adjustments listed in ADJUSTMENTS above.

SERVICE PARTS: ***CAUTION—Metering jets furnished in repair kits listed below are STANDARD (for 0 to 5000 ft. Altitude). See High Altitude Carburetor Note (above) for special high altitude metering jets.***

Gasket Set—Ford No. B2Q-9502-B, Lincoln No. HCK-9502A, Mercury No. MCK-9502A.

Repair Kit (incl. Std. Metering Jets)—Ford No. B4T-9590-A (includes B2Q-9502-B gasket set), Lincoln No. HCK-9590B (replaces HCK-9590A), Mercury No. MCK-9590A.

1953-54 LINCOLN-MERCURY 4-BARREL "CENTRI-QUAD"

	Carburetor No.
LINCOLN	
1953 First Cars	①EAD-9510-H
1953 Later Cars	②EAD-9510-K
1953 Later Cars③	④EAD-9510-M
1954 Early	EAD-9510-N
1954 Later	⑤ED-EAD-9510-S
MERCURY	
1954 Synchro-mesh	EBY-9510-G
1954 Mercomatic	EBY-9510-H
1954 Later Cars	⑤ED-EBY-9510-K

①—Replaced by EAD-9510-M.

②—Has Improved Main Body Cover & Plugs Assembly. Can be converted for "External Venting" as detailed in Changes, Cautions, Corrections below.

③—Replacement carburetor for earlier models.

④—Has Improved Main Body Cover & Plugs Assembly and External Venting System.

⑤—These carburetors have new Cover with revised External Vent system to correct fuel spill-over on sharp turns. *See Fuel Spill-over Correction below.*

►CHANGES, CAUTIONS, CORRECTIONS

►***HIGH ALTITUDE OPERATION CAUTION:*** All production carburetors are equipped with "Sea Level" size main metering jets. On cars operated at higher altitudes, BOTH main metering jets should be replaced with proper size jets for the altitude at which car being operated as follows:

Lincoln Carburetors

Main Metering Jet:	Size	Part No.
Sea Level (0 to 5000 ft.)	.061"	EAD-9533-A
Alt. (5000-10000 ft.)	.059"	EAD-9533-B
Alt. (10000-15000 ft.)	.057"	EAD-9533-C

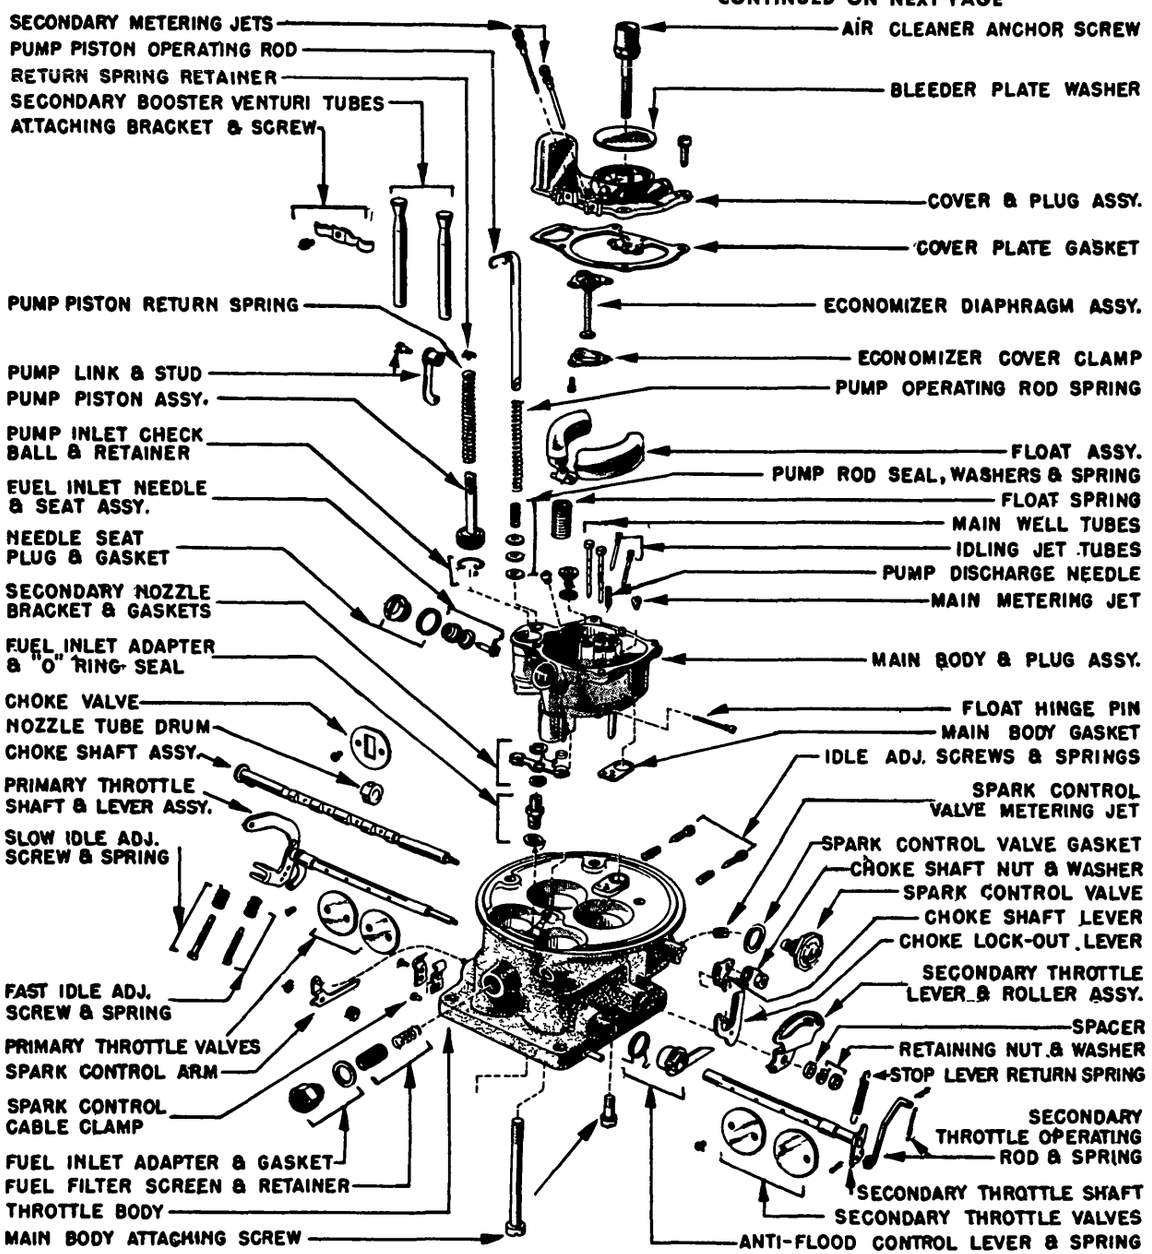
Jet Identification—Jets stamped with last two figures of "size" listed above.

►***1953 LINCOLN AIR CLEANER INTERFERENCE WITH CHOKE LOCK-OUT LEVER (Throttle locking in Partially Open Position):*** Caused by interference between choke lock-out lever and air cleaner. Remove and inspect air cleaner for point of interference (paint will be chipped off or scratched at point of contact). Correct by using ball peen hammer to tap down area on cleaner around point of contact to conform to preformed indentation. Use care not to damage seating surface of air cleaner. Check for free operation of choke lock-out lever when air cleaner re-installed.

►***1953 CARBURETOR NO. EAD-9510-H MAIN BODY COVER & PLUGS ASSEMBLY REPLACEMENT (To minimize faulty power valve action due to air leakage around air cleaner Anchor Screw Stud):*** New Main Body Cover & Plugs Assy. with identification number "5" etched or stamped on top of the cover can be installed on earlier carburetors. New assemblies have inserted brass bushing in air cleaner anchor screw stud hole to make power valve vacuum passage in cover entirely independent of anchor screw stud hole. When installing these new assemblies, use ¼" lockwashers, one above and one below, the bleeder plate washer. See OVERHAUL data for disassembly instructions. Tighten anchor screw stud to 4-5 ft. lbs. torque (supersedes 6-9 ft. lb. specification).

NOTE—Carburetor Nos. EAD-9510-K & M have this new type cover and plugs assembly.

Replacement Main Body & Plugs Assy.



Model	Orig. Part No.	Repl. Part No.	①Ident.
1953	EAD-99983B	EAD-99983D	"5"

①—Number stamped on top of cover.

►***PRIMARY & SECONDARY THROTTLE SYNCHRONIZATION CAUTION:*** For uniform engine acceleration, secondary throttle valve opening must be properly synchronized with opening of primary throttle valves. *See "Primary & Secondary Throttle Plate Synchronization" under ADJUSTMENTS below.*

►*1953 CARBURETORS EAD-9510-H & EAD-9510-K*

CONTINUED ON NEXT PAGE

1953 LINCOLN "CENTRI-QUAD" 4-BARREL CARBURETOR

1953-54 LINCOLN-MERCURY "CENTRI-QUAD" (Cont.)

EXTERNAL VENTING TO IMPROVE HOT STARTING (To correct an abnormally rich fuel-air mixture): External Vent Kit No. HDK-9531-A parts can be installed and other modifications made as listed below. This modification will create a passage between the bowl chamber and accelerating pump chamber and provide an external vent for fuel vapor originating in the bowl when a hot engine is not in operation and the throttle valves are closed (external vent is provided for in the new hollow pump piston operating rod).

Installation Procedure—*Use instruction sheet furnished with kit and see OVERHAUL data following for disassembly data in making following changes:*

1) With main body cover off and pump operating rod and piston assembly removed (CAUTION—do not disturb pump rod upper seal and retainer), increase size of existing 1/16" hole in wall between float bowl and pump chamber to ⅛" using extreme care to prevent metal chips and other foreign material entering carburetor chambers and passages.

NOTE—Use drill with reduced included angle of drill point (sharper point) so that drill pilots in existing hole. Clean carburetor carefully to remove all metal chips.

2) Reassemble carburetor using NEW TYPE PARTS as listed below. *CAUTION*—Torque air cleaner anchor screw to 4-5 ft. lbs.

3) Install NEW Choke Lever and Choke Rod. Check position of choke valve plates and check and adjust length of choke operating rod. *See Choke Valve Installation under Automatic Choke data below.*

4) It is recommended that new type Automatic Choke Assembly No. EAD-9850-B be installed to minimize cold starting difficulties. *See also External Vent Seasonal Adjustment below.*

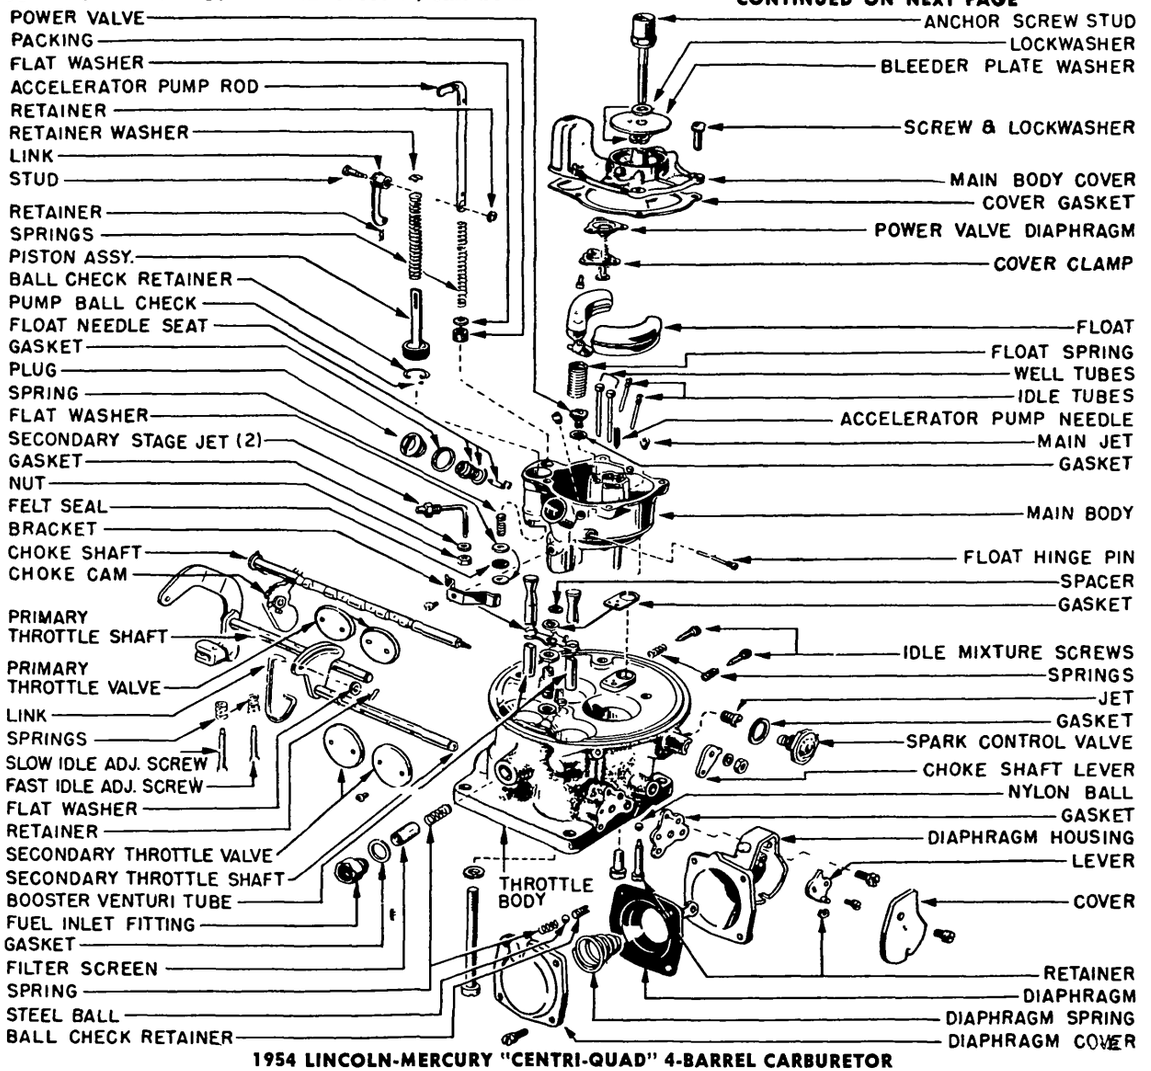
5) Invert air cleaner on bench (drain oil first), use blunt rounded punch and hammer to tap down indented area 3/16" to provide necessary clearance for new choke shaft lever. *CAUTION*—Use care not to distort or damage seating surface of air cleaner. Check for clearance of choke operating mechanism after air cleaner re-installed on carburetor.

External Vent Kit No. HDK-9531-A

Part	Part No.
Choke Lever	EAD-9551-C
Bowl Cover Gasket	EAD-9985-A
Pump Rod Assy.	EAD-9531-B
Pump Link Pin	EAD-9988-C
Link Pin Retainer	351826-S
Pump Link Assy.	EAD-9526-C
Pump Link Retainer	1GA-9599
Choke Rod	EAD-9869-D
Choke Rod Cotter Pins (2)	352200-S

►***1953 LINCOLN AUTOMATIC CHOKE PRODUCTION CHANGE & INSTALLATION ON EARLIER CARS TO IMPROVE COLD STARTING:*** New assembly, Part No. EAD-9850-B can be installed on cars where carburetors modified by external venting (above) and will provide better cold starting performance. **Choke Identification**—Choke Cover stamped "B" under directional arrow OR cover has **three** counter-clockwise arrows each marked "Lean" spaced equally around cover.

►***1953 LINCOLN INSTALLATION OF SEASONAL ADJUSTMENT FOR EXTERNALLY VENTED CARBURETORS:*** On carburetors with external venting (above), a spring type clip, Part No. EAD-99608-A, can be installed on pump rod directly above link stud at lower end of rod to provide a means of closing off vent holes for winter operation which will improve cold starting. *See Seasonal Adjustment of External Vent under ADJUSTMENTS below for recommended settings.*



►***EXTERNAL VENT CHANGE & SEASONAL ADJUSTMENT TO IMPROVE COLD STARTING (1954 Lincoln & Mercury & 1952-53 Lincoln Carburetors where External Vent Kit has been installed):*** On carburetors with external vent through hollow pump rod, spring type Adjustable Clip, No. EAD-99608-A, can be installed on lower end of accelerator pump rod to provide means for cutting off vent during winter operation. See "EXTERNAL VENT ADJUSTMENT" below *NOTE*—This clip will be installed in production on later carburetors.

►***1954 LINCOLN & MERCURY FUEL SPILL-OVER FROM EXTERNAL VENT ON SHARP RIGHT TURNS CORRECTION (Cars with early carburetors):*** Correct by installing new Carburetor Bowl Cover No. ED-EAD-99983-F (Lincoln), ED-EBY-99983-C (Mercury). Install cover as follows:

1)—Remove air cleaner. Remove carburetor cover and gasket, and accelerating pump assembly.

2)—Insert piece of ⅛" string solder in existing vent hole located ¼" down in web between fuel bowl and accelerating pump chamber. Cut off solder so that slight amount protrudes into float chamber

CONTINUED ON NEXT PAGE

1954 LINCOLN-MERCURY "CENTRI-QUAD" 4-BARREL CARBURETOR

1953-54 LINCOLN-MERCURY "CENTRI-QUAD" (Cont.)

(CAUTION—do not allow more than 1/16" protrusion in pump cylinder). Use needle-nose pliers to squeeze solder in hole to securely plug this vent hole

▷*CAUTION*—Minimum amount of solder should be left in pump chamber to avoid damage to pump plunger leather piston (use thin shim stock to protect leather when inserting pump plunger in cylinder).

3)—Reassemble carburetor, using new Bowl Cover Assembly as listed above with new gasket. These new bowl covers have a vent passage connecting the accelerating pump chamber with the float bowl which eliminates necessity of vent in web

NOTE—Later type carburetors ED-EAD-9510-S (Lincoln), ED-EBY-9510-K (Mercury) have this new type bowl cover and revised vent system.

▷*1953-54 LINCOLN & 1954 MERCURY AUTOMATIC CHOKE CONTROL HEAT TUBE ASSEMBLY CHANGE (To minimize exhaust gas leakage into automatic choke)*: New type heat tube assemblies (as listed below) and new intake manifolds were used in 1954 production starting approximately June 25, 1954 (Lincoln), August 16, 1954 (Mercury). This assembly can be installed on earlier cars provided that NEW Intake Manifolds are also installed. *NOTE*--Previous type Heat Tube Assemblies are furnished for use with first type manifolds.

Choke Heat Tube Assy.

Part	Part No.
Heat Tube Assembly	B4A-9890-A
Retaining Nut	B4A-9864-A
Washer Gasket	353999-S
Intake Manifold (Lincoln)	EAD-9425-D
Intake Manifold (Mercury)	EBY-9425-D

▷*HIGH ALTITUDE CARBURETOR CAUTION*: All production carburetors are fitted with Std. Metering Jets (Sea Level to 5000 ft.). Cars operated at higher altitudes are modified in the field by installation of correct type metering jets as listed below. ALL primary and secondary metering jets must be of correct size.

Metering Jet Assemblies

	Main Metering Jet No.		Secondary Jet Tube Assy.	
Lincoln Carb.	Mark	Part No.	Mark	Part No.
0 to 5000 ft.	60	1GA-9533C	55	EAD-99594B
5000-10000 ft.	56	78-9533E	52	EAD-99594C
10000-15000 ft.	53	8EL-9533B	49	EAD-99594D
Mercury Carb.				
0 to 5000 ft.	52	86H-9533	55	EAD-99594B
5000-10000 ft.	48	78-9533B	52	EAD-99594C
10000-15000 ft.	45	59A-9533D	49	EAD-99594D

DESCRIPTION: The 4-Barrel Centri-Quad carburetor is similar in design to previous dual Centri-flo carburetor with following new features:

Secondary Stage—Consists of two additional carburetor barrels located adjacent to the primary barrels. Secondary stage fuel system consists of two Metering Jets in the main body cover which discharge fuel through two Booster Venturi Tubes extending down into the secondary stage barrels. Booster venturi tubes are clamped in bracket on main body cover. Secondary stage does not have separate idle system or idle adjusting screws but primary stage idle passages are continued down to the mounting face of the throttle body and grooved passages are provided through which a portion of the idle fuel mixture is discharged through the secondary stage throttle bores. Secondary stage throttle valve shaft is linked to the primary stage throttle valve shaft with additional linkage to lock out secondary stage while choke operating.

NOTE—Secondary stage jets in 1954 models are located in side of main body and extend down into the fuel bowl Jets discharge into the booster venturi tubes which are likewise mounted on the side of the main body.

Bowl Vent System—Bowl is vented through a tube located in the front side of the main body cover so that filtered air enters the bowl at the same pressure as exists in the air horn providing "balanced" operation. Fuel bowl is also vented externally through hollow pump piston operating rod (cross-drilled passage near upper end of rod and vent hole near lower end of rod provide a vent for the fuel bowl when the throttle valves are closed or in nearly closed position). *See "1953 External Venting to Improve Hot Starting" Correction above.*

Idle Adjusting Screws (Primary Stage)—Angle of screw points has been reduced to provide a less critical adjustment of the idle fuel mixture.

Independent Fast Idle & Slow Idle Speed Adjustment—Fast and slow idle speed controlled by individual screws located on throttle shaft lever. Inner fast idle screw contacts fast idle cam while outer slow idle screw contacts side of cam lever pin.

Mechanical Spark Advance Control—Consists of a cable control linked to the carburetor throttle lever and the distributor breaker plate to provide mechanical control of the spark advance during rapid engine acceleration.

Secondary Stage Distributor Vacuum Control—A port in the secondary stage venturi provides an additional vacuum source for distributor advance control (this vacuum connection is located on throttle body adjacent to fuel inlet connection).

1954 Models—Also have following new features·

Vacuum Control of Secondary Stage Throttle Valves—Secondary throttle shaft is controlled by vacuum diaphragm unit mounted on throttle body. Vacuum passage terminates at right primary stage venturi so that secondary throttle valves open during periods of heavy engine loads or high speed operation (open when vacuum rises to point where atmospheric pressure on opposite side of diaphragm is sufficient to overcome diaphragm spring pressure). The mechanical linkage at the opposite end of the secondary throttle shaft closes the secondary throttle valves promptly (overcoming any lag in vacuum system) when the throttle is closed. *NOTE*—This mechanical linkage will hold secondary throttle valves closed in the event of failure of the vacuum control mechanism.

Choke Valves & Automatic Choke—Valves are round to provide full choke action when closed, Automatic choke thermostatic spring provides more positive choking action for cold starting.

ADJUSTMENT: *Make all adjustments exactly as follows:*

Idle Setting: First set BOTH primary idle mixture adjusting screws EXACTLY 1¼ turns open (no screws used for secondary stage). Start engine and operate it until normal operating temperature secured with choke valve wide open and fast idle cam in slow idle position. Back off fast idle adjusting screw (inner screw on throttle lever) so that it clears the fast idle cam. Set engine speed to correct hot or slow idle speed (see below) by turning slow idle speed adjusting screw (outer screw on fast idle cam). Turn both idle mixture adjusting screws equally ⅛ turn at a time in or out until smoothest idle performance obtained with highest steady vacuum reading. If engine speed changes during this operation, reset speed and repeat idle mixture adjustment. After idle adjustment completed, adjust fast idle (all models), and Anti-stall Dashpot (Mercury Mercomatic Cars).

▷*IDLE SPEED SETTING NOTE*: It is recommended that the idle speed be set with selector lever in NEUTRAL to approximately 475-500 RPM. (Synchro-mesh Cars), 460 RPM. (Automatic Trans. Cars). Then place selector lever in DRIVE and recheck engine idle speed which should be within range shown in table below. Readjust if speed is not within specified range.

Idle Mixture Setting

All Models — 1¼ turns open

Idle Speed Setting

	Synchro-mesh	Auto-Trans.
1953-54 (Lincoln)		①400-425 RPM
1954 (Mercury)	475-500 RPM	①425-440 RPM

①—With selector lever in "DR" position

▷*CAUTION*—Unless idle adjustment made exactly as outlined above (turning screws equally and in same direction), an apparently correct setting may result with a too-rich setting of one screw tending to offset a too-lean setting of the other screw (due to interconnected idle fuel passages in base of throttle body). Screws must be set alike except for slight variation in making final fine adjustment.

Dashpot Setting (Mercury with Mercomatic): After idle adjustment completed, turn ignition off, see that fast idle cam in slow idle position, hold throttle lever in closed position, turn dashpot adjusting screw out (counter-clockwise) until dashpot rod is pushed in to the limit of its travel, then turn adjusting screw in (clockwise) 1½-2 turns which will provide correct clearance of .045-.064".

Seasonal Adjustment for Externally Vented Carburetors: See "Changes, Cautions, Corrections" above for installation of spring clip on pump rod for vent control. Adjust clip as follows to provide best Hot & Cold Starting performance:

Summer (Temp. above 50°F)—Slide clip up on pump rod so that vent holes are exposed.

Winter (Temp. below 50°F)—Slide clip down on pump rod to close off vent holes.

Fast Idle Setting: After completing slow idle setting (above) and with engine at normal operating temperature, so that fast idle cam in slow idle position, turn fast idle adjusting screw (inner screw on throttle lever) in until screw just contacts lowest step on fast idle cam. This will provide correct fast idle speed. *NOTE*—If fast idle speed is unnecessarily high with above setting, fast idle screw may be backed off *not to exceed one full turn.*

CONTINUED ON NEXT PAGE

1953-54 LINCOLN, MERCURY "CENTRI-QUAD" (Cont.)

►*CAUTION*—If fast idle screw backed off more than one full turn from specified setting (above), engine flooding and stalling may occur during fast idle operation due to engine speed being too low to burn all fuel discharged into intake manifold.

Accelerating Pump Setting: Seasonal adjustment provided by three holes in primary throttle shaft lever for pump link engagament:
Center Hole—Normal operating conditions.
Outer Hole—Extreme cold weather.
Inner Hole—Extreme hot weather.

Float (Fuel) Level: To check fuel level with carburetor on car, remove air cleaner and main body cover from carburetor, crank engine with starter to fill bowl to operating level. Install Gauge 9550-B (1953 Lincoln) Gauge 9550-AH (1954 Lincoln-Mercury) squarely on top edge of main body so that gauging pins extend down into bowl. Fuel should be at least as high as longer "GO" pin but must not touch shorter "NO GO" pin. Adjust by bending float tab.

►*FLOAT LEVEL ADJUSTING NOTE:* Due to carburetor design (position of secondary jet tubes above floats), use of Float Adjusting Tool 9550-E may be difficult and following procedure is recommended for float level adjustment: **To raise fuel level**—Support float assembly with finger placed under float bracket, insert tip of medium screwdriver between bottom of float needle seat and edge of float tab, twist screwdriver so as to bend float tab downward. **To lower fuel level**—Support each segment of float by placing finger on top of float, insert tip of medium screwdriver beneath float tab and pry tab upward.

►*CHECKING FLOAT LEVEL:* After making float level adjustment, remove some fuel from bowl, crank engine (with ignition off) to bring fuel level up to new setting. Recheck fuel level and readjust if necessary.

CAUTION—Both floats must be same height and floats must not contact walls of float bowl.

FUEL LEVEL

All Carburetors.....①1/2" ± 1/32"

①—With fuel pump pressure of 3½-4½ lbs.

Automatic Choke: ***NOTE—Choke is separate unit mounted on side of intake manifold and linked to choke valve lever by a rod.*** Mark on cover should be in line with center mark of scale on choke housing. Adjust by loosening three cover retainer screws and rotating cover assembly.
Setting—Centered.

►*CHOKE OPERATING ROD ADJUSTMENT:* Operating rod length should be checked and adjusted whenever manifold, carburetor, automatic choke, or choke linkage removed and replaced. ***See Step 4 under CARBURETOR INSTALLATION ON ENGINE for operating rod adjustment.***

Spark Control Valve: No adjustment required. Calibrating spring in valve is permanently set to allow valve operating at 9½-10½" (1953), 8-10" (1954) of manifold vacuum. If operation not satisfactory, remove and inspect valve for free movement of the valve stem and inspect passage in screw.

Power Valve: No adjustment required. Power valve is calibrated to open below 7.5-9" of manifold vacuum.

Spark Advance Control Cabl : ***Adjustment required when carburetor installed on engine or whenever linkage disturbed or disconnected. See Lincoln Tune-Up data in Car Model Section.***

Primary & Secondary Throttle Plate Synchronization: Adjust hot engine idle speed to specifications (see Idle Setting above). Clearance between stop located on loose lever on secondary throttle shaft and secondary throttle lever should be .038-.044". To adjust without removing carburetor from engine, bend or file stop tab on loose lever arm. As a bench check, place .039" wire gauge (No. 61 drill) between primary throttle plate and throttle bore on throttle lever side of carburetor. With .039" gauge in position, tab on secondary loose lever on secondary throttle shaft should have a slight play between it and secondary throttle lever. Remove .039" gauge and replace with .040" wire gauge (No. 60 drill). There should be no play between loose lever and secondary throttle lever.

OVERHAUL: *NOTE*—Carburetor Holding Fixture 9510-C can be used to mount carburetor for overhaul if special adapter plate made up to match mounting holes of this carburetor. Check Secondary Throttle Operating Diaphragm before disassembling carburetor (see below). Then disassemble and overhaul carburetor as follows:

►***SECONDARY THROTTLE OPERATING DIAPHRAGM CHECK (Before disassembling carburetor):*** Fully open secondary throttle valves and block off diaphragm passage at opening in primary stage venturi (use eraser end of a pencil) BEFORE releasing secondary throttle valves. Release secondary throttle valves. Valves should remain open as long as venturi opening is blocked off. If valves do not remain open, diaphragm or gasket seal between diaphragm assembly and throttle body may be defective. Remove assembly from carburetor, disassemble, and inspect. Also inspect ball check valve located in diaphragm cover.

Disassembly (Secondary Throttle Operating Diaphragm): Take out attaching screw and remove vacuum diaphragm assembly cover plate. Remove retainer securing diaphragm rod to pin on lever and screw holding diaphragm lever on secondary throttle shaft, remove lever. Take out three screws retaining diaphragm housing on carburetor throttle body, remove diaphragm assembly and gasket.

Disassembly (Carburetor—after Secondary Throttle Operating Diaphragm removed): Mount carburetor on Holding Fixture 9510-C (modified for use with four barrel carburetors) and proceed as follows: Remove air cleaner anchor screw and air bleed washer from top of main body cover, remove four attaching screws and lockwashers holding cover on main body, remove cover and gasket. Remove pump rod pin and retainer from pump operating rod (hold top of pump piston while removing pin from pump rod), lift out pump piston assembly, remove pump rod upper seal and washer, remove pump rod lower seal, washers, and spring.

Main Body Disassembly—Remove float needle seat plug and gasket, using tool 9510-BB, remove float needle seat and gasket, using tool 9564. Remove screw and bracket retaining secondary venturi booster tubes, remove venturi tubes. Loosen lock-nuts holding secondary jets in man body, remove secondary jets, gaskets, and nuts. Remove float hinge pin, lift entire float assembly out (float, float needle, clip, and float spring). Remove power valve and gasket, using tool 9510-AA. Remove main metering jets, using tool 9533. Remove idle jet tubes, using tool 9544. Remove accelerating pump ball check retainer, using a wire hook to remove retainer from pump cylinder. Tip carburetor up and catch pump ball check, discharge needle, and main well tubes which will fall out of main body. Remove retainer from pump link pin, remove link from throttle lever. Remove two screws and lockwashers retaining main body on throttle body lift off main body (*CAUTION*—Note gasket and spacer between main body and throttle body, and "O" ring seal on fuel inlet adapter). Remove fuel inlet adapter and booster venturi bracket and gaskets (*NOTE*—One gasket on each side of bracket).

Throttle Body—Remove spark control valve and gasket from boss on throttle body, remove metering jet from inside spark control valve housing. Remove fuel inlet adapter, filter, gasket, and spring. Remove both idle adjusting screws and springs. Take out ball retainer in distributor vacuum passage, remove nylon ball. DO NOT disturb throttle valve and shaft assemblies, fast idle cam, or choke valve and shaft assembly unless replacement required due to wear or damage as determined by inspection. If replacement required, install NEW Throttle Body Assembly. Disconnect and remove secondary throttle control rod. If necessary to remove fast idle cam, proceed as follows:

Fast Idle Cam—Tap out retaining pin, remove fast idle cam from shaft. *CAUTION*—do not attempt to remove the cam shaft from the throttle body (retained by pin in body).

Power Valve Diaphragm—DO NOT remove assembly from main body cover unless tests indicate that replacement required. Remove by taking out three attaching screws and lifting off cover clamp and diaphragm assembly.

Cleaning & Inspection: Wash all parts except those noted below in clean solvent (*CAUTION*—Do not use solvent on pump piston leather, power valve diaphragm, spark control valve, nylon fuel inlet needle valve, nylon distributor passage ball, dashpot assembly, or secondary throttle operating diaphragm). Blow out passages in castings with air, dry all parts with air. Inspect all parts for wear and damage with particular attention to the following: Inspect castings and main body cover for cracks or leaks, inspect main well tubes, metering jets, and idle tubes for wear or clogged passages (*CAUTION*—clean with air, do not use drills to clean out calibrated openings). Replace all worn or damaged parts

Reassembly: Use all NEW gaskets. Install parts in reverse order of disassembly procedure (above) and note the following important points:
Distributor Passage Nylon Ball Caution—If new ball installed, make certain that correct size used.
Choke Valve Installation—Slide choke shaft in through throttle body and install nozzle tube drum on shaft as it enters each venturi (*CAUTION*—rounded opening on drums must face inlet side of carburetor and tapered side of hole must face

CONTINUED N NEXT PAGE

1953-54 LINCOLN, MERCURY "CENTRI-QUAD" (C nt.)

downward). Install choke valves, hold valves closed while tightening attaching screws. Install choke lever on end of shaft and make certain that pin on lockout lever engages slotted hole in choke lever, secure lever on shaft with lockwasher and nut. Install "C" washer on pin of choke lockout lever.

Choke Valve Plate Position—Check choke valve angle in closed position as follows: Hold choke valves closed at limit of travel, measure distance from top edge of venturi to top edge of choke valves at rear side. This distance must be 1/16". Adjust by bending stop tab on choke lever shaft. *NOTE—Choke operating rod length is adjusted as part of carburetor installation procedure. See step 4 under CARBURETOR INSTALLATION ON ENGINE below.*

Secondary Throttle Valve Equalization—If secondary throttle valve removed, use strips of .004" shim stock 1/8-3/16" wide between lower side of each valve (viewed from bottom) and carburetor throat, and hold valves closed against shims while tightening retaining screws. This method will insure proper closing of valves which is necessary for maximum manifold vacuum.

Main Body & Throttle Body Assembly—Install fuel inlet adapter, filter, spring, and gasket. Install fuel inlet fitting and bracket with a gasket on each side of the bracket, tighten the fitting securely. Apply light film of lubricant to "O" ring seal and install seal on fuel inlet adapter. Install gasket on main body support and position main body on throttle body aligning rounded opening of each nozzle tube drum with its discharge nozzle and properly positioning choke lever on fast idle cam. Tighten main body-to-throttle body attaching screws to 4-5 ft.lbs. torque. *(NOTE*—One long screw is located in recessed hole in center of bottom face of throttle body and special small diameter washer must be used with this long screw).

Secondary Jet Installation—Use a new gasket on each secondary jet, insert jets through openings in main body, install locknut on end of each jet with chamfered face of nuts toward carburetor wall. Position jets by moving lower ends to each side as far as possible to avoid interference with power valve operating rod, securely tighten retaining nuts.

Power Valve Diaphragm Installation—*This must be installed as follows to properly seat diaphragm on main body cover:* Place cover clamp over diaphragm stem, compress spring and wind rubber band tightly around stem and spring to hold spring compressed while assembly being installed. Position assembly on main body cover, tighten three attaching screws securely, then remove rubber band and check for free operation by pressing on diaphragm stem. Action must be absolutely free.

Carburetor Adjustments—Make all adjustments listed in ADJUSTMENTS above.

CARBURETOR INSTALLATION ON ENGINE: Install carburetor exactly as follows:

►*CAUTION—DO NOT use gasket sealer or compound on carburetor mounting gaskets.*

1) Position spacer on carburetor mounting pad on manifold with one gasket BELOW and second gasket ABOVE spacer.

2) Position carburetor over mounting studs and start fuel line and choke control inlet tube fittings but DO NOT tighten fittings at this time. Do not connect vacuum lines.

3) Install carburetor attaching nuts and lockwashers and tighten exactly as follows: Tighten all nuts just snug, then tighten each pair alternately in a criss-cross to a torque of 12-15 ft. lbs. *CAUTION*—Correct tightening is important to prevent air leaks or fuel leaks at grooved passages in base of carburetor throttle body.

4)—Install choke operating rod. Make certain that choke valve closed position is correct (see Reassembly), then check choke rod length as follows: With rod disconnected from carburetor lever, hold choke plates in fully closed position, raise rod to highest position, and check whether rod end enters carburetor lever freely. If not, bend rod (first type), adjust trunnion on rod (later type) until rod end enters hole in lever freely, connect rod.

5)—Tighten choke control inlet tube fitting, distributor vacuum line, and fuel line connection.

6)—Start engine and run it sufficiently to fill carburetor bowl with fuel. Check fuel level. *See Float Level data above.*

7)—Re-install main body cover (CAUTION—Do not use gasket sealing compound on cover gasket). Install bleeder plate washer (install lockwasher below and above bleeder plate washer), tighten anchor stud screw to 4-5 ft. lbs. torque.

8)—After engine warmed up, make all carburetor adjustments. See ADJUSTMENTS above.

SERVICE PARTS: *CAUTION—Metering jets furnished in repair kits listed below are STANDARD (for 0 to 5000 ft. Altitude). See High Altitude Carburetor Note (above) for special high altitude metering jets.*

Gasket Set—Lincoln-Mercury No. HDK-9502A (Lincoln Carb.), No. MEK-9502-A (Mercury Carb.).

Repair Kit (With Std. Metering Jets)—Lincoln-Mercury No. HDK-9590-B or HDK-9590-C (1953 Lincoln), No. HEK-9590-B (1954 Lincoln & Mercury).

FORD, LINCOLN, MERCURY 4-BARREL CENTRI-QUAD CARBURETORS

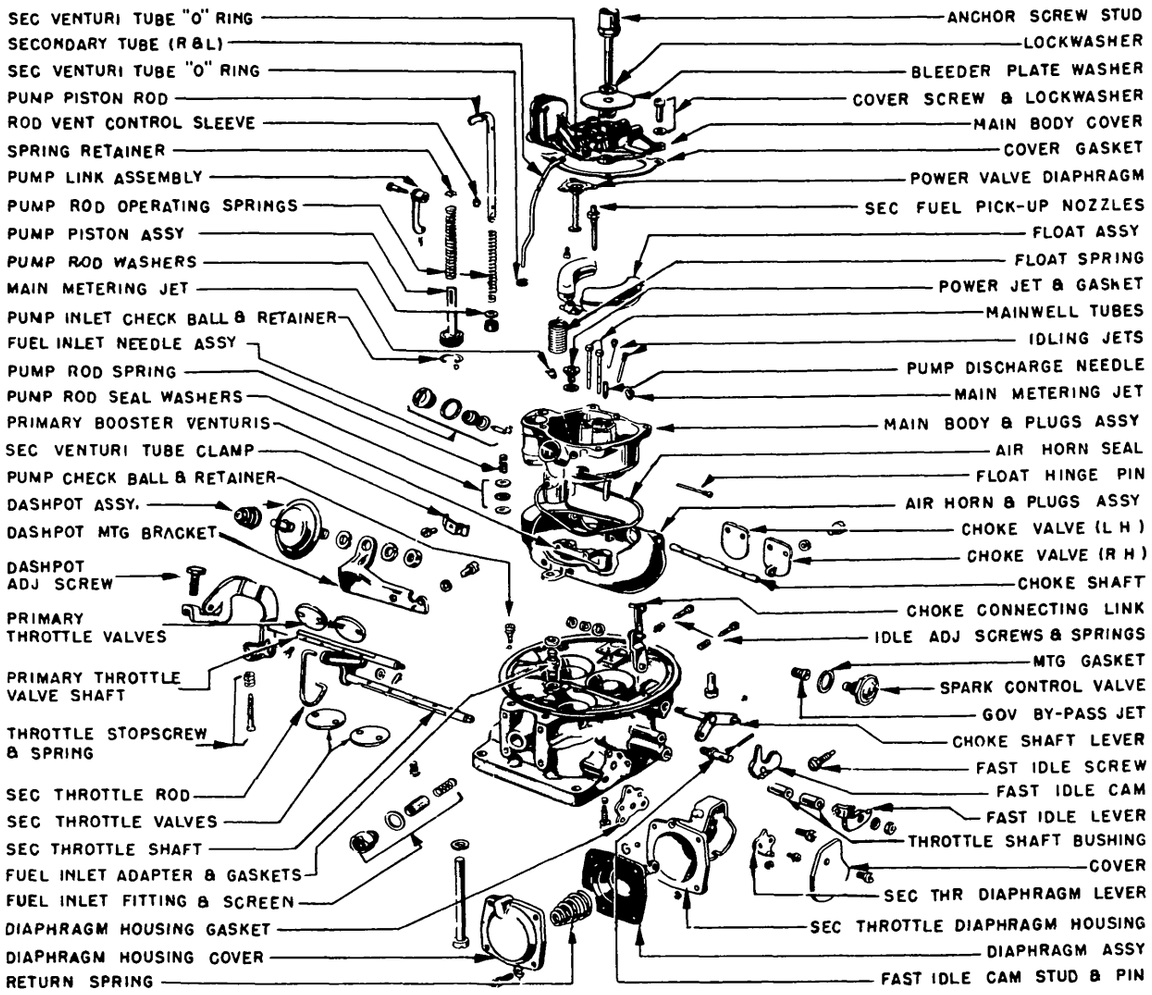
1955 2nd. (Mercomatic)	③ECK-9510-D
1955 Later (Mercomatic)	ECK-9510-H
1955 Later (Synchro-mesh)	ECK-9510 G

①—Ford 272' Special (with Power Package) & 292" Engine (Intercepter & Thunderbird)

②—Serv Part No B5A 9510-G for replacement

③—Serv Part No B5A-9510 H for replacement



►CHANGES, CAUTIONS, CORRECTIONS

►*CARBURETOR INSTALLATION CAUTION (First Cars with Choke Inlet Air Tube Washer in Throttle Body)* First carburetors have "0" Ring seal and retaining washer in recess in top surface of throttle body which seals air inlet tube when carburetor installed on engine This washer must be properly staked in throttle body and care must be used when installing carburetor that washer and seal are not dislodged by tube **Loose washer or seal may be carried into combustion chamber with resulting damage to engine** If washer is loose, install later type rubber grommet (Ford No B5A-9655 A) which replaces both "0" ring seal and washer

►*CHOKE VALVE BIND CORRECTION (Ford Carburetors)* On first carburetors, if choke valves bind on upper surface of throttle body, correct by grinding a slight depression in the top surface of the throttle body to provide 020' minimum clearance between valves and body *NOTE*—Later carburetors have additional clearance at this point

►*AUTOMATIC CHOKE ROD ADJUSTMENT (When installing Carburetor or Automatic Choke)* This adjustment extremely important for correct starting and warming up performance See latest adjustment procedure under "Automatic Choke" below

►*ROUGH ENGINE IDLE CORRECTION (Due to Leakage)* Check engine at 2000 RPM to stabilize fuel level in bowl If engine idles smoothly immediately after operation at 2000 RPM, but roughens progressively with length of time on idle, it can be assumed that leakage at inlet needle or gasket is occuring Remove inlet needle, seat and gasket Clean carburetor carefully to remove any foreign material. Install new inlet needle, seat and gasket. If rough idle not corrected by above and by engine tune-up (including valve lash), intake manifold should be checked for air leakage at gasket between manifold and cylinder head mating surface.

FORD, LINCOLN, MERCURY 4-BARREL "CENTRI-QUAD" CARBURETOR

►*HESITATION UPON ACCELERATION CORRECTION.* When a slight hesitation is felt upon light acceleration check to see that the carburetor is equipped with the correct accelerator nozzle and link and that link is set to correct adjustment See Accelerating Pump below.

DESCRIPTION· Four-barrel downdraft type Design has been changed from that used on 1954 Lincoln and new Secondary Fuel System, Primary Discharge Nozzles, and Choke Valve Assembly are used as follows

Primary Discharg N zzles—Discharge nozzles are located in the booster venturis mounted on the underside of the Air Horn & Plugs Assembly Distribution pins mounted in the lower end of the booster venturis assist in fuel distribution

Secondary Fuel System—Fuel is supplied to each secondary stage throat by tubes extending from the main body cover down to the main body Pick-up nozzles in the main body cover extend down into the fuel to the tubes Booster venturi tubes are not used

Choke Valve Assembly—Conventional choke valves are mounted on a short shaft in a new Air Horn & Plugs Assembly mounted on the throttle body directly above the primary barrels The choke shaft and lever assembly is mounted in the throttle body below the choke valves and is linked directly to the right hand choke valve (see illustration)

CONTINUED ON NEXT PAGE

FORD, LINCOLN, MERCURY CENTRI-QUAD (C nt.)

C ld Engine Idle Screw—The adjusting screw on the right side of all models contacts steps on fast idle cam during the engine warm-up period and controls cold engine idle speed (choke fast idle speed). Adjust cold engine idle speed each time the hot engine idle speed is adjusted.

ADJUSTMENTS: *Make all adjustments exactly as follows:*

Idle S tting: First set BOTH primary idle mixture adjusting screws (see table below) for initial adjustment. Start engine and operate it until normal operating temperature secured with choke valve wide open and fast idle cam in slow idle position. Back off fast idle screw so that it clears the fast idle cam. Set engine speed to correct hot or slow idle speed (see table below) by turning slow idle speed adjusting screw.

F rd—Turn both idle mixture screws (1/8 turn at a time) until smoothest idle at highest vacuum reading is obtained.

Linc ln-M rcury—Turn one idle mixture screw in until engine begins to run rough (lean), then back off needle until engine begins to roll (rich), then turn needle inward just enough to provide smoothest engine idle. Fuel mixture should favor the rich side. Repeat this procedure on other mixture screw.

All M d ls—Recheck idle speed and if not within limits readjust to specifications.

Idl Screw Setting

M d l	Turns Out
Ford (B5A-9510-G, H)	1 1/4
Ford (B5A-9510-M, N, B)	1/2-5/8
Lincoln-Mercury	1 1/2

Idle Speed

M d l	Idle Speed
Ford (Std. Trans.)	475-500 RPM
Ford Pass. Cars (Fordomatic)	①450-475 RPM
Ford Interceptor (Fordomatic)	①475-500 RPM
Ford Thunderbird (All Trans.)	①475-500 RPM
Lincoln (Turbo-Drive)	②425-450 RPM
Mercury (Std. Trans.)	475-500 RPM
Mercury (Merc-O-Matic)	②425-500 RPM

①—Selector lever in Neutral "N".
②—In "Drive" range.

Dashpot S tting (All Aut . Transmissions): After idle adjustment completed, turn ignition off, see that fast idle cam in slow idle position, hold throttle lever in closed position, turn dashpot adjusting screw out (counter-clockwise) until dashpot rod is pushed in to the limit of its travel, then turn adjusting screw in (clockwise) 1½-2 turns which will provide correct clearance of 045- 064"

Acc lerating Pump S tting: Set pump link in hole closest to throttle shaft (shortest stroke) for average or hot weather operation, outer hole for cold weather operation.

Bowl Ext rnal V nt S as nal S tting: Adjust clip on lower end of accelerator pump rod to open or close vent hole for best operation as follows:

Winter Operation (Temperatures b low 50°F)—Slide clip down on pump rod so that vent hole is CLOSED.

Summer Operation (Temperatures above 50°F)—Slide upward on pump rod so that full diameterof vent hole is open.

Fast Idle Setting: After making idle speed adjustment and with engine at normal operating temperature, turn fast idle speed adjusting screw until it just touches lowest step of fast idle cam *NOTE*—If this setting is unnecessarily high, the idle speed may be reduced by backing off the adjusting screw not to exceed one full turn

Secondary Throttle Operating Diaphragm Check: Remove carburetor from engine, remove main body and choke housing from throttle body Fully open (at the linkage) both primary and secondary throttle. Block off the secondary vacuum openings in the right primary and secondary venturi with the fingers Release sedondary throttle linkage while holding primary throttle linkage open. If no leak exists secondary throttle plates should remain partially open To check diaphragm unit, remove complete diaphragm and housing assembly from carburetor. Pull diaphragm rod in a direction to compress spring. Cover slot located in housing to carburetor mounting face with finger Release diaphragm rod If no leaks exist spring should remain partially compressed.

Float (Fuel) Level: To check fuel level with carburetor on car, remove air cleaner and main body cover from carburetor, crank engine with starter to fill bowl to operating level Install Gauge T54L-9550-C (Ford), 9550-AH (Lincoln-Mercury) squarely on top edge of main body so that gauging pins extend down into bowl. Fuel should be at least as high as longer GO pin but must not touch shorter NO GO pin Adjust by bending float tab.

► *CAUTION:* Both floats must be the same height and floats must not contact walls of float bowl.

FUEL LEVEL

All Carburetors	① 1/2±1/32"

①—With fuel pump pressure of 3½-4½ lbs.

Automatic Choke Setting: Mark on cover should be in line with center mark of scale on choke housing. Adjust by loosening three cover retainer screws and rotating cover assembly.

►*CHOKE ROD LENGTH NOTE:* Mercury engine has manifold to carburetor spacer EBJ-9447A (½" thick) and automatic choke rod B5A-9869-A (4¼" long). Whenever difficulty is experienced in adjusting choke rod for proper closing of choke plates, check dimension of these two parts.

Aut matic Choke R d Adjustm nt: Remove air cleaner, choke connector rod retainer and pull trunnion out of choke lever. Hold choke plates in fully closed position, raise and hold choke connector rod in its uppermost position and align the adjustable trunnion (on the upper section of rod) with the hole in carburetor choke shaft lever. Adjust the trunnion two additional turns upward (to lengthen the connecting rod). Secure the trunnion to the choke shaft lever.

Spark Control Valve: No adjustment required If operation not satisfactory, remove and inspect valve for free movement of the valve stem and inspect passage in adapter screw.

OVERHAUL: Check Secondary Throttle Operating Diaphragm before disassembling carburetor (see below). Then disassemble and overhaul carburetor as follows:

►*SECONDARY THROTTLE OPERATING DIAPHRAGM CHECK (Before disassembling carburetor):* Fully open secondary throttle valves and block off diaphragm passage at opening in primary stage venturi (use eraser end of a pencil) BEFORE releasing secondary throttle valves. Valves should remain open as long as venturi opening is blocked off. If valves do not remain open, diaphragm or gasket seal between diaphragm assembly and throttle body may be defective. Remove assembly from carburetor, disassemble, and inspect. Also inspect ball check valve located in diaphragm cover.

Disassembly (Secondary Throttle Operating Diaphragm): Take out attaching screw and remove vacuum diaphragm assembly cover plate. Remove retainer securing diaphragm rod to pin on lever and screw holding diaphragm lever on secondary throttle shaft, remove lever. Take out three screws retaining diaphragm housing on carburetor throttle body, remove diaphragm assembly and gasket.

Disassembly (Carburetor—after Secondary Throttle Operating Diaphragm removed): Remove carburetor cover and gasket. Remove pump rod pin from accelerator pump activating rod. Lift out pump piston. Remove pump rod upper seal and washer, accelerating pump rod lower seal, washers, and spring. Remove hairpin retainer from pin of the pump link, and link from throttle lever.

Main Body Disassembly—Remove float needle seat plug and gasket, and float hinge pin. Lift out float, float needle and clip, and float spring from carburetor bowl. Remove power valve and gasket, main metering jets and idle tube jets. Remove accelerating pump ball check retainer, invert carburetor to release main well tubes, accelerator pump discharge needle, and accelerator pump ball check valve. Remove two screws and lockwashers and separate choke housing from main body, remove main body. Remove spacer between main body and throttle body, remove fuel inlet adapter from main body.

Throttle Body—Remove spark control valve and gasket from throttle body, spark control metering jet from inside of spark control valve bore. Remove fuel inlet adapter, screen, filter, gasket, and spring, idle mixture adjusting screws, and the two screw-in plugs in secondary fuel passages. Invert throttle body and remove two

FORD, LINCOLN, MERCURY CENTRI-QUAD (Cont.)

steel balls. Remove two screws securing dashpot bracket to throttle body and remove bracket and dashpot assembly. Remove pin retainers from each end of throttle control rod, and flat washer from stop lever end of rod, remove rod. If fast idle cam not defective, remove retaining pin with a punch and remove fast idle cam. DO NOT ATTEMPT TO REMOVE FAST IDLE CAM SHAFT. If it is necessary to remove throttle plates for cleaning or repair, each plate must be identified as to the bore from which it was removed (left or right) so that plates can be installed in their original positions.

Power Valve Diaphragm–DO NOT remove assembly from main body cover unless tests indicate that replacement required. Remove by taking out three attaching screws and lifting off cover clamp and diaphragm assembly.

Cleaning & Inspection: Wash all parts except those noted below in clean solvent *(CAUTION*–Do not use solvent on pump piston leather, power valve diaphragm, spark control valve, nylon fuel inlet needle valve, nylon distributor passage ball, dashpot assembly, or secondary throttle operating diaphragm). Blow out passages in castings with air, dry all parts with air. Inspect all parts for wear and damage with particular attention to the following: Inspect castings and main body cover for cracks or leaks, inspect main well tubes, metering jet, and idle tubes for wear or clogged passages *(CAUTION*–clean with air, do not use drills to clean out calibrated openings). Replace all worn or damaged parts.

R assembly: Use all NEW gaskets. Install parts in reverse order of disassembly procedure (above) and note the following important points:

Throttle Plat Installati n–In addition to replacing each plate in its original position, place a .004" piece of shim stock 1/8-3/16" wide between the upper side (viewed from top) of each secondary throttle plate and the throat. Hold throttle plates closed against shim stock and tighten throttle plate screws. This assures maximum manifold vacuum for smooth efficient engine idle.

Main Body to Choke Housing & Throttle Body–Install spacer over mounting hole for long screw in throttle body, choke plate link so as to permit free travel of link under main body. Be sure "O" ring seal is not displaced and that main body locating dowels engage the throttle body. Small diameter washer must be used with longer of two main body to throttle body screws.

Accelerating Pump–Drop check ball into cylinder bore and tap lightly, using brass rod and mallet, to seat ball. Ball spring retainer projection must be placed over ball, and spring must bottom in cylinder bore groove.

Float Installation–Float spring must seat over boss in main body. Clip must hook the under side of float tab.

Main Body Cover Gasket–Make sure all holes have been punched in new gasket and that no foreign material has adhered to it. Never use any gasket sealer or any form of sealing compound on carburetor gaskets.

Power Valve Diaphragm Installation–Place new assembly on main body cover, position clamp, install the screw and secondary supply jets finger tight. Compress power valve stem to full limit of its travel, then tighten retaining screw and secondary supply jets. *NOTE*–Screw and tubes must be tightened while stem is in the compressed position to insure full travel of the power valve stem.

►*AIR CLEANER ANCHOR SCREW TIGHTENING CAUTION:* Over tightening may cause distortion of the carburetor main body and affect calibration of the metering passages.

Carbur tor Adjustm nts–Make all adjustments listed in ADJUSTMENTS above.

CARBURETOR INSTALLATION ON ENGINE: Install carburetor exactly as follows:

►*CAUTION: DO NOT use gasket sealer or compound on carburetor mounting gaskets.*

1) Position spacer on carburetor mounting pad on manifold with one gasket BELOW and second gasket ABOVE spacer.

2) Position carburetor over mounting studs and start fuel line and choke control inlet tube fittings but DO NOT tighten fittings at this time. Do not connect vacuum lines.

3) Install carburetor attaching nuts and lockwashers and tighten exactly as follows: Tighten all nuts just snug, then tighten each pair alternately in a criss-cross to a torque of 12-15 ft. lbs. *CAUTION*–Correct tightening is important to prevent air leaks or fuel leaks at grooved passages in base of carburetor throttle body.

4) Hold choke plates in fully closed position and adjust trunnion until the trunnion pin freely enters the hole in the choke lever. Adjust the trunnion two additional turns upward (to tighten the connecting rod). Install the trunnion in choke lever, secure it with a cotter pin. Check choke linkage for free movement. Install air cleaner. *NOTE*–This adjustment will assist in overcoming hard starting.

SERVICE PARTS: *CAUTION–Metering jets furnished in repair kits listed below are STANDARD (for 0 to 5000 ft. Altitude).*

Gasket Set–Ford No. B5A 9502-B (Ford Carb.), Lincoln-Mercury No. MFK 9502-A (Lincoln EBJ 9510-D, Mercury ECK 9510C, D, ECL 9510-B).

Repair Kit–(With Std. Metering J ts)–Ford No. B5A 9590-B (Ford B5A 9510-G,H), Lincoln-Mercury No. HFK 9590-A (Lincoln EBJ 9510-D), No. MFK 9590-A (Mercury ECK 9510C, D, ECL 9510-B).

Use .045" for 10,000 to 15,000 ft. altitudes (supersedes .046").

⑧—Use .070" for 5,000 to 10,000 ft. altitudes (supersedes .075").
Use .063" for 10,000 to 15,000 ft. altitudes (supersedes .072").

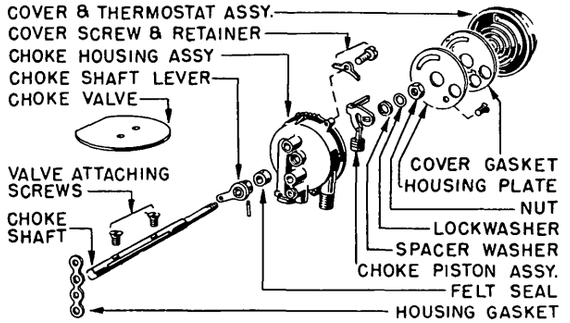
⑨—None (Main Well Discharge Nozzles used). ⑩—New (Size No. 40).
⑪—New (Size No. 43). ⑫—New Secondary Venturi Fuel Supply Metering Jet Tube.

LINCOLN & MERCURY AUTOMATIC CHOKE

►*1952 LINCOLN IMPROPER AUTOMATIC CHOKE OPERATION (Caused by exhaust gas leakage in Iconel Tube in Manifold): See "Lincoln-Mercury Centri-flo Carburetor" in Carburetor Section for complete data on checking and correcting this trouble.*

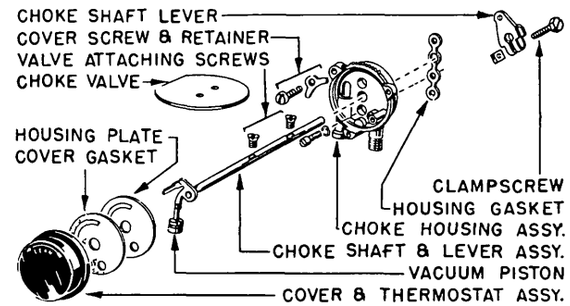
►*ERRATIC ENGINE PERFORMANCE (Erratic Idle Speed, Poor Gasoline Mileage, or Mis-firing caused by automatic choke opening late or not opening fully):* May be caused by air leak in hot air tube between manifold and choke housing due to use of 5/16" fitting instead of ¼" type. See that correct type fittings used and that all connections are tight.

DESCRIPTION: *Two types used (1) Integrally mtd. (on carburetor air horn), (2) Separately mtd. (on manifold and linked to choke valve lever by connector rod).*



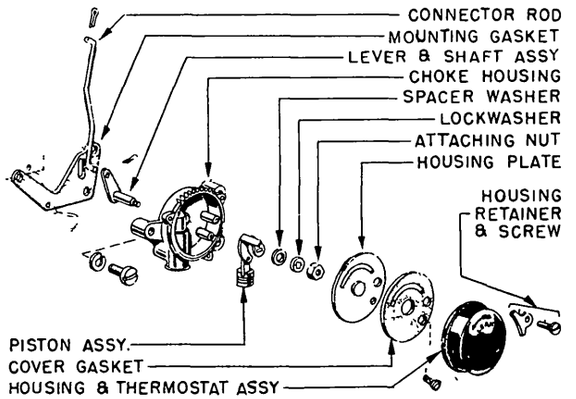
(1) Integrally Mtd. Type—Assembly is mounted on carburetor and linked directly to the choke valve shaft. It consists of a thermostatic coil and vacuum piston assembly to control the choke valve, a fast idle linkage which opens the throttle valve to provide a faster engine idle speed when cold, and an unloading device to correct engine flooding.

(2) Separately Mtd. Type—Choke assembly is similar to first type except that the complete assembly is mounted on the intake manifold by three attaching screws with air and vacuum channels (for control) terminating in ports at the mounting gasket. Automatic choke shaft lever is linked to carburetor choke shaft lever by a connector rod.



OPERATION: Automatic Choke—Thermostatic coil is bi-metal type and tends to "wind-up" and close the choke valve when the engine is cold so that the choke valve is fully closed for cold starting. In this position, the vacuum piston is at the top of the cylinder. As soon as the engine begins to fire, manifold vacuum tends to pull the piston down in the cylinder which opens the choke valve partially (valve is offset and air flow through the air horn also tends to open the valve). As the engine warms up, the thermostatic coil "unwinds" lessening the tension on the choke valve and allowing it to open so that at normal operating temperatures the choke valve will be wide open. Warm air is introduced into the choke housing to effect this unwinding of the thermostatic coil (filtered air from air horn passes through stove in manifold and then flows to the housing). This air flow is controlled by the vacuum piston (slots in the cylinder are uncovered when piston moves down in cylinder and warm air is drawn into housing).

Fast Idle—Consists of a stepped fast idle cam linked to the choke valve shaft and serving as the stop for the throttle valve idle speed adjusting screw.



Unloading Device—When the throttle valve is opened wide, the throttle lever opens the choke valve slightly through the fast idle linkage. This can be used to correct flooding caused by over-choking.

LINCOLN INTEGRAL AUTOMATIC CHOKE

MERCURY INTEGRAL AUTOMATIC CHOKE

LINCOLN & MERCURY SEPARATE AUTOMATIC CHOKE

CHOKE SETTING: Centered (At Index). Reference mark on edge of thermostatic coil and cover assembly shound be aligned with center (longer) line of scale on housing. If a richer or leaner setting required, setting should be changed not more than one division either way from centered setting.

Automatic Choke Adjustment—Loosen 3 cover retaining screws, rotate cover and coil assembly in direction of the arrow for Leaner setting and less choke action, and in opposite direction for Richer setting or more choke action.

FAST IDLE SETTING: Fast idle is set in production and should not require adjustment in the field.

DISASSEMBLY: *Each type disassembled as follows:*

Integrally Mtd. Type—Disconnect and remove connector rod linking choke lever and fast idle cam. On Mercury take out clampscrew and remove choke lever from shaft. Take out retaining screws and remove choke valve. Remove screws and retainers on cover, rotate cover and thermostatic coil assembly toward "lean" to disconnect coil hook, remove cover assembly and gasket. Take out attaching screw and remove housing plate. On Mercury, rotate shaft until vacuum piston is free from the cylinder, withdraw shaft and piston assembly from air horn. On Lincoln, remove nut, lockwasher, and spacer washer from end of shaft, rotate shaft and remove piston and link assembly (shaft cannot be removed until after choke housing removed). Remove choke housing attaching screws, remove housing and mounting gasket from air horn (On Lincoln, felt seal and shaft can then be removed from air horn).

Separately Mtd. Type—Disconnect and remove rod linking choke lever and carburetor choke valve lever. Take out three attaching screws and remove choke assembly and mounting gasket from air horn. Remove screws and retainers on cover, rotate cover and thermostatic coil assembly toward "lean" to disengage coil hook, remove cover assembly and gasket. Take out attaching screw and remove housing plate. Remove nut, lockwasher, and spacer washer on end of shaft, rotate shaft and remove vacuum piston and link assembly, withdraw choke shaft and lever through back of housing.

INSPECTION: See that all parts of choke mechanism are clean and that choke shaft and piston assembly operate freely and that piston edges and cylinder are free from burrs. *NOTE*—Carbon deposits on piston or in choke housing indicate possibility of exhaust gas leakage in Inconel Tube passage (see 1952 Lincoln Improper Choke Operation Note above). Blow out all passages in choke housing (and in carburetor on integrally mounted type) with compressed air. Use all new gaskets and seals when reassembling unit. DO NOT lubricate any part of the choke mechanism.

REASSEMBLY: Reverse disassembly directions (above). When installing cover and thermostatic coil assembly, see that coil hook is down, then rotate cover toward "rich" (opposite to direction of arrow) until hook is felt to engage choke shaft prong, install cover locking plates and screws. Readjust automatic choke after installation.

③—When used to replace manual choke carburetor, Stove Adapter Pkg. No. 7003924 will be required.
④—With manual choke control.
⑤—With automatic choke control.

▷CHANGES, CAUTIONS, CORRECTIONS

▷CARBURETOR IDENTIFICATION—Carburetors similar in appearance but have part number embossed on brass tag attached by one air horn screw and also have last two digits of part number stamped on air horn.

▷CHEVROLET CARBURETOR INSULATOR & GASKET INSTALLATION CAUTION: Use gasket only on 1932-36 cars where gasket used (discard gasket when heat insulator used). When installing insulator, remove and discard old insulator and inner metal sleeve. Install new insulator (or gasket) with two vacuum ports upward (next to carburetor).

CAUTION—Incorrect gasket or insulator installation will cause rich mixture and poor gasoline mileage (by allowing power jet to operate all of the time).

▷ENGINE STALLING WHILE PARKING (EARLY POWERGLIDE CARS with 7002051 Carburetor): Can be corrected by installing Throttle Return Check No. 7003220 (as used on later 7003060 carburetors). Requires installation of new type Throttle Body Assembly No. 7003235 (with contact arm on throttle lever for throttle check operation). *See Throttle Return Check data below.*

▷CHEVROLET 1949-50 ENGINE STALLING WHEN DECELERATED OR ON SUDDEN STOPS: Caused by incorrect adjustment or leakage. If condition not corrected by tuning up engine and adjusting carburetor (idle mixture and idle speed adjustment), remove carburetor and check for leakage as follows:

1) Leakage at Vacuum Channel or Carburetor Throat caused by incorrect sealing of Air Horn Gasket. Fill bowl with fuel, tip carburetor to left and roll back slightly on mounting flange until vacuum channel hole is at lowest point, check for fuel leakage from vacuum channel outlet at mounting flange face. Tilt carburetor in all directions and check for leakage in throat at gasket edge. If leaks noted, remove air horn assembly, remove floats, replace air horn gasket (and main well support gasket on first carburetors) with new rubberized Air Horn Gasket No. 7002894 (7003060 Carb.—may be identified by ⅛" round notch at edge of one bowl opening), No. 7002799 (Others). Check and adjust float level.

2) Leakage at Vacuum Power Piston. To check install carburetor on engine with manifold heat insulator upside down (will shut off vacuum channel). If this corrects stalling, leakage past piston is indicated. Correct by replacing air horn. CAUTION—heat insulator must be correctly installed when carburetor replaced on engine (two cut-out vacuum ports upward next to carburetor flange).

▷CHEVROLET ENGINE STALL OR HARD TO START WHEN HOT (Cars with 7002050 & 7002051 Carburetors): May be experienced in hot weather after prolonged high speed driving. On Powerglide cars, correct by installing later type 7003060 carburetor with new design bowl vents and Throttle Return Check. On other cars with 7002050 carburetor (& Powerglide cars if 7003060 carburetor not available), provide additional bowl vent by drilling air horn as follows:

7002050 & 7002051 Bowl Vent—Remove air horn from carburetor, drill ¼" diameter hole in air horn tower over top of accelerating pump plunger locating hole on side of tower ¼" down from top and 1" forward from rear edge of tower. Carefully clean all drill chips from air horn and recheck float level when re-installing air horn.

7002051 Carburetor Note—Install new Throttle Body and Throttle Return Check when making above correction on these carburetors.

▷CHEVROLET ENGINE ROUGH IDLE: If engine stalls when hot, see stalling correction above. If rough idle cannot be corrected by tuning up engine and cleaning out all fuel passages (blow out with compressed air), check for air leaks as follows: Examine main well support for burrs preventing tight connection at support mounting face, see that support is securely attached to air horn. Check for leak at upper seat of power piston by removing air cleaner and placing moistened finger over power piston vent passage in air horn (inside air horn toward right front edge and approximately 2" down). If engine idle smooths out when vent closed, air leak is indicated. Correct by replacing air horn and power piston.

▷CHEVROLET ENGINE SPEED EXCESSIVE WHEN CHOKE IN USE (Early 1950 Cars & Trucks): Caused by design of choke lever (has definite raised portion on cam in area where kick lever contacts cam in full choke position). Correct by installing later design No. 7002888 Choke Lever & Swivel Assy. (supersedes No. 7002084) or file approximately .038" off choke lever cam, starting at point where kick lever contacts cam in full choke position and blending back to zero at point ⅛" from starting point where kick lever contacts cam in no choke position. NOTE—Reworking of cam will result in approximately 1/16" throttle opening in full choke position (can be checked by inserting 1/16" drill between valve and carburetor wall).

▷CHEVROLET ENGINE SURGE AT 22-35 MPH. (1949-50 216" Engine Cars): Correct by tuning up engine with particular attention to following points:
Ignition Timing—Set at 5° BTDC. with octane selector at "0." Avoid excessive spark advance.
Spark Plug Gap—Increase gap to .040". Avoid excessively close plug gaps.
Tight Engine—Do not attempt to correct surge on cars until engine has been run 1000 miles or more.

▷CHEVROLET HESITATION ON ACCELERATION: Check for clogged pump passages (blow out with air), check pump plunger leather (replace if creased or not sufficently flexible to contact entire surface of cylinder), check seating of vent check ball in plunger (replace plunger if ball sticking or not seating). Check pump outlet check ball for leakage by operating pump with air horn removed. Fuel should remain on top of brass outlet guide. If fuel seeps back into bowl, remove pump guide and reseat ball by tapping lightly with brass rod. If ball seat pitted, replace bowl casting.

▷CHEVROLET 1949 CARBURETOR BOWL COVER GASKET CHANGE: Gasket No. 7002799 (superseding No. 7002114), used which incorporates main well support gasket. When this gasket used, gasket can not be removed for float setting (see float setting change following).

▷CHEVROLET 1949 FLOAT SETTING CHANGE: Float setting changed to 1 5/16" measured with the bowl cover gasket in place (new cover gasket described above cannot be removed for float level setting check). See FLOAT LEVEL data.

▷*CHEVROLET 1953 ENGINE SURGE ON EARLY PASS. CARS (At part-throttle float operation at 20-25 MPH. or during 40-25 MPH. overrun):* May be caused by too much vacuum advance or by slightly lean carburetor. Correct as follows:

1) Limit Vacuum Advance—On engines before No LAA-391110 (without Powerglide), No. LAQ-178807

CONTINUED ON NEXT PAGE

ROCHESTER B & BC (C nt.)

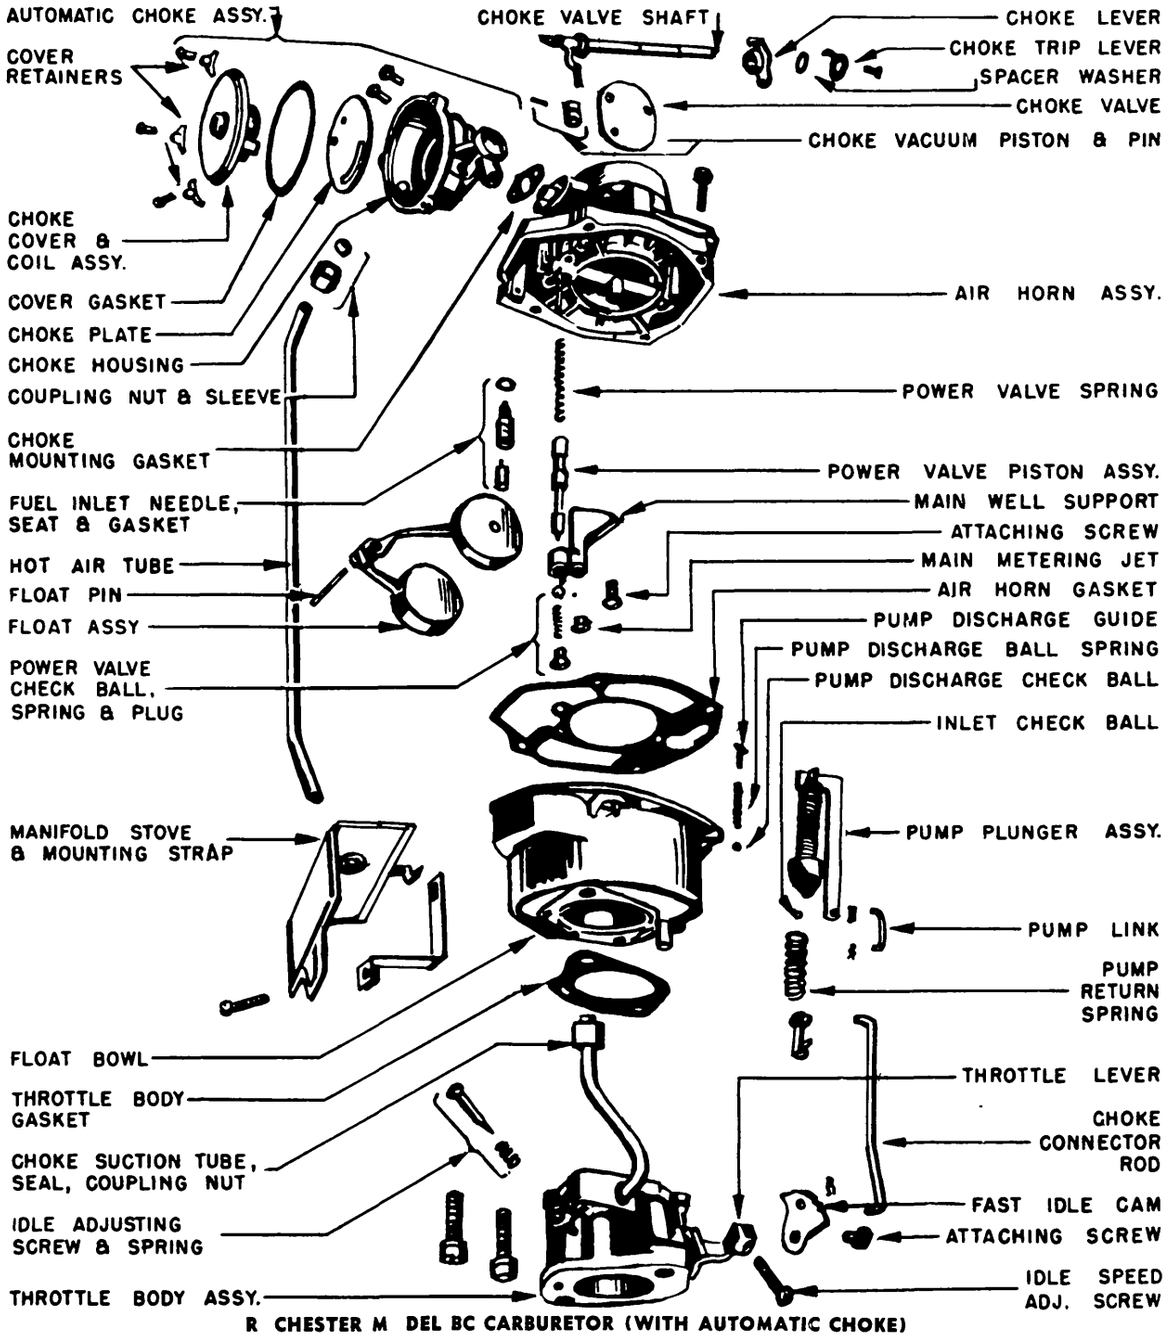
(with Powerglide), with 20° Vacuum Spark Advance Link (stamped "744"), limit link travel to 15° by inserting a ⅛" cotter pin in the link slot. *NOTE*—Engines after above numbers have new 15° Spark Advance Link (stamped "845").

2) Change Carburetor Main Well & Power Valve Support Assembly (First Powerglide Engines only)—On carburetors date stamped "L2" or "M2" (on bowl cover), replace original Main Well & Power Valve Support Assembly with new Assembly No. 7005422 which has slightly richer main metering jet and power jet. *NOTE*—Carburetors date stamped "A3" and later have this new No. 7005422 assembly (also used in ALL carburetors on engines without Powerglide).

3) Change Carburetor Metering Jet (All Engines): If carburetor slightly lean, install #59 or #60 Main Metering Jet (replacing original .057" Part No. 7002657 jet).

►**PONTIAC CARBURETOR INSTALLATION CAUTION:** Same carburetor used on all cars but throttle connector rod should be connected to **right hand** hole in throttle lever on Synchro-mesh Trans. cars, and to **left hand** hole on Hydra-Matic Drive cars (facing throttle lever side of carburetor).

DESCRIPTION



DESCRIPTION: Plain tube, downdraft type of new design with concentric fuel bowl, double float, vacuum controlled power system, and fast idle and throttle kicker linkage for starting and warming up.

Idle Fuel System—Fuel is drawn from main nozzle cross-bar in air horn and mixed with air admitted through three air bleeds in cross-bar. Fuel mixture is then metered by idle tube (in end of cross-bar) and taken down through passage to idle ports at throttle edge. For closed throttle idling, fuel is discharged through lower port and controlled by idle adjusting screw. As soon as throttle valve is opened for low speed operation, additional fuel is discharged through secondary ports above throttle.

1952-55 IDLE SYSTEM CHANGES: Idle cross passage in nozzle bar has only two air bleed holes (was three) and an additional passage is provided in the air horn to vent the idle passage to the fuel bowl which prevents vapor collecting in idle passages and cross bar when a hot engine is shut down. This vent system also acts as an air bleed for the idle system.

Main Fuel System—As throttle valve is opened and suction increases at main discharge nozzle under cross-bar, fuel mixture is discharged through this nozzle and idle system drops out. This fuel is metered by Main Metering Jet and mixed with air admitted through air bleeds in cross-bar. Main fuel system delivers all fuel required for normal operation in 25-70 MPH. range.

Power System—Consists of a ball type Power Valve controlled by a spring-loaded vacuum piston which permits additional fuel to flow to main nozzle when valve is open. Vacuum piston is normally held up by manifold vacuum so that power valve is closed by spring below ball. Whenever manifold vacuum drops below 5" (for full power or high speed operation), spring forces piston down and plunger stem opens valve. Fuel admitted through valve is metered by Power Restriction in fuel passage.

R CHESTER M DEL BC CARBURETOR (WITH AUTOMATIC CHOKE)

1954-55 TWO-STEP POWER SYSTEM (Model "BC" Carburetors): Power valve check ball is located in a well so that at a slight opening of the ball check, the fuel flow is controlled and metered by the clearance between the ball and the well. At wide open throttle, the ball is moved out of the restricted well area and the fuel flow is controlled by the power restriction in the fuel discharge channel. A special

CONTINUED ON NEXT PAGE

ROCHESTER B & BC (Cont.)

"barrel" shaped spring is used below the ball to provide clearance within the well.

Accelerating Pump System—Spring-loaded piston type which provides sustained discharge regardless of rate of throttle opening (link hole in pump plunger slotted and actuating spring located above pump piston). Fuel is drawn into pump cylinder through intake ball check in bottom of cylinder and is discharged through pump jet which sprays the fuel on the lower edge of the small venturi.

1952-55 PUMP SYSTEM CHANGES: Discharge passage in air horn and pump discharge jet have been eliminated (pump discharges through passage drilled in main body from point just below pump discharge guide and opening into main venturi section of carburetor). Pump inlet ball check screen, and inlet passage also eliminated (vapor vent passage in pump piston acts as pump inlet passage).

Pump Vapor Vent—Consists of a ball check valve in the piston head which allows any fuel vapor in cylinder to escape through passage in pump plunger opening into bowl. This check valve is closed during normal pump operation.

Automatic Choke & Fast Idle (All BC Carburetors): Consists of a thermostatic coil and vacuum piston assembly mounted in housing on air horn and linked to the choke valve shaft. Choke has two external tube connections—Heat Suction Tube from the choke housing to carburetor throttle body, Heat Tube from choke housing to manifold stove. Fast Idle and Unloader mechanism is linked to lever on opposite end of choke valve shaft.

Throttle Return Check (Chevrolet Powerglide Cars): Consists of a spring-loaded diaphragm type dashpot mounted on the carburetor with an adjustable plunger which contacts an arm on the throttle lever and prevents throttle valve closing too rapidly when accelerator pedal released. *See Throttle Return Check data below.*

ADJUSTMENT & OVERHAUL

IDLE ADJUSTMENT: If carburetor out of adjustment, turn idle adjusting screw in until it is seated, then back screw out 1½ turns. Start engine and allow it to idle until thoroughly warm. Then adjust with choke valve wide open and fast idle inoperative.

Idle Screw Setting—Set for smooth idle. Final setting should not be more than ½ turn in or out from initial position as shown below.

Idle Mixture Setting

Model	No. Turns Open
Chevrolet	
1949-53 (Exc. Powerglide)	1½-2½ turns
(Powerglide)	1-2½ turns
1954 Pass Cars (All)	1-2½ turns
Trucks (235" Eng)	1½-2½ turns
(261" Eng)	1-1½ turns
1955 Pass Cars (All)	2½ turns
Trucks (BC Carb)	2½ turns
(B Carb)	1½-2½ turns
Pontiac	1½ turns

Idle Speed Setting

Model	Synchro-mesh	Auto. Trans.
Chevrolet		
1949-53 All	450-500 RPM	①425 RPM
1954 Pass Cars	475 RPM	①425 RPM
Trucks	450-500 RPM	②400-450 RPM
1955 Pass Cars	475 RPM	①425 RPM
Trucks	450-500 RPM	②400-450 RPM
Pontiac	450-475 RPM③	365-385 RPM

①—With selector lever in "DR" position.
②—With selector lever in "N" position.
③—Or 7-8 MPH.

ACCELERATING PUMP: Not necessary to check pump. No seasonal adjustment provided.

▷*CHEVROLET 1949-50 PUMP LINK PRODUCTION CHANGE & REPLACEMENT CAUTION:* Design changed in production and correct type must be used on each of the following carburetor models:

Chevrolet Accelerating Pump Link

Carburetor	First Type Link	Later Type Link
7002050 & 7001374	7002353	③7002820
7002051	7002355①	②④7002821
7003060		②④7002821

①—Has shallow groove machined on upper end.
③—Has shallow groove machined on center.
③—Length .840". ④—Length .805".

POWER JET: Valve opens when manifold vacuum drops below 5" of mercury. No adjustment required.

▷*CHEVROLET POWER VALVE PISTON SPRING CAUTION:* Correct type must be used on each carburetor:

Power Valve Piston Spring

Carburetor	Length	Weight	Part No.
7002050 & 7001374	2 3/16"	4½ ozs.	①7002071
7002051 & 7003060	2 17/64"	5 ozs.	②7002366
7002870			7002896
7003152, 7003863, 7003865			7002071
7003160, 7003526, 7003864			7002366
7004475, 7004477, 7004620			7002071
7004468, 7004476, 7004478.			7002366
7004495, 7004915			7002366
7004468, 7005140			7002366
7005921, 7005922			7002896
7007180, 7007181			7002896

①—Wire Diameter .014".
②—Wire Diameter .015". Copper flash marking.

FLOAT LEVEL: *CAUTION—Two adjustments required: (1) Float Level Setting, (2) Float Drop or Travel.*

▷*MODEL BC CAUTION*—When removing bowl cover, disconnect heat tube at upper coupling nut and use extreme care not to disturb seal at lower end of tube.

▷Chevrolet Float Level Note—First type Float Level Gauge J-4186 can be used but should be placed on top of gasket (do not remove gasket). New Gauge No. 3696192 checks both floats for height and alignment in single operation.

Float Level Setting: Measure from bottom of each float to gasket on bowl cover (do not remove gasket) with needle valve closed (float and cover assembly inverted). To check float level, remove air horn and float assembly and invert with cover gasket in place. Install gauge (see table below) in position over floats (on Chevrolet, center tang on gauge will enter main discharge nozzle). Bend float arms vertically so that each float just touches top of cut-out in gauge. On Chevrolet, bend float arms horizontally so that each float is centered in gauge cut-out (this adjustment made as part of float drop setting on Pontiac). Check setting by tilting assembly 90° to each side and make certain that floats are still centered in gauge, recheck float level. This alignment of floats is neecssary to insure that floats will not rub on sides of bowl.

Float Level Setting

Car & Carb.	Float Level	Checking Gauge
Chevrolet (all)	1 5/16"	①3696192
Pontiac 7002870	1 1/4"	J-4554

①—Rochester Gauge No. M-250.

▷*CAUTION—Both floats must be set exactly alike.*

Chevrolet Float Travel (Drop) Setting—1¾" from cover gasket to the bottom of each float with the floats in extreme lower position. To check, hold assembly in upright position so that floats drop to bottom of travel, measure from gasket seat on cover to bottom of floats. If distance not within limits, adjust by bending float tang on float lever.

Pontiac Float Travel (Drop) Setting—¼" from cover gasket to top of each float with the floats in extreme lower position. Use float level gauge (below) to check float travel. Hold air horn assembly right side up with floats hanging freely. Install gauge with flat side up against cover gasket and small cut-out in gauge over main discharge nozzle. Bend float tang at rear of float arm so that tops of both floats just contact bottom of cut-outs in gauge (gauge should slide freely between cover gasket and floats). Bend float arms horizontally so that each float is centered in gauge cut-out (this alignment necessary to insure that floats will not rub on sides of bowl).

▷*CAUTION—Recheck float level after adjusting float travel.*

▷Chevrolet Air Horn Installation Caution: When reinstalling air horn assembly, hold throttle kicker in vertical position (against spring tension) while lowering air horn on body casting.

Float Needle Valve & Seat: Furnished as matched sets.

Float Needle Valve & Seat

Car Model	Size	Part No.
Chevrolet (All)	.091"	②7002359
Pontiac		③7002885

②—Marked by two grooves on O. D. of seat.
③—Used with No. 7002849 Float Valve Clip by which intake needle is clipped to float arm.

THROTTLE KICKER (Chevrolet Model B Carburetors): Spring-loaded kicker lever mounted on side of bowl casting. Lower end of kicker lever acts as stop for the throttle lever stopscrew and upper end bears against fast idle cam which is integral with

CONTINUED ON NEXT PAGE

ROCHESTER B & BC (C nt.)

the choke valve lever. Rotation of cam as choke valve is closed for cold starting rocks the kicker lever and opening throttle for fast idle.

Adjustment—Not required. Operation will be satisfactory if parts correctly assembled.

FAST IDLE (Model BC Carburetors): A stepped fast idle cam linked to the choke valve and serving as a stop for the throttle lever stopscrew. Stopscrew engages high step of cam when choke valve is closed for cold starting so that the throttle valve is opened to fast idle position. Rotation of the cam as the choke valve opens causes the stopscrew to rest on successively lower steps of the cam and allows the throttle to close to the final hot or slow idle position. Adjustment required only when linkage disconnected (to establish correct relationship between fast idle cam and choke valve positions).

Adjustment—To check setting, rotate fast idle cam until throttle stopscrew rests on second (next to highest) step of cam. Check choke valve opening or clearance between lower edge of valve and air horn wall. This clearance should be equal to thickness of proper checking gauge (see table below). If clearance not correct, adjust by bending connector rod using bending tool BT-18 (Chevrolet & Pontiac No. J-4552).

Fast Idle Setting

Car & Carb.	Choke Opening	①Checking Gauge
Chevrolet (1949-53)	.073"	③ BT-64
(1954-55)	.076"	BT-99
Pontiac (All)	.059"	④ BT-50

①—SMALL end of combination gauge.
③—Chevrolet Gauge No. J-5120.
④—Pontiac Gauge No. J-4553.

UNLOADER (Model BC Carburetors): Consists of tang throttle lever which engages the fast idle cam and opens the choke valve to correct flooding when the throttle valve is opened wide.

Adjustment—To check setting, hold throttle in wide open position, check choke valve opening or clearance between lower edge of valve and air horn wall. This clearance should be equal to thickness of proper checking gauge (see table below). If clearance not correct, adjust by bending tang on throttle lever using bending tool BT-18 (Chevrolet & Pontiac No. J-4552).

Unloader Setting

Car & Carb.	Choke Opening	②Checking Gauge
Chevrolet (1949-53)	.166"	③ BT-64
(1954-55)	.230"	⑫ BT-99
Pontiac (7002870)	.221"	④ BT-50

②—LARGE end of combination gauge.
③—Chevrolet Gauge No. J-5120.
④—Pontiac Gauge No. J-4553.

THROTTLE RETURN CHECK (CHEVROLET): Used on Powerglide Cars. *NOTE*—Not originally installed on first No. 7002051 carburetors, but can be installed in the field by installing new Throttle Body Assembly No. 7003235 also. Make installation as follows:
Installation (On Carburetor No. 7002051)—Install the carburetor together with the Throttle Return Check Unit on manifold (return check held in place by one mounting stud nut), check alignment of return check plunger adjusting screw with contact arm on throttle lever and bend bracket or contact arm as necessary to center the adjusting screw on radius or contact arm. Make certain that latest type No. 3695705 Throttle Return Spring (with ½" loop at each end) is used.

CAUTION—No. 3685718 Throttle Return Spring (with 1½" loop at each end) was used on first cars but is now used only on truck engines.

Adjustment: ***CAUTION—Different procedure required on manual choke and automatic choke carburetors as directed below. After adjusting, check performance as indicated.***

Model B (Manual Choke) Carburetors—Check alignment of adjusting screw with contact arm on throttle lever and bend return check mounting bracket or contact arm to center adjusting screw on arm. With engine thoroughly warmed up, adjust carburetor for smooth idle at 425 RPM. with selector lever in "D" position, shut off engine. Remove air cleaner. Insert .090" feeler gauge between choke lever cam and fast idle lever on air horn. Hold return check shaft from turning with a 9/32" wrench, turn adjusting screw out until it just contacts the throttle lever contact arm. Screw must not project more than ⅜-½" measured from underside of screw head to shoulder on shaft. If screw projects more than ½", bend mounting bracket and readjust screw. Then check performance (see below).

Model BC (Automatic Choke) Carburetors—Check and adjust return check adjusting screw alignment, and adjust engine idle speed, as directed for Model B type above. Shut off engine. Move choke valve to closed position so that throttle stop screw rests on high step of fast idle cam. Hold return check shaft from turning with a 9/32" wrench, turn adjusting screw out until it just contacts the throttle lever contact arm. Screw must not project more than ⅜-½" measured from underside of screw head to shoulder on shaft. If screw projects more than ½", bend mounting bracket and readjust screw. Then check performance (see below).

Throttle Return Check Performance Test—Set parking brake securely, place selector lever in "D" position. Accelerate engine to stall speed, then release accelerator pedal quickly. If engine stalls, turn adjusting screw out ½ turn and repeat test. Do not turn screw out more than 1½ turns from point of initial setting. *CAUTION*—More than 1½ turns will disengage screw from nylon locking device.

CHOKE (Chevrolet—Manual Type): Offset, semi-automatic type valve (lever is spring-loaded on shaft so that valve is free to assume correct position during warming up period).

Adjustment—With control wire retainer screw on choke lever loosened, see that choke button on instrument panel pushed all the way in, hold choke valve wide open, tighten retainer screw.

CHOKE (Carburetor Model BC—Automatic Type): Thermostatic coil and vacuum piston assembly mounted in housing on air horn and linked directly to choke valve shaft. A special suction tube is used extending from choke housing to vacuum port in carburetor throttle body.

Setting—Centered (At Index) for all models.
Adjustment—Loosen three retainer screws on cover, rotate cover until scribed mark on cover is in line with longer center mark of scale on housing. This will provide centered setting.

►***CARBURETOR 7005922 & 7007180 NOTE:*** On these models, heat tube connected directly at center of Thermostat Coil & Cover Assembly and cover is locked in place by one of the cover retainers which has two teeth engaging serrations in the cover. When adjusting choke setting, retainer screw must be backed off sufficiently so that retainer can be disengaged from cover.

OVERHAUL: With carburetor off engine, proceed as follows:

Disassembly: ***CAUTION—Choke assembly on Model B (manual choke with throttle kicker) and on Model BC (automatic choke and fast idle) disassembled differently as follows:***

Model B Air Horn & Manual Choke—Take out 4 air horn and bowl cover attaching screws, remove choke control bracket. Hold throttle kicker in vertical position (free of fast idle cam), lift air horn and bowl cover assembly straight up taking care not to damage floats. Choke valve and shaft can be disassembled, if necessary, after bowl cover parts have been disassembled (below).

Model BC Air Horn & Automatic Choke—Loosen ½" brass fitting on upper end of heat suction tube at automatic choke housing (CAUTION—use care not to disturb tube seal in throttle valve body). Remove three choke cover attaching screws, rotate cover counter-clockwise to free thermostatic coil hook from choke valve tang, lift off cover and thermostatic coil assembly, remove cover gasket and baffle plate. Free fast idle connector rod retainers and remove rod. Remove retaining screw on opposite end of choke valve shaft, carefully pry off choke trip lever, spacing washer, and counterweight. Take out two choke valve screws, remove valve, rotate choke shaft clockwise until vacuum piston clears bore in housing, withdraw shaft and piston assembly from air horn. Piston can be removed from shaft by taking out piston pin. Take out two choke housing attaching screws, remove choke housing and gasket from air horn. Take out 6 air horn and bowl cover attaching screws, lift air horn and bowl cover assembly straight up using care not to damage floats.

Bowl Cover Disassembly—Remove float hinge pin and lift off float assembly, remove float needle, remove needle seat and gasket. Remove the main metering jet and power valve from main well support (CAUTION—do not lose ball and spring when removing power valve). Take out main well support attaching screw, lift off support, remove gasket, lift out power piston and spring.

►***CAUTION—Do not remove idle tube which is pressed in bowl cover (serviced as an assembly).***

Choke Valve—For choke valve servicing or replacement, remove choke valve screws, lift valve out. Remove retainer ring from groove in shaft boss on air horn, slide shaft, spring, and lever assembly out of air horn casting.

Float Body—Remove screw, lift off throttle kicker lever and spring. Hold pump plunger down in cylinder, remove cotter pin or hairpin retainer from

C NTINUED ON NEXT PAGE

ROCHESTER B & BC (Cont.)

pump link, remove link from throttle lever and pump plunger, lift pump plunger from bowl, lift out return spring. Remove ball check from bottom of pump cylinder. Turn pump discharge guide until it can be removed, remove discharge spring and ball check by inverting assembly and allowing these parts to fall out. Remove pump intake screen retainer and screen.

Throttle Body—After disassembling float body, take out two throttle body attaching screws, lift throttle body off. Unscrew idle adjusting screw and remove screw and spring. On "BC" carburetor, take out attaching screw and remove fast idle cam.

▷*HEAT SUCTION TUBE CAUTION*—Do not remove tube or disturb tube seal in throttle body. If seal is loose, seal can be tightened or new seal installed after carburetor completely reassembled.

▷*THROTTLE VALVE CAUTION*—Do not remove throttle valve. Valve is close fit and idle discharge holes are drilled in close relationship to valve. This will be disturbed if valve and shaft removed.

Cleaning & Inspection: Wash all parts EXCEPT automatic choke housing, coil, and pump plunger, in carburetor cleaning solvent and dry with air. Blow out all passages with air and inspect for carbon deposits. Inspect all parts for wear or damage.

▷*CAUTION—Do not use wire or drills to clean out drilled passages or calibrated jets and restrictions.*

▷*NOTE*—Replace Throttle Body Assembly if throttle arm or shaft excessively worn or damaged. Do not attempt to remove and replace throttle valve.

Reassembly: Use new gaskets. Reassemble carburetor by reversing disassembly directions and note the following important points:

Model B Choke Valve Installation—Center the valve in air horn with mark "RP" facing upward before tightening attaching screws. Turn choke shaft spring clockwise until outer hooked end engages upper end of choke lever (loose lever to which choke control attached), wind up inner end of spring approximately ½ turn and hook over end of choke shaft lever.

Model BC Choke Valve Installation—After air horn assembled on bowl casting, install choke housing using new gasket and tightening attaching screws securely. Place NEW packing on upper end of heat suction tube and tighten coupling nut (if new seal required on lower end of tube see data below). Install choke valve shaft and vacuum piston assembly, rotate shaft counter-clockwise to enter piston in bore in housing, install choke valve on shaft with mark "RP" upward, center valve in air horn before tightening attaching screws. Install baffle plate and choke housing gasket, install choke cover and thermostatic coil, rotate cover clockwise until coil hook engages tang on choke shaft lever and index mark on cover is aligned with center mark of scale on housing, tighten three cover screws. Install counterweight on opposite end of shaft with tang facing in toward choke housing, install spacing washer, trip lever (with tang over tang on counterweight with choke valve fully open) tighten screw in end of shaft. Install fast idle connector rod with cotter pin end of rod at fast idle cam, connect rod and check entire choke system for free movement. *NOTE*—Choke valve should be closed at temperature of 75°F.

▷Heat Suction Tube Seal Servicing—If tightening of loose seal does not correct leaks at this point (check with gasoline while engine idling—leak will cause engine to roll or stall), install new seal as directed below.

Tightening Tube Seal—Use installing tool J-4551 to tap seal down evenly around tube.

Installing New Tube Seal—Loosen throttle body-to-bowl casting screws, insert flared end of heat suction tube and seal into hole in throttle body and tap seal down lightly with tool J-4551 (rotate tube while tapping seal to insure starting uniformly into hole in throttle body). Tighten coupling nut at upper end of tube finger tight, using NEW packing on tube. Use hammer and tool J-4551 to spread seal securely in throttle body (rotate tool to secure uniform spreading of seal). Loosen coupling nut at upper end of tube, check tube tightness in throttle body (tube should not turn), tighten coupling nut securely, tighten throttle body attaching screws. Check seal for leaks after carburetor installed on engine.

Accelerating Pump Ball Checks—Install aluminum intake check ball in bottom of pump cylinder, see that ball lifts freely from its seat. Install steel outlet check ball in outlet passage in bowl casting, tap ball lightly with hard fibre or brass rod to seat it, then make certain that ball lifts freely from its seat. Install bronze spring on top of outlet ball, index end of discharge guide in spring and press guide down until top is flush with bowl surface.

Float Assembly—Install air horn and bowl cover gasket before installing floats. Make certain that tang on the float lever faces up toward cover. Adjust float level and float travel before installing air horn on float body.

Adjustment—When carburetor assembled, set idle adjusting screw 1½ turns open. After carburetor installed and engine warmed up, adjust idle as directed under Idle Adjujstment. Check and adjust Fast Idle, Unloader, and Choke Setting.

REPAIR PARTS: Gasket Kits—No. 7001386 (Chevrolet Model B Carburetors through 1950 and also later carburetors as follows: 7003152 & 7003160), No. 7004595 (Chevrolet Model B Carburetors as follows: 7003863, 7003864, 7003865, 7004468, 7004475, 7004476, 7004477, 7004495), No. 7004085 (Chevrolet Model BC Automatic Choke Carburetors), No. 7006126 (Model B No. 7005140), No. 7001391 (Pontiac).

Repair Kit—No. 7004363 (Chevrolet—all carburetors), No. 7001392 (Pontiac). *NOTE*—Chevrolet Kit does not include gaskets and separate Gasket Kit must be used.

ROCHESTER MODEL AA (OLDSMOBILE)

OLDSMOBILE	Carburetor No.
1949 Series 88 & 98	7001570
1950 Series 88 & 98	7002570

DESCRIPTION: Dual downdraft, concentric bowl, horizontal air intake type with vacuum controlled power jet and positively operated diaphragm type accelerating pump operated by throttle lever through a rack-and-pinion engagement. The circular float bowl is mounted on the underside of the carburetor cover and is suspended in the air stream so that it is cooled by the air entering the carburetor.

►**1950 Carburetor Changes**—1950 carburetor modified from 1949 design for increased performance. Principal change is in Accelerating Pump design permitting Pump Jet Targeting before carburetor completely assembled. *See Accelerating Pump data below.*

Fuel System: Consists of Idle (Low Speed) Fuel System, Main (High Speed) Fuel System, Power Fuel System, and Accelerating Fuel System which operate as follows (Idle & Main Systems duplicated for each carburetor barrel):

Idle Fuel System—Fuel for idling is taken from the main jet well up through a brass Idle Tube which meters the fuel and is then mixed with air admitted through Idle Air Bleed in cover passage above tube. Fuel mixture then flows through horizontal passage in cover and additional air is admitted through Idle Channel Bleed opening into air horn. Fuel mixture is then taken down through passage to idle ports at throttle edge. For closed throttle idling, all fuel is discharged through lower port below throttle and is controlled by the Idle Adjusting Screw. As the throttle is opened, additional fuel is discharged through Secondary Idle Port and Top Idle Port also. Idle system supplies all fuel up to approximately 25-30 MPH.

Main Fuel System—Fuel is metered by Main Metering Jet in bottom of float bowl and flows up through vertical passage to Discharge Nozzle in small venturi. This fuel is mixed with air admitted through Main Well Air Bleed in cover. This air bleed action is controlled by the brass Main Well Tube in the upper end of the main well or vertical passage. Main Well Tube has calibrated holes on one side which control the fuel/air ratio through the driving range. Main discharge nozzles supply all fuel through the 30-60 MPH. driving range and this fuel is metered by the main metering jets.

Power Fuel System—Consists of a power valve controlled by a spring-loaded vacuum diaphragm assembly which bypasses fuel directly to the main Discharge Nozzles. Valve is normally closed (diaphragm and stem held up against spring tension by manifold vacuum) but is opened by the stem whenever manifold vacuum drops off (wide open throttle or full-power operation, or sudden acceleration) permitting fuel flow through Power Restriction.

Accelerating Fuel System—Consists of a diaphragm type pump assembly mounted on the side of the bowl and pump jets mounted in the pump housing which are aimed to discharge fuel across the throat of each carburetor barrel when throttle valve opened for acceleration. Pump is positively actuated through a rack-and-pinion drive by an actuating spring on the pump shaft which is wound up by the closing of the throttle. Return spring bearing on inner side of diaphragm is calibrated to take up all play and lost motion in the pump linkage. Pump intake strainer screen, intake ball check and outlet check needle located in bowl casting.

IDLING ADJUSTMENT: Adjust only with engine warmed up so that choke valve wide open and engine idling at hot or slow idle speed (Automatic Choke & Fast Idle inoperative). Set throttle stopscrew for correct idle speed, adjust both idle adjusting screws (one for each barrel) so that engine idles smoothly. Screws control fuel mixture and should be turned in for leaner mixture, out for richer mixture. Recheck idle speed. See car model page for complete tune-up instructions.

Idle Setting

Idle Screw Setting—Approximately 1 turn open.

Idle Speed (Synchro-mesh Trans.)—425 RPM.

Idle Speed (Hydra-Matic Trans.)—350 RPM. with selector lever in Drive "Dr" position.

PERFORMANCE: Should be satisfactory if idling adjustment and accelerating pump seasonal setting correct. All jets are fixed non-adjustable type.

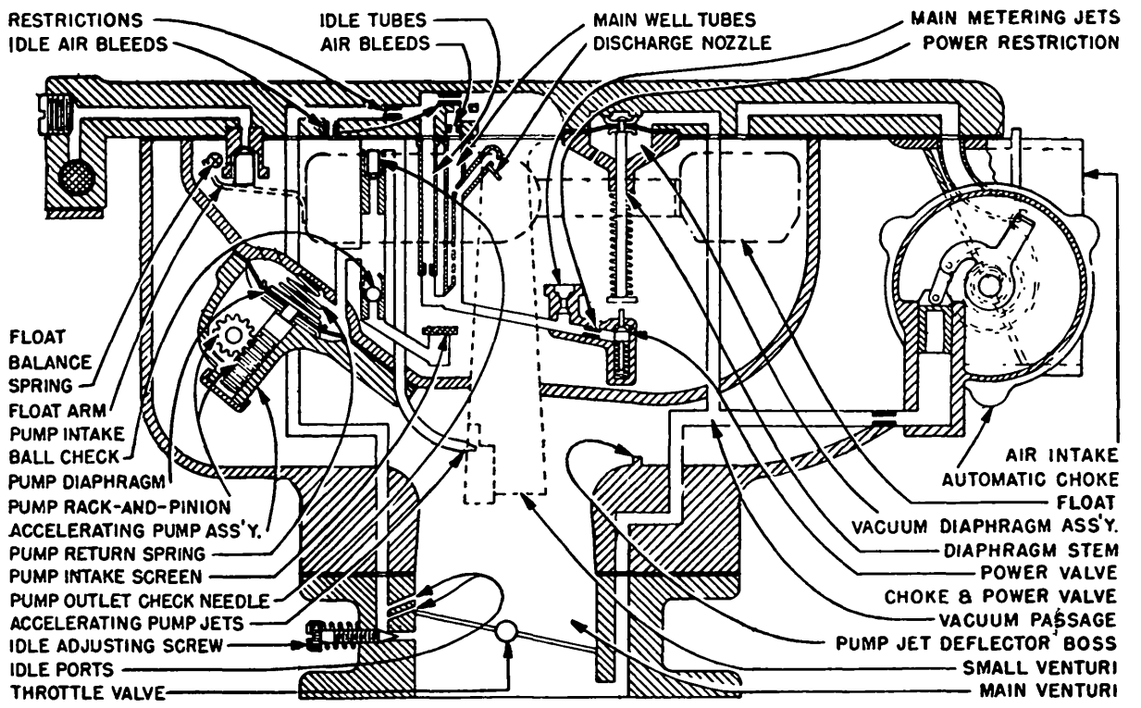
POWER VALVE ASSEMBLY: Not adjustable. Valve remains closed with manifold vacuum greater than 8" of HG. and opens when vacuum drops below 8".

Checking Power Valve—Assembly can be checked for improper assembly, leakage, or punctured diaphragm with cover assembly removed as follows: Depress power valve stem to full down position, place finger over vacuum supply hole in cover and hold tightly. Release power stem. Stem should move slightly. Remove finger from supply hole. Stem should move out through full travel with slight metallic click. Check seal at vacuum supply hole in cover gasket (leakage at this point will be noted by carbon deposit extending from hole to outer edge of cover gasket). Check vacuum passage for clogging and restrictions with air.

ACCELERATING PUMP: Pump is controlled by throttle lever through connector rod and pump shaft lever with pump adjustment on pump shaft lever (3 holes for connector rod) as follows:

Outer Hole—Minimum Stroke.

Center Hole—Medium Stroke.



Inner Hole—Maximum Stroke.

Recommended Setting (1949)—Outer hole (min.). **(1950)**—Center hole (medium stroke).

►**Other Pump Adjustments**—*Pump Actuating Lever adjustment and Pump Jet Targeting adjustment should be made after carburetor has been overhauled:*

Pump Actuating Lever Adjustment—See that pump connector rod installed in recommended hole of pump shaft lever (above), disconnect rod from throttle lever. Back off throttle lever stopscrew and fast idle screw so that throttle valves close tightly. Hold throttle lever in closed throttle position, pull

CONTINUED ON NEXT PAGE

R CHESTER (OLDSM BILE) DUAL CARBURET R

ROCHESTER MODEL AA (Cont.)

down on pump connector rod so that pump shaft and lever in closed position, check rod length. TOP edge of rod end should be flush with BOTTOM edge of hole in throttle lever (rod should be "too long" by thickness of rod diameter). Adjust by bending rod at center bend. Connect rod.

▷*CAUTION*—Fast Idle and Engine Idle Speed must be readjusted after pump adjustment completed.

1949 Pump Jet Targeting—Pump jets must be aimed so discharge stream from jet strikes housing venturi on opposite side of carburetor throat at point just below deflector boss on casting. To check pump jets with carburetor completely assembled and filled with fuel, note fuel discharge visible in air horn while operating pump slowly by hand. Fan-shaped spray should be noted and spray should not come out end of air horn. Adjust by bending pump jet slightly. *CAUTION—Use care not to damage jet.*

1950 Pump Jet Targeting—Adjust before assembling bowl and cover housing. Pump jets must be aimed to strike small splashers (raised bosses) cast on bowl. To check aim, place small amount of fuel in carburetor, operate pump by hand and note fuel discharge. Adjust by bending pump jet slightly until stream strikes splasher to give a fan-shaped spray.

▷*CAUTION—Use care not to damage jets when adjusting.*

FLOAT LEVEL: *CAUTION*—Float Balance Spring tension must be checked and adjusted whenever the float level is adjusted.

Float Level—23/32" from top of seam on free end of float to gasket seat on cover with cover assembly inverted and needle valve seated. To check, remove and invert cover assembly, remove gasket, use scale or Carburetor Gauge (see gauge note) to measure from cover to top of float seam with float hanging freely. To adjust, bend float arm at point between needle valve and float (CAUTION—do not bend front of float, float must be parallel to cover).

▷Carburetor Gauge Note—Marked line for above setting will be found near square end of Gauge BT-17 (1949), BT-35 (1950).

Float Balance Spring Tension—Balance spring at back of float hinge pin assists float and also acts as a dampener. To check float tension, hold cover assembly right side up and horizontal so that float drops of own weight against balance spring tension. Bottom of float at free end should be 1/8" above bottom of power valve stem. Check by placing scale on bottom of power valve stem. Adjust by bending tang on float arm which engages balance spring (bend tag against spring to lessen float drop, away from spring to increase drop).

▷*CAUTION—Float tang must be assembled BACK of Balance Spring. Flooding will result if tang is in front of balance spring.*

Float Intake Needle & Seat—Furnished only as matched set—Oldsmobile No. 7001846.

CHOKE: Rochester Automatic Choke.

▷*CAUTION*—Choke Rod adjustment must be made whenever carburetor disassembled and overhauled

Choke Setting—Centered (index mark on cover aligned with index mark on housing).

▷Choke Coil Housing Gasket Note—1950 gasket is wider than Early 1949 type to insure proper fit around housing circumference and should always be used as service replacement on 1949-50 carburetors.

Choke Rod Adjustment—To check, hold throttle valve closed, move fast idle cam so that fast idle screw is against (not on) first step of cam, see that choke trip lever is in contact with counterweight on choke shaft, measure choke valve opening or clearance between lower edge of valve and air horn wall with Carburetor Gauge BT-17 (1949), BT-35 (1950)—see Note below. Choke valve opening should be .047". To adjust, use Bending Tool BT-18 to bend connector rod slightly at point between fast idle cam and choke lever. Check to make certain that rod does not bind or rub on housing.
Carburetor Gauge Note—First or "C" step of gauge is used for this .047" setting (both gauges).

UNLOADER: Consists of a tang on the throttle lever which engages the fast idle cam and opens the choke valve slightly when the throttle valve opened Setting—.238" (1949), .220" (1950) choke opening with throttle wide open. Hold throttle lever in wide open throttle position, see that choke trip lever is in contact with counterweight tang on choke shaft, measure choke valve opening or clearance between lower edge of valve and air horn wall with Carburetor Gauge BT-17 (1949) or BT-35 (1950)—see Note below. Adjust by using Bending Tool BT-18 to bend tang on throttle lever slightly.

▷Carburetor Gauge Note—Second or "D" step of gauge used for above setting is .238" (BT-17), .220" (BT-35).

FAST IDLE: Consists of a fast idle cam serving as a stop for the fast idle screw (upper screw) on the throttle lever. Cam is linked to choke valve lever and is rotated so that the fast idle screw rests on the first (highest step) when choke valve closed.

Setting (Carburetor on Engine)—500 RPM. engine idling speed. To adjust, with engine and transmission warm, idle engine, open throttle partially and rotate fast idle cam by hand so that fast idle screw rests on first (low step) of fast idle cam. Adjust screw so that engine idling speed is 500 RPM.

Setting (On Bench)—.020" ('49), .023" ('50) throttle opening with choke valve closed and fast idle screw on highest (starting) step of fast idle cam. To check, move connector rod so that choke valve fully closed, close throttle so that fast idle screw rests on high step of fast idle cam. Check throttle valve opening or clearance between edge of valve and carburetor wall with Carburetor Gauge BT-17 (1949), BT-35 (1950). Adjust by turning fast idle screw in or out until correct throttle opening secured.

▷Carburetor Gauge Note—Wire gauge section of gauge used for above setting is .020" (BT-17), .023" (BT-35).

▷*CAUTION*—If stalling experienced during warm-up with above setting (equivalent to engine speed of 1200-1250 RPM. with engine and transmission warm), increase this engine speed to 1600-1650 RPM. by turning fast idle screw in further.

CARBURETOR OVERHAUL: With carburetor removed from engine, proceed as follows:

Disassembly: Take out eight screws (outer circle of screws) retaining cover on carburetor housing, hold throttle lever in FULL open position (to free pump actuating lever from pump yoke inside housing), lift cover and bowl assembly straight up and out of housing. Take out six screws retaining bowl on cover, lift cover and float assembly off bowl.

Carburetor Bowl—Remove power valve and fibre gasket from bottom of bowl (use 5/16" width screwdriver), remove two main metering jets, remove retaining ring and pump strainer screen (use thin blade screwdriver or pointed tool to free ring). Invert bowl and catch two main well tubes, two idle tubes, and pump outlet check valve which should drop out (tap bowl lightly or use toothpick or other wooden wedge to lift tubes out if necessary—do not use metal tool to remove these tubes). Use small flexible wire hooked in outside hook of pump actuating spring to unwind spring three full turns to free position (CAUTION—use care not to distort or stretch spring). Take out five pump housing attaching screws, lift pump housing off (CAUTION—use care not to disturb pump jets which are aimed for proper targeting of pump discharge). Lift out conical pump return spring. Unscrew and remove pump intake ball check plug (use 1/4" width screwdriver).

▷*CAUTION—Do not attempt to remove Main Discharge Nozzles from bowl.*

Bowl Cover—Remove float hinge pin, lift float off, remove intake needle valve. Take out three retaining screws and lift out power valve diaphragm and stem. Remove float intake needle seat and gasket Remove fuel inlet nut and strainer screen.

Carburetor Housing & Throttle Body—Lift out balance tube in air horn. Take out three attaching screws and remove automatic choke cover and thermostatic coil as an assembly (CAUTION—use care not to distort coil). Take out choke valve attaching screws and remove valve. Disconnect and remove pump rod using care not to bend rod. Disconnect and remove choke rod. Take out choke shaft counterweight attaching screw, remove collar, washer, and counterweight. Revolve choke shaft until vacuum piston free from cylinder, withdraw piston and shaft as an assembly. Take out three throttle body attaching screws and lift off throttle body. Remove nut and lockwasher on pump shaft, remove pump yoke from within housing (CAUTION—do not lose small felt packing washer in housing counterbore at outer end of shaft).

Throttle Body—Take out fast idle cam attaching screw, remove fast idle cam. Remove both idle adjusting screws and springs.

▷*CAUTION*—Do not remove throttle valves or shaft unless these parts require replacement (channels in throttle body can be cleaned with valves in place).

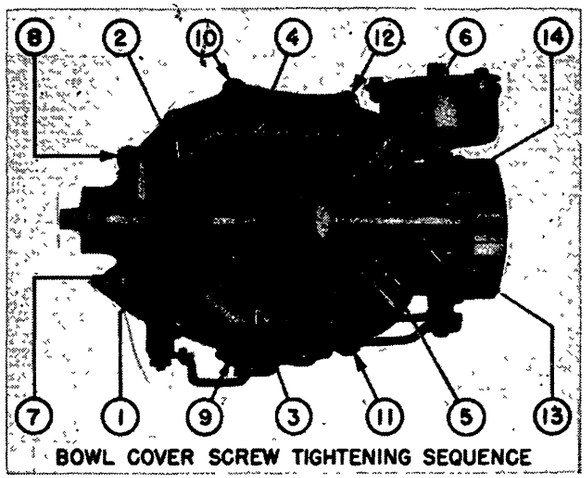
Accelerating Pump Housing—Lift off conical return spring, pull diaphragm and rack out (allow pump lever to rotate—necessary to disengage rack from pinion). Remove cotterpin and washer from end of pump shaft, tap shaft out of housing and pinion gear, lift pinion gear out.

▷*CAUTION*—Do not lose felt washer on shaft at each side of housing.

Cleaning & Inspection: Clean all parts (EXCEPT

CONTINUED ON NEXT PAGE

ROCHESTER "AA" (C ntinu d)



Pump & Diaphragm Assembly and Power Valve Diaphragm Assembly) in carburetor cleaning solvent, blow out all fuel channels and passages with air, dry parts with air. Check all parts for wear or damage.

►*CAUTION—Do not use wire or drills to clean or gauge jets and other calibrated parts.*

Reassembly: Use all new gaskets (see Service Parts data below). Reassemble carburetor by reversing disassembly directions and note the following important instructions:

Float Assembly—Install float over power valve stem with tang on float arm on outside of balance spring. See that balance spring not distorted, replace spring if free length greater than 9/16". Adjust float level and balance spring tension before installing cover assembly on carburetor housing.

Pump Housing Assembly—Parts must be assembled and installed exactly as follows to insure correct pump operation: Place steel washer and felt washer on pump shaft, assemble actuating spring on shaft with small hooked end against actuating lever, place pinion gear in gear slot in housing, insert pump shaft, sliding shaft through gear until knurled section of shaft is against gear, then tap shaft lightly through gear, assemble felt washer and flat washer on end of shaft, install cotter pin. Check to see that shaft rotates freely. Install pump diaphragm, engaging rack teeth with pinion gear (pinion will turn as rack inserted in housing), in such a position that when the diaphragm is in the "pump refill" or "cocked" position, the flat side of the pump lever arm will be parallel to the mounting face of the pump housing (NOTE—this may require lifting of rack and rotating of pump shaft and lever until correct position is secured). Install conical return spring on diaphragm retaining cup (spread last spring coil slightly so that spring is retained in cup). Install housing assembly on bowl, insert five mounting screws loosely, see that diaphragm not pinched or distorted, tighten all five screws evenly and securely. Check assembly for free movement. Return spring should cause arm to rotate freely from "discharge" point to "cocked" position (NOTE—if pump binds, tap end of shaft lightly to free it in housing). Turn actuating spring so that free end is against housing, use light wire engaged in spring hook to "wind up" spring 2½ turns, hook end of spring over pump lever. Check to see that pump operates freely from "cocked" to "discharge" position by hand.

BOWL COVER SCREW TIGHTENING SEQUENCE

Main Well Tubes—See that flat on head of each tube aligned with flat in housing counterbore. On later carburetors with key pinched in upper end of tube, see that key enters slot cast in float bowl.

►**Main Well Tube Change**—These keyed type tubes started in production April 1949 (carburetors with D-9 Identification Tag). Use only **plain type** Main Well Tubes, No. 7001675, on these first carburetors (without key slot in bowl casting), **keyed typ** Main Well Tubes, No. 7002124, on later carburetors with mating slot in bowl casting.

►*CAUTION—Late type Main Well Tubes (with key) must only be used on carburetors with mating slot in bowl.*

Balance Tube—Tube is curved and open end must face open end of air horn.

Cover & Bowl Assembly Installation—When installing assembly in housing, hold throttle valve in wide open position and make certain that pump actuating lever engages pump yoke in housing. After installation completed, check for free operation by moving throttle lever from closed to open position.

Bowl Cover Screw Tightening Caution—Always tighten cover screws in correct sequence (see illustration) to eliminate possibility of leaks at bowl cover.

►*NOTE*—Pump spring will partially open throttle valves in closed position.

Carburetor Adjustments: After reassembly completed, check and adjust: Pump Actuating Lever, Pump Jet Targeting or Aim, Automatic Choke Setting, Choke Rod adjustment, Unloader & Fast Idle setting.

SERVICE PARTS: Gasket Set—Oldsmobile No. 7001849. **Repair Kits**—(1949) No. 7001353, (1950) 7001376.

ROCHESTER "BB" (CADILLAC & OLDSMOBILE)

CADILLAC	Carburetor No.
1951 All Series	7004200
OLDSMOBILE	
1951 88 & 98	7002900
1952 Deluxe 88	7002900

►CHANGES & CORRECTIONS

►*REDUCED GASOLINE MILEAGE (Caused by air leakage due to cracked Accelerator Pump Boot):* Improved type boot furnished under Part No. 7003147 (same number as previous type) should be used for replacement and will provide longer service life without cracking and resultant air leaks.

NOTE—This new boot may be identified by raised ridge around shaft hole at top of boot.

►*CADILLAC SETTING CHANGES (To prevent possibility of engine stalling during warm-up):* Use following latest specifications when adjusting carburetor:

Choke Setting—Should be CENTERED (supersedes previous setting of 2 Point Lean).

Fast Idle Setting—Engine should run at 1500 RPM. **at operating temperature** with fast idle screw resting on **high step** of fast idle cam.

Float Travel or Drop—Should be 1¾" (supersedes previous setting of 1⅝"). *CAUTION—Scribed line on Float Gauge should not be used for this setting.*

►**CADILLAC CARBURETOR THROTTLE RETURN CHECK:** These carburetors have spring-loaded diaphragm type dashpot mounted on the carburetor with an adjustable plunger which contacts an arm on the throttle lever and prevents throttle closing too rapidly when accelerator pedal released. *See Throttle Return Check data below.*

DESCRIPTION

DESCRIPTION: Dual or double barrel, plain tube downdraft type with concentric fuel bowl and double floats, vacuum controlled power system, fast idle and automatic choke. Carburetor used on Cadillac has special "Choke Modifier" which prevents loading up or excessively rich mixture during warming up period.

Idle Fuel System—Fuel is drawn from main nozzle cross-bar in air horn and mixed with air admitted through air bleed holes in cross-bar. Fuel mixture is then metered by Idle Tube (pressed in end of cross-bar) and taken down through passage to idle ports at the edge of each throttle valve. For closed throttle idling, fuel is discharged through lower ports (below throttle) and is controlled by the idle adjusting screw. As soon as the throttle valve is opened, additional fuel is discharged through the upper ports (above throttle) also.

Main Fuel System—As the throttle valves are opened and suction increases at the main discharge nozzles under the cross-bar, fuel mixture is discharged through these nozzles and the idle system drops out. This fuel is metered by the Main Metering Jet and is mixed with air admitted through the air bleeds in the cross-bar. Main fuel system supplies all fuel required for normal operation below 75 MPH, and is supplemented by the Accelerating Pump (sudden acceleration) or Power System (for full power or wide open throttle operation).

Power System—Consists of a plunger type valve controlled by a spring-loaded vacuum piston which provides additional fuel flow to main nozzles when the valve is open. Vacuum piston is normally held up at the top of its stroke by manifold vacuum so that the power valve is held closed by the spring below the valve plunger. Whenever the manifold vacuum drops below 7" (sudden acceleration or

CONTINUED N NEXT PA E

ROCHESTER BB (Cont.)

driving speeds above 60-75 MPH.), the piston spring forces the piston down and opens the power valve. The additional fuel admitted through the valve is metered by the Power Restriction in the channel leading to the Main Well Passage.

Accelerating Pump System—Spring-loaded piston type which provides sustained discharge regardless of rate of throttle opening (pump plunger is spring-loaded on plunger stem with second spring below plunger). Fuel is drawn into pump cylinder through strainer screen and ball type intake check valve and is discharged through ball type outlet check valve and pump jet at side of secondary venturi in each carburetor barrel.

Pump Vapor Vent—Consists of a ball type check valve in the pump plunger which allows any vapor in the pump cylinder to escape through a passage in the plunger and return to the bowl. This check valve is closed during normal pump operation.

ADJUSTMENT & OVERHAUL

IDLE ADJUSTMENT: Adjust only with engine warmed up so that choke valve wide open and fast idle inoperative (idling at hot or slow idle speed). Set throttle stopscrew for correct idle speed, adjust both idle adjusting screws so that engine idles smoothly. Screws control fuel mixture and should be turned out for richer mixture. Recheck idle speed. See car model page for complete tune-up instructions.

Idle Setting—Screws approx. 1½ turns open.

Idle Speed	Synchro-Mesh	①Hydra-Matic
Cadillac	400 RPM.	375 RPM.
Oldsmobile	425 RPM	②375 RPM.

①—With selector lever in "Dr" position.
②—"Whirlaway" only. 400 RPM. on cars where Hydra-Matic reworked to start in First Gear.

ACCELERATING PUMP: Pump is operated by throttle lever through a connector rod and rocker arm linkage. No seasonal adjustment is provided and no Targeting of the pump jets is required but pump rod setting should be checked and adjusted to insure correct pump stroke and delivery.

Pump Rod Adjustment—Disconnect choke rod from fast idle cam or back out fast idle screw, back out throttle stopscrew so that throttle valves are fully closed, disconnect connector rod at pump rocker arm. Hold rocker arm down so that pump plunger is in extreme up position. Use bending tool to bend connector rod until bottom edge of rod end is flush with top edge of hole in rocker arm (rod "too long" by amount equal to diameter of hole). Connect rod.

▷*CAUTION—Idle speed (and fast idle setting if screw disturbed) must be reset after this adjustment.*

POWER VALVE ASSEMBLY: Not adjustable. Valve opens when manifold vacuum drops to 7" (at road speed of 60-70 MPH. or upon rapid acceleration).

FLOAT LEVEL: *CAUTION—Two adjustments required:* Float Level—With air horn and bowl cover assembly removed and inverted (CAUTION—DO NOT remove cover gasket), install float level gauge over floats with locating tangs on gauge inserted in secondary venturi. Bend float arms until both floats are equal vertically, then bend float button (which contacts float needle) until both floats just touch upper edge of cutout in gauge. Finally bend float arms horizontally until each float is centered between gauge legs (CAUTION—this adjustment necessary to prevent floats hanging up on float bowl walls). Tilt air horn assembly 90° to each side and make certain that floats do not touch gauge legs in either position.

Float Level Gauge

Cadillac	J-4715
Oldsmobile	BT-51

Float Tension—Hold air horn and bowl cover assembly right side up with floats hanging free. Measure distance from underside of cover gasket to bottom edge of float (see setting notes below). If this distance not correct, bend float tang at rear of float toward balance spring to lessen the distance, or away from spring to increase the distance.

Cadillac Setting Note—Setting is 1¾" (supersedes previous specification of 1⅝") and should be measured with a scale. CAUTION—do not use scribed line on gauge.

Oldsmobile Setting Note—Setting is 1⅝" and can be checked with Float Level Gauge by placing leg of gauge against gasket (scribed line on gauge should be even with bottom of float).

Oldsmobile Setting Note—Setting is 1¾" and can be *Modifier" which must be adjusted as part of choke setting.*

CHOKE SETTING

Cadillac	①Centered
Oldsmobile (Synchro-mesh Cars)	2 Points Rich
Oldsmobile (Hydra-Matic Cars)	Centered

①—Supersedes previous specification of 2 Points Lean.

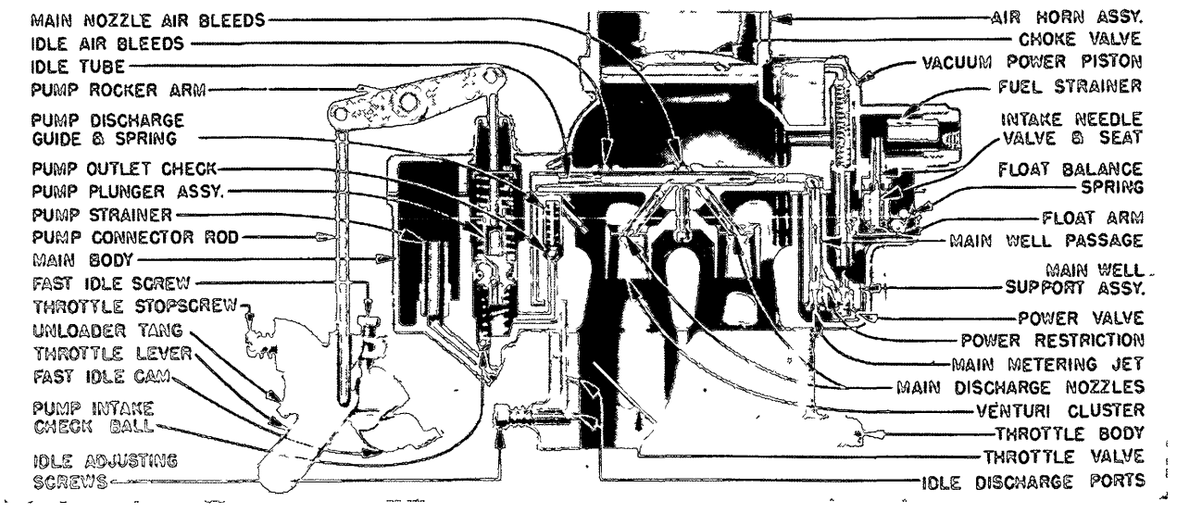
Cadillac Choke & Modifier Setting: Back off fast idle screw and throttle stopscrew so that throttle valves tightly closed. Loosen choke modifier lever retaining screw, rotate index pointer counter-clockwise until pointer is aligned with long scribed line on cover (Centered setting), tighten retainer screw. With this setting, choke valve should be almost closed at 75°F.

▷*CAUTION—If choke valve does not close when pointer rotated (above), thermostatic coil is not engaging choke valve lever in housing.*

Oldsmobile Choke Setting: Loosen heat tube coupling on choke cover, loosen three cover retainer screws and free the toothed retainer from the serrations on the cover, rotate cover until index mark on cover is aligned with center graduation of scale on housing (centered setting) or correct number of graduations on Rich side (Rich setting), engage toothed retainer with serrations in cover, tighten all retainer screws, tighten heat tube coupling.

▷*CAUTION—Use care not to rotate or distort choke cover when tightening heat tube coupling.*

FAST IDLE: *CAUTION—Two adjustments required and must be made in DIFFERENT SEQUENCE on Cadillac and Oldsmobile:*



Cadillac: Adjust in following order:

1) Fast Idle Adjustment—Carburetor on Engine. Hold throttle partly open and rotate fast idle cam until fast idle screw rests on high step of fast idle cam, adjust fast idle screw until engine runs at exactly 1500 RPM. with engine at normal operating temperature.

Carburetor off Engine—Rotate fast idle cam until choke valve is fully closed, hold throttle lever in closed position so that fast idle screw rests on highest step of fast idle cam. Adjust fast idle screw until throttle valve opening (clearance between edge of valve and carburetor bore on side opposite idle ports) is exactly .0295" (measure with wire gauge on Tool J-4716).

2) Choke Rod Adjustment—Hold choke valve open, close throttle valve, then move choke valve toward closed position until fast idle screw contacts edge of fast idle cam. With choke valve in this position,

CONTINUED ON NEXT PAGE

ROCHESTER MODEL BB CARBURETOR

ROCHESTER BB (C nt.)

measure clearance between lower edge of choke valve and flat on inside of air horn using wide step of gauge J-4716 (.620"). If clearance not correct, adjust by bending choke rod.

Oldsmobile: Adjust in following order:

1) Choke Rod Adjustment—Rotate fast idle cam until intermediate step (short center step) is under fast idle screw. With choke cover set at center index mark and choke shaft trip lever in contact with choke counterweight, choke valve should be slightly open. Measure this opening (clearance between lower edge of valve and air horn wall) with smaller "A" end section of Gauge BT-49 (.177"). If clearance not correct, bend rod at lower bend near fast idle cam.

►*CAUTION—Choke rod must not rub against side of housing in any position.*

2) Fast Idle Adjustment—Carburetor on Engine. Rotate fast idle cam so that fast idle screw rests on extreme end of lowest step of fast idle cam, adjust screw so that engine runs at 500 RPM.

Carburetor off Engine—With choke cover set at center index mark, hold choke valve and throttle valves closed so that fast idle screw rests on highest step of fast idle cam, adjust screw for throttle valve opening (clearance between lower edge of valve and carburetor wall on side opposite idle ports) of .025" (measure with wire gauge on Tool BT-49).

UNLOADER: Consists of a tang on the throttle lever which engages the fast idle cam and opens the choke valve when the throttle lever is moved to the wide open position. Check unloader after setting automatic choke and adjusting choke rod.

Checking & Adjustment—Move throttle lever to wide open position, measure choke valve opening (clearance between lower edge of valve and inner wall of air horn) with gauge listed below. If opening not correct, adjust by bending tang on fast idle cam (Cadillac), tang on throttle lever (Oldsmobile).

UNLOADER SETTING

	Tool No.	Choke Opening
Cadillac	J-4176	.515"①
Oldsmobile	BT-49	.209"②

①—Use smaller step of gauge.

②—Use intermediate "B" step of gauge.

CADILLAC THROTTLE RETURN CHECK: Spring-loaded diaphragm type dashpot mounted on carburetor with adjustable plunger which contacts arm on throttle lever.

Adjustment: First check alignment of adjusting screw on throttle return check plunger with contact arm on throttle lever and bend return check mounting bracket, as necessary, to center adjusting screw on radius of contact arm. Set throttle valves partly open by installing 27/64" drill rod between pump rocker arm and return check mounting bracket on top of bowl cover, locating the drill against the head of the air horn screw. Hold return check plunger from turning (use wrench on plunger flats), turn adjusting screw with a ⅜" wrench until it just contacts throttle lever arm.

THROTTLE VALVE SETTING: It is recommended that throttle valves not be removed from throttle body and that **Throttle Body & Valves be replaced as an assembly** whenever wear noted at throttle valve, shaft or shaft bore in body.

CARBURETOR OVERHAUL: With carburetor off engine, proceed as follows:

Disassembly: On Cadillac carburetors, first disconnect choke modifier rod from lever on choke cover and remove lever and pointer by taking out retainer screw in lever.

Automatic Choke & Choke Valve—Disconnect choke suction tube by loosening coupling nut at choke housing (CAUTION—use care not to disturb seal at lower end of tube). Take out three cover screws and retainers and lift off choke cover and thermostatic coil assembly, lift out choke baffle plate. Remove choke valve from shaft. Disconnect choke rod from fast idle cam, then take out screw in end of choke shaft and pry trip lever, spacing washer, and choke counterweight and rod assembly off shaft. Rotate choke shaft counter-clockwise until piston is free, then withdraw shaft and piston assembly (piston can be removed from shaft lever by removing piston pin). Remove choke housing and gasket by taking out two attaching screws within housing.

Air Horn & Bowl Cover—Disconnect and remove pump actuating rod. Disconnect pump plunger stem from rocker arm, remove rocker arm. Remove fuel inlet fitting, strainer nut, and strainer. Take out four lower cover screws (carburetor inverted), four upper cover screws, lift cover assembly off carefully (if necessary, tap cover lightly to break seal). Take out float hinge pin and remove float assembly with intake needle attached (CAUTION—use care not to damage float balance spring). Press pump plunger rubber seal through cover and remove pump plunger and seal, then remove seal from plunger. Remove intake needle seat and gasket with ½" screwdriver. Remove both main metering jets from main well support, then remove power valve plug, spring, and valve from support, remove support and lift off cover gasket. Remove power valve vacuum piston and spring from cover. Take out secondary venturi cluster attaching screw, lift off cluster (CAUTION—do not damage locating tongue on cluster). Carefully remove float balance spring and clips.

►*CAUTION—Do not attempt to remove Idle Tube from cross bar.*

Bowl (Main Body)—Lift pump return spring out of pump cylinder, then invert bowl while holding pump discharge guide in place and remove pump intake check ball (will fall out of cylinder). Remove pump screen. Invert bowl and remove pump discharge guide, spring, and outlet check ball. Take out four bowl-to-throttle body attaching screws, separate throttle body and gasket from bowl.

►*CAUTION—Do not remove heat suction tube from throttle body and use extreme care not to disturb tube seal.*

Throttle Body—Remove both idle adjusting screws and springs. Take out fast idle cam screw and remove cam. On Cadillac carburetors, take out choke modifier rod lever screw and remove lever and rod. Remove throttle stopscrew and fast idle adjusting screw from throttle lever.

►*CAUTION—Do not remove throttle valves or throttle shaft (replace throttle body assembly if wear noted in these parts).*

Cleaning & Inspection: Clean carburetor castings and metal parts except choke coil, housing, and pump plunger with carburetor cleaning solvent. Clean pump plunger with clean gasoline only. Blow out all passages in castings with compressed air. Clean or replace all filter screens. Inspect all parts for wear and replace as necessary. Inspect tightness of suction tube seal in throttle body (seal can be tightened after carburetor reassembled) and condition of packing in coupling nut at upper end of tube. Replace packing if tightly compressed or distorted.

►*CAUTION—Do not use wire or drills to clean passages and jets.*

Reassembly: Use new gaskets (see Service Parts data below). Reassemble carburetor by reversing the disassembly procedure and note the following points:

Float Assembly—Tang on float arm must be on OUTSIDE of float balance spring. Adjust float level and float tension before installing air horn on bowl casting.

Main Well Support Assembly—Install gasket on cover and align all cover and gasket holes before installing support. Install vacuum power piston and spring first, then place support over power piston (CAUTION—main well guide sleeves must be aligned in cover) and tighten both support screws evenly. Hold power piston up in cylinder when installing power valve, spring, and plug in support.

Pump Check Ball Installation—Install the SMALL ALUMINUM inlet check ball in the bottom of the pump cylinder and the LARGE STEEL discharge check ball in the pump discharge passage below the discharge spring and guide.

Choke Valve Assembly Install valve with "RP" mark up or outward, use new screws to attach valve. Install choke shaft counterweight with "RP" mark outward, then install spacing washer and trip lever with tang on lever on top of counterweight tang. Assemble offset end of choke rod to counterweight. Check entire choke assembly for free movement.

►**Suction Tube Seal Replacement**—If new seal required due to loose seal or damaged tube, install seal **after carburetor completely assembled.** Loosen throttle body-to-bowl attaching screws, place new seal on lower end of suction tube and against the flared end of the tube, insert tube and seal in throttle body recess using tool J-4551 (Cadillac), BT-45 (Oldsmobile) to start seal evenly in throttle body (tap lightly on seal while rotating tool). Position tube and tighten coupling nut at upper end finger-tight. Then use tool and hammer to spread seal securely in throttle body (rotate tool to insure uniform spreading of seal). Tighten coupling nut at upper end of tube securely, tighten throttle body-to-bowl attaching screws.

Carburetor Adjustments: After carburetor assembled, check and adjust: Accelerating Pump Rod, Automatic Choke, Fast Idle, Unloader, Idle mixture (set both screws 1½ turns open for preliminary setting). After carburetor installed on engine, adjust idle mixture and hot or slow idle speed.

SERVICE PARTS: Gasket Sets—No. 7001393 (all).

Repair Kit—No. 7001399 (Cadillac), 7001390 (Oldsmobile).

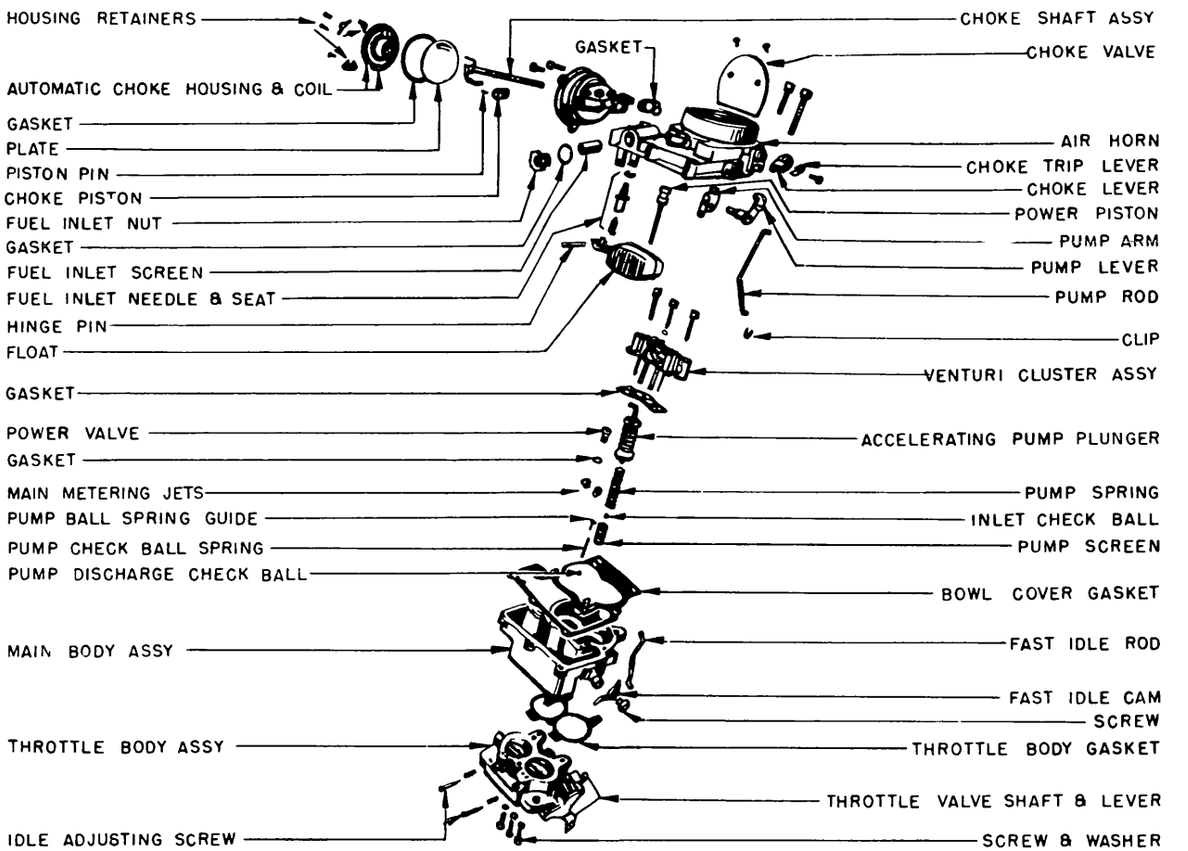
►CHANGES, CAUTIONS, CORRECTIONS

►*1955 CHEVROLET V8 LEAN SURGE CONDITION AT 55-75 MPH. (All Cars with Early No. 7006825 & 7005810 Carburetors)* Correct by installing late type Venturi Cluster Assemblies & Main Metering Jets as listed below *NOTE*—These new parts are installed in production on later Nos 7008004 & 7008005 Carburetors



Carburetor	Lat Typ Carburetor Parts No. 7006825	No. 7005810
Venturi Cluster Assy	7007990	7007989
Main Metering Jet (2)	7002952	7002951

►*1955 PONTIAC V8 ROCHESTER CARBURETOR INSTALLATION CAUTION (First 1000 ENGINES)* Intake manifold on these engines will not take Rochester carburetor without possibility of high vacuum leak at windshield wiper vacuum passage in carburetor flange (insufficient sealing area) These manifolds can be identified by curved section at rear edge of carburetor mounting flange and *only Carter carburetor should be used.* On later manifolds, with nearly straight section at above point, *either Carter or Rochester Carburetors can be used.*

►*1955 PONTIAC CARBURETOR FLOODING OR OVERLOADING May be caused by excessive fuel pump pr ssure (in excess of 5 lbs.). See Fuel Pump data on Pontiac V8 car model page.*

►*PONTIAC HARD STARTING OR LOADING CORRECTION.* New type choke piston Rochester No. 7009032 is used on late production carburetors. It is .041" shorter and has five grooves instead of six. This construction provides a greater initial choke opening and relieves complaints of hard starting or loading on early production cars.

DESCRIPTION Dual downdraft type with Automatic Choke (2GC), or Manual Choke (2G) Standard Trans. Truck These carburetors have Rochester Calibrated Cluster design "Venturi Cluster Assembly", vacuum controlled Power System, throttle operated accelerating pump with double-spring pump plunger All carburetors have an internal vent in the air horn and an external vent on the bowl cover (On Oldsmobile, this vent is controlled by a tang on the pump lever and is opened at low idle only)

ROCHESTER 2GC DUAL CARBURETOR

ADJUSTMENTS: Make all adjustments exactly as follows

Idle Setting: If preliminary adjustment required to warm up engine, set both idle adjusting screws 1½ turns open from inner seated position (all models) With engine at operating temperature (choke valve wide open, fast idle inoperative), adjust throttle stopscrew for correct idle speed (see table below), then turn each idle adjusting screw in or out to secure smoothest possible idle performance (highest manifold vacuum and RPM) See Oldsmobile Note following Readjust idle speed and recheck idle setting

►*OLDSMOBILE NOTE·* After setting idle adjusting screws as above, turn each screw out (rich) ¼ turn which will provide desired idle performance (manifold vacuum and RPM will drop off slightly) Check performance by opening throttle to 1000 RPM point and then snapping throttle closed If engine rolls due to richness, turn each screw in (lean) not more than 1/8 turn

Car Model	Idle Speed Setting Synchro-mesh Cars	Automatic Trans.
Chevrolet V8	475 RPM	425 RPM in "D"
Chevrolet Trucks	475 RPM	425 RPM in "N"
Oldsmobile	425 RPM	400 RPM in "Dr"
Pontiac	450-475 RPM	390-410 RPM in "Dr"

►*AUTOMATIC TRANSMISSION THROTTLE LINKAGE ADJUSTMENT·* See Car Model pages for necessary adjustment following idle speed adjustment *OLDSMOBILE NOTE*—Carburetor has "Split-Throttle Lever" and linkage will not be disturbed by idle speed setting.

Atmospheric Idle Vent (Oldsmobile): *Not used on Chevrolet & Pontiac.* Consists of a vent opening in the bowl cover with a vent cap actuated by a tang on the pump lever. Vent is opened at low idle but must be closed at all other throttle positions

Idle Vent Checking & Adjustment—Back off fast idle screw until it clears highest step of fast idle cam Open throttle valves exactly .020" by inserting SMALL end of Gauge BT-67 between edge of throttle valve and bore on side opposite idle adjusting screw At this point, idle vent should just be closed. Adjust by bending pump lever tang using bending tool BT-69

Accelerating Pump Rod Setting: *This is a linkage adjustment (Pump does not have Seasonal setting).* With throttle stopscrew backed off so that throttle valves completely closed, place combination Float & Pump Gauge (see table below) in inverted position on pump housing on bowl cover Leg on gauge should just con-

CONTINUED ON NEXT PAGE

ROCHESTER 2G & 2GC (C nt.)

tact top of pump rod. Adjust by bending lower end of pump rod using bending tool BT-18.

Pump Rod Setting

Car Model	Checking Gauge & Distance
Chevrolet V8 (Pass. & Trk.)	①BT-107 (15/16")
Oldsmobile	②BT-109 (15/16")
Pontiac	③BT-105 (15/16")

①—Chevrolet No. J-5915. ②—Oldsmobile No. J-5917. ③—Pontiac No. J-5916.

Fl at Setting: *Both Float Level and Float Drop must be correct. Check and adjust as follows:*

Float Level—Remove bowl cover and float assembly but DO NOT remove bowl cover gasket. Invert assembly, place combination Float & Pump Gauge (see table below) over float and against pump side of power piston shaft so that outer gauge leg is in line with center of float. Bottom of float should just contact bottom edge of gauge. Adjust by bending float arm using bending tool BT-69.

Float Level Setting

Car Model	Checking Gauge & Height
Chevrolet V8	①BT-107 (1 5/32")
Oldsmobile	②BT-109 (1 9/32")
Pontiac	③BT-105(1 15/64")

①—Chevrolet No. J-5915. ②-Oldsmobile No. J-5917. ③—Pontiac No. J-5916.

Float Drop—Hold bowl cover and float assembly upright so that float drops down to limit of travel. Place combination Float & Pump Gauge against gasket on cover at free end of float (see Float Level Setting table above for gauge number) so that single leg of gauge extends downward. Bottom of float at free end should be even with scribed line on gauge (1 29/32" on all carburetor models). Adjust by bending float arm tang (behind needle seat) toward needle seat to decrease drop or away from needle seat to increase drop.

Fast Idle Setting: *On Chevrolet & Pontiac, Choke Rod Setting automatically provides correct fast idle setting (no separate Fast Idle Screw). On Oldsmobile (with separate Fast Idle Screw), an additional Fast Idle Adjustment is required:*

Choke Rod Checking & Adjustment (All Models)—Turn throttle stopscrew (Chevrolet & Pontiac), Fast Idle Screw (Oldsmobile) in until it just contacts second step of fast idle cam, close choke valve until screw rests against shoulder of high step on cam. Check choke valve opening or clearance between upper edge of choke valve and air horn wall by inserting SMALL end of gauge (see table below) vertically. Adjust by bending tang on choke lever counterweight using bending tool BT-69

Choke Rod (Fast Idle) Setting

Car Model	Checking Gauge & Choke Opening
Chevrolet V8	④BT-108 (.089")
Oldsmobile	⑤BT-110 (.040")
Pontiac	⑥BT-106 (.053")

④—Chevrolet No J-5921 ⑤—Oldsmobile No. J-5918. ⑥—Pontiac No J-5920.

Fast Idle Screw Setting (Oldsmobil only)—*Manufacturer recommends that this adjustment be mad ON THE ENGINE as outlined below.*

Ch cking & Adjustment (Off th Engine)—Back off fast idle screw Place SMALL end of Gauge BT-67 (.020") between edge of throttle valve and bore on side opposite idle adjusting screw, close throttle against gauge and apply tension to throttle lever to hold gauge in place. Close choke valve so that high step of fast idle cam is in line with fast idle screw, turn fast idle screw in until gauge just drops out.

Checking & Adjustment (On the Engine)—With engine and transmission at normal operating temperature and selector lever in Neutral, rotate fast idle cam so that high step in line with fast idle screw, turn fast idle screw in until engine speed is 1400-1500 RPM. This will provide correct warm-up speed and prevent stalling.

Unloader Setting: Place throttle lever in wide open position (see Oldsmobile Note below), check choke valve opening or clearance between upper edge of valve and air horn wall using LARGE end of correct gauge (see table below) inserted vertically. Adjust by bending tang on throttle lever using bending tool BT-69

►*OLDSMOBILE NOTE:* Before making above adjustment, the throttle stopscrew (slow idle speed screw) must first be turned IN one turn from point where throttle valves are completely closed.

Unloader Setting

Car Model	Checking Gauge & Choke Opening
Chevrolet V8	④BT-108 (23/64")
Oldsmobile	⑤BT-110 (9/64")
Pontiac	⑥BT-106 (.163")

④—Chevrolet No. J-5921. ⑤—Oldsmobile No. J-5918. ⑥—Pontiac No J-5920.

Automatic Choke Setting: CENTERED with scribed index mark on cover in line with long cast mark on choke housing (all models). To adjust, loosen heat tube connection on cover, loosen three cover retainer screws (*CAUTION*—If one retainer is "toothed" type engaging notches in cover, screw must be backed off sufficiently so that retainer can be disengaged from cover notches), rotate cover to align marks.

NOTE—With above setting, choke valve should be lightly closed at 75°F.

OVERHAUL: Adjustments may be made and various parts be serviced without completely disassembling the entire unit.

Disassembly: Major units of carburetor consist of Air Horn Assembly, Main Body, and Throttle Body.

Air Horn Assembly—Consists of Automatic Choke & Fuel Bowl Cover.

Automatic Choke—Remove three choke cover screws and retainers, choke cover and coil assembly, cover gasket and baffle plate. Remove choke trip lever, fast idle link and lever (rotate lever until slot in lever will pass over tang on link). Remove two choke valve screws and choke valve. Rotate choke shaft counterclockwise to free choke piston from housing, then pull piston and choke shaft from carburetor. Remove two choke housing attaching screws and remove choke housing and gasket from Air Horn.

Fuel Bowl Cover—Disconnect pump link from throttle lever by rotating it until it clears pump lever. Remove eight cover screws and remove cover. Invert cover on flat surface, remove float hinge pin, float assembly and float needle. Remove float needle seat and gasket and remove filter screw. Depress power piston shaft allowing spring to snap, which forces piston from casting. Remove retainer on pump plunger shaft and plunger assembly from pump arm. Remove pump lever and shaft by loosening setscrew on inner arm and removing outer lever and shaft. Remove cover gasket.

Main Body—Remove pump plunger return spring from pump well main metering jets, and power valve. Remove three screws from top of cluster and remove cluster and gasket. With long nose pliers, remove pump discharge spring retainer, then the spring and check ball. Invert Main Body and remove three large bowl to throttle body attaching screws, remove throttle body.

Throttle Body—Remove fast idle cam, idle adjusting needles and springs. Throttle body should be replaced as an assembly to insure proper relation of valves.

Cleaning & Inspection: Thoroughly clean carburetor castings and metal parts in clean solvent. *CAUTION*—Choke coil and housing and pump plunger should not be immersed in solvent. Clean pump plunger in clean gasoline only. *DO NOT SOAK AIR HORN ASSEMBLY IN CLEANER OR SOLVENT FOR MORE THAN ONE HALF HOUR IF CHOKE PISTON HOUSING HAS NOT BEEN REMOVED.* Blow out all passages in casting until dry. *CAUTION*—Do not pass drills or wires through calibrated jets or passages as they may enlarge orifice and seriously affect carburetor calibration. Inspect all parts for wear damage, burrs or ridges. Inspect gaskets for being hard or brittle, pump leather for damage.

Reassembly: Throttle Body to Main Body—Install idling adjusting screws and springs in throttle body until finger tight and then back off 1½ turns for temporary adjustment, add throttle body gasket and attach throttle body to bowl. Install fast idle cam, drop pump discharge ball into discharge hole and replace spring and retainer. Install cluster with new gasket, tighten screws evenly, (center screw takes red fibre gasket). Replace main metering jets and power valve with new gasket.

Fuel Bowl Cover (Air Horn)—Replace pump lever assembly, install filter screen float needle seat and gasket. Replace power piston in vacuum cavity (check to see that piston travels freely). Lightly stake retainer in place. Attach plunger shaft with retainer shaft end pointing inward. Install cover gasket. Attach needle to float, position it carefully and insert float hinge pin. Adjust float (see table above for setting). Place cover in position making certain that accelerator pump plunger is positioned and will move freely.

Choke—Place new gasket in position, attach choke housing to cover and tighten screws securely. Place choke shaft in choke housing and rotate clockwise so that piston rides in bore in housing. Install choke valve on shaft with letters "RP" facing upward, center choke valve before tightening screws. Place baffle plate and choke housing gasket into position and install choke coil and cover. Rotate cover clockwise until index marks on cover and housing are aligned. Attach retaining screws and tighten securely. Replace link in fast idle cam and choke lever, place choke lever on cover with the tang facing outward and toward the pump lever. Install trip lever so that tang of trip lever is under tang of choke lever.

SERVICE PARTS

Gask t Sets—Rochester No. 7007009 (7005810, 7008004, 7006825, 7008005), No. 7006999 (7006770, 7006100).

R pair Kits—Rochester No. 7007011 (7005810,7008004, 7006825, 7008005), No. 7007012 (7006970, 7006100).

ROCHESTER "AA" AUTOMATIC CHOKE

Car Model	Carburetor
Oldsmobile 8, 88 & 98 (1949)	7001570
Oldsmobile 8, 88 & 98 (1950)	7002570

DESCRIPTION: Automatic choke assembly is mounted on the side of the carburetor air horn and linked directly to the choke valve shaft lever. It consists of a thermostatic coil and vacuum piston assembly to control the choke valve and also operates the fast idle mechanism through a connector rod linked to the lever on the opposite end of the choke shaft.

OPERATION: Automatic Choke—Thermostatic coil is bi-metal type and tends to "wind up" and close the choke valve when the engine is cold so that the choke valve will be completely closed for cold starting. In this position, the vacuum piston is at the top of cylinder. As soon as the engine begins to fire, manifold vacuum tends to pull the piston down in the cylinder which opens the choke valve slightly to prevent stalling (valve is offset and air flow through intake also tends to open valve). As the engine warms up, coil unwinds, lessening tension on choke valve and allowing air flow to open the valve so that at normal operating temperatures the choke valve is wide open. Warm air is introduced into the coil housing through a pipe extending from the exhaust manifold to the coil housing cover to effect this unwinding of the coil.

Fast Idle—Consists of a stepped fast idle cam mounted so as to serve as a stop for the fast idle screw on the throttle lever and linked to the choke lever by a connector rod. Cam is rotated to the "fast idle" position (with stopscrew resting on high step of cam) when choke valve closed for cold starting, and is rotated to the hot or slow idle position (with stopscrew resting on progressively lower steps of the cam) as the engine warms up and the choke valve opens.

Unloader—When the throttle valves are opened wide, choke valve is opened slightly through the fast idle linkage. This will correct flooding caused by over-choking.

ADJUSTMENT: *CAUTION—Three separate settings (Choke Setting, Fast Idle Setting, and Unloader Setting) are required. Adjust in order as follows:*

Choke Setting: Centered (At Index). With cover screws loosened, rotate cover until index mark on cover is aligned with mark cast on carburetor housing. With this setting, choke valve should be fully closed at 75°F.

▷*CHOKE COIL HOUSING COVER GASKET CAUTION*—New wider housing gasket used on 1950 carburetors and should be used for service replacement on all 1949-50 carburetors. See that gasket seats evenly and correctly seals entire circumference of choke housing. Any air leak at this point will prolong choke operation, resulting in over-choking.

▷*CHOKE HEAT PIPE CAUTION*—⅛" pipe plug is installed in right hand end of heat pipe in manifold and this pipe plug and all heat pipe connections must be securely tightened. Any air leaks in the heat pipe system will prolong choke operation and result in over-choking and poor economy.

Choke Rod Adjustment—Turn fast idle screw in until spring is slightly compressed, hold throttle valves in closed position and rotate fast idle cam until screw resting aaginst first step on cam. Check to see that trip lever is in contact with choke counterweight. Choke valve should be slightly open in this position. Check opening with gauge tool BT-17 (use .147" or "C" step of gauge) inserting gauge between lower edge of choke valve and air horn wall. If opening not correct, adjust by bending connector rod slightly, using tool BT-18. Make certain that choke valve does not rub on air horn wall in any position.

Unloader Setting: Thermostatic coil cover must be correctly set at INDEX when making this adjustment (see Choke Setting above). Open throttle valves to wide open position, making certain that choke trip lever is in contact with tang on choke counterweight. Check choke valve opening with special gauge (see table), inserting gauge between lower edge of valve and air horn wall. If opening not correct, adjust by bending tang on throttle lever slightly, using bending tool BT-18.

UNLOADER SETTING

Carburetor	Checking Tool	Choke Opening
7001570 (1949	BT-17	.238"①
7002570 (1950)	BT-35	.220"②

①—"D" step of BT-17 gauge.
②—"D" step of BT-35 gauge.

Fast Idle Setting: *Can be adjusted on the bench or on engine (if set on bench, check setting after carburetor installed on engine).*

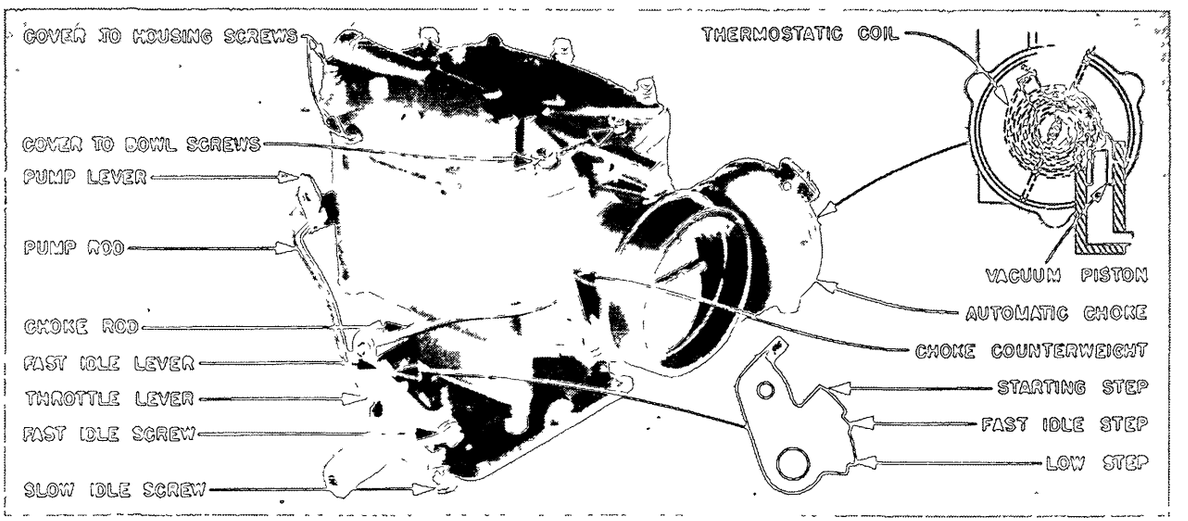
Setting (Carburetor on bench)—Check by moving connector rod so that choke valve fully closed, close throttle valve so that fast idle screw rests on fast idle step of fast idle cam. Check throttle valve opening or clearance between valve edge and carburetor wall, using correct gauge (see table). Adjust by turning fast idle screw in or out until throttle valve opening is correct.

Setting (Carburetor on engine)—Hold throttle partially open, rotate fast idle cam until fast idle screw is in line with lowest step on cam, hold cam in this position. Run engine and turn fast idle screw in or out until engine speed is exactly 500 RPM (all models) with engine warm.

FAST IDLE SETTING

Carburetor	Checking Tool	Throttle Opening
7001570 (1949)	BT-17	.020"③
7002570 (1950)	BT-35	.023"④

③—"E" step of BT-17 gauge.
④—"E" step of BT-35 gauge.



DISASSEMBLY: Remove float bowl balance tube from air horn. Take out three attaching screws and lugs on thermostatic coil cover, remove cover and coil assembly (CAUTION—use great care not to distort coil). Take out choke valve screws, remove choke valve. Remove pump rod and choke connector rod (CAUTION—use care not to bend or distort rods). Remove choke counterweight, collar and washer from choke shaft. Revolve choke shaft until vacuum piston is free from cylinder, remove shaft and piston as an assembly. If necessary to remove fast idle cam, take out cam attaching screws.

INSPECTION: Check choke shaft for wear in air horn, replace if clearance excessive. Clean all parts with carburetor cleaning solvent, blow out all passages with compressed air (CAUTION—make certain that vacuum piston cylinder vacuum passage is open and clean).

REASSEMBLY: Reverse the disassembly directions and also note the following important points:

Choke Valve Installation—Install valve with identifying letter "RP" outward. Check valve for free operation. Valve must not rub on air horn and should fall freely to wide-open position with thermostatic coil not engaged.

Adjustment—Adjust Choke Setting, Unloader Setting, and Fast Idle Setting. See Adjustment data above.

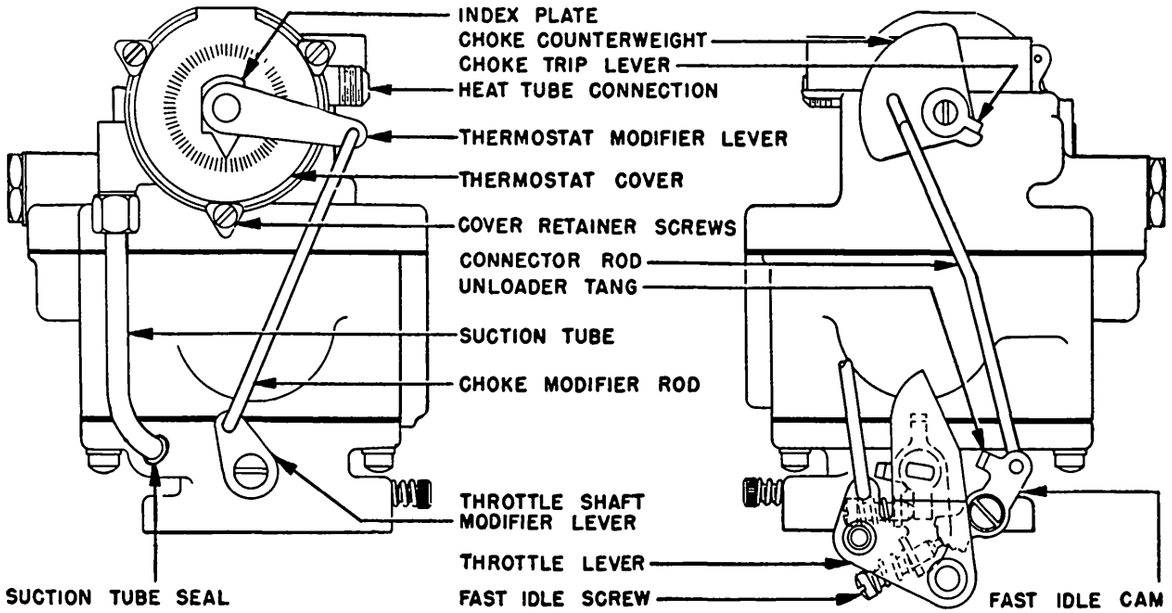
ROCHESTER "AA" AUTOMATIC CHOKE & FAST IDLE

ROCHESTER "BB" & "BC" AUTOMATIC CHOKE

►CHANGES, CAUTIONS, CORRECTIONS

►**CHOKE SUCTION TUBE SEAL CAUTION:** This tube extends from choke housing to throttle body and **must be tight** at both ends to insure correct choke operation. If tube seal disturbed by carburetor or choke assembly, *see Suction Tube Seal Replacement data below.*

DESCRIPTION: The automatic choke assembly is mounted on the side of the carburetor air horn and is linked directly to the choke valve lever. It consists of a thermostatic coil and vacuum piston assembly to control the choke valve and also operates the fast idle mechanism through a connector rod linked to a lever on the choke valve shaft.



Cadillac "Choke Modifier"—Consists of a linkage between the thermostatic coil and throttle valve lever so that thermostatic coil tension is controlled by the throttle and is lessened as the throttle is opened to provide a continuously variable unloading action which improves performance and economy during warming-up period.

►*CAUTION—Choke modifier must be adjusted as part of automatic choke setting (see adjustment data).*

OPERATION: Automatic Choke—Thermostatic coil is bi-metal type and tends to "wind up" and close the choke valve when the engine is cold so that the choke valve will be completely closed for cold starting. In this position, the vacuum piston is at the top of cylinder. As soon as the engine begins to fire, manifold vacuum tends to pull the piston down in the cylinder which opens the choke valve slightly to prevent stalling (valve is offset and air flow through intake also tends to open valve). As the engine warms up, coil unwinds, lessening tension on choke valve and allowing air flow to open the valve so that at normal operating temperatures the choke valve is wide open. Warm air is introduced into the coil housing through a pipe extending from the exhaust manifold to the coil housing cover to effect this unwinding of the coil.

Fast Idle—Consists of a stepped fast idle cam mounted so as to serve as a stop for the fast idle screw on the throttle lever and linked to the choke lever by a connector rod. Cam is rotated to the "fast idle" position (with stopscrew resting on high step of cam) when choke valve closed for cold starting, and is rotated to the hot or slow idle position (with stopscrew resting on progressively lower steps of the cam) as the engine warms up and the choke valve opens.

Unloader—When the throttle valves are opened wide, choke valve is opened slightly through the fast idle linkage. This will correct flooding caused by over-choking.

ROCHESTER "BB" (CADILLAC) AUTOMATIC CHOKE & FAST IDLE (OTHER "BB" & "BC" TYPES SIMILAR EXCEPT NO MODIFIER)

DISASSEMBLY: On Cadillac carburetors, first disconnect choke modifier rod from lever on choke cover and remove lever and pointer by taking out retainer screw in lever. On all models, disconnect choke suction tube by loosening coupling nut at choke housing (CAUTION—use care not to disturb seal at lower end of tube). Take out three cover screws and retainers and lift off choke cover and thermostatic coil assembly, lift out choke baffle plate. Remove choke valve from shaft. Disconnect choke rod from fast idle cam, then take out screw in end of choke shaft and pry trip lever, spacing washer, and choke counterweight and rod assembly off shaft. Rotate choke shaft until piston is free, then withdraw shaft and piston assembly (piston can be removed from shaft lever by removing piston pin). Remove choke housing and gasket (2 screws within housing).

CLEANING & INSPECTION: Clean all metal parts except choke coil and housing with carburetor cleaning solvent. Blow out all passages with compressed air. Inspect all parts for wear and replace as necessary. Inspect tightness of suction tube seal in carburetor throttle body (seal can be tightened or renewed after choke and carburetor reassembled—see below) and condition of packing in coupling nut in upper end of tube).

REASSEMBLY: Install all parts in reverse order of disassembly procedure above using all new gaskets. Install choke valve with trademark "RP" up or outward, using new screws to attach valve. Install choke shaft counterweight with "RP" mark outward, then install spacing washer and trip lever with tang on lever on top of counterweight tang. Assemble connector rod with offset end of rod at counterweight (Cadillac & Oldsmobile), cotter pin end of rod at fast idle cam (Chevrolet & Pontiac).

►**SUCTION TUBE SEAL SERVICING:** If tightening of seal at lower end of tube does not correct leaks at this point, install new seal as directed below.

Tightening Tube Seal—Use installing tool and hammer to tap seal down evenly around tube.

Installing New Tube Seal—If new seal required due to loose seal or damaged tube, install seal **after carburetor completely assembled.** Loosen throttle body-to-bowl attaching screws, place new seal on lower end of suction tube and against the flared end of the tube, insert tube and seal in throttle body recess using tool J-4551 (except Oldsmobile), BT-45 (Oldsmobile) to start seal evenly in throttle body (tap lightly on seal while rotating tool). Position tube and tighten coupling nut at upper end finger-tight. Then use tool and hammer to spread seal securely in throttle body (rotate tool to insure uniform spreading of seal). Tighten coupling nut at upper end of tube securely, tighten throttle body-to-bowl attaching screws.

►CHANGES, CAUTIONS, CORRECTIONS

►***CADILLAC & OLDSMOBILE "TWIN-TURBINE DYNAFLOW" CAR CAUTION:*** If "Throttle Return Check Dashpot" used, this unit should be adjusted as directed below (following Idle Adjustment).

►***1952 CADILLAC ACCELERATOR PUMP STEM BOOT CRACKING (Causing air leaks which may result in reduced gasoline mileage):*** If pump boot on pump stem at bowl cover cracked, install improved boot which will provide longer service life. NOTE—This improved boot, No. 7003147 (same number as previous type), can be identified by raised ridge at pump stem hole on upper end of boot.

►***1952 CADILLAC ROUGH IDLING (Caused by Improper Seating of Secondary Throttle Valves):*** If caused by weak throttle return spring, install new type STRONGER SPRING, No. 7004145, and wrap spring **one complete turn** around throttle shaft to provide correct tension.
Return Spring Identification—The new No. 7004145 spring is made of heavier wire and fewer turns than previous type and can be identified by slight bend of secondary throttle lever end of spring. ***NOTE—This spring used in production on late 1952 and all 1953 carburetors.***

►***1952 CADILLAC FLOAT SETTING CHANGE TO CORRECT CUTTING OUT ON SHARP TURNS OR STEEP HILLS*** **(Early "B-2" Series carburetors without "X" on Brass Code Tag):** When servicing these early carburetors, float balance springs and clips should be **removed and discarded.** Set float level (both float height and float travel or drop) to new specifications (see Float Setting data below). Make this change as follows
(1) Remove bowl cover assembly from carburetor (not necessary to remove carburetor from engine).
(2) Invert bowl cover and remove both primary and secondary float assemblies, power valve vacuum piston and piston spring.
(3) Remove AND DISCARD both float balance springs and clips.
(4) Use pliers to bend float arm tang under float hinge on each float assembly toward float about 45° from original position.
(5) Re-install both float assemblies on bowl cover.
6) Adjust Float Height and Float Drop to new specifications (see Float Setting data below).
(7) Install power valve vacuum piston and spring. Reassemble carburetor and tune up engine.

►***LATER CARBURETOR NOTE***—All "B-2" series carburetors marked by "X" on brass code tag have had above correction made on them. All "C-2" and later series have this change incorporated in production.
1953 CADILLAC "SPEED-UP" CONTROL ON AIR-CONDITIONED CARS: This device automatically increases engine idle speed to 750-800 RPM. when air-conditioning switch turned on. ***See Speed-Up Control Adjustment following Idle Adjustment.***

►***1953 CADILLAC HIGH SPEED ENGINE SURGE (At 60-70 MPH. in "Dr. 3" range):*** Caused by slightly lean condition due to fuel swirling in bowl and not being directed into lower end of main well pick-up tubes. Correct by installing later type Primary Venturi Cluster, Part No. 7006114 (not necessary to remove carburetor from engine for this change). ***NOTE***—This new cluster used on late 1953 carburetors.

►***CADILLAC & OLDSMOBILE "TWIN-TURBINE DYNAFLOW" CAR CAUTION:*** If "Throttle Return Check Dashpot" used, this unit should be adjusted as directed below (following Idle Adjustment).

►***1953 CADILLAC HIGH SPEED ENGINE SURGE (At 60-70 MPH. in "Dr. 3" range):*** Caused by slightly lean condition due to fuel swirling in bowl and not being directed into lower end of main well pick-up tubes. Correct by installing later type Primary Venturi Cluster, Part No. 7006114 (not necessary to remove carburetor from engine for this change). ***NOTE***—This new cluster used on late 1953 carburetors.

►***1953-54 CADILLAC "SPEED-UP" CONTROL ON AIR-CONDITIONED CARS:*** This device automatically increases engine idle speed when air-conditioning turned on while engine idling with selector lever in Neutral "N" position. ***See Speed-Up Control Adjustment following Idle Adjustment below.***

►***1954 CADILLAC CARBURETOR PRODUCTION CHANGE (To eliminate Surge in 20-30 MPH. Speed Range):*** Carburetor No. 7006962 used on later cars This carburetor has revised idle circuit (New Idle Tubes and changed idle channel resistance), New Main Metering Jets, and New Throttle Body. Adjustment specifications are same as for previous carburetor models.

►***1954 CADILLAC IDLE SPEED SETTING CAUTION ON AIR-CONDITIONED CARS:*** Idle speed setting should be adjusted seasonally: (1) When air-conditioning use discontinued for winter months, (2) When air-conditioning is put into use for summer months. This is necessary to compensate for compressor load when engine idling in "Dr." ***See Idling Adjustment below. CAUTION—Engine may stall during summer months, or operate at too fast an idle speed during winter months, if proper procedure not followed.***

►***1953 OLDSMOBILE METERING JETS & VENTURI CLUSTER PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: Different parts used in production as follows:***

Primary & Secondary Main Metering Jets—FIVE different jet combinations used in production on all carburetors (Synchro-mesh & Hydra-Matic Carburetor Types) as indicated by production tag-dates as follows: A through D, E, F through G, H through I, J through L. ***EXISTING JET SIZES NEED NOT BE CHANGED UNLESS JETS BEING REPLACED. SELECT REPLACEMENT JETS FROM TABLE BELOW.***

REPLACEMENT MAIN METERING JETS: TWO jet combinations required for all 1953 carburetors as follows:

1953 Oldsmobile Main Metering Jets
(Hydra-Matic Drive Cars)

Carb No.	Primary		Secondary	
7005600①	Size	Part No.	Size	Part No.
A thru G	051"	7002651	056"	7002656
H thru L	049"	7002649	.056"	7002656

(Synchro-mesh Trans. Cars)

Carb No.	Primary		Secondary	
7005700①	Size	Part No.	Size	Part No.
A thru G	051"	7002651	.047"	7002647
H thru L	.049"	7002649	.049"	7002649

①—Tag-dated production groups as indicated.

Venturi Cluster & Nozzle Assembly—Beginning with carburetors tag-dated "H" a new Primary Venturi Cluster with "crushed" nozzles was used in all carburetors. This nozzle assembly has same part number as previous type with "full" nozzles and will be furnished for service. ***PRIMARY VENTURI CLUSTER & NOZZLE TYPE FOR EACH METERING JET GROUP LISTED ABOVE IS AS FOLLOWS:***

1953 Oldsmobile Primary Venturi Cluster
(Synchro-mesh & Hydra-Matic Cars)

Carburetor	Primary Venturi Cluster	
Tag-date	Part No.	Nozzle Type
A thru G	7005533②	Full Nozzle
H thru L	7005533②	Crushed Nozzle

②—Part No. continued without change.

►***1953-54 OLDSMOBILE SECONDARY VENTURI RESTRICTOR RING CAUTION:*** When overhauling carburetors, check steel restrictor rings installed in end of secondary venturi clusters and make certain that these are tight. Rings are staked at two points and should be staked, if loose, to prevent dropping out in service.

►***1954 OLDSMOBILE CARBURETOR GASKET CAUTION: New Air Horn Gasket and Throttle Body Gasket used in 1954 carburetors as detailed below. Previous type gasket MUST NOT BE USED in 1954 carburetors*** (Wrong air horn gasket may cause stalling on quick stops, wrong throttle body gasket will cause excessively rich mixture due to cutting off of power piston vacuum line), however, these gaskets may be used in earlier carburetors.

1954 Air Horn Gasket—No. 7006061. Has two additional cutout sections on primary side to allow pri-

CONTINUED ON NEXT PAGE

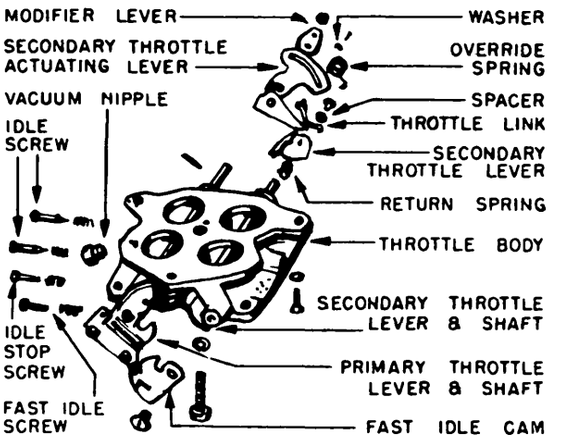
ROCHESTER 4-BARREL 4GC
(C ntinu d)

mary bowl fuel to enter air horn section of bowl during quick stops.

1954 Throttle Body Gasket—No. 7006062. Has additional vacuum channel hole to line up throttle body and bowl vacuum channels for power piston operation.

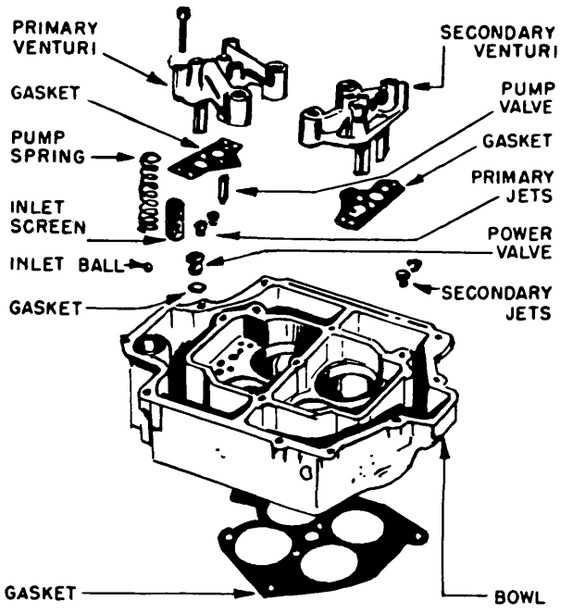
DESCRIPTION: These models are essentially double dual (two-barrel) carburetors with a conventional dual **primary** unit supplemented by a similar dual **secondary** unit for maximum engine performance. Both the primary and secondary units have separate feul bowl and float systems, idle systems, main metering and discharge systems, and interconnected throttle valves as described below. Only the primary unit has an accelerating pump system and choke valve with an automatic choke control (the secondary throttle valves are locked closed for starting and warming up and remain closed during part-throttle operation). ***See Throttle Linkage data below.***

Fuel System: A single fuel inlet is used (located on secondary side of bowl cover) with a passage in the cover leading to the fuel inlet valve for each float chamber. Each bowl has a twin float assembly controlling the fuel inlet valvc. Bowls are vented to the air horn by vent tubes and have additional vent passages terminating at the air cleaner mounting flange. ***See also Idle Vent data below.***



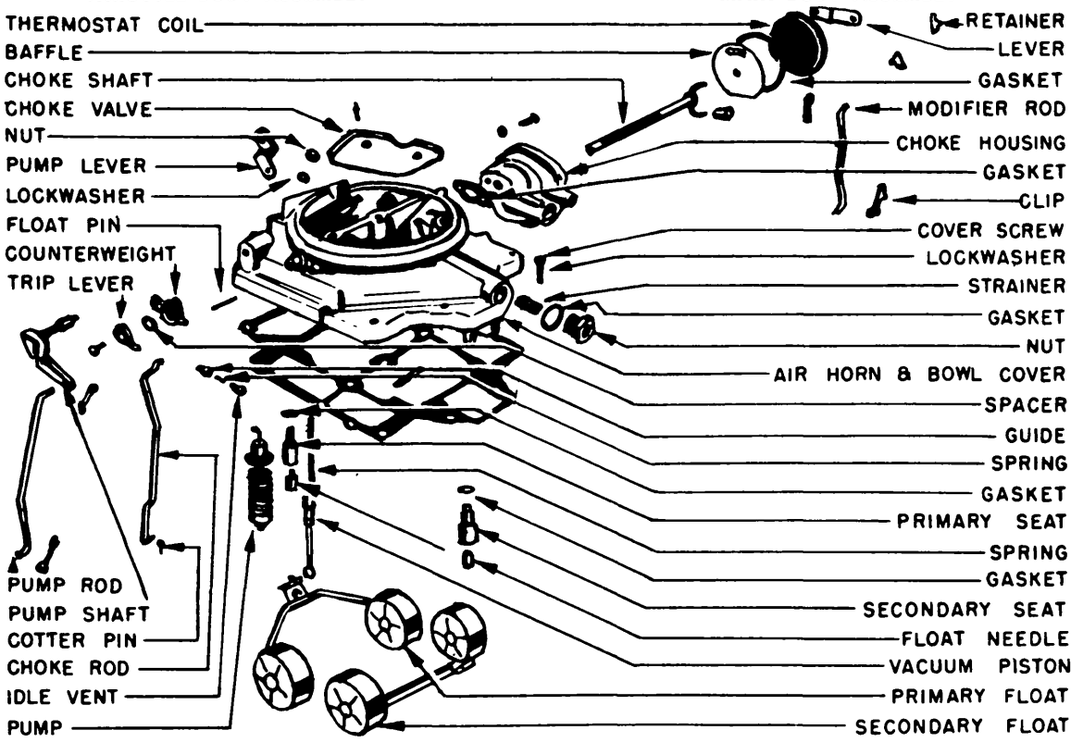
Idling & Low Speed—Entire idle system is duplicated for both the primary and secondary sides of the carburetor except that idle mixture adjusting screws are provided only on the primary side. Both idle systems discharge into the primary carburetor barrels so that both idle systems are controlled by the opening of the primary throttle valves (idle systems drop out as primary throttle valves open and main nozzles come into action and take over). Secondary throttle valves are locked out by the choke mechanism when the engine is warm these valves do not begin to open until primary throttle valves are 50-60% open.

Driving Range (Less than 50-60% Throttle)—The primary throttle valves are directly connected to the accelerator pedal and open as the pedal is depressed (secondary throttle valves are linked to the primary throttle valves and remain closed until primary valves are 50-60% open). Opening of the primary throttle valves brings the main discharge nozzles into action and the idle systems drop out (both the primary and secondary idle systems are controlled by the primary throttle valve position). Fuel for these main nozzles is metered by the primary main metering jets. Under conditions of low manifold vacuum (hill-climbing, acceleration, etc.), main metering jets are supplemented by fuel bypassed through the power valve and metered by the power restriction (separate valve operated by a spring-loaded vacuum power piston). Power valve is used only for the primary side of the carburetor.



High Speed or Full Power (More than 50-60% Throttle)—At 50-60% throttle, the linkage between the primary and secondary throttle valve levers begins to open the secondary valves. These secondary valves open at a relatively greater rate so that both the primary and secondary valves reach the "wide open" position at the same time. In this range, fuel is discharged through all four carburetor barrels to provide maximum engine power. Secondary fuel is metered by secondary main metering jets and discharged through secondary main nozzles in exactly the same manner as on the primary side except that no power valve is used.

Accelerating Pump—*Used only on primary side of carburetor.* Pump is conventional type with pump



CONTINUED ON NEXT PAGE

THROTTLE BODY ASSEMBLY

MAIN BODY ASSEMBLY

ROCHESTER 4GC 4-BARREL CARBURET R AIR H RN & B WL COVER ASSEMBLY

ROCHESTER 4-BARREL 4GC (Continued)

plunger linked to primary throttle valve lever so that the additional fuel needed for acceleration is discharged through the pump jets into the primary carburetor barrels when the primary throttle valves are opened for acceleration. A relief check valve is located in the pump discharge channel to prevent excessive pressures in the pump circuit (opening of the check valve permits fuel to be by-passed back into the bowl).

Primary & Secondary Throttle Linkage: Secondary throttle valve lever is linked to a secondary actuating lever on the primary throttle valve shaft with an overrun provision so that secondary valves do not begin to open until primary valves are 50-60% open. The linkage provides a more rapid opening of the secondary valves so that both the primary and secondary valves reach the wide open position at the same time. This linkage must be checked and adjusted to insure this synchronized opening. *See Adjustment data.*

Secondary Throttle Lock-out: A means is provided by which the choke mechanism locks the secondary throttle valves closed while the choke is in operation so that no choke valve is required on the secondary side of the carburetor. This lock-out mechanism differs on the various carburetors but all types must be checked and adjusted to insure unlocking of the secondary valves for normal operation. *See Adjustment data.*

Atmospheric Idle Vent: This is an outside bowl vent controlled by a ball or disc type check valve which is opened mechanically (by an arm on the pump countershaft or operating lever) when the throttle valves are closed. This permits fuel vapors to escape and minimizes hot weather starting or idling difficulties due to fuel vapor formation. Vent must close when throttle valves open and vent setting should be checked and adjusted as part of the carburetor adjustment procedure. *See Adjustment data.*

Throttle Return Check Dashpot: Used on all Cadillac and Oldsmobile Dynaflow Drive Cars. Consists of a dashpot which slows throttle closing when accelerator pedal released suddenly and prevents engine stalling. See Adjustment data below.

1954 Air Horn Assemblies—Over-all height has been reduced with following principal changes: New Floats ("D" shaped with flat at top), Modified Choke System (Bakelite coil cover, larger vacuum piston, narrower choke valve, relocated indicator mark visible without removing air cleaner), redesigned Power Piston, New Pump Plunger (shorter with new type pump boot), additional bowl vents, and new Air Horn Gasket. *(CAUTION*—previous type gasket must not be used on 1954 carburetors).

1954 Float Bowl Assemblies—Minor changes only (Oldsmobile), no change (Cadillac). Oldsmobile carburetor does not have secondary side idle system (see Overhaul data for new Primary & Secondary Venturi Cluster assemblies).

1954 Throttle Body Assemblies—Oldsmobile throttle body has lower over-all height with throttle linkage mounted directly on the body (no separate linkage plate used). New throttle lever and linkage assembly insures positive closing of secondary throttle valves.

ADJUSTMENT: *CAUTION—Adjustments must be made in exact sequence as given below (except for Idle Mixture and Idle Speed Tune-up adjustments).*

Idle Setting: *Adjust only with engine at normal operating temperature with automatic choke not operating* (choke valve wide open, fast idle inoperative so that engine idles at hot or slow idle speed). With engine warm, set idle speed adjusting screw (throttle stopscrew) for correct idling speed as shown in table below (use tachometer), then adjust each idle mixture adjusting screw (one screw for each primary carburetor barrel—two screws only) until engine idles smoothly and RPM. is at maximum. Recheck idle speed.

OLDSMOBILE NOTE—It is recommended that after above adjustment (for highest vacuum reading and maximum idle speed), each idle screw be turned out ¼ turn for slightly richer mixture (both idle speed and vacuum reading will drop off slightly). Check setting by slowly opening throttle until engine speed increases to 1000 RPM., then close throttle rapidly. If a slightly rich roll is noted as engine returns to idle speed, turn each idle screw in not more than ⅛ turn.

NOTE—Change in Idle Speed affects throttle linkage adjustment on all cars except Oldsmobile. Oldsmobile split throttle lever design insures throttle linkage remaining as set when idle speed adjusted.

IDLE SPEED

Car Model	Synchro-mesh	Auto. Trans.
Buick ('55)	450 RPM	450 RPM
Cadillac ('52)	400 RPM	① 375 RPM
Cadillac ('53) ③	400 RPM	② 400 RPM
Cadillac ('54)		④ 400 RPM
Oldsmobile ('52-53)	425 RPM	② 400 RPM
Oldsmobile ('54)	425 RPM	① 400 RPM
Oldsmobile ('55) ⑤	425 RPM	① 400 RPM
Packard ('55)	400-450 RPM	400 RPM in "High"
Pontiac ('55)	450-470 RPM	390-410 RPM

①—With selector lever in either "Dr" position.
②—With selector lever in "Dr" (Hydra-Matic Drive Cars), "P" position (Dynaflow Drive Cars).
③—See "Speed-Up" Control below for special idle speed on Air-conditioned Cars.
④—with selector lever in "DR" and Air-conditioner "ON" (Summer months), "OFF" (Winter months). See special procedure following.
⑤—Air Conditioning must be turned "ON" on cars with Air Conditioning equipment.

►*CADILLAC IDLE SPEED SETTING PROCEDURE:* Set idle speed in accordance with season as follows: When air-conditioning being used (Summer months), place selector lever in "Dr," turn Air-conditioner "ON," set idle speed at 400 RPM. When air-conditioning not being used (Winter months), place selector lever in "Dr," see that Air-conditioner "OFF," set idle speed at 400 RPM. (it will be necessary to cut idle speed setting down from summer setting to maintain this 400 RPM. idling speed).

Cadillac Speed-Up Control (Air-conditioned Cars): This unit increases engine idle speed when idling with selector lever in "N" and air-conditioner "ON."

Adjustment—With engine warm and idling, place selector lever in "N," turn air-conditioning ON, loosen locknut on diaphragm shaft and turn knurled adjusting nut to obtain engine speed of 900 RPM., tighten locknut. *NOTE*—This setting supersedes previous recommendation of 750-800 RPM.

Throttle Return Check Dashpot Adjustment: Check setting by opening throttle for a few seconds, then quickly release accelerator pedal. If engine stalls, adjustment is required.

Adjustment (Cadillac)—Check alignment of adjusting screw and contact arm on secondary throttle lever, bend return check bracket as necessary to center screw on contact lever radius. Check performance with selector lever in "Dr" or "L," by opening throttle and quickly releasing accelerator pedal. *(CAUTION*—apply brakes firmly when making this test). If engine stalls, adjust by turning adjusting screw (hold shaft with ⅜" wrench while turning screw), repeat test and readjust until stalling condition eliminated.

Adjustment (Oldsmobil)—Turn adjusting screw in or out of return check plunger to secure 1/16" clearance between screw and throttle lever with plunger bottomed in return check and throttle valves closed in hot or slow idle position. *NOTE*—Plunger travel 7/32" from inner to outer position.

Float Setting: *CAUTION—Both Primary and Secondary Float Assemblies must be checked and adjusted separately and both FLOAT LEVEL & FLOAT DROP must be checked for each assembly.* **Remove bowl cover and float assembly from carburetor but DO NOT remove bowl cover gasket for following checks:**

►*1952 CADILLAC FLOAT SETTING CAUTION*—Specifications below apply to carburetors without balance springs (B-2 Series marked by "X" on brass code tag and all C-2 Series and later carburetors). *See "Cadillac Float Adjustment Change" under Changes, Cautions, Corrections (above) for removal of balance springs on first carburetors.*

Float Level—*CAUTION—Do not remove bowl cover gasket.* **Invert bowl cover, install float gauge on cover and against curvature in air horn bore, or use scale to measure distance from gasket on cover to highest point on each float. If floats do not almost touch top portion of gauge between gauge legs, or if scale distance not correct, adjust by bending float arms at rear of float assembly** *(CAUTION*—all floats must be set alike). **Bend float arms horizontally until each float is centered between the gauge legs and check this setting by tilting bowl cover assembly 90° to each side to make certain that floats do not touch gauge legs under these conditions** *(CAUTION*—this adjustment important to prevent floats touching sides of bowl and hanging up in service).

FLOAT LEVEL SETTING
(Primary & Secondary Floats)

Car Model	Float Height	Gauge No.
Buick ('55)	1 35/64"	J-6151
Cadillac ('52)	1 3/4" ①	② BT-85
Cadillac ('53)	1 9/16"	③ BT-87
Cadillac ('54)	1 19/32"	BT-101
Oldsmobile ('52)	1 1/4"	BT-66
Oldsmobile ('53)	1 9/16"	BT-87
Oldsmobile ('54-55)	1 5/8"	BT-89
Packard ('55)	1 5/8"	④ BT-89
Pontiac ('55)	1 19/32"	J-6179

①—For carburetors WITHOUT Float Balance Springs only (supersedes 1⅜" setting applicable to carburetors WITH balance springs).
②—Cadillac No. J-5198.
③—Cadillac No. J-5465. ④—Packard No. 5399.

CONTINUED ON NEXT PA E

ROCHESTER 4-BARREL 4GC (Continued)

Float Drop—*CAUTION—Do not remove bowl cover gasket.* Hold bowl cover assembly in upright position so that floats are free to hang down. Use scale to measure distance from bottom face of gasket on bowl cover to bottom of floats. If this distance or float travel (see table below) not correct, adjust each model as directed below (*CAUTION*—All floats must be set alike).

Cadillac Carburetors (without Balance Spring). Bend float tang on float arm under float hinge which contacts side of needle seat (this tang repositioned as part of balance spring removal procedure) away from needle seat to increase float drop, or toward seat to decrease float drop.

Oldsmobile Carburetors (With Balance Spring). Bend tang at rear of float assembly (which contacts balance spring) away from the balance spring to increase float drop, or toward balance spring to decrease float drop.

FLOAT DROP SETTING
(Primary & Secondary Floats)

Car Model	
Buick ('55)	2 1/4"
Cadillac ('52)	①2 1/4"
Cadillac ('53-54)	2 1/4"
Oldsmobile ('52)	②1 15/16"
Oldsmobile ('53-55)	2 1/4"
Packard ('55)	2 1/4"
Pontiac ('55)	2 1/4"

①—For carburetors WITHOUT Float Balance Springs only (supersedes 1 15/16" setting applicable to carburetors WITH balance springs).
②—2¼" on later carburetors.

Accelerating Pump Stroke: *CAUTION—This is a linkage adjustment and not a seasonal change recommendation.* Back off idle speed stopscrew and fast idle screw so that primary throttle valves are fully seated, hold throttle lever in this position, use scale to measure height of pump plunger rod (from top surface of bowl cover to bottom edge of pump plunger rod). If height not correct (see table below), adjust by bending pump rod as required.

PUMP STROKE SETTING

Car Model	
Buick ('55)	1 3/32"
Cadillac ('52-54)	15/16"
Oldsmobile ('52-55)	1 1/16"
Packard ('55)	1 3/32"
Pontiac ('55)	1 1/16"

CAUTION—Do not readjust fast idle screw until after Choke Modifier has been adjusted on Cadillac.

Atmospheric Idle Vent: *CAUTION—Targeting or centering of the lever tang on the vent valve must be done first to insure proper closing of the valve (hanging up of valve in open position may cause poor mileage).*

Targeting of Lever Tang—Check position of idle vent lever tang and bend tang, as necessary, to centralize it on the vent valve.

Setting—Close primary throttle valves against wire gauge of correct size (see table below) installing gauge on side opposite idle adjusting screws, hold throttle valves in this position while adjusting idle vent. The operating tang on the lever should just touch vent valve. Adjust by bending contact arm using bending tool BT-69.

IDLE VENT SETTING

Car Model	Gauge Size & No.
Cadillac	①② .063" BT-79
Oldsmobile	① .040" BT-67
Packard	①③ .040" BT-67

①—LARGE end of gauge.
②—Cadillac Gauge No. J-5195.
③—Packard No. J-6061.

Automatic Choke: *CAUTION—Cadillac carburetor has Choke Modifier and is adjusted differently as follows:*

Choke Modifier (Cadillac)—With throttle stopscrew and fast idle screw backed off so that primary throttle valves fully seated, loosen retainer screw in index lever and rotate the index pointer on the Choke cover 1 Notch Rich position or one graduation counter-clockwise from long scribed line or center graduation on cover (1952-53), Center At Index (1954), tighten lever retaining screw. Then adjust choke rod, fast idle, unloader.

AUTOMATIC CHOKE SETTING

Car Model	Choke Setting
Buick ('55)	Centered At Index
Cadillac ('52-54)	See Choke Modifier
Oldsmobile ('52-53)	Centered At Index
Oldsmobile ('54-55) Synchro-mesh	1 Notch Lean
Oldsmobile ('54-55)Hydra-Matic	Centered At Index
Packard ('55)	Centered At Index
Pontiac ('55)	Centered At Index

Choke Rod: With automatic choke correctly set (above), turn fast idle screw in until it contacts intermediate step of fast idle cam, rotate cam until fast idle screw is against shoulder of highest step on cam and make certain that choke trip lever is in contact with choke counterweight. Measure choke valve opening by inserting wire gauge of correct size (see table below) between top edge of choke valve and dividing wall in air horn. If valve opening not correct, adjust by bending choke connector rod.

CHOKE ROD SETTING

Car Model	Gauge Size & No.
Buick ('55)	③ .040" J-6152
Cadillac ('52-53)	①② .031" BT-78
Cadillac ('54)	① .040" BT-102
Oldsmobile ('52-55)	① .053" BT-68
Packard ('55)	①③ .053" BT-68
Pontiac ('55)	.054" KMO-480A

①—SMALL end of gauge.
②—Cadillac Gauge No. J-5196.
③—Packard No. J-6056.
④—Large end of gauge.

Fast Idle: *NOTE—Adjustment can be made with carburetor OFF ENGINE or with carburetor ON ENGINE:*

Carburetor Off Engine—With automatic choke and choke rod correctly adjusted, move fast idle cam so that choke valve is fully closed, hold primary throttle valves closed so that fast idle screw is aligned with highest step of fast idle cam. Adjust fast idle screw in against fast idle cam until throttle valve opening is correct as measured by wire gauge (see table below) inserted between edge of valve and carburetor wall on side opposite idle screws.

FAST IDLE SETTING

Car Model	Gauge No.
Buick ('55)	.020" J-1388
Cadillac ('52-54)	①.028" BT-79
Oldsmobile ('52-53)	①.020" BT-67
Oldsmobile ('54-55)	①.024" BT-90
Packard ('55)	①②.024" BT-90
Pontiac ('55)	.033" J-6178

①—SMALL end of gauge.
②—Packard No. J-6057

Carburetor On Engine—Run the engine until both the engine and transmission are at operating temperature. With engine idling and transmission in neutral, and with choke valve wide open, rotate fast idle cam so that high step of cam is under the fast idle screw. Adjust fast idle screw for correct engine speed as shown in table below (use tachometer). *CAUTION—Air cleaner must be in place.*

FAST IDLE SPEED

Buick ('55)	1800 RPM
Cadillac ('52-55)	1700 RPM
Oldsmobile ('52-55)	① 1400-1500 RPM
Packard ('55)	① 1500 RPM
Pontiac ('55)	1800 RPM

①—With transmission in neutral.

Unloader: With automatic choke and choke rod correctly adjusted, hold choke trip lever down so that it is in contact with the choke counterweight, move throttle valves to wide open position, measure choke valve opening by inserting wire gauge of correct size (see table below) between upper edge of valve and dividing wall in air horn. If choke valve opening not correct, bend tang on fast idle cam using tool BT-69.

UNLOADER SETTING

Car Model	Gauge Size & No.
Buick ('55)	③ .115" J-6152
Cadillac ('52-53)	①② .067" BT-78
Cadillac ('54)	① .125" BT-102
Oldsmobile ('52-53)	① .092" BT-68
Oldsmobile ('54-55)	① .115" BT-90
Packard ('55)	①③ .115"BT-90
Pontiac ('55)	.115" J-6178

①—LARGE END of gauge.
②—Cadillac Gauge No. J-5196.
③—Use small end of gauge.
④—Packard No. J-6057.

Secondary Throttle: *CAUTION—Three separate adjustments required as follows:*

1) Secondary Throttle Position—Move both choke and primary throttle valves to wide open position. If secondary throttle valves not wide open, remove throttle operating link, bend tangs on wide open stops on primary and secondary shafts as required to obtain wide open position, then bend throttle operating link to proper length.

2) Secondary Throttle Lock-out—With choke valve partially closed, check side clearance between secondary lock-out lever tang and edge of slot in fast idle cam using a feeler gauge of correct thickness (see table below). If clearance not correct, adjust by bending tang on lever using BT-18 tool.

3) Secondary Throttle Clearance—With choke valve wide open check clearance between lower face of secondary lock-out lever tang and edge of fast idle

CONTINUED ON NEXT PAGE

Form 28B—1956-M

ROCHESTER 4-BARREL 4GC
(C ntinu d)

cam using a feeler gauge of correct thickness (see table below). If clearance not correct, adjust by bending tang on lever up or down using BT-69 bending tool (1952-53), BT-91 (1954-55).

SECONDARY THROTTLE SETTING

Setting:	Feeler Gauge Thickness (2) Lock-out	(3) Lever Clearance
Buick	.015"	.030"
Cadillac	.015"	.015"
Oldsmobile	.015"	.035"
Packard	.015"	015"
Pontiac	.015"	015"

Car Starter Switch Setting (Buick): Back off throttle stop screw to close throttle valves completely. Make pencil mark on switch end of primary throttle shaft to line up with longest of three indicator marks on casting. With test light across switch terminals, slowly open throttle valves. Light should come on when pencil mark is between the two marks on casting. Adjust by changing shims (Maximum .066"). Reset idle RPM to specifications.

Dampener Valve Setting (Buick): Remove fast idle cam and replace retaining screw. Adjust lever tang (Tool J-6058A) to give measurement of 51/64" (Tool J-6153 No. 1 end) from cam screw shoulder vertical to top of counterweight lever. Hold lever in this position, seat damper valves against outside of bore and tighten in place. Readjust tang to give 53/64" (Tool J-6153 No. 2 end) from cam screw shoulder vertical to top of lever. Proper adjustment prevents valve edge striking bore when in closed position.

OVERHAUL: ***CAUTION—When disassembling carburetor, be sure to keep PRIMARY and SECONDARY side parts separate so they will not be confused or interchanged when carburetor reassembled.***

Disassembly: Carburetor consists of three main subassemblies (Air Horn & Bowl Cover, Carburetor Bowl, and Throttle Body) which can be overhauled separately as follows:

Air Horn & Bowl Cover—On Cadillac, disconnect and remove choke modifier rod. On all models, disconnect and remove pump connector rod. Remove trip lever retaining screw from end of choke shaft, remove trip lever and spacing washer from shaft. Take out fast idle cam pivot screw, remove choke rod with lever and cam as an assembly. Take out all air horn retaining screws *(CAUTION*—there are 13 screws—3 inner and 10 outer—with **one screw in counterbore in dividing wall just inside edge of air horn**). Lift air horn and bowl cover assembly straight up using extreme care not to damage float assemblies *(CAUTION*—break cover loose from bowl with finger pressure only, DO NOT pry on cover flange). Disassemble as follows: Invert the cover assembly, take out float hinge pins and remove floats and intake needles, remove needle seats and gaskets *(CAUTION*—Keep each float assembly, intake needle, and seat together, DO NOT mix primary and secondary side parts). Remove power piston by rotating retaining washer until flat side allows piston to pass, remove piston spring. Remove idle vent valve, spring, and retainer by pressing on retainer with a screwdriver and sliding assembly up out of well in bowl cover. Remove pump plunger and rubber seal as an assembly by disengaging plunger shaft from pump lever and pulling assembly out of cover (seal, retainer, washer, and spring can be removed from plunger for cleaning). Remove pump inner lever from countershaft by removing nut and washer, then slide countershaft out of cover boss. Remove fuel inlet fitting, gasket and strainer. If choke to be disassembled, proceed as follows: On Cadillac, remove retaining screw and lift off choke modifier lever. Remove cover attaching screws and retainers, lift off thermostat cover and coil assembly *(CAUTION*—On Cadillac, do not remove metal pointer or coil from shaft in cover), remove gasket and baffle plate. Remove choke valve (remove staking burrs from valve screws before taking screws out). Rotate choke shaft counter-clockwise until choke piston clears cylinder, slide shaft out and remove shaft and piston as an assembly (piston can be disconnected by using a wire to push piston pin out of piston and link). Remove choke housing by taking out two attaching screws, remove and discard choke housing gasket.

Carburetor Bowl—Take out three attaching screws and lockwashers in each venturi cluster, carefully remove clusters by lifting them straight up to avoid damaging idle tubes and main well tubes *(CAUTION*—Clusters are serviced as an assembly and should not be disassembled further). Keep primary and secondary side clusters separate (primary cluster has pump discharge nozzles). Remove all main metering jets (located in bowl adjacent to venturi cluster support). *CAUTION*—Primary and secondary side metering jets are different size and must not be interchanged. Remove power valve and gasket (located in bowl adjacent to primary metering jets). Remove pump return spring from pump cylinder, then invert bowl casting to remove aluminum pump inlet ball (from bottom of pump cylinder) and brass pump outlet check needle (from passage under primary venturi cluster mounting face). *CAUTION*—Do not lose these parts and NEVER substitute a steel ball for the aluminum inlet ball. Remove pump inlet screen from intake passage at side of cylinder.

Throttle Body—Remove large screw and washer from counterbore in center of throttle body (visible when bowl and throttle body inverted), remove three smaller screws and lockwashers from flange, carefully separate throttle body from bowl, remove and discard gasket. Remove both idle adjusting screws and springs, idle stop screw and spring, and fast idle screw and spring *(CAUTION*—keep each screw and its proper spring together). On Cadillac, remove choke modifier lever and retaining screw from primary throttle shaft. Free secondary throttle actuating link by taking out cotter pin in each end, unhook inner end of primary throttle shaft override spring from lever using long-nose pliers, remove override spring retaining screw from primary throttle shaft, remove secondary throttle lever retaining screw and washer, then slide secondary throttle actuating lever and override spring off primary throttle shaft, remove link. Slide secondary throttle lever and return spring from secondary throttle shaft. This completes throttle body disassembly.

►***CAUTION—Throttle body is furnished as an assembly with throttle valves and shafts and no attempt should be made to remove throttle valves (disturbing valves will upset low speed metering performance).***

Cleaning & Inspection: Wash all parts thoroughly in carburetor cleaning solvent **except** following parts which should be cleaned in clean gasoline: Choke cover and coil assembly, pump plunger, primary venturi cluster (with pump discharge nozzles). Blow out all passages in castings with air, remove all gum and carbon deposits *(CAUTION*—do not use drills to clean out jets and passages). Inspect strainer screens and replace if distorted or plugged. Check floats for dents, leaks, or wear at hinge pin holes. Inspect fast idle cam for wear on steps. Inspect throttle body carefully for wear at throttle valves and bore and shaft wear in bore (replace as an assembly if worn excessively). Inspect all parts for wear or damage and replace as required.

Reassembly: Use new gaskets. Install all parts in reverse order of disassembly procedure (above) and pay particular attention to the following:

Secondary Throttle Lever & Spring Installation: Install return spring on secondary throttle shaft with bent end of spring in hole in throttle body, wind up spring one complete turn, then install secondary lever on shaft over straight end of spring (bent portion of lever should be above shaft), install spacer and retaining screw in end of shaft. Install secondary throttle actuating link (insert plain end through lever hole, install cotter pin on shaft side to clear return spring).

Primary Throttle Lever & Spring—Start secondary throttle actuating lever on primary throttle shaft with curved slot portion outward and toward the rear. With inner portion of lever on shaft, start override spring on shaft with long end inward, then slide lever and spring on shaft and engage washer end of secondary throttle actuating link in slot in lever. Install override spring retaining screw through loop end of spring and into primary throttle shaft from upper side. Hook inner end of override spring over top edge of secondary throttle actuating lever. Install washer and cotter pin on end of secondary throttle actuating link. On Cadillac, install choke modifier lever and retaining screw on end of primary throttle shaft (lever must point upward when throttle closed and marking "RP" must be outward).

Throttle Body-to-Bowl Assembly Caution—Install new gasket on bottom surface of bowl with largest projecting tab on primary side and surrounding vacuum passage to power valve piston *(CAUTION*—gasket is not reversible). Install all throttle body attaching screws loosely (including large screw in center of throttle body), then tighten all screws evenly.

Venturi Cluster Installation Caution—Make certain that brass pump discharge needle installed in pump passage in bowl before installing primary venturi cluster. Use new gaskets and install each venturi cluster in correct position making certain that clusters correctly aligned by the tangs on the cluster. CAUTION—Primary and Secondary clusters not interchangeable and can be identified by brass pump discharge nozzzles used on primary cluster only.

►*1953 OLDSMOBILE VENTURI CLUSTER PRODUCTION CHANGE*—See data under Changes, Cautions, Corrections above for different types used in production and replacement parts caution.

Metering Jet Installation Caution—Primary and secondary side metering jets are DIFFERENT sizes

CONTINUED ON NEXT PAGE

ROCHESTER 4-BARREL 4GC CARBURETOR (Continued)

(in general, secondary jets are larger size than primary jets) and must be installed in correct positions. *NOTE*—On later Cadillac carburetors, primary jets are brass finish, secondary jets are copper-plated.

▷*1953 OLDSMOBILE METERING JET PRODUCTION CHANGE*—See data under Changes, Cautions, Corrections above for different sizes used in production and recommended replacement jet sizes.

Accelerating Pump Plunger Assembly—When installing rubber seal on plunger stem, slide seal on shaft with larger end toward the piston, see that upper end engaged in groove in plunger stem. Insert assembly through bowl cover from below and pull seal through cover so that cover edge engages groove in seal. When installing cover, guide plunger carefully into pump cylinder.

Float and Intake Valve Assembly—Make certain that parts installed in correct position (primary and secondary parts not interchangeable). On Cadillac, make certain that float hinge pins installed in holes farthest from bowl cover. On Oldsmobile, see that tang on float arm is back of float balance spring (balance springs not used on later Cadillac carburetors and should be removed and discarded on earlier carburetors—see Changes & Corrections above). Adjust float level and float drop or travel (see Adjustment data above).

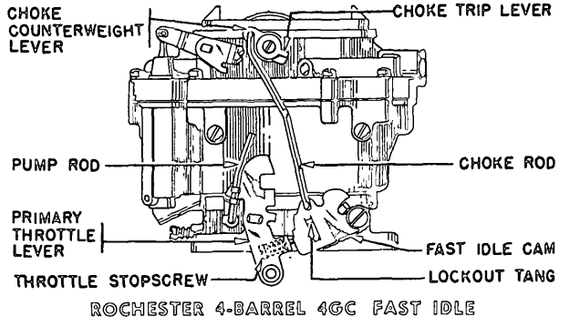
Air Horn & Bowl Cover Installation—Use new gasket, carefully align all holes in gasket and cover. When installing cover, use care in guiding pump plunger into pump cylinder and power valve piston into its bore, and see that floats not bent by striking on edge of bowl. Install all bowl cover attaching screws, tighten inner screws first, and then outer screws, evenly and securely.

Choke Valve Installation—After choke shaft and piston assembly installed in air horn, slide choke valve through shaft with letters "RP" upward, use new screws and install screws loosely, then tighten screws as follows: Cadillac—press firmly on choke housing end of shaft and hold valve tightly closed, tighten screws securely and stake ends of screws lightly taking care not to bend choke shaft. Oldsmobile—First install counterweight, spacing washer, and trip lever on end of choke shaft, press lightly on end of choke shaft to obtain minimum clearance of .020" between spacing washer and counterweight, tighten choke valve attaching screws with shaft in this position, stake screws lightly taking care not to bend choke shaft. Install choke baffle plate with curved slot over tang on choke lever.

Thermostatic Housing & Coil Installation—With retainer screws loose, rotate cover counter-clockwise until coil hook picks up choke lever tang, then position cover for correct choke setting (see Adjustment data) and tighten retaining screws. On Cadillac, install choke modifier lever loosely (lever should be forward and slightly down when metal pointer is at scribed line), tighten lever screw as part of Choke Modifier adjustment (see Adjustment data).

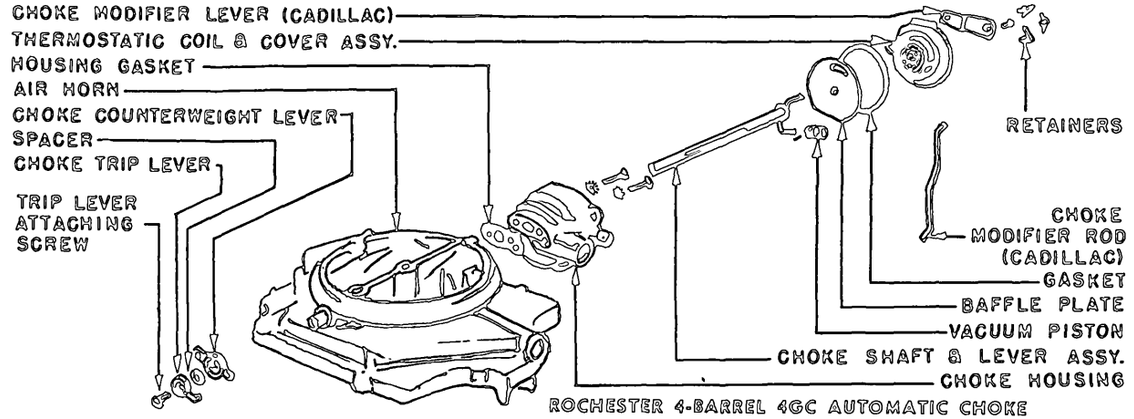
Carburetor Adjustments—Make all adjustments as directed in Adjustment section above.

SERVICE PARTS: Gasket Sets—Rochester No. 7004690 (7004300, 4500, 4800, 5100, 5600, 5700, 6125, 6250), No. 7006135 (7005900, 6000, 6220, 6221, 6250, 6962), No. 7007134 (7007000, 7230), No. 7008804 (7006200).



Repair Kit Pkg.—Rochester No. 7004691 (7004500), No. 7005588 (7005100, 6215), No. 7005592 (7004300, 4800, 5600, 5700, 6250), No. 7006375 (7006220, 6221, 6962), No. 7006133 (7005900, 6000, 7000, 7230), No. 7008803 (7006200).

ROCHESTER 4-BARREL "4GC" AUTOMATIC CHOKE



DESCRIPTION: Automatic choke and fast idle mechanism is similar to type used on Rochester dual carburetors and is adjusted in the same manner. Choke valve is located on primary side of the air horn and controls the primary barrels only (Secondary throttle valves are locked closed while the choke is in operation and no choke valve is required).

Cadillac Choke Modifier—Consists of linkage between the thermostatic coil and the throttle lever so that the thermostatic coil tension is controlled by the throttle and is lessened as the throttle is opened to provide a continuously variable unloading action which improves performance and economy during warm-up period.

DISASSEMBLY: On Cadillac, remove retaining screw and lift off choke modifier lever (*CAUTION*—do not remove metal pointer or coil from shaft in cover). Remove thermostatic coil cover attaching screws and retainers, lift off cover and coil assembly, remove gasket and baffle plate. Take out choke trip lever attaching screw, remove choke trip lever, spacing washer, and choke lever and collar assembly from choke shaft. Take out fast idle cam attaching screw, remove choke lever and collar assembly, choke rod, and fast idle cam as an assembly. Remove choke valve by taking out two valve attaching screws (remove staking burrs from screws before removing them). Rotate choke shaft counter-clockwise to free choke piston from cylinder, withdraw shaft and piston assembly from housing. Take out piston pin to remove piston from choke lever. Remove two choke housing-to-air horn screws, remove housing and gasket from air horn.

ROCHESTER 4-BARREL 4GC FAST IDLE

ROCHESTER 4-BARREL 4GC AUTOMATIC CHOKE

Cleaning & Inspection: Wash all metal parts thoroughly in carburetor cleaning solvent except choke cover and coil assembly (clean with clean gasoline). Inspect choke shaft for wear in bore in air horn, check fast idle cam for wear on steps or in rod attaching holes. Inspect thermostatic coil for distortion. Blow out all passages with compressed air.

REASSEMBLY: Use new gaskets, install parts in reverse order of disassembly procedure and note the following important points:

Choke Valve Installation—After choke shaft and piston assembly installed in air horn, slide choke valve through shaft with letters "RP" upward, use new screws and install screws loosely, then tighten screws as follows: Cadillac—press firmly on choke housing end of shaft and hold valve tightly closed, tighten screws securely and stake ends of screws lightly taking care not to bend choke shaft. Oldsmobile—First install counterweight, spacing washer, and trip lever on end of choke shaft, press lightly on end of choke shaft to obtain minimum clearance of .020" between spacing washer and counterweight, tighten choke valve attaching screws with shaft in this position, stake screws lightly taking care not to bend choke shaft. Install choke baffle plate with curved slot over tang on choke lever.

Thermostatic Housing & Coil Installation—With retainer screws loose, rotate cover counter-clockwise until coil hook picks up choke lever tang, then position cover for correct choke setting (see Adjustment data) and tighten retaining screws. On Cadillac, install choke modifier lever loosely (lever should be forward and slightly down when metal pointer is at scribed line), tighten lever screw as part of Choke Modifier adjustment

STROMBERG MODELS AAV-1, AAV-2, AAVS-2

CHRYSLER	Stromberg Model & No.
1941 C30 & C33 Eights	AAV-2 No. 380041
1942 C36 & C37 Eights	AAV-2 No. 380086
1946-48 C39 & C40 Eights	AAVS-2 No. 380165 or 380169

▷CHANGES, CAUTIONS, CORRECTIONS

▷Chrysler 1938-42 Replacement Carburetor—Stromberg Model AAV-2, No. 380853, Carburetor replaces following original equipment carburetor Nos: A-18792, 380041, 380059, 380060, 380061, 380086, 380090.

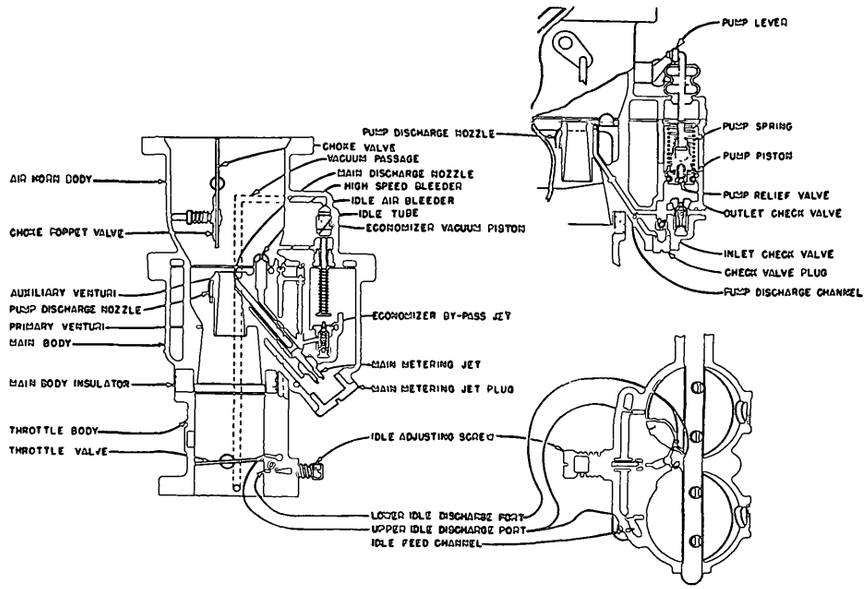
▷Chrysler 1946-48 Carburetor Note—Two types of carburetors—Stromberg Part No. 380165, Code No. 4-111, with Square Air Horn; and Part No. 380169, Code No. 4-112, with Round Air Horn. Carter (B&B) Model E7A1 Carburetor also used on these models. *See Carter (B&B) carburetor article in this section for all data on this model.*

▷Chrysler Throttle Guard (1940-48 Cars with Fluid Drive and Vacamatic or Hydraulically Controlled Transmissions)—This device mounted on carburetor and designed to prevent engine stalling when accelerator pedal released suddenly (prevents throttle valve closing too suddenly). *See "Chrysler Throttle Guard article in Carburetion Equipment Section for complete data on this unit.*

▷Chrysler 1946-48 Transmission Kick-down Switch (AAVS-2 Carburetor)—This transmission control kick-down switch, Stromberg Part No. 384476, is mounted on the carburetor and operated by the throttle valve shaft. *See servicing data (below) and Chrysler Transmission Control Kick-down Switch article in Carburetion Equipment Section for complete data on this unit.*

DESCRIPTION

DESCRIPTION (AAV-1, 2):—Duplex, downdraft, throttle actuated accelerating pump and vacuum controlled economizer. Carburetor has single air intake, float chamber and accelerating pump but has two independent mixing chambers or barrels. Venturi, main discharge jet, main metering jet, throttle valve, accelerating pump discharge nozzle, and idling system duplicated for each barrel. Float bowl is new design fitted with baffles to prevent surging and has twin floats mounted at opposite ends of bowl chamber which encircles carburetor body. Float valve is clipped to lever midway between floats.



Fuel System (Idling and Low Speed):—Fuel for idling is taken from the main jet well up through the idling tube which meters the fuel and is mixed with air admitted through the idle air bleed hole in the cross channel. From this point the fuel mixture is taken down through a channel to the discharge ports. For closed throttle idling, the fuel mixture is discharged through the lower port below the throttle and is controlled by the idle adjusting screw. In this position the upper port above the throttle valve serves as an additional air bleed. When the throttle is opened for low speed running, additional fuel is discharged through this upper port also.

Driving Range (22-75 M.P.H.):—At approximately 22 M.P.H. the idling system drops out and all fuel is supplied by the main discharge jet located directly above the main metering jet and discharging into the small auxiliary venturi. Main nozzle is air bled by the high speed air bleeder located directly above the nozzle in the auxiliary venturi support.

High Speed and Wide Open Throttle Running:—At speeds above 75 M.P.H. or whenever the throttle is held open, the drop in vacuum above the spring loaded vacuum piston allows the spring to force the piston down so that the piston stem opens the by-pass valve located directly below the piston assembly. This allows additional fuel, metered by the by-pass jet, to flow to the main discharge nozzle.

DESCRIPTION (AAVS-2): Carburetor is of same design as AAV-1 and AAV-2 models (above) except for new idle discharge ports and single idle mixture adjusting screw as follows:

Fuel System (Idling & Low Speed)—Fuel for idling is taken from the main jet well up through the idling tube which meters the fuel and is mixed with air admitted through the idle air bleed hole in the cross-channel. From this point, the fuel mixture is taken down through a channel to the discharge ports. A single idle adjusting screw is located in this channel below the upper (secondary) discharge ports so that this screw controls the fuel mixture discharge through both lower (primary) discharge ports for closed throttle idling. In this position, the upper idle discharge ports serve as additional air bleeds. As soon as the throttle is opened for low speed running, additional fuel is discharged through the upper ports also.

ADJUSTMENT & OVERHAUL

IDLING ADJUSTMENT (AAV-1, 2): Idling adjusting screw for each barrel controls fuel discharge from lower port. Turn each screw in for leaner mixture and out for richer mixture (set both screws alike). Idle speed controlled by throttle lever stopscrew and should be set for 6 MPH idling speed with engine warmed up (choke valve wide open and fast idle inoperative). See tune up instructions on car model page for complete adjustment data.

Chrysler Vacamatic Transmission Car Note—On 1942 cars with Vacamatic Transmission, idle speed should be set at 4½ MPH. maximum. Idle speed of 6 MPH is correct for cars with Synchro-mesh Transmission only.

IDLING ADJUSTMENT (AAVS-2): A single idling adjusting screw controls fuel discharge from lower discharge ports in both carburetor barrels. This screw should be turned in for leaner mixture and out for richer mixture. Idle speed is controlled by throttle lever stopscrew and should be set for 6 MPH. idling speed (Cars with Synchro-mesh Transmission) with engine warmed up (choke valve wide open and fast idle inoperative). See Tune-up data on car model page for complete adjustment data.

NOTE—The single idling adjusting screw controls both carburetor barrels and they will be equalized automatically without special attention when the screw is turned to adjust the mixture for closed throttle idling.

METERING JETS:—Main metering jets are non-adjustable fixed type. Jets should be changed only for special operating conditions such as high altitude. See Jet Specification Table for standard jet calibrations for all models.
NOTE—Whenever main discharge jet located directly above main metering jet is removed, new lead gasket must be used in carburetor body to insure a good seal when jet is replaced. Use tool T-19099 to remove plug, tool T-24924 to remove and install main metering jet, tool T-24967 for main discharge jet.

ECONOMIZER:—Consists of a by-pass valve and jet in the carburetor main body controlled by a vacuum piston in a cylinder in the air horn casting. Economizer by-passes fuel around main metering jets to main nozzles when vacuum in

CONTINUED ON NEXT PAGE

STROMBERG MODELS AAV-1, AAV-2, AAVS-2 (C nt.)

manifold decreases sufficiently so that piston is forced down by spring. No adjustment required.

NOTE—Use special tool T-24733 to remove vacuum power piston No. P-22803.

Setting—Vacuum piston opens valve with manifold vacuum of 5-7" of HG. (AAV-1, 2), 4-6" of HG. (AAVS-2) corresponding to a car speed of approximately 70-75 MPH.

ACCELERATING PUMP:—Operated by throttle lever through 'walking beam' linkage. Fuel is drawn into pump chamber through inlet ball check valve when throttle is closed and is discharged through outlet check valve and pump discharge nozzle in each carburetor barrel when throttle is opened for acceleration. Piston is spring loaded on pump rod to increase duration of pump discharge (sudden throttle opening will cause piston to lag, compressing pump spring, expansion of spring prolongs piston movement and pump discharge). A spring loaded relief valve located in head of pump piston will by-pass some fuel if accelerating pump operated rapidly to prevent loading up engine (this valve normally closed so that all fuel is discharged to nozzles).

NOTE—Pump outlet check valve (By-pass jet) consists of a spring-loaded plunger type valve located in the bottom of the pump cylinder.

Capacity—With pump link connected as indicated, and pump operated slowly (S), fast (F), capacity in cc. per 10 strokes should be as follows:

ACCELERATING PUMP SETTING

Car Model	Carburetor	Pump Capacity	Setting
Chrysler ('39-42)	AAV-2	21-25 (F), 27-31 (S)	Maximum
Chrysler ('46-48)	AAVS-2	21-25 (F), 27-31 (S)	Minimum

Adjustment (Chrysler)—Two holes provided in throttle lever for pump link engagement. Inner hole (short radius) provides minimum stroke, outer hole (long radius) max. stroke. See car model page for settings.

FAST IDLE: Consists of a rotary cam linked to the choke valve and which serves as throttle lever stopscrew stop. Cam is rotated to fast idle position when choke valve closed for cold starting so that throttle valve is held open slightly.

Adjustment—To check setting, hold stopscrew against first step of fast idle cam and check choke valve opening with 1/8" drill rod inserted between edge of choke valve and air horn wall. If opening not correct, adjust rod length (turn ball joint end on rod). Open throttle wide and again check choke valve opening with 7/32" rod. If opening not correct, bend extended arm of fast idle cam slightly.

FLOAT LEVEL: Fuel Level—Should be 5/8" below top edge of bowl with 4 lbs. pressure (engine idling) or approximately even with the bottom of the inspection hole on side of bowl (remove plug to check level).

Float Height—Use special service tool, T-24971 when setting floats. Remove air horn and float bowl cover assembly, invert assembly, mount gauge tool on gasket. Tops of floats should be even with tops of vertical guides on tool and sides of floats should be parallel to tool guides without any drag (this is important to prevent floats dragging on sides of bowl when installed). Adjust floats by bending float lever. CAUTION—Use extreme care to set both floats alike.

Float Valve & Seat—Part No. P-22499. Furnished only as matched sets.

NOTE—Valve needle is clipped to float lever by wire clip.

Float Bowl Vent—Bowl is vented to outside through opening inside of air horn directly below air cleaner collar or into air horn by vent tube pressed in side of air horn above choke valve.

THROTTLE VALVE SETTING: To check throttle valve setting, back throttle stopscrew off so that throttle valves tightly closed, insert drill rod of correct size in idle port and vacuum spark port (when used), measure distance from throttle valve edge to drill rod. See table below for settings. All distances are plus or minus .004".

THROTTLE VALVE SETTING

Car Model	Throttle Valve	Idle Port① Setting — Drill	Vacuum Port① Setting — Drill
Chrysler (1942)	P-22752—5°	.030"—#56	.015"—#56
Chrysler ('46-48)	P-22752—5°	.018"—#55	.018"—#56

①—"Drill" figure is correct size drill rod to be used in checking valve.

CHOKE: Sisson Automatic Choke is standard equipment.
See "Sisson Automatic Choke" in Carburetion Equipment Section.

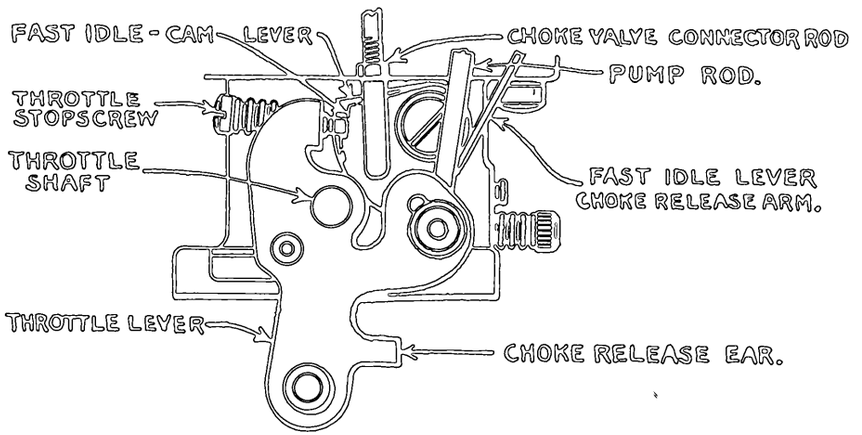
SERVICING: AAVS-2 Kick-down Switch Note—This unit is a separate sub-assembly mounted on the air horn by means of two attaching screws. When overhauling carburetor, remove switch assembly by taking out these attaching screws. CAUTION—Use new gasket, Part No. 384468, when re-installing switch (vacuum passages in mounting flange must be tight).
See Chrysler Transmission Control Kick-down Switch article in Carburetion Equipment Section for complete data on the kick-down switch unit.

Disassembly: Disconnect both the pump connector and the fast idle connector rods, take out retaining screws and lift off bowl cover and air horn assembly. Take out float hinge pin, remove float and needle valve assembly, remove fuel inlet elbow. Remove idle tubes from main body casting, take out pump discharge nozzle attaching screw, remove nozzles, remove pump discharge ball check valve from screw hole (ball will drop out when carburetor inverted, use extreme care not to lose this ball and make certain that it is re-installed when carburetor reassembled). Remove main discharge jet plugs (use special screwdriver T-19099), take out metering jets (use special tool T-24924). If main discharge jets are removed, use special tool T-24967 and see that all traces of old lead gasket removed from jets and seat in carburetor (use new gasket when jets re-installed). Take out four retaining screws and remove throttle body. Remove pump inlet valve plug, strainer screen and inlet valve. Remove economizer by-pass valve. Remove vacuum piston assembly (use special wrench T-24733).

Servicing: Examine the economizer vacuum piston and remove any carbon or gum with crocus cloth (do not use emery or clean piston with gasoline or other cleaning fluid). Check by-pass valve and pump check valves for tightness by using special T-24970 tester (screw valve in proper opening of tester, immerse valve in gasoline and blow through tester—any leakage of valve will be indicated by bubbles). Clean all jets with gasoline or use denatured alcohol to dissolve gum deposits (CAUTION—do not attempt to clean jets with wire or drill rod). Blow out all channels and passages in carburetor with air, remove any carbon deposits in ports and throttle body. Replace worn and damaged parts.

Reassembly: Use all new gaskets (see Service Parts lists below). Reassemble the carburetor by reversing disassembly directions given above. Use new lead gasket when installing main discharge jets and make certain that all traces of old gasket removed from jets and seat in carburetor casting. Check and adjust float level, accelerating pump setting, throttle valve setting, fast idle, and idle setting when carburetor reassembled.

SERVICE PARTS: Gasket Sets—Stromberg No. 382395.
Repair Kits (incl. Gaskets)—Stromberg No. RK-113.



CHRYSLER EIGHT FAST IDLE
(STROMBERG CARBURETOR TYPE)

Car Model	Carburetor	Automatic Choke
Chrysler 8, C39, C40 (1946)	Stromberg AAVS-2	Sisson AC-600
Chrysler 8, C39, C40 (1947)	Stromberg AAVS-2	Sisson AC-600
Chrysler 8, C39, C40 (1948)	Stromberg AAVS-2	Sisson AC-600

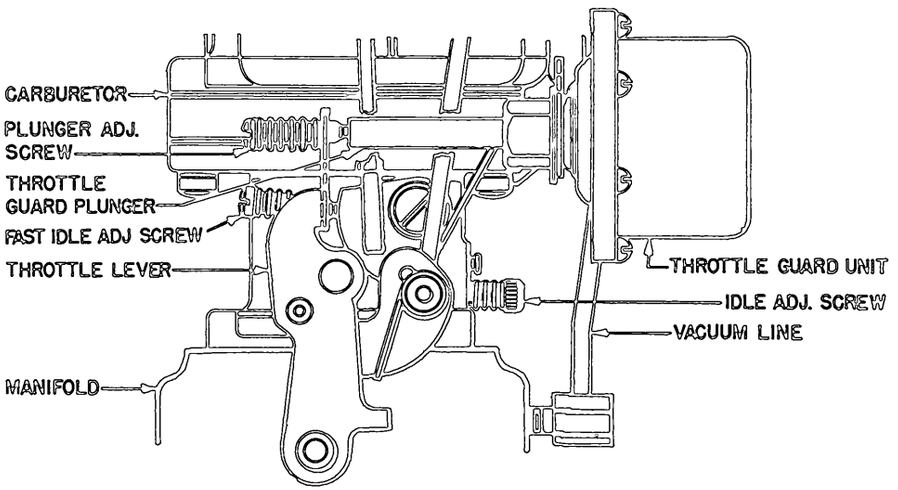
▷*AUTOMATIC CHOKE NOTE:* These carburetors and fast idle mechanism are used with separately mounted Automatic Choke. See Sisson Automatic Choke data.

DESCRIPTION & OPERATION: Fast Idle. Consists of a stepped fast idle cam and a fast idle lever pivoted directly above the throttle valve shaft and linked to the choke valve lever. Fast idle cam serves as the stop for the throttle stopscrew. When the choke valve is closed for cold starting, fast idle cam is rotated so that the stopscrew rests on the highest step of the cam and the throttle valve is opened to the fast idle position. As the engine warms up and the choke valve opens, fast idle cam is allowed to drop down and throttle valve to close progressively until, when the choke valve is wide open, the throttle is closed to the hot or slow idle position with the stopscrew resting on the lowest step of the cam.

Unloader or Choke Release—Consists of an ear on the throttle lever which strikes an extended arm on the fast idle lever when the throttle is opened wide so that choke valve is opened somewhat to correct flooding.

SETTING & ADJUSTMENT: Fast Idle. To check setting, close throttle valve so that stopscrew is against first step of fast idle cam. Move choke valve toward closed position as far as possible (do not force valve beyond point where stopscrew strikes edge of next step on fast idle cam). Choke valve opening in this position should be ⅛" (check by inserting ⅛" drill rod between edge of valve and air horn wall). Adjust by loosening locknut and changing position of ball joint on lower end of connector rod.

Choke Release—To check setting, open throttle valve wide, note choke valve opening by inserting drill rod between edge of valve and air horn wall. Opening should be 7/32". Adjust by bending arm on fast idle cam lever slightly.



AUTOMATIC CHOKE: Setting & Adjustment. See Sisson Automatic Choke.

CHRYSLER EIGHT THROTTLE GUARD
(STROMBERG CARBURETOR TYPE)

Used on following Models with Fluid Drive:

Chrysler 8, Saratoga C39K, New Yorker C39N, Town & Country (1946-47-48)
Chrysler 8, Crown Imperial Model C40 (1946-47-48)

DESCRIPTION & OPERATION: Throttle Guard is designed to prevent engine stalling when the accelerator pedal is released quickly. It consists of a plunger operating on a swivel block which is part of the accelerator linkage. Plunger is actuated by a spring-loaded vacuum diaphragm unit (similar to those used for vacuum spark control) connected to the engine manifold and having a relief valve at the point where it is connected to the Throttle Guard body. In normal operation, the throttle guard plunger follows the swivel in the linkage as the accelerator pedal is depressed (due to the vacuum unit spring pressure). When the accelerator pedal is released quickly, the increase in manifold vacuum acting with the throttle return spring pull offsets the vacuum unit spring pressure and the accelerator pedal return is retarded, the speed of the pedal return being controlled by the metered relief valve in the vacuum line.

ADJUSTMENT: With push pin removed, hold choke valve wide open and close throttle valve so that adjusting screw is against lowest step of fast idle cam. Insert the stub pin setting tool, then adjust each model as follows:

Models C26 27 ('40), C30, 33 ('41)—Adjust nut on rear end of bell crank-to-carburetor rod until a slight drag is secured on a .010" feeler placed between the swivel block and the stub pin setting tool. Tighten locknut and lock against adjusting nut using care not to disturb setting. Remove stub pin setting tool and install throttle guard push pin.

Models C36, C37 ('42), C39, C40 ('46-48)—Turn adjusting screw on carburetor throttle lever (directly above idle speed adjusting screw) until clearance between screw and end of throttle guard plunger is .010" (slight drag on .010" feeler) with engine running.

SERVICING: No special servicing operation required. If throttle guard does not operate satisfactorily after adjustments have been correctly made, check connecting tube, fittings, and vacuum unit for leaks.

Installation (All Models)—Attach the throttle guard and bracket so that the bracket is in a horizontal position when the assembly is mounted on the engine.

STROMBERG MODELS AAV-16, 26, 167, 267

	Stromberg Model & Part No.
BUICK

STUDEBAKER	
1941-42 President 7C, 8C	AAV-26 No. 380038

①—With Standard Air Cleaner.

②—With Heavy Duty (Oil Bath) Air Cleaner.

③—Late 1942 beginning with Engine No. 4540297.

CARBURETOR MODEL IDENTIFICATION: Individual carburetors may be identified by Code Number on bowl cover above fuel level inspection plug as follows: **Buick Code Numbers**—7-37 (380029), 7-57 (380097), 7-66 (380106), 7-69 (380225), 7-70 (380226).

Cadillac Code Numbers—205-8 (380015), 205-10 or 205-10A (380063), 205-14A or 205-14B (380154).

Packard Code Numbers—10-40, 10-40A, B, C, D, or E (A-19172), 10-44 (380037).

Studebaker Code Numbers—6-97, 6-97A, 6-97B or 6-97C (380038).

►CHANGES, CAUTIONS, CORRECTIONS

►**Buick 1941 & Later Carburetor Idle Channel Wire Cautions:** Special restricting wire installed in the idle fuel channel in the carburetor throttle body and main body castings on these carburetors. This wire must not be removed and must be re-installed when carburetors are re-assembled.

►**Buick Starting Switch Note**—Separate assemblies mounted on carburetor and operated by throttle valve shaft as follows: (1941-47) Delco-Remy No. 1990127, (1948-49) Stromberg No. 385000. *See "Starter Controls" in Electrical Equipment Section.*

►**Cadillac 1946-48 Carburetor Production Change**—Carburetor changed from first type (Code No. 205-14A) to later type (Code No. 205-14B). These carburetors have different jet calibrations. *See Stromberg Jet Specification Table for complete data on each model.*

►**Buick, Cadillac Studebaker Other Carburetors**—Carter Dual "WCD" or "WDO" dual carburetors are also used on these models. *See Carburetor Index for Carter carburetor articles for data on these models.*

►**Packard Throttle Guard Note**—Used on Econo-Drive (Overdrive) cars to prevent engine stalling when free-wheeling. *See article in Carburetion Equipment Section for complete adjustment instructions.*

►**Packard 1941 Air Bleed Change to correct Poor Idling Performance Complaints.** Idle air bleed in carburetor main body (see illustration) was #70 drill size on first 10-44 and 10-44A carburetors and has been changed to #60 drill size on later Code 10-44B carburetors. To correct complaints of poor idling performance on Packard cars, check carburetor and on first types with #70 idle air bleed, increase this hole size by drilling idle air bleed out with #60 drill.

►**Studebaker 1941 Acceleration Flat Spot Correction (First Code 6-97 Carbs.):** Later Code 6-97A carburetors (Serial No. 7139912 up) have idle passage inserts installed in idle passages and main metering jet orifice counterbore. To correct complaints of acceleration flat spot at approximately 20 MPH. on cars with first type 6-97 carburetor (before above Serial No.), install following parts: Two No. 382269 Idle Passage Inserts, Two new type No. P-24773 Main Metering Jets. To make this installation, remove carburetor and remove throttle body which will expose drilled idle passages in main body casting. Install insert in each idle passage, driving insert down flush with bottom of counterbore in carburetor body with big end of insert toward opening in passage. Remove and discard both old metering jets, install new type metering jets.

►**Studebaker Code 6-97A Later Production Carburetors**—Have all parts and changes as recommended for earlier 6-97 carburetors installed in production.

DESCRIPTION

DESCRIPTION: Aircraft type (double float), duplex or dual, downdraft types. Similar to "AAV" carburetors (preceding) except for new design Automatic Choke.

AAV-167 & AAV-267 Carburetors—Similar to corresponding AAV-16 & AAV-26 carburetors except that assemblies include Stromberg No. 385000 Starting Switch. *See "Stromberg Starting Switch" in Electrical Equipment Section.*

CARBURETOR ADJUSTMENT & OVERHAUL

IDLE ADJUSTMENT: Adjust only with engine warmed up so that Automatic Choke and Fast Idle inoperative (choke valve wide open and stopscrew on lowest step of fast idle cam). Check idle speed, then turn both idle screws (one screw for each barrel, adjust both screws alike) in until the engine begins to miss, then turn screws out until engine begins to roll, finally turn screws in slowly until engine fires smoothly. These screws control idle fuel discharge from lower idle port and should be turned in for leaner mixture. Recheck idle speed. See car model page for complete tune-up instructions.

IDLE SETTING

Car Model	Carburetor	Idle Setting	Idle Speed
Buick ('41-47)	AAV-16, 26	1¼ turns open	450 RPM, 8 MPH.
Buick ('48-49)	AAV-167, AAV-267	1¾ turns open	450 RPM, 8-MPH.
Cadillac ('39-47)①	AAV-26		7-8 MPH.
Cadillac ('48)①	AAV-26		375-380 RPM.
Cadillac ('41-48)②	AAV-26		375 RPM.
Packard ('40)	AAV-26	1½-1¾ turns open	6 MPH.
Packard ('41)	AAV-26	1-1⅛ turns open	6 MPH③
Studebaker ('41-42)	AAV-26		450 RPM, 8 MPH.

①—Cars with Synchro-mesh Trans. ②—Cars with Hydra-Matic Drive.

③—8-10 MPH. on cars with Electromatic Clutch.

⑤—550-600 RPM. (Synchro-mesh Trans.), 500-550 RPM. (Automatic Trans.)

Buick Note—If vacuum gauge used for idle adjustment, turn both idle adjusting screws out evenly in 'rich' direction until vacuum gauge reading is 1" lower than maximum.

METERING JETS: Main metering jets are non-adjustable type located under plug at lower end of each nozzle. Jets should be changed only for special operating conditions such as high altitude. See Stromberg Jet Specification Table. IMPORTANT—See Notes (above) for production changes in jet sizes.

ECONOMIZER: Consists of by-pass valve and jet in the carburetor main body controlled by a vacuum piston in a cylinder in the air horn casting. Economizer by-passes fuel around main metering jets to main nozzles when vacuum in manifold decrease sufficiently to allow piston to be forced down by spring. Vacuum piston is set to open valve with manifold vacuum as listed in table below which corresponds to a car speed of approximately 65-70 MPH.

ECONOMIZER SETTING

Car Model	In. of HG.	Car Model	In. of HG.
Buick 40, 50 (1941-49)	5-6"	Cadillac (1940)	4-6"
Buick 60, 70, 90 (1942)	4-6"	Cadillac (1946-48)	6½-7½"
Buick 70 (1946-47)	4-6"	Packard	4-6"
Buick 70 (1948-49)	5-6"	Studebaker ('41-42)	5-6"
Cadillac (1939, 41-42)	5-6"		

ACCELERATING PUMP: Similar design as used on other "AAV" carburetors with spring-loaded relief valve in piston head and duration spring on rod above piston (light spring above duration spring in dust washer retainer).
Capacity—Pump capacity per 10 strokes fast (F), slow (S) is shown in table below. Pump must be set for correct stroke (see Adjustment) as shown in table.

CONTINUED ON NEXT PAGE

STROMBERG MODELS AAV-16, 26, 167, 267
(C ntinu d)

ACCELERATING PUMP SETTING

Car Model	Carburetor	Pump Capacity	Pump Setting
Buick 40, 50	AAV-16, 167	11-15 cc. (F), 15-19 cc. (S)	Medium
Buick 60, 70, 90 ('40-47).	AAV-26	10-14 cc. (F), 15-19 cc. (S)	Center
Buick 70	AAV-267	10-14 cc. (F), 15-19 cc. (S)	Medium
Cadillac ('39-42)	AAV-26	13-17 cc. (F), 18-22 cc. (S)	Minimum
Cadillac ('46-48)	AAV-26	23-27 cc. (F), 29-33 cc. (S)	Maximum
Packard	AAV-26	14-18 cc. (F), 27-31 cc. (S)	Maximum
Studebaker ('41-42)	AAV-26	12-16 cc. (F), 16-20 cc. (S)	Minimum

Adjustment (Buick)—Three holes provided in throttle lever for pump rod engagement. Center hole is recommended setting for normal operating conditions. See car model page for recommended settings and changes on each model.

Adjustment (Others)—Two holes provided in throttle lever for pump rod engagement. Inner hole (short radius) provides minimum stroke and pump discharge, outer hole (long radius) maximum stroke. See tune-up data on car model page for recommended settings and seasonal changes.

Pump S rvicing N te—Strainer screen located in plug below pump intake check valve should be cleaned frequently to insure satisfactory pump operation.

FAST IDLE: ***CAUTION—All cars not adjusted alike and each model must be adjusted exactly as follows:***

Buick (1940-47): To check setting, close choke valve on #53 drill (insert drill between upper side of valve and air horn wall), check clearance between ear on locking lever on throttle valve shaft and lug on loose lever on fast idle cam stud (this lever linked to fast idle cam by torsion spring). These levers should just clear as throttle valve is opened and closed. To adjust, bend connecting rod between choke valve lever and fast idle cam using care not to bind the rod in the cam slot or to distort the fast idle cam return spring.

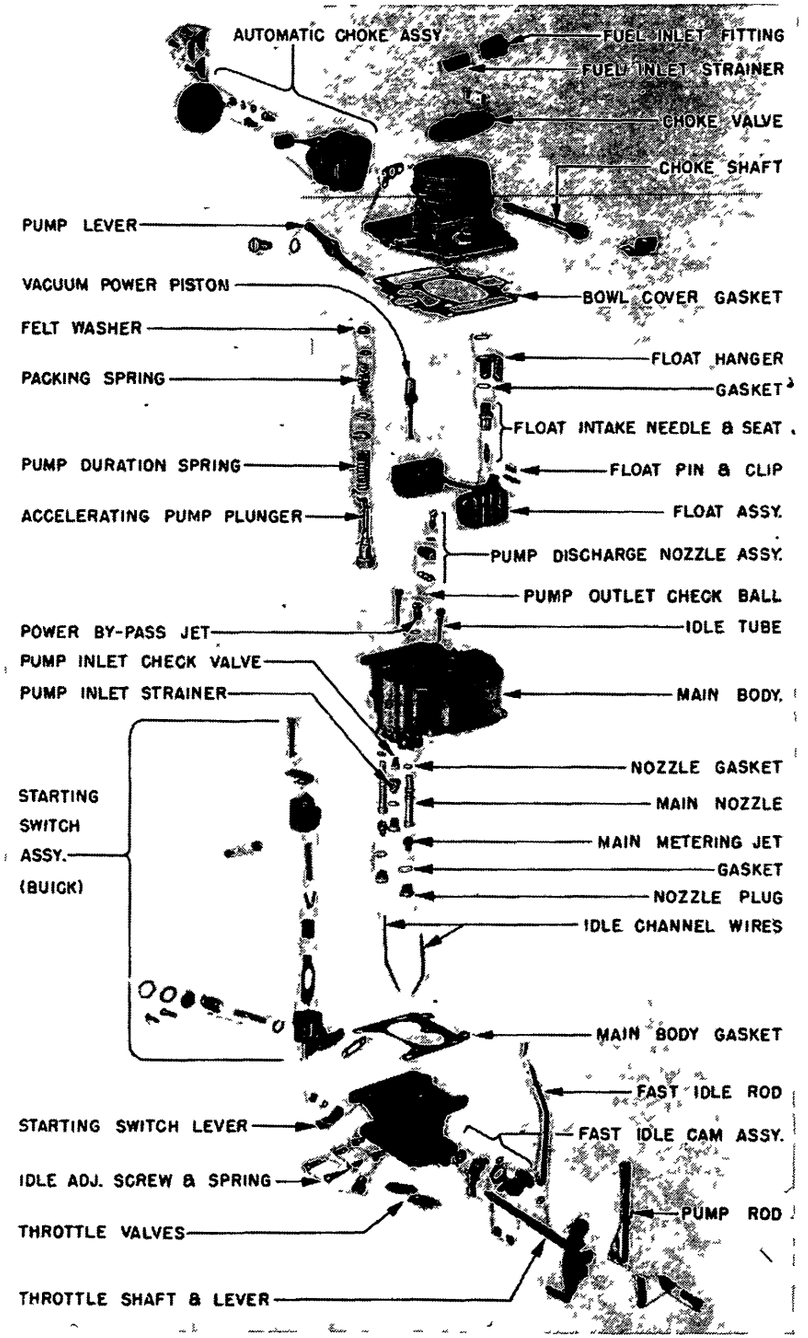
Buick (1948 & Later): ***CAUTION—Two separate settings required as follows:***

Fast Idle Cam Setting—Close choke valve against #26 drill (insert drill between air horn wall and center of upper edge of choke valve), hold valve against drill, see that fast idle cam spring holds cam up against end of fast idle connector rod. Close throttle valve until stopscrew contacts fast idle cam. Screw should clear edge of highest step of cam and rest on second step. Adjust by bending fast idle connector rod at large curve for correct screw contact.

Lock Lever & Loose Lever Clearance—Close choke valve against #53 drill (insert drill between air horn wall and center of upper edge of choke valve), hold valve against drill. Slowly open and close throttle valve and check clearance between lock lever on throttle shaft and loose lever behind fast idle cam. If clearance not just enough to permit lock lever to pass loose lever, bend end of lock lever up or down as required for this clearance.

FAST IDLE SETTING (BUICK)

Car Model	Carburetor	Choke Valve Opening
Buick ('40-47)	AAV-16, AAV-26	#53 drill
Buick ('48-49)	AAV-167, AAV-267	#26 & #53 drill



Cadillac (1939-48), Packard (1940-41), Studebaker (1941-42): Open the throttle, rotate fast idle cam until stopscrew is on high lobe of cam, move choke valve toward closed position as far as possible. Check remaining choke valve opening by inserting drill rod of correct size (see table) between edge of choke valve and air horn wall. If choke valve opening not correct, adjust by bending connector rod slightly at point near choke valve lever using extreme care not to cause any bind in the fast idle mechanism.

FAST IDLE SETTING (EXCEPT BUICK)

Car Model	Carburetor	Choke Valve Opening
Cadillac (41-42)	AAV-26	#32 drill (.116")
Cadillac ('46-48)	AAV-26	#40 drill
Packard ('40)	AAV-26	3/32" drill
Packard ('41)	AAV-26	7/64" drill
Studebaker ('41-42)	AAV-26	7/64" drill

UNLOADER (CHOKE RELEASE) SETTING: When throttle valve is opened wide, an ear on the throttle lever contacts a lug on the fast idle cam or fast idle cam

CONTINUED ON NEXT PAGE

STROMBERG "AAV" CARBURETOR (BUICK SHOWN—OTHERS SIMILAR)

STROMBERG MODELS AAV-16, 26, 167, 267
(C ntinu d)

loose lever and opens the choke valve to correct flooding. To check operation, hold throttle valve wide open, check choke valve opening by inserting drill rod (or special tool) of correct size (see table below) between edge of choke valve and air horn wall. If choke valve opening not correct, adjust by bending ear on throttle lever slightly, using care not to cause binding of fast idle rod or to distort fast idle cam spring.

UNLOADER SETTING

Car Model	Carburetor	Drill Size	Tool No.
Buick ('39-49)	AAV-16, 167; AAV-26, 267	11/64"	T-25057
Cadillac ('39-41)	AAV-26	11/64"	T-25056
Cadillac ('42-48)	AAV-26	11/64"	T-25057
Packard	AAV-26	11/64"	T-25056
Studebaker ('41-42)	AAV-26	11/64"	T-25056

FLOAT LEVEL: ***CAUTION—Floats must be adjusted vertically (Float Height) and laterally (to prevent floats dragging on sides of bowl) as follows:***

Float Level: Use special service tool T-24971 to check floats. Remove air horn and bowl cover assembly, invert cover, install tool on gasket. Tops of floats should be even with, or above or below (see table) tops of vertical guides on gauge and sides of floats must be parallel to sides of gauge guides (to prevent floats dragging on sides of float bowl). CAUTION—Use extreme care to adjust both floats exactly alike.

Float Setting Note—When using gauge (see table), adjust floats vertically for float setting shown, adjust laterally so that sides of floats parallel to gauge without any drag (necessary to prevent floats dragging on sides of bowl). Correct float setting should give correct fuel level (below).

FLOAT LEVEL SETTING

Car Model	Carburetor	Float Height (On Gauge)
Buick 40, 50 ('40-49)①	AAV-16, 167	3/64" above
Buick 40, 50 ('40-49)②	AAV-16, 167	1/32" below
Buick 60, 70, 80, 90 ('40-47)	AAV-26	3/64" above
Buick 70 ('48-49)	AAV-267	1/32" below
Cadillac ('41)	AAV-26	5/64" above
Cadillac ('42-48)	AAV-26	1/64" above
Packard ('40)	AAV-26	Even
Packard ('41)	AAV-26	1/64" above
Studebaker ('41-42)	AAV-26	Even

①—Carburetors with Brass Float. ②—Carburetors with Steel Float.

Fuel Level: Fuel level in float bowl should be even with the bottom of the inspection hole on the side of the bowl with 5 lbs. pressure (3 lbs. on Packard and Studebaker). Remove plug in inspection hole to check fuel level. With bowl cover and gasket removed, fuel level in bowl (below top edge of bowl) should be:

FUEL LEVEL SETTING

Car Model	Carburetor	Fuel Level
Buick ('39-49)	AAV-16, 167; AAV-26, 267	19/32"
Cadillac	AAV-26	5/8"
Packard	AAV-26	5/8"
Studebaker ('41-42)	AAV-26	5/8"

Float Valve & Seat—Part No. P-22499. Furnished only as matched sets. When installing, make certain that needle valve is clipped to float lever.

THROTTLE VALVE SETTING: To check the throttle setting, back throttle stop-screw off so that valves are tightly closed, insert drill rod of correct size in idle port and vacuum spark port (when used), measure distance from throttle valve edge to drill. See table below for settings. All figures are plus or minus .004".

THROTTLE VALVE SETTING

Car Model	Throttle Valve	Idl P rt① Setting	Idl P rt① Drill	Vacuum Port① Setting	Vacuum Port① Drill
Buick ('41-47—AAV-16)	P-24684—5°	.022"	#60	.041"	#58
Buick ('42-47—AAV-26)	P-24740—5°	.022"	#60	.055"	#58
Buick ('48-49 AAV-167)	P-24684—5°	.022"	#60	.080"	#58
Buick ('48-49 AAV-267)	P-24740—5°	.022"	#60	.055"	#58

Packard ('41)	P-24740—5°	.022"	#58	.012"	#58
Studebaker ('41-42)	P-24740—5°	.015"	#60	Flush	#56

①—**"Drill" figure is correct size drill rod to be used in checking valve.**
⑧—First Code No. 205-14A Carb.
⑨—Later Code No. 205-14B Carb.
⑩—Part No. 384912 (Right, 384913 (Left).
⑪—Plus .006" or minus .000".

CHOKE: Offset type butterfly valve with Stromberg Automatic Choke control. ***See Stromberg Automatic Choke in Carburetion Equipment Section.***
Choke Setting—Inverted "V" mark on thermostat cover scale should be "Centered or in line with projection on top of choke housing except models noted in table below. This standard setting may be varied not more than two graduations in either direction to provide best performance under exceptional operating conditions. To adjust, loosen three housing cover retainer screws, rotate cover and coil assembly.

►***CAUTION***—When connecting heat tube to the choke thermostat cover, do not use excessive pressure (may distort or rotate cover and change setting).

AUTOMATIC CHOKE SETTING

Car Model	Carburetor	Choke Setting
Buick 40, 50 ('40-49)	AAV-16, AAV-167	1 Graduation Lean
Buick Others ('39-49)	AAV-26, AAV-267	Centered
Cadillac ('39-40)	AAV-26	Centered
Cadillac ('41-42)	AAV-26	See Note (below)
Cadillac ('46-48)	AAV-26	Centered
Packard ('40-41)	AAV-26	Centered
Studebaker ('41-42)	AAV-26	Centered

Cadillac ('41-42) Setting—First Code 205-10 carburetors set 2 Graduations Rich (inverted "V" mark on thermostat cover scale two graduations counter-clockwise from reference mark on housing), **Later Code 205-10A** carburetors Centered (inverted "V" mark in line with reference mark on housing).

Cadillac ('46-48) Setting—On both Code No. 205-14A and 205-14B carburetors, **the inverted 'V' mark on the thermostat cover scale should be set to coincide with the reference mark on the housing. Thermostat, Cover, and Screen Assembly is Part No. 384648 and is marked '20' for identification.**
Studebaker ('41-42) Setting—Cover is marked for 3 settings as follows: 'H', 'M', 'R'. **Standard setting is with 'R' mark coinciding with reference mark on housing flange and is correct for regular fuel and operating conditions. If engine loads up or over-chokes with this 'R' setting, change to 'M' setting. Use 'H' setting only when highly volatile fuel is used continuously.**

Thermostatic Coil Identification:—All thermostatic coil and cover assemblies are marked by small figure stamped on cover for identification as follows:

Buick—6 (All Series).

Cadillac—19 (1942—First Code 205-10 Carbs.), 13 (1942—Later Code 205-10A Carbs.), 20 (1946-48—Code 205-14A and 205-14B Carbs.).

Packard—10 (1940—Std. on Code 10-40D Carbs. and used to replace "11" and "3" units on Code 10-40C and earlier Carbs.), 14 (1941).

STARTING SWITCH (Buick Models): Delco-Remy or Stromberg unit mounted on carburetor and operated by throttle valve shaft.
See "Delco-Remy Vacuum Starter Switch" and "Stromberg Starter Switch" in Electrical Equipment Section for complete data.

DISASSEMBLY OF CARBURETOR: With carburetor removed from engine, proceed as follows:

C NTINUED ON NEXT PAGE

STROMBERG MODELS AAV-16, 26, 167, 267 (Continued)

Automatic Choke Removal—Take out three cover screws, lift off choke cover and thermostat assembly, remove locknut from choke shaft (wrench T-25047), remove lockwasher, serrated washer, housing screws. Remove housing while sliding vacuum piston lever off end of choke shaft. Remove choke valve, withdraw choke shaft and lever assembly. Remove lead ball plugs from choke housing (tool T-25052) using care not to damage plug seats.

Air Horn & Float—Disconnect fast idle rod from fast idle cam and pump rod from pump lever (push upward on spring housing and pull outward). Take out pump lever fulcrum screw (left-hand thread) and spring washer, disconnect lever from accelerating pump plunger stem. Take out air horn attaching screws, lift off air horn and float as an assembly. Remove pump piston assembly, remove felt washer, splash washer, and retainer spring from piston link. Remove float pin (tap on end opposite serrated end), lift out float, remove inlet valve and seat assembly (use wrench T-20140). Remove vacuum power piston from air horn (use wrench T-29733), remove gasoline connection and inlet strainer. Remove starter vacuum switch by taking out two mounting screws.

Main Body Casting—Remove power bypass jet and gasket with a large screwdriver, remove both idle tubes (CAUTION—use care not to damage small end of tubes which contain metering orifice). Remove pump discharge nozzle screw, nozzle, gaskets, invert assembly and catch check valve ball which will drop out of channel. Remove main discharge jet plugs and gaskets, then remove main metering jets. Remove main discharge nozzles by screwing Jet Remover J-24967 into base of jet and pulling nozzles out of body (NOTE—threads cut by removing tool will not affect metering characteristics of nozzles). Make certain that lead gaskets are removed from main body. Remove screws attaching throttle body, then remove idle channel reducer wires. Remove pump inlet check valve plug and gasket, remove strainer and inlet check valve. Remove all lead plugs from main body casting using Plug Remover T-25052 being careful not to damage plug seats in casting.

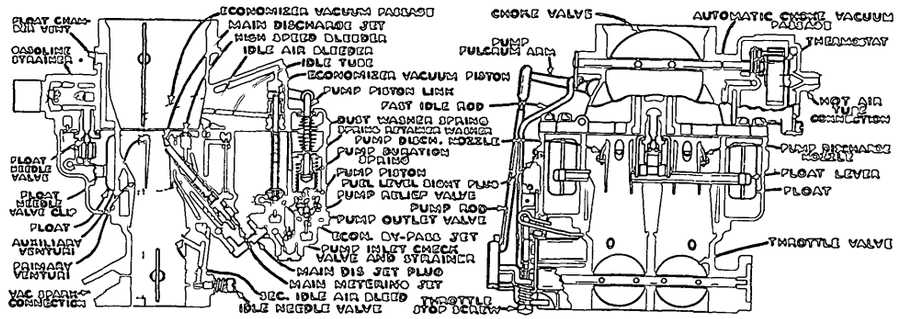
Throttle Body—Take out both idle needle valves and springs, remove taper drive plugs from body (unless carburetor very dirty, do not disturb these plugs). Mark each throttle valve to insure replacement in same barrel and in same position, take out valve attaching screws, withdraw throttle valve assembly.

CLEANING & INSPECTION: Use Bendix Carburetor Cleaning Solvent to thoroughly clean all parts (immerse and soak all metal parts in solvent), rinse in kerosene or white gasoline, dry with air and blow out all channels and passages with air. Inspect all parts for wear or damage, replace all doubtful parts. Use all new gaskets when reassembling.

REASSEMBLY OF CARBURETOR: Use all new gaskets. Assemble carburetor by reversing order of disassembly and note following important points:

Throttle Valve Installation—Align marks made before disassembly, make certain that small bleed holes in valve are toward idle discharge holes, check for even clearance of valve in bore before tightening attaching screws.

Pump Inlet Strainer—Use tool T-25097 to install strainer after pump inlet check valve has been installed (place strainer on rounded end of tool pin, insert strainer in tool tube, place tube in main body and use opposite end of tool pin to slide strainer into place). Install check valve plug using new copper gasket (make certain that plug and seat are clean to insure good seal).



Idle Reducer Wires—Insert long ends of reducer wires in idle channels in throttle body, guide short ends of wires into idle channels in main body when installing throttle body. *NOTE*—These idle channel wires used only in Buick carburetors and Studebaker AAUVB-26 carburetor.

Main Discharge Nozzles and Jets—Make certain that old lead gaskets completely removed from nozzle seats in main body, use new lead gaskets assembled over beveled ends of main nozzles, use tool T-24967 to install nozzles making certain that nozzles positioned so that flat surface on end is parallel to direction of air flow through venturi. Use tool T-24924 to install main metering jets. Use new copper gasket on main discharge jet plugs (make certain that plug and seat are clean to insure good seal).

Vacuum Power Piston—Use wrench T-24733 to install piston in air horn (CAUTION—hold tool flat against gasket surface to avoid damage to piston). Do not lubricate piston. Check piston for free operation after installation.

Float & Needle Valve Installation—Install float hanger with new gasket on each side. Install new needle valve seat (wrench T-20140). Place new gasket on air horn, attach inlet valve needle to clip on float lever, install floats and tap fulcrum pin lightly in place so that serrated end grips hanger leg securely.

CAUTION—Check float lever for binding in hanger after installation.

▷*BUICK FLOAT CAUTION—Buick floats beginning 1948 are designed for 5 lbs. fuel pump pressure and identified by figure "5" stamped on float lever. No other type float should be used (both brass and steel floats are marked in this manner).*

Carburetor Adjustments—Check Float Level Setting, Fast Idle Setting, Unloader Setting, Choke Setting as carburetor is assembled. After carburetor installed on engine, adjust idle mixture and idle speed. See adjustments.

Buick Starter Switch Setting—*See "Delco-Remy Vacuum Starter Switch" and "Stromberg Starter Switch" in Electrical Equipment Section.*

SERVICE PARTS: Gasket Sets—Stromberg No. J-5656-G (Buick AAV-16), No. 382373 (Buick AAV-167), No. J-5655-G (Buick AAV-26), No. 382372 (Buick AAV-267), No. 382393 (Cadillac 1941-48, Studebaker 1941-42), No. 382394 (Packard 1941).

Repair Parts Kit: Furnished for each model as follows:

Buick—Stromberg No. RK-72 (Series 40, 50 1940-47), No. RK-73 (Series 60, 70, 90 1942-47), No. RK-140 (Series 40, 50 1948-49 AAV-167), No. RK-141 (Series 70 1948-49 AAV-267).

Cadillac—Stromberg No. RK-20 (A-18962), RK-76 (A-19212), No. RK-108 (380015), No. RK-125 (380063), No. RK-134 (380154).

Packard—Stromberg No. RK-106 (1940 Code 10-40, 1040A, 10-40B Carbs.), No. RK-78 (1940 Code 10-40C, 10-40D Carbs.), No. RK-107 (1940 Code 10-40E and later Carbs.), No. RK-110 (1941 380037 Carbs.).

Studebaker—Stromberg No. RK-111 (1941-42).

►CHANGES & CORRECTIONS

►***BUICK 1950-51 AAUVB-267 & AAVB-267 CARBURETOR PRODUCTION CHANGES:*** Parts changes were made at two different points in production so that THREE different types of each carburetor may be found in service as identified by Code Number (see Code Nos. listed in footnotes above). ***WHEN SERVICING THESE CARBURETORS, MAKE RECOMMENDED CHANGES AS FOLLOWS:***

FIRST TYPE (Code 7-88 & 7-89)—Install Torsion Spring on pump lever and **change Code No. to 7-88A & 7-89A.** To install spring, remove pump lever attaching screw, slip spring over lever boss on carburetor, re-install lever, engage hooked end of spring under short end of lever. Remove air horn attaching screw directly under pump lever, align looped end of spring with screw hole re-install screw.

SECOND TYPE (Code 7-88A & 7-89A)—These carburetors have Pump Lever Torsion Spring as recommended for installation on first Code 7-88 & 7-89 carburetors above. No changes recommended.

CAUTION—New parts listed below for later 7-88B & 7-89B carburetors are not interchangeable with earlier parts and cannot be installed on these earlier 7-88A & 7-89A carburetors. CORRECT TYPE PARTS MUST BE USED ON EACH CARBURETOR.

THIRD TYPE (Code 7-88B & 7-89B)—These carburetors have new parts listed below which are NOT INTERCHANGEABLE with similar parts on earlier carburetors:

Parts Changes:	7-88 & A 7-89 & A	7-88B & 7-89B
Accelerating Pump Lever	P-24677	385589
Accelerating Pump Rod	385352	385592
Start-Aid Lever	P-24462	385606
Start-Aid Spring	P-24681	385607
Starter Switch Assy.	385000	①385611
Switch Contact Spring	385006	385610
Switch Housing	385031	①385063
Assistor Spring	385569	385605

①—Identified by letter "A" on housing. NOT interchangeable with first type due to new design contact guide spring.

►***BUICK 1950-51 AIR CLEANER "BLOW-UP" CORRECTION***—This condition caused by gasoline vapor collecting in silencer chamber and can be corrected by venting carburetor as follows: Drill a 1/16" hole through center of each welch plug on rear of carburetor body (hole located at point of low suction and will not affect carburetor performance). Use extreme care to prevent metal chips falling into manifold if this modification made with carburetor on engine. ***NOTE***—Later production carburetors have these holes.

►***BUICK CARBURETOR STARTING SWITCH CHANGE (Stromberg Carburetors)***—Design of some switch parts changed (Vacuum Piston Seal, Felt Air Filter, Filter Spring, Washer, Slide, and Filter Screen Retainer) and only **new type parts should be used when servicing Starter Switches.** These parts furnished in Change-over Kit Part No. 386260. ***See "Stromberg Starter Switch" in Electrical Equipment Section for complete data.***

NOTE—Code No. 7-90B and 7-91A carburetors have new type switches and do not require modification.

►***BUICK 1953 SERIES 50 CHANGE TO ELIMINATE DETONATION OR SPARK RAP (First 7-95 Carburetors):*** Increase size of vacuum spark control port from .040" to .081" as follows: Remove carburetor from engine, place throttle valves in wide open position and protect valves from damage by drill. Remove spark control fitting from throttle body. Working through spark control fitting hole, use No. 47 drill to enlarge original .040" spark control hole, then finish drill hole with No. 46 drill (.081"). Blow out all chips and thoroughly clean carburetor, reinstall spark control fitting. MAKE OTHER RECOMMENDED CHANGES (following). Re-install carburetor on engine. ***NOTE—Code 7-95A carburetors have this .081" spark port.***

►***BUICK 1953 SERIES 50 IMPROVED WARM-UP & STALLING ELIMINATION (First 7-95 Carburetors) Make following Choke & Fast Idle Cam Changes:***

1) Automatic Choke—Enlarge heat hole in choke housing as follows: Remove air horn and float bowl cover assembly from carburetor, remove float assembly, remove thermostat cover and coil assembly. Remove lead ball from outer end of horizontal vacuum passage in choke housing (adjacent to choke piston cylinder). Using No. 54 drill in pin vise (***CAUTION***—use grease on drill to catch chips), work through the vacuum passage and enlarge the original No. 56 hole at the inner end of the passage to No. 54 drill (.055") size. Blow out passage thoroughly with air, install new lead ball to seal outer end of passage, install thermostat cover and set to Center (At Index) setting, assemble float and reassemble carburetor.

2) Fast Idle Cam Setting—Check and adjust Fast Idle Cam using No. 41 drill for setting gauge (was #26 drill), check "Start Aid" (Fast Idle Lever Clearance). ***See Fast Idle Setting data below.***

3) Unloader (Choke Release) Setting—Check and adjust unloader. ***See Unloader Setting data below.***

►***BUICK 1953 SERIES 50 ENGINE SURGE ON TURNS CORRECTION (First 7-95 Carburetors):*** Drill 3/16" hole through wall of baffle in float bowl (above power by-pass valve) exactly as follows: Remove air horn and bowl cover assembly from carburetor, remove throttle body from main body (see OVERHAUL data below for disassembly instructions), remove power by-pass valve and gasket from main body and **drop a ¼" x ½" round head stove bolt in by-pass valve well** (to protect valve seat from drill damage). Use a 3/16" drill in electric drill or hand chuck, slip piece of ¼" tubing over drill stem so that only first 7/16" of drill exposed, rest cutting end of drill on head of stove bolt and shank end of drill on idle tube boss on side of bowl (opposite side from starting switch mounting), drill through the wall. Remove all drill chips by blowing out with air, remove stove bolt from by-pass well, thoroughly clean carburetor. Reassemble and adjust carburetor.

►***STUDEBAKER 1951 RECOMMENDED CHANGES (First Code No. 6-107 Carburetors):*** When servicing these carburetors, manufacturer recommends that following new type parts be installed (or old parts reworked as indicated) and that new settings be used as listed below.

Parts Changes:	Code 6-107	Cod 6-107A
Main Metering Jet	P-24473①	②P-24473
Power By-pass Jet	P-21657③	④P-24674
Vac. Piston, Link, Lever	385580	⑤385579
Thermostat Cover Assy.	385638	⑤385778
Fast Idle Cam	385593	⑥385593
Fuel Strainer & Clip	385360 & 385355	

①—.044". ②—.045". ③—#56. ④—#60.
⑤—First type can be reworked—see below.
⑥—Marked by "1" stamped on end of cam..

Vacuum Piston Change—Rework first type piston by drilling #54 hole in center of piston head. When installing piston, make certain that piston and cylinder are thoroughly clean and that piston moves freely in cylinder **without any type of lubrication.**

Thermostat Cover Assembly—Thermostat Cover Plate (behind thermostatic coil) must be removed (not used on later No. 385778 Assy.). To remove plate, break staking on center of hub which retains thermostatic coil end, remove coil, remove and discard cover plate. Replace thermostatic coil making certain that hook on end of coil is adjacent to inverted "V" mark on edge of cover, restake end of hub with small punch to retain the coil end.

Fast Idle Cam—Install new fast idle cam identified by figure "1" stamped on highest step of cam (same part number as original type). This cam will provide faster idle speed during warm-up period.

Fuel Inlet Strainer & Clip—Install these parts at fuel inlet (same parts as used for accelerating pump).

Carburetor Code Marking—After above parts installed, add "A" to 6-107 code number on float chamber cover.

Automatic Choke Setting—Set all Code 6-107A carburetors to **2 Points Lean.** ***See "Hot Air Stove Change" and "Filtered Air Change" below for choke setting change when these other changes mad .***

►***STUDEBAKER 1951 CODE 6-107A CARBURETORS:*** This carburetor has all parts and changes recommended for inclusion in Code 6-107 carburetors (above).

►***STUDEBAKER 1951 AUTOMATIC CHOKE HOT-AIR STOVE CHANGE FOR IMPROVED CHOKE ACTION:*** Beginning with 1951 Engine No. V95954, new hot-air stove used which is located closer to automatic choke. This new stove can be installed on previous engines with Code 6-107A carburetors (6-107 carburetors on first engines must be modified to 6-

CONTINUED ON NEXT PAGE

STROMBERG "AAUVB" & "AAVB" (Continued)

107A as directed in previous release before stove can be installed on these engines):

Choke Stove Installation (Engines before No. V-95954)—See Note below for parts required. Remove carburetor from manifold, carefully cover manifold opening with masking tape, remove and discard old automatic choke-to-manifold pipe, then proceed as follows:

1) Center-punch approximate center of boss located to left of left front carburetor mounting stud. Drill a ¼" hole in the boss, then enlarge the hole using a 33/64" drill (CAUTION—DO NOT use any other drill than 33/64" for enlarging or finishing this hole).

2) Insert new Automatic Choke Manifold Heat Tube, No. 531359, in this hole with plugged end toward center of left bank cylinder head, use a rawhide mallet to set the tube into place so that end of tube extends 1" above the boss.

3) Use compressed air to clean off manifold and remove all dirt from bottom of heat tube.

4) Install shroud, No. 531361, on manifold-to-choke tube and loom assembly, No. 531812, then install assembly in tube slipping shroud down over end of tube.

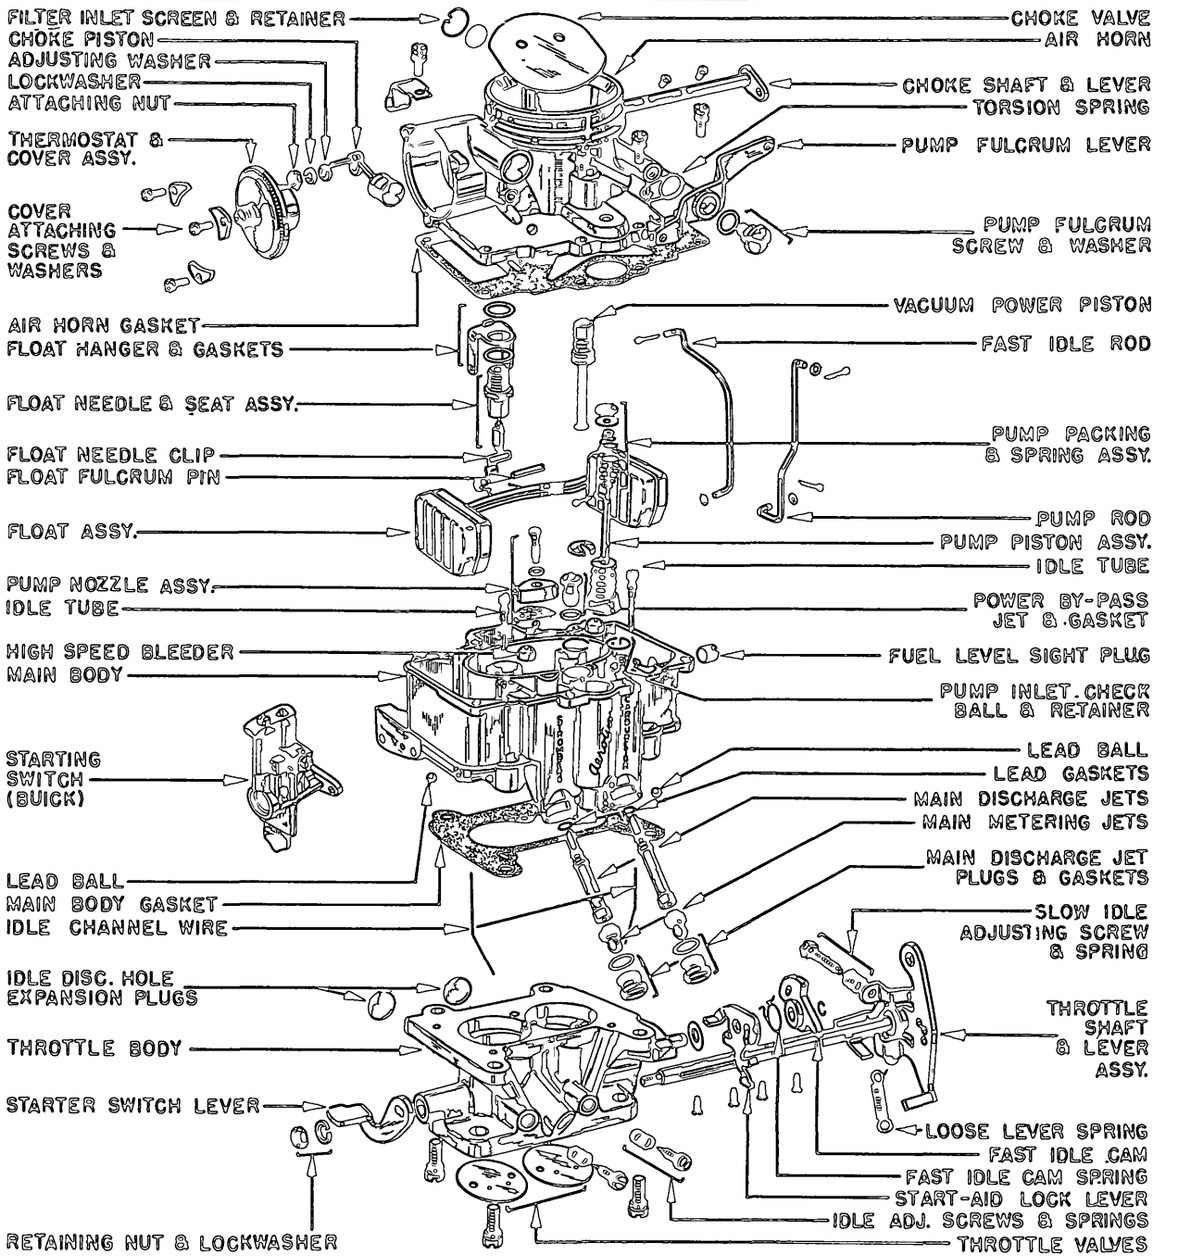
5) Clean carburetor automatic choke housing and vacuum piston. Set choke for centered setting (arrow on cover aligned with index or sharp edge of boss on top of housing).

6) Re-install carburetor with new gasket, connect manifold-to-choke tube and tighten coupling nut finger-tight (tighten coupling securely after carburetor mounting nuts tightened).

Parts Change Note—Parts required for above change are: Manifold Heat Tube No. 531359, Manifold-to-Choke Tube & Loom Assy. No. 531812, and Shroud No. 531361.

▷*STUDEBAKER 1951 AUTOMATIC CHOKE "FILTERED AIR" CHANGE FOR IMPROVED CHOKE ACTION:* Beginning with 1951 Engine No. V172611, new system used by which filtered air (from air cleaner) is fed to choke stove in manifold to prevent dust being carried into choke mechanism and interfering with choke operation. This "filtered air" sytem can be installed on eariler cars as follows:

NOTE—On engines before No. V95954, new Automatic Choke Stove must be installed first (see Automatic Choke Hot Air Stove Change above).



1) Thoroughly clean entire intake manifold and carburetor with compressed air, remove air cleaner.

2) Disconnect manifold-to-choke tube and loom assembly and remove the tube and shroud.

3) Remove choke cover, inspect vacuum piston and cylinder for evidence of sticking caused by dust, clean out cylinder with small wire brush, polish piston with crocus cloth, clean entire choke housing and cover assembly with compressed air. Make certain that choke assembly moves freely after reassembly.

CAUTION—See Choke Valve Bind Correction above.

4) When re-installing choke cover, make certain that additional gasket installed between cover and baffle plate on Code 6-111 carburetors (not used on Code 6-107A) and that regular gasket installed in housing recess (all carburetors). Set choke cover 1 Notch Lean (6-107A carburetors) or centered (6-111 carburetors).

STROMBERG "AAUVB" & "AAVB" CARBURETORS

5) Thoroughly clean heater tube in manifold by blowing out with compressed air (use 18" length of ¼" copper tube on air line to insure cleaning bottom of heater tube).

6) Install Shroud Base No. 532350 on heater tube with larger opening up (*CAUTION*—bottom of shroud base must seat on intake manifold). Install two Shroud Base Asbestos Gaskets No. 532358 in the base (*CAUTION*—use extreme care that gasket material does not fall into heater tube). Install new Shroud-and-Pipe Assy. No. 532362 on base and use wooden block to tap it down over heater tube so that it seats securely on the gaskets in the base.

CONTINUED ON NEXT PAGE

STROMBERG "AAUVB" & "AAVB" (C ntinu d)

7) Install small end of Heater Tube Seal Spring No. 532360 over lower end of manifold-to-choke tube and loom assembly, then assemble Seal Washer No. 361-04 and Silicone Seal No. 532366 on tube under the spring. Insert tube and loom assembly down into heater tube and position spring on tube so that spring will be compressed at final assembly. Connect upper end of tube assembly to choke cover.
8) Disassemble air cleaner, drill 7/16" hole in air cleaner elbow 1½" up from lower edge of elbow and 90° to rear of elbow center line. Thoroughly clean inside of elbow with compressed air. Install Rubber Grommet No. 532367 in this hole with external chamfer in (use liquid soap on grommet).
9) Clean and service air cleaner and re-install.
10) Insert Nipple No. 532368 in end of Nipple-to-Shroud Hose No. 959x7½ so that flared end protrudes ¼" from end of hose, inset flared end of nipple into air cleaner elbow grommet (use liquid soap as lubricant), connect other end of hose to Shroud and Pipe Assy. No. 532362 (see step 6 above).
11) Check installation by running engine until it is warmed up to operating temperature, note choke action. Then allow engine to cool off and make certain that choke valve returns to closed position.
Parts Change Note—Above parts furnished in Automatic Choke Heater Tube Kit No. 532365.

►***STUDEBAKER LATE 1951 CODE 6-111 CARBURETORS:*** This carburetor has different specifications (not interchangeable with Code 6-107 & 6-107A).

►***1951 STUDEBAKER AAUVB-26 CODE 6-107A CARBURETOR MODIFICATION FOR IMPROVED HOT STARTING:*** Vent the carburetor externally by drilling holes in Throttle Body Casting ONLY:

Throttle Body Vents—Remove carburetor from engine and disassemble throttle body so that it can be thoroughly cleaned after drilling. Use #36 drill, drill two holes through from outside into carburetor barrels (one hole in each barrel). Locate holes 3/8" below upper gasket surface of throttle body and toward center of each barrel from idle passage. ***CAUTION—Vent holes must be of proper size and located exactly as above. DO NOT vent air horn (as done on Code 6-111 carburetors).***

►***STUDEBAKER 1951 V8 ACCELERATION HESITATION CORRECTION (Stromberg AAUVB-26 No. 6-111):*** If this condition apparent when accelerating gradually in high gear at approximately ¼ throttle, check for leak in accelerating pump at intake ball seat. Check and correct as follows:

Checking for Leakage—With carburetor on bench, remove pump piston assy., partially fill bowl with fuel (to fill pump passages and pump cylinder), re-install pump piston. Hold pump discharge nozzle screw hole closed, depress pump piston. If fuel seen bubbling up through inlet port screen, or if a noticeable resistance to pump piston movement is not felt (with fuel escaping around piston), leakage is indicated. Reseat ball check as follows:

Seating Ball Check—Dismantle pump for access to inlet ball check. Use a drift to tap the ball sharply with a light hammer to smooth out ball seat. Recheck for leakage before reassembling.

►***STUDEBAKER 1951 CHOKE VALVE BIND (First Stromberg AAUVB-26 Code 6-111)***—Choke valve bind causing incorrect choke operation due to interference between air horn body and sides of choke valve (most noticeable in extremely cold weather). Correct by loosening two valve attaching screws and relocating valve on choke shaft. If free operation of the valve cannot be secured in this manner, remove valve and carefully file flat surface on each side of valve (not necessary to remove more than several thousandths of an inch of metal).

►***STUDEBAKER 1951-52 IMPROVED STARTING WITH HOT ENGINE CHANGE (Stromberg AAUVB-26 Code 6-111):*** To correct starting difficulties or excessive cranking when engine hot, carburetor should be vented externally by drilling holes in Air Horn Casting and Throttle Body Casting EXACTLY as detailed below. Remove carburetor from engine and disassemble for this modification. ***CAUTION—Vent holes must be proper size and located as follows:***

Air Horn Vent—Use #32 drill. Drill one hole through from outside into bowl vent passage in air horn. Locate hole 3/16" above upper surface of cover flange and in center of bowl vent riser (just to left of pump plunger hole in cover).

Throttle Body Vents—Use #36 drill. Drill two holes through from outside into carburetor barrels (one hole in each barrel). Locate these holes 3/8" below upper gasket surface of throttle body and toward center of each barrel from idle passage.

►***LATE 1952 STUDEBAKER CARBURETORS:*** Stromberg Code No. 6-111B and 6-111C carburetors, with modifications from original 1951-52 Code 6-111 carburetor, used on later 1952 cars as follows:
Code 6-111B Carburetors—These carburetors were modified in the field to provide external venting for improved hot starting (one hole in bowl vent passage, two holes in carburetor barrels) as directed above for Code 6-111 carburetors.
Code 6-111C Carburetors—Used beginning Engine No. V-201506. These carburetors have the external vent holes (see 6-111B note above) and do not require modification in the field.

►***1953 BUICK SERIES 50 HARD COLD STARTING & WARMING-UP PERFORMANCE CORRECTION (Stromberg AAVB-267 Carburetor):*** This condition noted by excessive cranking time when starting, and stalling when stopping or stumble on acceleration during warming-up period. Correct by making the changes detailed below. *NOTE*—All parts required for this change furnished in Service Kit, Buick No. 1391945.

1)—Remove carburetor from engine and disassemble air horn (see Overhaul data below).
2)—Remove and discard Thermostat Cover Assembly. Remove and discard automatic choke vacuum piston.
3)—Remove lead plug from passage inside choke housing and from passage at gasket surface on lower face of air horn (use Tool T-25052).
4)—Using a #30 drill in a pin vise, enlarge the original #53 restriction in the horizontal passage (insert drill through choke housing) to meet the vertical passage. ***CAUTION—DO NOT drill into outer wall—vertical passage is approximately 1 5/64" deep from edge of boss.***
5)—Blow out all chips with compressed air and thoroughly clean air horn. Assemble new lead plug in channel in choke housing (use Tool T-25054) and in passage in gasket surface in air horn. NOTE—tap lead plug in passage carefully to avoid restricting cross-channel and smooth the surface of the plug down with a file to provide a complete and smooth surface for the air horn gasket.
6)—Reassemble air horn, using NEW Choke Piston and NEW Thermostat Coil & Cover Assembly (furnished in kit—cover identified by stamp "30"). No adjustment required for this new choke piston.
7)—Make all carburetor adjustments, setting the carburetor to following specifications:

Float Level—5/64" above vertical guides on Gauge T-24971.

Choke Setting—Centered (inverted "V" mark on cover in line with left end of boss on choke housing).

Fast Idle Setting—Use #26 drill to adjust fast idle rod, and #53 drill to check locking lever and loose lever clearance.

Unloader Setting—Use #29 drill to check choke valve opening.

8)—Remove main discharge jet plugs (see illustration). Remove and discard both Main Metering Jets. Install NEW .051" Main Metering Jets (Part No. P-24673), install main discharge plugs and tighten securely.
9)—Check Starting Switch Adjustment. With starting switch operating lever just contacting switch slide, throttle opening or clearance between edge of throttle valve and barrel should be 3/32" (.090-.100").
10)—Stamp Code No. 7-95C on carburetor.

DESCRIPTION: Dual or Double Barrel Downdraft Carburetors with automatic choke. Buick carburetors have two types of Starting Switch assemblies. See Starter Switch below. Similar in design to "AAV" carburetors used previously.

ADJUSTMENT: Set these carburetors to the following specifications:

IDLING ADJUSTMENT

Idle Screw Setting—Adjust both screws equally with engine warmed up to normal operating temperature so that choke valve wide open and fast idle inoperative. Set throttle stopscrew for correct idle speed, turn each idle adjusting screw in until engine begins to miss, then turn screw out until engine begins to roll, finally turn screw in until engine runs smoothly. Recheck idle speed. See car model page for complete Tune-Up instructions.

Idle Setting

Buick (All Models).....Approx. 1½ turns open
Studebaker.....Approx. 1¾ turns open
Idle Speed (Buick)—450 RPM. (all cars).
Idle Speed (Studebaker)—550-600 RPM. (Synchromesh Trans. Cars), 500-550 RPM. (Automatic Trans. Cars with selector lever in Neutral "N").

ACCELERATING PUMP

Car Model	Pump Capacity	Pump Setting
Buick 70	10-14 cc(F), 15-19 cc(S)	Medium
Studebaker	11-14 cc(S)	Minimum

NOTE—Pump capacity is for 10 strokes, Fast (F), Slow (S) with pump stroke setting as indicated.
Recommended Pump Setting—Buick—Center Hole (medium stroke), Studebaker—Inner Hole (minimum stroke)

ECONOMIZER SETTING

No adjustment required. Valve opens when manifold vacuum drops to 4-6" (or 65-70 MPH.).

FLOAT LEVEL

Float Setting—5/64" projection above top edge of Checking Gauge T-24971 (all models). To check float level, invert bowl cover and float assembly, place checking gauge on cover gasket (DO NOT remove gasket) with lugs on gauge seated in holes in

C NTINUED ON NEXT PAGE

STROMBERG "AAUVB" & "AAVB" (Continued)

bowl cover. Adjust both floats vertically so that tops of floats are 5/64" above gauge guides, adjust floats laterally so that they are parallel to gauge guides without binding (necessary to prevent floats dragging on sides of bowl).

Fuel Level—21/32" below top edge of bowl with pressure of 5 lbs. (all models) or even with bottom of threads in inspection hole on side of bowl.

THROTTLE VALVE SETTING

NOTE—When checking throttle valve position, insert drill of size noted in idle port and vacuum spark port, check clearance (edge of valve to drill).

Idle Port Clearance

Car Model	Drill Size	⑧Setting
Buick 40, 50 ('50-51)①	#58	.030"
Buick 70 ('50-51)②	#60	.015"
Buick 40, 50 ('51)③	#55	.036"
Buick 70 ('51)④	#53	.035"
Buick 40, 50 ('52-53)	#55	⑤.036"
Studebaker ('51)⑥	#58	.040"
Studebaker ('51-52)⑦	#56	.040"

Vacuum Spark Port Clearance

Car Model	Drill Size	⑧Setting
Buick 40, 50 (All)	#58	.080"
Buick 70 (All)	#58	.055"
Studebaker (All)	#58	.020"

①—Code 7-88, 7-88A, 7-88B carburetors.
②—Code 7-89, 7-89A, 7-89B carburetors.
③—Code 7-90 carburetors.
④—Code 7-91 & 7-91A carburetors.
⑤—Notch in valves should center with secondary idle hole within .010" with valves closed.
⑥—Code 6-107 & 6-107A carburetors.
⑦—Code 6-111 & A, B, C carburetors.
⑧—Plus or minus .004".

FAST IDLE SETTING

Buick Fast Idle: *TWO settings required:*

▷*CAUTION—1953 Series 50 with Automatic Choke & Fast Idle Cam Changes (see Changes & Corrections) requires different fast idle cam setting.*

1) Fast Idle Cam—Close choke valve against correct size drill rod (see table below), see that fast idle cam spring holds cam upward against end of fast idle rod (rod in lower end of slot in cam). Close throttle until stopscrew contacts fast idle cam. If screw does not just clear edge of highest step on cam and bear against second (short) step, adjust by bending fast idle rod at upper curve. See that rod does not bind on cam or in choke lever.

Buick Fast Idle Cam Setting

Car & Carburetor	Checking Drill Size
Buick 40 All AAUVB-267	#26 (.147")
Buick 50 ('50-52) AAVB-267	#26 (.147")
Buick 50 (1953) AAVB-267	①#41 (.096")
Buick 70 ('50-51) AAVB-267	#26 (.147")
Buick 40, 50 (1954)	#51 (.067").
Buick 40 (1955)	#54 (.055").

①—Supersedes #26 (see Improved Warm-up and Stalling Elimination Change).

2) Lever Clearance. Close choke valve against #53 drill, adjust clearance between ear on locking lever on throttle valve shaft and lug on loose lever on fast idle cam stud so that these levers just clear as throttle valve opened and close. Adjust by bending end of loose lever up or down.

Studebaker AAUVB-26 Fast Idle: Hold throttle valve stopscrew against lowest lobe of fast idle cam. Move choke valve as far as possible toward closed position (CAUTION—do not force valve past point at which stopscrew comes up against step on fast idle cam). Measure choke valve opening by inserting 11/32" drill rod (Tool T-25085) between edge of choke valve and air horn wall. Adjust by bending connector rod at horizontal bend below choke lever.

UNLOADER (CHOKE RELEASE)

Setting—.151-.121" or #29 drill (Exc. 1955 Buick), .086" or #44 drill (1955 Buick), choke valve opening with throttle valve wide open. To check open throttle valve wide, measure choke valve opening or clearance between edge of valve and air horn wall using correct size drill rod. Adjust by bending throttle lever ear which contacts fast idle cam.

▷*BUICK NOTE*—After making above adjustment, close throttle and choke valve, then open throttle against tension of the start-aid lever spring. The lock lever should release the loose lever and the spring tension before stop arm on throttle lever contacts stop boss on throttle body.

AUTOMATIC CHOKE

Car Model	①Choke Setting
Buick (All Models)	Centered
Studebaker (Code 6-107)②	Centered
Studebaker (Code 6-107A)②	2 Points Lean
Studebaker (Code 6-111, A, B, C)	Centered

①—Reference point is left end of boss on choke housing.
②—*See "Hot Air Stove Change" and "Filtered Air Change" under Changes & Corrections above for DIFFERENT Choke Settings when these changes made.*

▷*THERMOSTAT CAUTION:* The correct Thermostat and Cover Assembly, identified by a number stamped on cover adjacent to "V" mark must be used. See table below.

Car & Year	Identification No.
Buick 1950-52	#23
Buick 1953-55	#30
Studebaker 1951①	#25
Studebaker 1951②	#26
Studebaker 1952	#26

①—Up to Engine number V-95954.
②—Starting with Engine number V-95954.

CHOKE ADJUSTMENT CAUTION—Use extreme care when tightening heat tube connection not to rotate or distort choke cover.

STARTING SWITCH
(1950-54 Buick Carburetors)

▷*BUICK 1950-51 NOTE—See Changes & Corrections above for changes on 7-88B & 7-89B carburetors.*

Switch Setting (Carburetor on Engine)—On Dynaflow cars, make certain Dashpot and throttle linkage correctly adjusted, place transmission selector lever in neutral and set hand brake firmly to hold car. With engine not running, insert a pin through felt filter and screen to operate vacuum piston, push vacuum piston in and hold it while opening throttle (this will allow slide to engage groove in piston and prevent slide dropping down to complete contact), hold throttle open, remove pin. Place 5/64" spacer between fast idle stopscrew and fast idle cam with fast idle cam in cold idle position. Close throttle so that spacer holds cam in cold idle position. Turn ignition on, hold spacer, depress accelerator to start engine. Engine should not crank. Repeat above test with 3/64" spacer between stopscrew and fast idle cam. Engine should crank. If engine cranks with 5/64" spacer, bend tang on switch operating lever downward slightly and recheck switch timing. If engine does not crank with 3/64" spacer, bend tang on operating lever upward slightly and recheck switch timing. *See "Stromberg Starter Switch" in Electrical Equipment Section for complete data.*

(1955 Buick Carburetor)

Switch Setting (Carburetor on Engine)—On Dynaflow cars make certain Dashpot and throttle linkage are correctly adjusted, and transmission selector lever is in Neutral and parking brake fully applied. Back off throttle stop screw, rotate fast idle cam to slow idle position if necessary, and fully close throttle valve. Hold a stiff 6" scale or straight edge against rear face of lower arm of throttle lever which contacts Dashpot, with scale resting on rocker arm cover. With throttle valve fully closed, scribe pencil mark on cover at front edge of scale. Turn ignition switch and open throttle slowly. Scribe a second mark on rocker arm cover at point where starting motor is energized. The switch is correctly timed when distance between marks on rocker arm cover is 29/32"-1 7/16". To retime switch, change timing shims in switch assembly. Reset engine idle speed to 450 RPM and recheck throttle linkage and Dashpot adjustments. *See "Carter Car Starter" in Electrical Section.*

OVERHAUL: On Buick carburetors, first remove vacuum switch assembly and gasket. Disconnect and remove accelerating pump rod and fast idle rod. Disconnect pump lever from pump piston stem, then take out pump lever fulcrum screw (this screw has left-hand thread), remove lever. Take out air horn attaching screws and lockwashers, lift air horn assembly straight up and off main body. Remove pump spring from pump cylinder and pump piston assembly from air horn. Take out throttle body retaining screws and lockwashers, then lift main body straight up and off. Remove gasket, lift idle channel wires out of throttle body.

Air Horn Disassembly—Tap float hinge pin out (push pin out toward serrated end), remove float and intake needle assembly, free needle from float lever clip, lift off air horn gasket. Unscrew needle valve seat (Wrench T-20140), remove seat, float hanger, and gaskets. Remove staking from around edges of vacuum piston cylinder, remove piston assembly (piston can be removed by gripping upper end of stem directly above the spring with pliers and using 1" block of wood as a fulcrum so that piston can be pulled straight out). Take out thermostat cover screws, remove thermostat cover assembly. Use wrench T-25047 to remove locknut on end of choke shaft, remove lockwasher and serrated washer (Buick carburetors). Take out choke valve attaching screws, remove valve, slide choke shaft out, remove choke piston and lever assembly.

Main Body Disassembly—Remove power by-pass jet and gasket, remove both idle tubes. Remove main discharge jet plugs and copper gaskets, use special socket wrench T-24924 to remove main metering jets. Use Jet Remover T-24967 to remove main discharge jets (screw tool into end of jet and pull jet from main body—threads formed by tool will not affect metering characteristics of jet), make certain that discharge jet lead gaskets removed from body recess. Take out pump discharge nozzle screw, remove nozzle assembly and gaskets, invert body to drop discharge check ball from dis-

CONTINUED ON NEXT PAGE

STROMBERG "AAUVB" & "AAVB" (C ntinu d)

charge passage. Remove intake check ball retainer from bottom of pump cylinder, invert body to drop out intake check ball. Remove pump inlet strainer screen (not used on all carburetors).

Throttle Body Disassembly—Hold down on vacuum switch terminal cap while removing hold-down clip. Remove terminal cap and switch return spring, then lift out switch guide block with contact spring and shims. Do not lose timing shims and the spring washer on contact spring. Turn throttle body over to allow plunger rod ball to drop into hand. Mark throttle valves so they may be reinstalled in original positions in barrel of throttle body (Scribe valve, stem and bore to insure accurate repositioning). Remove screws, slide valves out of stem, remove retainer washer, then remove throttle lever and stem assembly, from throttle body. Remove idle needle valves & springs, pry ring from post which supports fast idle cam and remove fast idle cam, lock lever, and spacer washer.

Cleaning & Inspection: Clean all parts thoroughly in Bendix Metalclene or similar cleaning solution, rinse in solvent. Make certain that all carbon and gum deposits removed, blow out all passages and dry parts with air *(NOTE*—If necessary to remove lead plugs, use Tool T-25052. Install new plugs with Plug Set T-25053. Inspect all parts for wear.

Air Horn & Choke Parts—Vacuum piston and cylinder in air horn must be clean and free of burrs or scores. DO NOT use any abrasive material for cleaning these parts.

Vacuum Power Piston & By-Pass Jet—Surface of piston must be thoroughly cleaned. DO NOT use any abrasive material for polishing the surface of piston. Test by-pass jet for tight seating by sucking on upper end. Replace as necessary.

Main Body—Main body must be thoroughly clean and all passages free of foreign material. Check high speed and idle air bleeders for correct sizes. Use drill size #70 for checking high speed bleeder, and #56 for idle air speed bleeder.

Main Discharge Jets & Idle Tubes—Inspect main discharge jets to insure that tips are not damaged or walls distorted so as to deform holes. Test idle tubes by blowing or sucking to make sure metering holes are clear, be sure small ends are not damaged so as to deform metering holes.

Pump Piston, Discharge Nozzle and Related Parts—Pump piston leather must be free of cracks, creases, turned edges or other damage. Relief valve in piston must seat (test by blowing on lower end of piston). Suck or blow on discharge nozzle to be sure holes are clear and always replace pump inlet and discharge channel check valve balls. Replace check valve ball seats if strong light reveals that they are rough or loose in seat. To replace seat, use a steel ball and tap lightly, then discard ball.

Throttle Valves, Throttle Lever & Stem Assembly—Check throttle stem bearing for wear. Air leaks will affect performance if wear is in excess of .006". Replace throttle valves that show sharp edges, burrs, or are bent.

Reassembiy: Use all NEW gaskets, install parts in reverse of disassembly procedure. Note following:

Throttle Shaft & Lever Assembly—Attach fast idle rod to fast idle cam with washer and hook cam spring into groove in rod. Install spacer washer, loose lever lock lever, and fast idle cam on post in throttle body, then snap ring in groove in post. Install lever and stem assembly in throttle body and retainer in end of stem.

Throttle Valve Installation—After throttle shaft and lever assembly installed in body, install each throttle valve in same barrel from which removed, install new valve screws loosely, then close valves, carefully align marks made before disassembly and tighten screws securely. Check valves by holding throttle body up toward a light, shift valves as necessary until least amount of light visible around valve edge, finally stake valve screws (support screw head on steel block while staking opposite end).

Accelerator Vacuum Switch—Lubricate contact surfaces of terminal cap with Beacon M-285 lubricant, or petroleum jelly if Beacon Lubricant not available, by working lubricant into a piece of clean cloth and lightly swabbing inside of cap. *CAUTION*—Do not use ordinary lubricants or lubricate ball or plunger as poor switch contact will occur during cold weather. Place plunger in position with groove up so that ball rests on lip at inner end of plunger. *NOTE*—If plunger not correctly installed, poor switch action with resulting gear clashing will occur. Make sure all timing washers, contact spring, and return spring washer are in proper position before installing return spring and terminal cap. Be sure terminal cap is properly seated. *For switch timing, see "Switch Setting (Carburetor on Engine)" above.*

Main Discharge Jet Assemblies—Place new lead gasket over beveled end of main discharge jet, use remover tool T-24967 to seat jets in main body *(CAUTION*—flat surface on end of jet must be parallel to air flow), install main metering jets and plugs with new copper gaskets.

Idle Channel Wires—When installing throttle body on main body, make certain that idle channel wires installed with short end in throttle body and guide opposite end into idle channel in main body. *CAUTION—use care not to bend channel wires.*

Choke Valve Installation—After choke shaft installed in air horn, install valve with dash mark on valve toward top of air horn, install new screws loosely, close valve and make certain clearance around valve uniform, then tighten screws securely. Check for free operation (valve should drop freely of own weight and should not bind at any position),

Choke Piston Setting (Buick)—After choke piston and lever assembly installed in cylinder, install adjusting washer with serrated side toward piston lever, install lockwasher and nut and tighten nut finger-tight. Install Gauge T-25046 in choke housing with the outer flange piloting in the housing and the small hole in the gauge fitting over the pin on the choke lever. Turn gauge until two indicator lines on face are centered on left end of indicator boss on housing. Close choke valve against #29 drill rod (insert drill between upper edge of valve and air horn wall), tighten piston lever locknut lightly. Remove drill and gauge, close choke valve, tighten locknut securely, recheck setting. *NOTE*—This adjustment not required on Studebaker.

Thermostatic Coil Installation—Place coil assembly on housing with coil hook downward, rotate assembly in direction of arrow until "V" mark on cover in line with left edge of indicator boss on housing, tighten retainer screws securely.

Vacuum Power Piston Installation—Make certain that piston operates freely in cylinder but DO NOT lubricate piston, seat retaining washer in body recess and stake edge of cylinder at three points

Float & Intake Valve Installation—Use new gasket on each side of float hanger, tighten intake needle seat securely. Install new gasket on air horn before installing float assembly, clip intake needle to float arm, install assembly and tap float fulcrum pin in so that serrated end locks in hanger leg. Adjust float level (see ADJUSTMENTS). Make certain that float lever moves freely in hanger and that intake needle has 1/16" travel in closed position (adjust by bending float lever stop).

Carburetor Adjustment—See ADJUSTMENTS.

STROMBERG DUAL "AAV," "AAUVB," "AAVB" & 4-BARREL "4A" TYPES

DESCRIPTION

DESCRIPTION & OPERATION: Thermostatic coil and vacuum piston type. Thermostatic coil and vacuum piston are mounted on carburetor and linked directly to choke valve lever (no external linkage). Vacuum passage (for piston operation) is drilled in carburetor casting and opens into manifold below throttle valve. Hot air tube (for thermostatic coil operation) is connected between choke housing and hot air stove on exhaust manifold. When engine is cold, thermostatic coil winds up and tends to close choke valve (valve cannot close until throttle opened momentarily to release fast idle screw from cam; but is snapped closed as soon as throttle opened). When engine begins to fire, manifold vacuum causes vacuum piston to be drawn into cylinder which opens choke valve slightly against the thermostatic coil tension to provide proper air mixture for continued running. As engine warms up, thermostatic coil tends to unwind, releasing choke valve and allowing it to open (valves are offset).

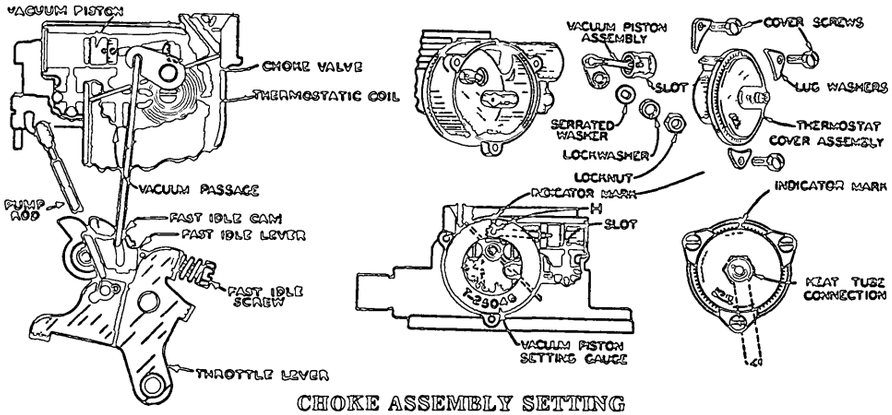
▷*BUICK 70 "4A" 4-BARREL NOTE:* Automatic choke and fast idle mechanism is similar to design used on other Buick dual or 2-barrel carburetors and is adjusted in same manner. Choke valve is located on primary side of air horn and controls primary barrels only (Auxiliary Throttle Valves on secondary side are locked closed by the choke valve while choke is in operation so that no choke mechanism is required on the secondary side).

Fast Idle:—Consists of a stepped cam linked to the choke valve. When choke valve closed by thermostatic coil for cold starting, cam is revolved so that the throttle stopscrew rests on highest step of the cam and throttle is held open in fast idle position. As engine warms up and choke valve opens, cam is revolved and throttle allowed to close, until with the engine warm and choke valve wide open, throttle is closed to hot or slow idle position.

ADJUSTMENT & OVERHAUL

▷*CAUTION—When reassembling all models except Studebaker AAV-26 & AAUVB-26, special ring gauge must be used to adjust vacuum piston assembly position on choke shaft (see Reassembly data below).*

DISASSEMBLY: Disconnect heat tube from thermostat housing cover, remove carburetor from manifold. Remove thermostat cover retaining screws and lug washers, remove thermostat cover assembly by rotating it clockwise to disengage coil hook from lever prong and then lifting it off the housing. Remove locknut on end of choke valve shaft (use socket wrench T-25047), remove lockwasher and serrated washer (serrated washer not used on Studebaker models). Remove vacuum piston assembly from the housing.



CLEANING & INSPECTION: Clean vacuum cylinder and piston with a clean cloth saturated with acetone or alcohol (CAUTION—do not use abrasives to clean cylinder or piston). Blow out all channels with compressed air. Clean the screen on the inside of the cover by blowing through heat tube connection and around inside cover (CAUTION—when using compressed air, use care not to distort screen or thermostatic coil). Do not attempt to remove thermostatic coil from cover (these parts furnished as an assembly).

REASSEMBLY: *Do not lubricate piston or cylinder.* Install vacuum piston assembly in cylinder, assemble lever on choke valve shaft. Install serrated washer (not used on Studebaker), lockwasher, and locknut. On all models except Studebaker, adjust vacuum piston assembly before tightening locknut (see Adjustment below). Tighten locknut securely, recheck choke valve opening to make certain setting not disturbed by tightening the nut. Install thermostat cover assembly with coil hook at the bottom, then rotate cover in "Rich" direction (counterclockwise) until inverted "V" mark on cover is in line with center graduation of scale on housing. Install lug washers and tighten retainer screws securely. NOTE—This procedure will provide "Centered" setting. See Choke Setting data for special settings used on some models.

Vacuum Piston Assembly Adjustment (Not required on Studebaker AAV-26 and AAUVB-26). With locknut tightened loosely (do not tighten fully until piston adjusted), install ring gauge (see Note below) with hole in tool fitting over pin on choke lever and indicator line on rim of tool in line with reference mark on choke housing. Hold choke valve closed against drill or gauge (see table), tighten locknut lightly with wrench T-25047, remove the gauge ring and then tighten the locknut securely. Recheck the choke valve to make certain that setting not changed by tightening of locknut. See that choke valve operates freely. This adjustment is extremely important to properly position vacuum piston and thermostatic coil prong.

▷Buick Ring Gauge Note: Gauge No. T-25046 used on all Buick models with dual (2-barrel) carburetors EXCEPT Models AAUVB-267 & AAVB-267 for which NEW Gauge No T-25367 should be used or T-25046 gauge modified to permit its use on these models. *See "Buick Service Tool" under CHANGES, CAUTIONS, CORRECTIONS for modification instructions.*

▷Buick Series 70 (4-Barrel Carburetor) Ring Gauge Note: Use Gauge No. T-25367 on these models. Reference point on this gauge consists of two lines and reference point on housing (left end of boss) should be centered between the two lines.

CHOKE ASSEMBLY SETTING

Car Model	Carburetor	Drill Size	Ring Gauge
Buick 40, 50 ('40-49)	AAV-16, 167	15/64"①	T-25046
Buick 70 ('42-49)	AAV-26, 267	#3 drill②	T-25046
Buick 40, 50 ('50-52)	AAUVB-267	#29 drill	③T-25367
Buick 70 ('50-51)	AAVB-267	#29 drill	③T-25367
Buick 40 ('53)	AAUVB-267	#29 drill	T-25367
Buick 50 ('53)	AAVB-267	#29 drill	T-25367
Buick 70 ('52-53)	4A	#29 drill	T-25367
Cadillac ('41-42)	AAV-26	#3 drill②	T-25046
Cadillac ('46-48)	AAV-26	#2 drill	T-25046
Packard ('41)	AAV-26	#4 drill	T-25046

①—Or Tool No. T-25085.

②—Or Tool No. T-25086.

③—Tool No. T-25046 can be used if modified (see Tool Note).

Fast Idle Connector Rod Installation: When reassembling the fast idle connector rod, install bushing (washer—Buick), on lower end of rod after rod has been assembled to lever. See that fast idle cam torsional spring is assembled with end of spring hook against ear of lever. See that cam operates freely and make certain that rod does not bind in slot in cam. This is very important.

Auxiliary Throttle Valve Lockout Slide Clearance (Buick 4A Carburetors): *The Lockout Slide is operated by the choke mechanism and must be checked and adjusted after the choke mechanism has been reassembled. Two separate adjustments are required:*

Locked Clearance—With auxiliary throttle valves in closed position, close choke valve fully so that lock slide engages auxiliary valve counterweight lever. Check clearance between ear on slide and edge of lever with a feeler gauge. This clearance should be .025" minimum, .060" maximum. Adjust by bending ear on slide.

Unlocked Clearance—With choke valve wide open, move auxiliary throttle valves to wide open position. Clearance between end of locking ear on slide and edge of auxiliary valve counterweight lever should be 3/64" minimum, 5/64" maximum. Adjust by bending choke lever slide actuating arm.

STROMBERG MODEL BXOV-26

STUDEBAKER	Stromberg No.
1941-42 Commander 11A & 12A	①380036
1947-50 Comm. & Land Cruiser 14A, 15A, 16A, 17A②	380178

①—See Replacement Carburetor data below.
②—Except First 10,000 cars in 1950 (Carter "WE").

►CHANGES & CORRECTIONS

Studebaker 1941-42 Replacement Carburetor—Original carburetor (Code No. 6-98 and 6-98A) replaced by 1947 carburetor No. 380178 (Code No. 6-104).

►**Studebaker No. 380036 & 380178 Carburetor Replacement Parts Change:** New type Accelerating Pump Piston, Duration Spring, and Pump Spring have superseded parts formerly furnished for these carburetors. **All of these parts must be installed as an assembly** when servicing the above carburetors and are furnished in Repair Parts Kit No. RK-112.

Parts Changed:	New Part No.	Superseded Part No.
Accelerating Pump Piston	385100	382485
Pump Duration Spring (Upper)	385164	P-24102
Pump Spring (Lower)	385102	Not Used

DESCRIPTION: Plain tube, downdraft type with throttle operated accelerating pump. This model fitted with integral Fast Idle & Automatic Choke (thermostatic coil mounted on air horn and linked directly to choke valve shaft).

IDLING ADJUSTMENT: Adjust only when engine warm and Automatic Choke and Fast Idle inoperative (choke valve wide open, throttle stopscrew on lowest step of fast idle cam) and engine idling at hot or slow idle speed. Idle adjusting screw controls fuel mixture discharge from lower idle port and should be turned in for leaner mixture, out for richer mixture (standard setting approximately 1¼ turns open from inner seated position). Idle speed controlled by throttle lever stopscrew and should be reset after idling adjustment completed for correct hot or slow idling speed. See car model page for complete tune-up instructions.

IDLE SETTING

Car Model	Idle Screw Setting	Idle Speed
Studebaker	1-1¼ turns open	①8-10 MPH.

①—On Automatic Transmission cars, set at 500-550 RPM.

METERING JETS: Main metering jet is non-adjustable type located under plug at lower end of discharge jet. Jets should be changed only for special operating conditions such as high altitudes. See Stromberg Jet Specification table for complete jet data.

ECONOMIZER: Consists of a by-pass valve and jet in the carburetor main body controlled by a vacuum piston in a cylinder in the air horn casting. Economizer by-passes fuel around main metering jets to main nozzles when vacuum in manifold decreases sufficiently so that piston is forced down by spring. No adjustment required.

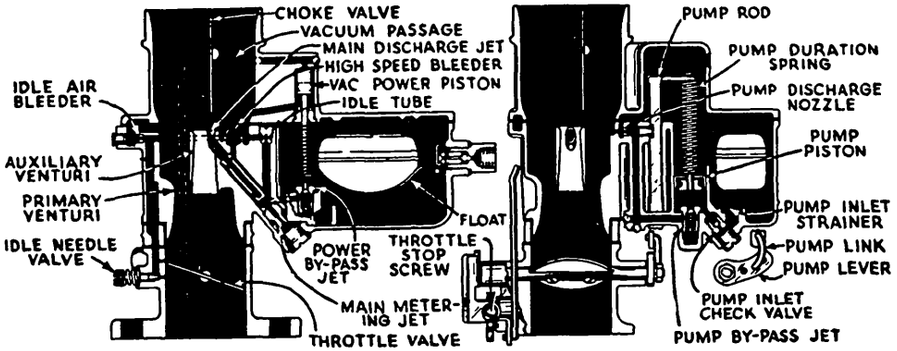
Setting—Vacuum piston opens valve with manifold vacuum of 4-6" of HG. corresponding to car speed of 65-70 MPH.

ACCELERATING PUMP: Operated by throttle lever through vertical pump rod under float bowl cover. Fuel is drawn into pump chamber through strainer screen and inlet ball check valve and is discharged through outlet valve and pump discharge nozzle located in side of mixing chamber above main venturi when throttle opened for acceleration. Pump piston has duration spring on piston rod (spring compressed on sudden throttle openings, subsequent spring expansion prolongs pump discharge).

Capacity—Pump capacity in cc. per 10 strokes with pump set for medium stroke (link in center hole of throttle lever) is shown in table below. Use T-24972 Pump Capacity Burrette Gauge to check pump capacity.

ACCELERATING PUMP SETTING

Car Model	Pump Capacity	Pump Setting
Studebaker	11-14 cc. (S), 5-8 cc. (F)	Medium Stroke



(F)—Fast Stroke, (S)—Slow Stroke.

Adjustment—Three holes provided in throttle lever for pump link connection. Link engaged in center hole provides normal setting, outer hole (long radius) provides maximum pump discharge, inner hole (short radius) minimum discharge. See car model page for settings and seasonal changes.

Pump Servicing Note—Strainer screen located in pump inlet in bottom of float bowl should be cleaned at frequent intervals to insure satisfactory pump performance.

FAST IDLE & CHOKE RELEASE:—Fast idle mechanism consists of a fast idle lever and cam mounted below the throttle valve shaft so that the cam serves as a stop for the throttle stopscrew. Fast idle lever is linked to choke valve lever by connecting rod so that cam is rotated to the fast idle position when the choke valve closes for cold starting. Choke release mechanism consists of an ear on the throttle lever which engages a lug on the fast idle cam so that the cam is rotated and choke valve opened when the throttle valve is opened wide. Fast idle and choke release setting are both adjusted by bending connector rod as follows:

Adjustment—Hold throttle stopscrew on lowest step of fast idle cam and against edge of second step, move choke valve toward closed position as far as possible (do not force valve beyond point where fast idle cam and lever are stopped against throttle stopscrew). Check choke valve opening by inserting 11/32" drill rod between upper edge of valve and air horn wall. If choke opening not correct, adjust by bending connector rod at bend near choke valve lever.

FLOAT LEVEL: Fuel Level—Set at 5/8" below top edge (gasket seat) of bowl with 3 lbs. pressure (engine idling). Adjust by bending float arm at point where it is attached to float (use tool T-24733).

NOTE—Float fulcrum pin is retained by spring clip seated in float seat recess. When installing fulcrum pin, see that spring clip is seated and that it engages notches at ends of pin.

Float Bowl Vent—Bowl is vented to outside atmosphere through slot in upper end of pump rod housing on bowl cover.

Float Needle Valve & Seat: Furnished in matched sets only as follows:

Studebaker—Part No. P-24063—.086" Intake Hole.

THROTTLE VALVE SETTING: To check throttle valve setting, back throttle stopscrew off so that valve is tightly closed, insert drill rod of correct size (see table below) in idle port and vacuum spark port, measure distance from throttle valve edge to drill rod. See table below for settings. All specificationes are plus or minus .004" except as noted.

	Idle Port ①		Vacuum Spark Port①	
Car Model	Setting	Drill	Setting	Drill
Studebaker	.010"	#60	Flush	#56

①—"Drill" figure is correct size drill rod to be used in checking valve.

CHOKE: Valve is offset plain type. Operated by automatic choke thermostatic spring coil which is linked directly to shaft.

Choke Setting (Studebaker)—Three settings marked on coil housing cover as follows: 'H', 'M', 'R' (additional mark '7' provided for coil identification). Standard setting is with 'R' mark coinciding with projection on thermostat housing and is correct for regular fuel and operating conditions. If engine loads up or overchokes with this 'R' setting, change setting to 'M'. Use 'H' setting only when highly volatile fuel is used continuously.

CAUTION—When connecting heat tube at thermostatic coil housing cover connection, do not use excessive pressure which may rotate cover and change choke setting.

CONTINUED ON NEXT PAGE

STROMBERG MODEL BXOV-26 (Continued)

DISASSEMBLY OF CARBURETOR: Disconnect choke link, take out six retaining screws, remove bowl cover and air horn assembly. Remove float pin lock wire (this will spring out when released), remove float hinge pin, remove float, needle valve, and needle valve seat. Remove idle tube from carburetor body casting, disconnect pump link and withdraw pump rod and piston assembly. Remove pump outlet check valve (in bottom of pump cylinder), remove inlet check valve plug and valve assembly. Remove main jet plug (use tool T-19099), main metering jet (use tool T-24924), and main discharge jet (use tool T-24967). Remove vacuum economizer by-pass valve assembly. To remove vacuum piston, use tool T-24733 inserting tool prongs in slots in piston retaining plug. To dismantle choke assembly, take out retaining screws and remove thermostat cover and coil assembly (do not remove thermostat coil from cover), remove small nut and lockwasher on end of choke valve shaft, turn lever to withdraw vacuum piston from cylinder and remove piston and link assembly.

Servicing—Examine vacuum economizer piston and automatic choke vacuum piston for carbon or gum deposits. Check economizer by-pass and pump check valves for tightness by using special T-24970 tester (screw valve in proper opening of tester, immerse valve in gasoline and blow through tester—any valve leakage will be indicated by bubbles). Clean all jets with gasoline or use denatured alcohol to dissolve gum deposits (CAUTION—do not attempt to clean jets with wire or drill rods). Blow out all channels and passages in carburetor with air, remove all carbon deposits in ports and throttle body. Replace all worn or damaged parts.

REASSEMBLY OF CARBURETOR: Use all new gaskets (see below), reassemble carburetor by reversing disassembly directions given below. Check and adjust float level, accelerating pump setting, throttle valve setting, fast idle and choke setting, and idle setting when carburetor reassembled.

SERVICE PARTS:—Gasket Sets—Part No. J-5652-G (all models).
Repair Kits (incl. Gaskets)—No. RK-112 (Studebaker).

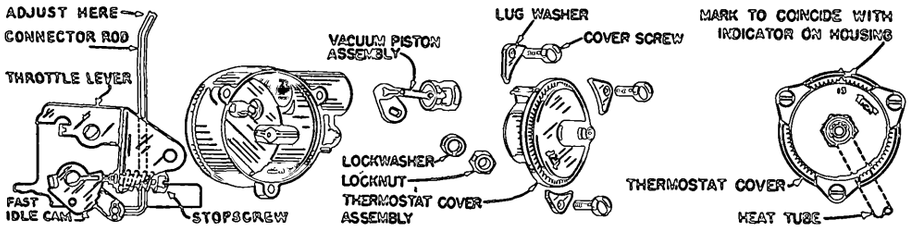
STROMBERG BXOV-26 TYPE AUTOMATIC CHOKE

Used On:

Car Model	Carburetor
Studebaker Commander, 11A (1941), 12A (1942)	BXOV-26
Studebaker Commander, all Models (1946-50)	BXOV-26

DESCRIPTION & OPERATION: Thermostatic coil and vacuum piston type. Thermostatic coil and vacuum piston are mounted on carburetor and linked directly to choke valve lever (no external linkage). Vacuum passage (for piston operation) is drilled in carburetor casting and opens into manifold below throttle valve. Hot air tube (for thermostatic coil operation) is connected between choke housing and hot air stove on exhaust manifold. When engine is cold, thermostatic coil winds up and tends to close choke valve (valve cannot close until throttle opened momentarily to release fast idle screw from cam, but is snapped closed as soon as throttle opened). When engine begins to fire, manifold vacuum causes vacuum piston to be drawn into cylinder which opens choke valve slightly against the thermostatic coil tension to provide proper air mixture for continued running. As engine warms up, thermostatic coil tends to unwind, releasing choke valve and allowing it to open (valves are offset).

Fast Idle (BXOV-26 Type):—Stepped valve linked to choke. When choke valve closed for cold starting, cam is revolved so that throttle stopscrew rests on highest step of cam and throttle is held open in fast idle position. As engine warms up and choke valve opens, cam is revolved and throttle allowed to close, until with the engine warm and choke valve wide open, throttle is closed to hot or slow idle position.



ADJUSTMENT: Thermostatic Coil Setting. Inverted "V" mark or "O" mark on thermostatic coil housing should line up with reference mark on choke housing. This standard setting may be varied not more than 2 graduations for use of high test fuel or with exceptional operating conditions. If warming up performance is not satisfactory with this setting, check choke valve and linkage for binding or replace thermostatic coil assembly. When installing thermostatic coil, place coil housing in position with coil hook down, then rotate housing in 'Rich' direction until correct setting secured (this will insure coil hook engaging prong properly).

Studebaker Models—Choke housing on these models marked by three letters 'H', 'M', 'R'. To adjust, loosen mounting screws, rotate housing until 'R' mark lines up with reference projection on housing flange. This is standard setting. If engine tends to load up or over-choke, change setting to 'M' position. Use 'H' setting only when highly volatile fuels used.

Fast Idle Setting—With choke valve open, close throttle so that stop-screw is on low lobe of fast idle cam and against step on cam. Move choke valve toward closed position as far as possible (do not force valve beyond point where all clearance is taken up). Check remaining choke valve opening by inserting 11/32" drill (BXOV-26), 35/64" drill (EE-16) between edge of choke valve and air horn wall. If choke valve opening not correct, adjust by bending fast idle connector rod slightly at bend near upper end.

CAUTION—Make certain that fast idle mechanism operates freely without binding.

DISASSEMBLY: Disconnect the heat tube from the thermostatic coil cover, remove carburetor from manifold. Remove thermostat coil cover attaching screws and lug washers, remove thermostat coil and cover assembly (rotate cover clockwise to disengage coil hook from lever prong). Remove cork insulator and baffle plate. Remove locknut on end of choke valve shaft (use wrench T-25047), remove lockwasher. Loosen housing attaching screws slightly (do not take screws out), take out vacuum piston assembly.

Servicing—Clean vacuum piston cylinder with clean cloth saturated with Acetone or alcohol. Clean vacuum piston (do not use abrasives). Blow out all channels with compressed air. Do not attempt to remove thermostatic coil from housing (service as an assembly).

REASSEMBLY: Do not lubricate the vacuum piston or cylinder when installing assembly. Install piston and engage slot in lever on flatted end of choke valve shaft (can only be installed in correct position), tighten housing attaching screws securely. Install lockwasher and and locknut, use wrench T-25047 to tighten locknut securely. Install baffle plate and cork insulator (CAUTION—if cork insulator buckled or does not fit properly, it will cause vacuum piston lever to bind and new insulator should be used). Install thermostat coil and cover assembly and adjust as directed above.

Thermostat Checking (Studebaker Models)—To calibrate a replacement thermostat, or to check a thermostat which may have been damaged or tampered with, proceed as follows: Submerge coil and cover assembly in water at exactly 70°F. (use thermometer to check water temperature) and allow assembly to remain in the water for several minutes. Remove assembly and mark edge of cover in line with center of thermostatic coil hook. The "H" mark should be two graduations, "M" mark four graduations, and "R" mark six graduations, from this reference mark. Thoroughly dry the thermostatic coil and cover assembly before installing it in the carburetor.

CARBURETOR MODEL IDENTIFICATION:—Carburetors are identified by Code Number stamped on float bowl as follows: **3-54A (A-18123), 3-55 (A-18133), 3-59 & 3-59B (380044), 3-60 & 3-60B (380045), 3-65 (380079), 3-66 (380080), 3-76 (380158), 3-77 (380159), 3-82 (380218), 3-83 (380219), 3-84 (380220), 3-87, A, B, & later (380221); 3-93, A, B, C & later (380249); 3-95, A, B, C, D, E, F, & later (380251); 3-97, A, B, & later (380253); 3-103, A, & later (380268).** 3-111 (No. 380331).

►***See Production Change Notes below for parts changes indicated by these Code Number letter changes.***

►CHANGES & CORRECTIONS

►**1951 Carburetor Main Body & Vacuum Power Piston Production Change (BXVD-3 Carburetors No. 380249 & 380253, BXVES-3 Carburetors No. 380251 & 380268):** Beginning with early 1951 production, new Main Body casting with new longer Vacuum Power Piston used on all carburetors listed above. First type Main Body will not be furnished for service and new type Main Body **with new longer Vacuum Power Piston** must be used when replacement of main body required. Old and new type parts can be identified as follows:

Main Body—Bottom of by-pass jet boss (below float bowl) is **7/16" above** bottom of dashpot on first type main body, and is even with bottom of dashpot on new type main body.

Vacuum Power Piston	Part No.	Over-all Length
First Type	P-24201	2 5/32"
Later Type	385527	2 9/16"

NOTE—When new main body and new vacuum power piston installed, code number stamped on carburetor should be changed to show the latest number (code when this change occurred in production) as follows: No. 380249—Code 3-93C & Later, No. 380253—Code 3-97B & Later, No. 380251—Code 3-95F & Later, No. 380268—Code 3-103A & Later.

►**Dodge 1941 BXVD-3 Carburetor Production Change**—On later cars with Code 3-59B (U.S.), 3-60B (Exp.) carburetors, these carburetors differ in specifications from first Code 3-59 and 3-60 carburetors as follows: Main Metering Jet—.057" Part No. P-19442 (was .058"), Power By-pass Jet—#58 Part No. 382675 (was #54 No. P-21197), Vacuum Piston Assembly—No. P-24201 (was No. P-24043).

►**Dodge 1941 BXVD-3 Economy Complaints on First Cars**—On these cars with first BXVD-3 carburetors Code 3-59 (Domestic), 3-60 (Export); new Main Metering Jet, Power By-pass Jet, and Vacuum Piston Assembly (same as listed above for later 3-59B and 3-60B carburetors) may be installed for increased economy. Refer to Servicing data below. Change does not apply to BXV-3.

►**Dodge & Plymouth 1947-48 BXV-3 Carburetor Production Change**—New type Pump Link 384390, & Pump Link Clip 384391, used on late carburetors, furnished in Repair Kits for use in servicing earlier carburetors (supersedes Pump Link No. P-24836 & Cotter Pin No. P-19374). Install these parts as follows: Install pump link with open end in toward carburetor casting engage center loop of clip on center of pump link, with loop on upper end of clip encircling upper leg of link in back of pump rod, and lower end of clip in back of pump lever on throttle shaft.

►**Dodge & De Soto 1947-48 BXVD-3 Carburetor Production Change**—Parts listed below were used on late production carburetors and are furnished in regular Repair Kits for installation on earlier carburetors:

Pump Link & Retainer—Same as production change on BXV-3 (see above for part numbers and installation data).

Dash Pot Lever Torsion Spring—A Torsion Spring, No. 384614, and special Throttle Shaft Nut, No. 384613, have been added and should be installed on earlier carburetors. Spring is held in position by the nut and spring ends should be looped under dash pot lever and pump lever.

Dash Pot Rod Clevis Clip—New type clip, No. 384618 used to retain dash pot rod in dash pot lever. This clip supersedes No. 382745 Torsion Spring used for this purpose on earlier carburetors.

►**Dodge 1948-51 Canadian BXVD-3 No. 380253 Carburetor Production Changes:** Later Code 3-97A and succeeding carburetors have various parts changes from first Code 3-97 carburetors as listed below. **Correct type parts must be used on each carburetor.**

Carburetor:	Code 3-97	Code 3-97A	Code 3-97B & Later
Main Body Assembly	385057	385386	①
Main Body Gasket	P-24037	385384	385384

Contact Piston Spring	385155③	③385155
Terminal Block Assy	385438	385438

①—See Main Body & Vacuum Power Piston Change (above).
②—Marked by Blue color. See Kick-down Switch Change (following).
③—Not colored. May be identified by free length of 1⅜'.
④—Includes No. 903899 Wire Clamp Screw & No. 384450 Lockwasher.

►**Dodge 1949 BXVES-3 Carburetor Kick-down Switch Change for Improved Transmission Performance**—On first Code 3-95 & 3-95A carburetors, original No. 385146 Kick-down Switch Contact Piston Spring should be replaced by

C NTINUED ON NEXT PAGE

STROMBERG MODELS BXV-3, BXVD-3, BXVES-3 (C nt.)

No. 385162 spring which is colored with Blue dye for identification. This new spring raises kick-down speed limit to 35-43 MPH. (was 40 MPH.). When this change made, stamp letter "B" next to stamped code no. 3-95A on bowl cover near fuel inlet (this spring used in regular production on Code 3-95B carburetors).

►*CAUTION—Do not use this No. 385162 spring on Code 3-95C and later carburetors (have new uncolored spring with free length of 1 3/8").*

►**Dodge 1950-51 Canadian BXVES-3 No. 380268 Carburetor Production Change:** Later 3-103A and succeeding carburetors have new type Main Body Casting and new Vacuum Power Piston. *See Main Body & Vacuum Power Piston Change (above).*

DESCRIPTION

DESCRIPTION: Single barrel, plain tube, downdraft type, throttle operated accelerating pump and vacuum controlled economizer. BXVD-3 carburetors have special "Slow-Closing Throttle." BXVES-3 carburetors have this same Slow-Closing Throttle and also have special "Kick-down Switch" for automatic transmission control.

Slow-Closing Throttle (Dashpot)—Consists of a dashpot and piston in float bowl and linked to the throttle lever with an adjusting screw on the control lever under the float bowl. Dashpot on BXVES-3 carburetor has solenoid control of the dashpot outlet check valve (cuts out dashpot action at speeds above 8-15 MPH.). *See Slow-Closing Throttle adjustment data below and "Dodge Slow-Closing Throttle" in Carburetion Equipment Section for complete data.*

Kick-down Switch—Built-in grounding switch on carburetor operated by throttle lever (lug on lever depresses switch plunger when throttle valve wide open). Used for automatic transmission control. *See Transmission Control Kick-down Switch adjustment data below and "Chrysler, DeSoto, Dodge Kick-down Switch" in Electrical Equipment Section for complete data.*

Fuel System (Idling and Low Speed):—Fuel for idling taken from main jet well up through Idling Tube which meters the fuel to a cross-channel in which it is mixed with air admitted through Idle Air Bleed (air bleed passage opens into carburetor barrel below choke valve). Fuel mixture then taken down through channel to discharge ports at the throttle edge. For closed throttle idling, fuel discharged through lower port below throttle valve and controlled by idle adjusting screw. When throttle cracked open for low speed running, additional fuel is discharged through upper idle port also.

Driving Range (Below 65 MPH.)—As throttle is opened, suction increases on main discharge jet and this jet supplies fuel, the idling system dropping out. Fuel for main discharge jet is metered by main metering jet located at lower end of discharge jet. Discharge jet is air bled by High Speed Bleeder.

High Speed and Wide Open Throttle Operation—At speeds above 65 MPH. or whenever throttle held wide open so that manifold vacuum falls off, spring on vacuum piston forces piston down and opens by-pass valve. Fuel metered by the by-pass jet then flows directly to the main discharge jet.

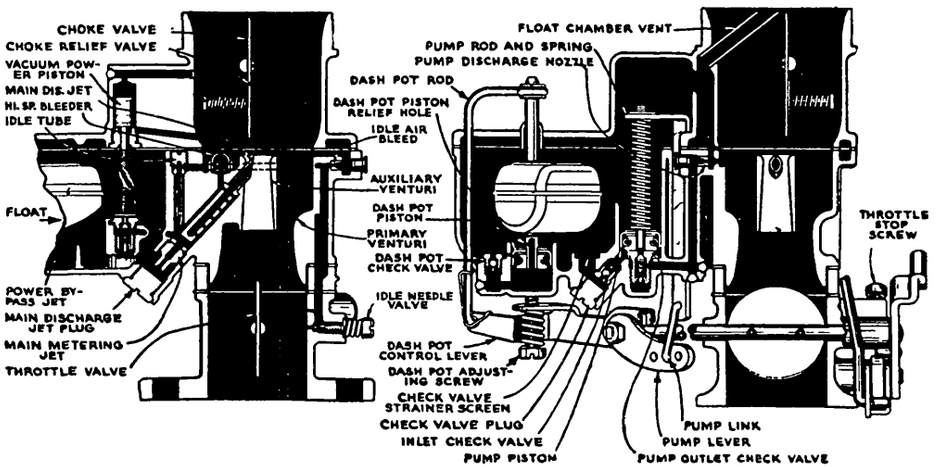
ADJUSTMENT & OVERHAUL

IDLING ADJUSTMENT: Adjusting screw controls fuel discharge from lower idle port and should be turned in for leaner mixture, out for richer mixture. Adjust only with engine warmed up so that choke valve wide open and fast idle inoperative. Recheck idle speed after adjustment completed. See car model page for complete tune-up instructions.

IDLE SETTING

Car Model	Idle Screw Setting	Idle Speed
Dodge, DeSoto, Plymouth	①	6 MPH.
Dodge (Auto. Trans.)	①	450-475 RPM.

①—Midway between "rich" and "lean" points.



METERING JET: Main metering jet is non-adjustable and should be changed only for special operating conditions such as high altitude. See Stromberg Jet Specification table for complete jet data.

ECONOMIZER: Vacuum piston type. Consists of vacuum piston in cylinder in the air horn casting which controls the by-pass valve and jet assembly in the main body casting. No adjustment required.

ECONOMIZER SETTING

Car Model	Carburetor	Valve Opening (" of HG)
Dodge ('39-41)	BXV-3, BXVD-3	4-6" (65-70 MPH)
Dodge ('42-48)	BXV-3	4-6" (65-70 MPH)
Dodge ('42-47)	BXVD-3	3-4" (65-70 MPH)
Dodge ('47-53)	BXVD-3, BXVES-3	3-5" (65-70 MPH)
De Soto ('47-48)	BXVD-3	3-5" (65-70 MPH)
Plymouth ('47-48)	BXV-3	4-6" (65-70 MPH)

ACCELERATING PUMP: Operated by the throttle lever through a pump rod under float bowl cover. Fuel is drawn into pump chamber through strainer screen and inlet ball check valve and is discharged through outlet valve and pump discharge nozzle located in side of mixing chamber above main venturi when throttle opened for acceleration.

ACCELERATING PUMP SETTING

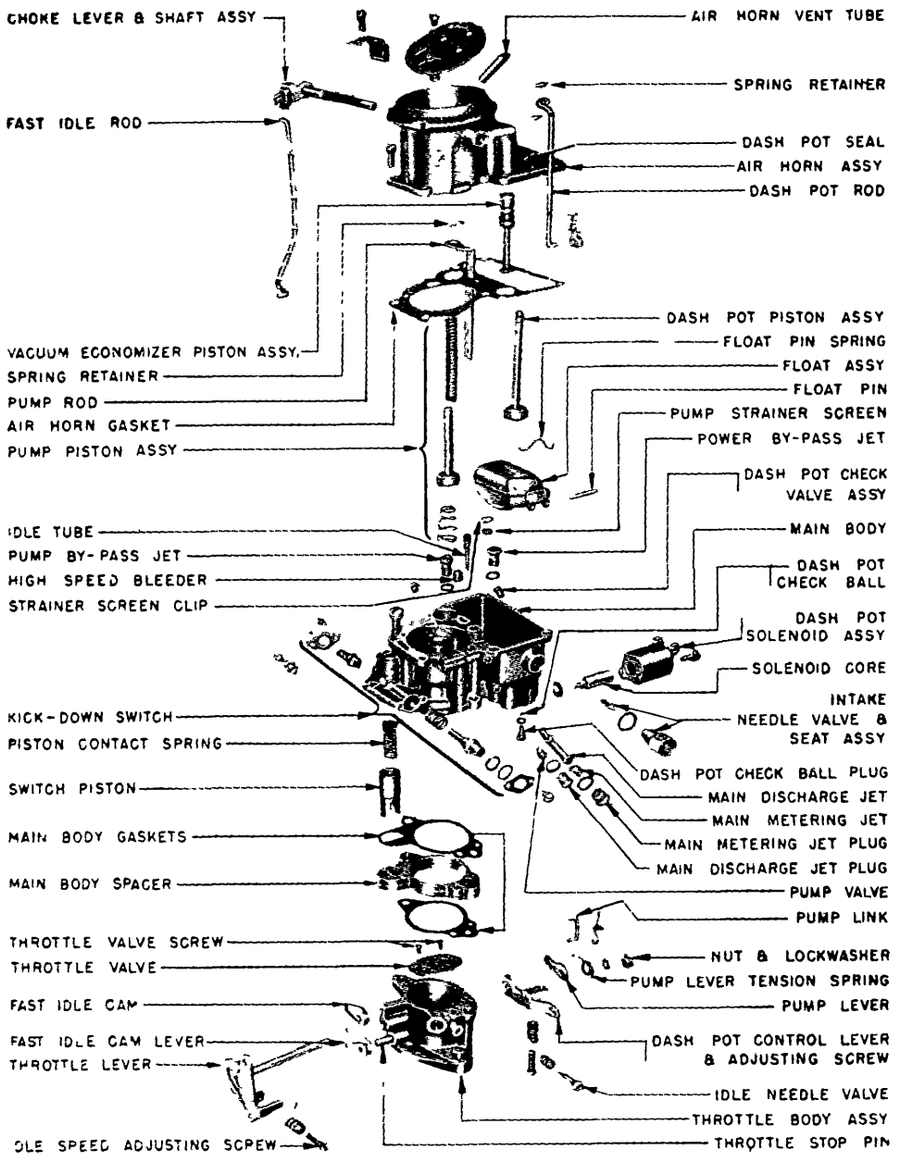
Car Model	Pump Capacity	Pump Setting
Dodge, De Soto, Plymouth	11-14 cc. (10 slow strokes)	Medium

NOTE—Pump travel will be 1/4-9/32".

Adjustment—Three holes provided in throttle lever for pump link connection. Link engaged in center hole provides normal setting, outer hole (long radius) provides maximum pump discharge, inner hole (short radius) minimum discharge. See car model page for settings and seasonal changes.

Pump Servicing Note—Strainer screen located in pump inlet in bottom of float bowl should be cleaned frequently to insure satisfactory pump performance.

FAST IDLE: Consists of a cam directly below the throttle lever shaft and linked to the choke valve. Cam serves as stop for throttle lever stopscrew and opens throttle to fast idle position when choke valve is closed for starting. No adjustment (stopscrew should be at high point of cam with choke valve closed).



SLOW-CLOSING THROTTLE (BXVD-3 & BXVES-3): Dashpot piston assembly in the float bowl with the piston linked by a rod to a control lever which engages the throttle valve lever. When the throttle is opened, dashpot cylinder is filled with fuel which flows freely in through dashpot check valve. When the accelerator pedal is released (to close throttle), this fuel is trapped in the cylinder and escapes through relief hole in piston stem, retarding piston movement, and preventing throttle closing too rapidly.

See "Dodge Slow-closing Throttle" in Carburetion Equipment Section.

Setting: Full travel of dashpot piston 5/16-11/32" (BXVD-3), 13/32-7/16" (BXVES-3) with all slack removed from linkage. To check travel, place scale on float bowl cover at dashpot piston stem, measure distance from bowl cover to edge of retainer on stem, then open throttle and recheck distance. Difference in readings is piston travel (above).

Adjustment—Turn adjusting screw on dashpot control lever under float OUT to lengthen stroke, IN to shorten stroke.

CONTINUED ON NEXT PAGE

STROMBERG MODEL BXVES-3 CARBURETOR (BXV-3 & BXVD-3 SIMILAR)

STROMBERG MODELS BXV-3, BXVD-3, BXVES-3 (C nt.)

KICK-DOWN SWITCH FOR TRANSMISSION CONTROL (BXVES-3): Consists of vacuum-controlled, throttle operated, grounding switch.

See "Chrysler, DeSoto, Dodge Kick-down Switch" in Electrical Equipment Section.

Kick-down Switch Production Change—See Production Change Notes (preceding) for 1949 Code 3-95 & 3-95A carburetors.

Setting—5/32" minimum travel of switch plunger when carburetor throttle valve in wide open position. Plunger should have minimum of 1/64" over-travel in this position.

Adjustment—Bend tang or ear on throttle lever which contacts switch plunger for proper travel.

FLOAT LEVEL: Fuel Level—Should be 5/8" below top edge of float bowl (gasket removed) with 3 lbs. fuel pressure. Measure with depth gauge. Adjust by bending float lever arm using Tool T-24733.

Needle Valve & Seat Assembly—Furnished only in matched sets as follows:

Dodge—(1939) No. 24063, (1940-41) No. P-24827—.086" Intake Hole, (1942 380079 & 380080) No. 382901—.093" Intake Hole), (1942-47 380158 & 380159) No. P-21918 .093" Intake Hole. (1947-53 No. 380218 and later Carburetors) No. 384956 with .093" Intake Hole.

De Soto & Plymouth—(1947-48) No. 384956—.093" Intake Hole.

CAUTION—Valve spring clip must be engaged in notches on float fulcrum pin.

CHOKE: Choke valve is offset type with poppet type relief valve.

Automatic Choke—Sisson. See article in Carburetion Equipment Section.

THROTTLE VALVE SETTING: Valve is No. P-24059—20° type. To check the valve setting, back stopscrew off so that valve closed tightly, insert #58 drill in idle port, two #60 drills (1939-48), #58 drills (1949-53), in vacuum spark ports. Throttle valve should be flush with drills (.006" maximum clearance between valve and idle port drill).

DISASSEMBLY OF CARBURETOR: Disconnect fast idle rod. On the BXVD-3 only, disconnect dashpot piston connector rod. Take out retaining screws, remove bowl cover and air horn assembly. Free clip on float hinge pin (clip will spring out when released), take out hinge pin, remove float and needle. Disconnect accelerating pump link, withdraw pump rod and piston assembly, remove pump outlet check valve (in bottom of pump cylinder). Remove economizer valve assembly. Remove main discharge jet plug (use T-19099 screwdriver). If main metering jet and main discharge jet to be removed (can be cleaned with air without being removed) use special tool T-24924 (to remove metering jet), T-24967 (to remove discharge jet). To remove vacuum economizer piston, use tool T-24733 and engage tool prongs in slot in piston retainer.

Servicing—Clean all jets with gasoline or use denatured alcohol to dissolve gum deposits (do not attempt to clean jets with wire or drill rods). Blow out all jets and passages in carburetor with air.

REASSEMBLY OF CARBURETOR: Use new gaskets (see Parts List), assemble carburetor by reversing disassembly directions. Check and adjust float level, accelerating pump setting, throttle valve setting, dashpot or slow closing throttle setting (BXVD-3 & BXVES-3), kick-down switch setting (BXVES-3). After carburetor installed on engine, adjust idle mixture and idle speed.

SERVICE PARTS: Gasket Sets. Stromberg No. J-5968-G (All BXV-3 & BXVD-3 carburetors except following), No. 382369 (BXVD-3 No. 380249 Code 3-93A and later carburetors). No. 382369 (BXVD-3 No. 380253), No. 382371 (BXVES-3 No. 380251, 380268, 380331 carburetors).

Repair Parts Kits (incl. Gaskets): Stromberg No. RK-16 (A-18073), No. RK-75 (A-18123, A-18133), No. RK-118 (380044), No. RK-119 (380045), No. RK-120 (380089), No. RK-121 (380079), No. RK-130 (380158), No. RK-131 (380159), No. RK-139 (380219 & 380220), No. RK-143 (380218 & 380852), No. RK-148 (380249 Code No. 3-93 only), No. RK-159 (380249 Code No. 3-93A & later carbs.), No. RK-149 (380251 & 380331), No. RK-150 (380253), No. RK-161 (380268).

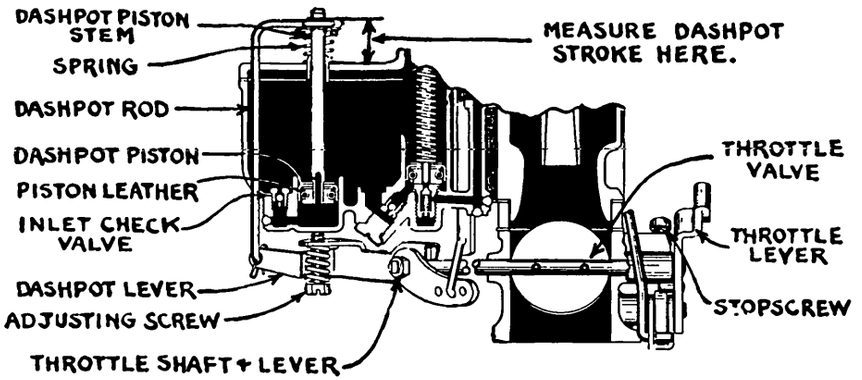
DODGE SLOW-CLOSING THROTTLE
(STROMBERG CARBURETOR TYPE)

Car Model Used n following Models with Fluid Drive	Carburetor
D Soto, Model S11S, S11C (1947-48)	Stromberg BXVD-3
Dodge, Deluxe & Custom Model D24 (1946-48)	Stromberg BXVD-3
Dodge, All Models (1949-52) Std. Trans.	Stromberg BXVD-3
Dodge, All Models (1949-53) Auto. Trans.	Stromberg BXVES-3

►**Slow-Closing Throttle Note:** Two different types used. The type used on BXVD-3 carburetors does not have solenoid controlled check valve and operates whenever throttle is closed regardless of car speed. The solenoid controlled check valve on BXVES-3 type is controlled by the transmission governor and cuts out the slow-closing feature at higher car speeds as described below.

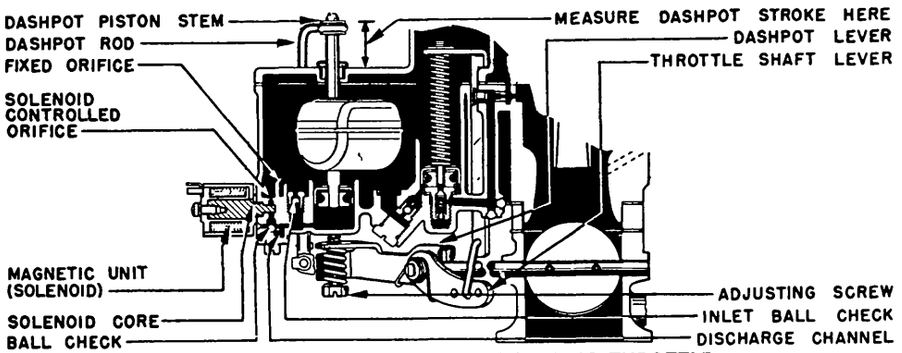
DESCRIPTION & OPERATION: (BXVD-3). Slow-closing throttle consists of a dashpot and piston assembly in the float bowl with the piston linked by a rod to a control lever which engages the throttle valve lever. When the throttle is opened, dashpot cylinder is filled with fuel which flows freely in through dashpot check valve. When the accelerator pedal is released (to close throttle), this fuel is trapped in the cylinder and is allowed to escape slowly through the relief hole in the dashpot piston stem above the piston. This action retards the movement of the piston and linkage toward the closed throttle position and the linkage prevents the throttle valve closing too rapidly.

(BXVES-3)—Operates similarly to BXVD-3 type (above) at low car speeds but has solenoid control of an outlet ball check valve (in addition to regular bleed passage with fixed orifice). At car speeds below 8 MPH. (Low Range), 15 MPH. (High Range), with governor contacts closed, solenoid is energized and holds check valve ball on its seat so that all fuel in dashpot cylinder is forced to escape through the fixed-orifice bleed passage to secure the slow-closing throttle feature. At speeds above 8 MPH. (Low Range) or 15 MPH. (High Range), with governor contacts open, solenoid is not energized and check valve is open. Fuel in dashpot cylinder is then free to escape through this check valve in addition to the regular bleed passage and no slow-closing throttle action results.



CHECKING & ADJUSTMENT: To check dashpot travel, place rule on float bowl cover at dashpot piston stem, measure distance from bowl cover to edge of retainer on stem with throttle valve closed. Open throttle wide, remove all slack from dashpot linkage, repeat measurement. Difference in these two readings is DASHPOT TRAVEL (see setting below).

DASHPOT PISTON TRAVEL SETTING



BXVD-3 Carburetors—5/16-11/32". **BXVES-3 Carburetor**—13/32-7/16".

Adjustment—Turn adjusting screw on dashpot control lever under float bowl IN to shorten travel setting or OUT to lengthen travel setting.

SERVICING: *No special service operations required. See "Stromberg BXV-3, BXVD-3, BXVES-3 Carburetor" in Carburetor Section for complete disassembly and overhaul data.*

1954 Series 60, 70, M/100	Code 7-98

①—See Changes and Corrections below.

▷CHANGES & CORRECTIONS

▷*1952 BUICK CODE 7-92 CARBURETOR CHANGE TO SHORTEN CRANKING TIME WITH HOT ENGINE: The following modifications can be made on first Code 7-92 Carburetors (CAUTION—Later Code 7-92B carburetors have similar change made in production and do not require this rework):*

1) With carburetor off engine, remove air horn and float bowl cover assembly, remove float asemblies from cover.

2) Working from bottom side of cover, use a No. 22 (.157") drill (⅛" drill can be used) and drill four holes through air horn rim and cored passages (on choke housing side of casting, holes should be to right and left of center dividing wall in cover and in line with passage in this wall; on opposite side of casting, holes should be in cored passages and all holes should open on upper or air cleaner face of air horn immediately adjacent to edge of air intake).

3) With air horn upright, drill external vents as follows: On side opposite Choke Housing: On primary (left hand) side, use No. 36 (.1065") drill (7/64" drill can be used) to drill into the vertical #22 vent passage locating the hole 5/16" up from the top face of the air horn flange and in line with the existing vent hole at the upper end of the vent passage, plug this original vent hole using a suitable ⅛" lead plug. On the secondary (right hand) side, drill into the vertical vent passage similarly (5/16" up from top of flange) using a No. 42 (.0935") drill (3/32" drill can be used). On Choke Housing Side: On secondary side, drill a No. 42 hole into the vertical #22 vent passage locating the hole directly below the horizontal fuel channel in the casting. Plug the existing vent hole (above and to right of new hole location) using a ⅛" lead plug. On primary side, drill a No. 36 hole into the #22 vertical vent passage locating the hole directly below the vacuum passage boss below the vacuum piston cylinder.

4) Carefully clean air horn and bowl cover casting, reassemble floats and re-install assembly.

5) Remove throttle body assembly from carburetor, use a No. 36 (.1065") drill (7/64" drill can be used) to drill an external vent hole into each of the four carburetors barrels, locating holes as follows: All holes should be ½" down from upper (main body mounting) face of throttle body Primary Side Holes should to toward outside or away from secondary barrels, Secondary Side holes should be toward inside or toward primary barrels and adjacent to vertical passages in casting. Carefully clean throttle body and re-install.

6) Adjust carburetor. *See ADJUSTMENT below.*

▷*1953 BUICK ACCELERATION HESITATION CORRECTION (Early Cars):* If a cold engine tends to *(First Engines):* If a cold engine has tendency to hesitate on quick throttle opening, completely tune-up engine using extreme care that all settings are correct and exact, check manifold heat control thermostatic spring, and operation of carburetor hot-air stove. *See Buick 50, 70 Tune-up data in Car Model Section.*

▷*1953 BUICK 70 CHANGE TO ELIMINATE DETONATION OR SPARK RAP (First Code 7-94 & 7-94A Carburetors).* Increase size of vacuum spark control port from .040" to .081" as follows: Remove carburetor from engine, remove carburetor throttle body (see OVERHAUL data below for disassembly). Turn idle speed adjustment screw out or counter-clockwise until primary throttle valves seat tightly. Using a long shank No. 50 drill, and working from inner side of throttle valve bore (directly above throttle valve edge), enlarge original spark control hole. Drill hole out further with No. 47 long shank drill, finally finish drill the hole with a No. 46 (.081") drill. *CAUTION*—Drilling hole out in steps as directed above will prevent gouging of throttle valve and insure accurate sizing of spark control hole. Blow out all chips and thoroughly clean throttle body, reassemble carburetor and re-install on engine. Reset idle speed at 450 RPM. with warm engine.

▷*1953 BUICK 70 IMPROVED WARM-UP & STALLING ELIMINATION (First Code 7-94 & 7-94A Carburetors):* Make following Automatic Choke and Fast Idle Cam changes:

1) Automatic Choke—Enlarge heat hole in choke housing (from No. 60 drill size to No. 55 drill size) and drill No. 70 hole in head of choke piston as follows: Remove air horn and float bowl cover assembly from carburetor, remove float assembly (to prevent damage to floats), remove thermostatic coil and cover assembly. Remove locknut, lockwasher, and serrated washer from choke valve shaft, remove vacuum piston, link, and lever assembly from housing. Using a No. 70 (.028") drill, drill a hole through the center of the head of the vacuum piston. Using a No. 55 (.052") drill, enlarge the original No. 60 drill hole in center of brass bushing in choke housing (on left side facing open end of housing with choke setting indicator boss upward). Re-install choke piston and adjust piston lever position on choke shaft. *See "Choke Piston Setting Adjustment" under ADJUSTMENTS below.*

2) Fast Idle Cam Setting—Check and adjust Fast Idle Cam using a No. 41 drill rod as a setting gauge (changed from No. 26 drill), check and adjust "Start Aid" (Loose Lever and Lock Lever Clearance). *See "Fast Idle" under ADJUSTMENTS below.*

3) Unloader (Wide-open Kick & Deflooder) Setting —Check and adjust unloader. *See "Unloader" under ADJUSTMENTS below.*

▷*1953 BUICK SERIES 70 HARD COLD STARTING & WARMING UP PERFORMANCE CORRECTION (Stromberg 4A Carburetor):* This condition noted by excessive cranking time when starting, and stalling when stopping or stumble on acceleration during warming up period. Correct by making the changes detailed below. *NOTE*—All parts for this change furnished in Service Kit, Buick No. 1391946.

1)—Remove carburetor from engine. Remove and discard Thermostat Cover & Coil Assembly. Remove choke stem nut and serrated washer. Remove and discard Choke Piston.

2)—Remove brass reducer from passage inside choke housing by drilling reducer with a #30 drill and using tool T-24967 or "easy-out" tool to remove reducer. Discard reducer.

3)—Remove and discard drive plug from outer end of channel directly below vacuum piston cylinder in choke housing. Use a special length #42 drill (T-25086 drill, 3¼-3½" long, ground for brass) in a pin vise to drill out the restriction in this channel inserting drill through drive plug end of channel and drilling until drill breaks through at point where brass reducer removed from within choke housing. *CAUTION*—On some Code 7-94 & 7-94A carburetors, a small reducer was located approximately 1½" in from drive plug end of channel. Use care when drilling through this reducer and if it is moved out of position by drill, re-install reducer with a drift pin. Blow out all chips from drive plug end of channel *(CAUTION*—do not blow from choke housing end of channel).

4)—Remove air horn from carburetor (see Disassembly under OVERHAUL below). Remove float assemblies. Remove and discard SECONDARY float needle valve, pin, spring, seat, and gaskets. Install NEW secondary needle valve seat and gaskets (gasket above and below float hanger), tighten seat to approximately 75 in. lbs., using tool T-20140. Check primary needle valve seat to make certain it is tightened to same torque.

5)—Assemble intake needle parts and install floats *(CAUTION*—Primary float marked "522", secondary float marked "520").

6)—Check and adjust Float Level to NEW settings of: Primary—#46 Drill or 5/64". Secondary—#52 Drill or 1/16". *NOTE*—This float setting is same as used on 1954 Code 7-98 carburetors. See Float Setting below.

7)—Check Idle Tubes for looseness. Retighten wedges or re-install tubes, using new wedges. *See Idle Tube Removal & Installation under OVERHAUL below.*

8)—Re-install air horn on carburetor body. Install NEW brass plug in choke housing and NEW aluminum drive plug in outer end of channel.

9)—Install NEW choke piston, serrated washer, lock washer, and nut, using tool T-25047. NOTE—No adjustment necessary with new piston.

10—Install NEW Thermostat Cover & Coil Assembly (marked "30") and adjust for centered setting (inverted "V" mark on cover in line with end of projection on cover).

11)—Make carburetor adjustments, setting the carburetor to the following specifications:

Fast Idle—Use #41 drill to check choke opening when adjusting fast idle rod, use #53 drill when checking loose lever and lock lever clearance.

Unloader—Use #2 drill to check choke valve opening with throttle valve wide open.

Lock-out Slide—Locked clearance should be .025" min., .060" max. (1/32"-1/16"), unlocked clearance should be 3/64" min., 5/64" max.

12)—Remove PRIMARY main discharge jet plugs, remove and discard primary main metering jets. Install NEW .049" jets (Part No. P-19442), reinstall main discharge jet plugs and tighten securely.

13)—Check Starting Switch adjustment. With switch operating lever just contacting switch slide, throttle valve opening or clearance between edge of valves and barrel should be within .100" to .110" (#39 and #41 drill).

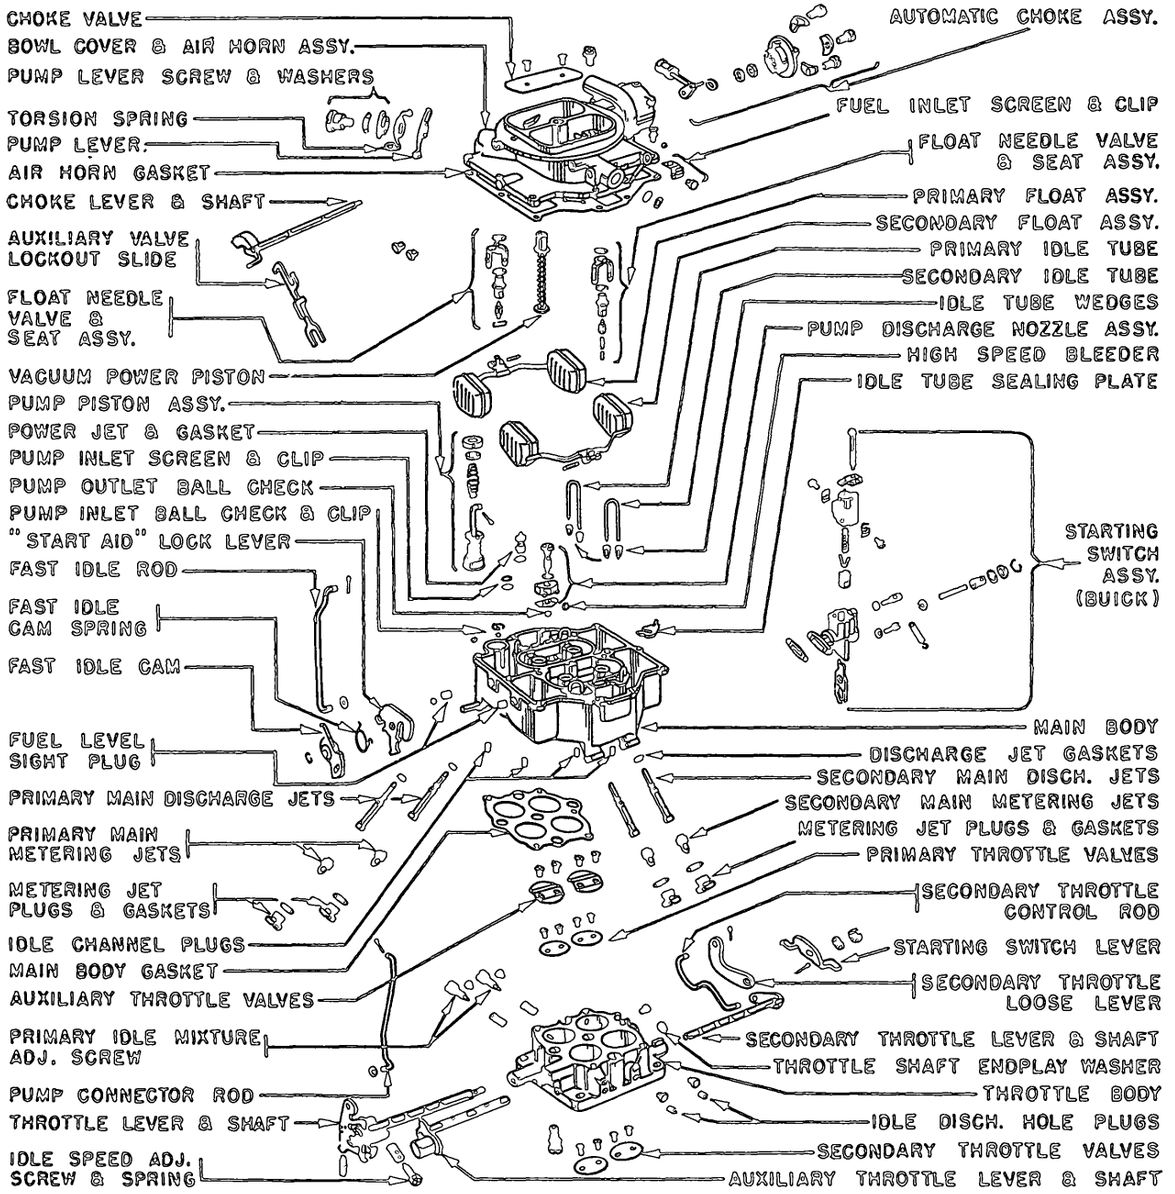
14)—Stamp new Code No 7-94D on carburetor.

DESCRIPTION: These models are essentially double dual (two-barrel) carburetors with a conventional dual primary unit supplemented by a similar dual secondary unit for maximum engine performance. Both the primary and secondary units have separate fuel bowl and float systems, idle systems, main

CONTINUED ON NEXT PAGE

STROMBERG 4-BARREL 4A (Continued)

metering and discharge systems, and interconnected throttle valves as described below. Only the primary unit has an accelerating pump system and choke valve with an automatic choke control (the auxiliary throttle valves are locked closed for starting and warming up and remain closed during part-throttle operation). *See Throttle Linkage data below.*



Fuel System: A single fuel inlet is used (located on secondary side of bowl cover) with a passage in the cover leading to the fuel inlet valve for each float chamber. Each bowl has a twin float assembly controlling the fuel inlet valve (secondary inlet valve is "spring-loaded" type). Bowls are vented to the air horn by vent tubes and have additional vent passages terminating at the air cleaner mounting flange (also have external vents in bowl cover). *See also Idle Vent data below.*

Idling & Low Speed—Entire idle system is duplicated for both the primary and secondary sides of the carburetor except that idle mixture adjusting screws are provided only on the primary side (adjusting screw holes closed by plugs on secondary side). Fuel is discharged into each carburetor barrel and secondary idle system continues to function throughout the part-throttle range until the secondary throttle valves begin to open. Primary idle systems drop out as primary throttle valves open and main nozzles come into action and take over. Auxiliary throttle valves are locked out by the choke mechanism when the engine is cold and even when the engine is warm these valves do not begin to open until primary throttle valves are 50-60% open.

Driving Range (Less than 50-60% Throttle)—The primary throttle valves are directly connected to the accelerator pedal and open as the pedal is depressed (secondary throttle valves are linked to the primary throttle valves and remain closed until primary valves are 50-60% open). Opening of the primary throttle valves bring the main discharge nozzles into action and the primary idle systems drop out (the secondary idle systems continue to function as long as the secondary throttle valves remain closed). Fuel for these main nozzles is metered by the primary main metering jets. Under conditions of low manifold vacuum (hill-climbing, acceleration, etc.), main metering jets are supplemented by fuel by-passed through the power valve and metered by the power restriction (separate valves operated by a spring-loaded vacuum power piston). Power valve is used only for the primary side of the carburetor.

High Speed or Full Power (More than 50-60% Throttle)—At 50-60% throttle, the linkage between the primary and secondary throttle valve levers begins to open the secondary valves. These secondary valves open at a relatively greater rate so that both the primary and secondary valves reach the "wide open" position at the same time. In this range, fuel is discharged through all four carburetor barrels to provide maximum engine power. Secondary fuel is metered by secondary main metering jets and discharged through secondary main nozzles in exactly the same manner as on the primary side except that no power valve is used.

Accelerating Pump—Used only on primary side of carburetor. Pump is conventional type with pump plunger linked to primary throttle valve lever so that the additional fuel needed for acceleration is discharged through the pump jets into the primary carburetor barrels when the primary throttle valves are opened for acceleration. A relief check valve is located in the pump discharge channel to prevent excessive pressures in the pump circuit (opening of the check valve permits fuel to be by-passed back into the bowl).

STROMBERG "4A" 4-BARREL CARBURETOR

Auxiliary Throttle Valves (Buick Carburetors): These are offset type counterweighted valves located directly above the secondary throttle valves (not used on primary side of carburetor). These valves are locked closed by the choke mechanism during choke operation (to insure faster cold engine starting) and when unlocked are controlled entirely by the air velocity through the carburetor (not connected to the throttle linkage).

CONTINUED ON NEXT PAGE

STROMBERG 4-BARREL 4A (Con.inued)

Primary & Secondary Throttle Linkage: Secondary throttle valve lever is linked to a secondary actuating lever on the primary throttle valve shaft with an overrun provision so that secondary valves do not begin to open until primary valves are 50-60% open. The linkage provides a more rapid opening of the secondary valves so that both the primary and secondary valves reach the wide open position at the same time. This linkage must be checked and adjusted to insure this synchronized opening. *See Adjustment data.*

Auxiliary Throttle Valve Lock-out: A means is provided by which the choke mechanism locks the auxiliary throttle valves closed while the choke is in operation so that no choke valve is required on the secondary side of the carburetor. This lock-out mechanism must be checked and adjusted to insure unlocking of the secondary valves for normal operation. *See Adjustment data.*

ADJUSTMENT: *CAUTION—Adjustments must be made in exact sequence as given below (except for Idle Mixture and Idle Speed Tune-up adjustments).*

Idle Setting. *Adjust only with engine at normal operating temperature with automatic choke not operating* (choke valve wide open, fast idle inoperative so that engine idles at hot or slow idle speed). If initial adjustment required to enable engine to be started and warmed up, set each screw 1 turn open. With engine warm, adjust idle speed adjusting screw for correct idle speed shown in table below (use tachometer), turn each idle mixture adjusting screw (one screw for each primary carburetor barrel—two screws only) in until engine begins to miss or run unevenly, then turn screws out until engine begins to roll, finally set screws midway between these two points so that engine idles smoothly. Recheck idle speed.

IDLE SETTING

	Idle Screw Setting	Idle Speed
Buick 70	1 1/8 turns open.	450 RPM.

Float Setting: *CAUTION—Primary and Secondary float assemblies must be checked and adjusted separately.* Fuel level can be checked without disassembling carburetor, float level setting requires removal of bowl cover and float assemblies.

Fuel Level—*CAUTION—Primary and Secondary fuel levels are different.* Fuel level in each bowl should be even with bottom of threads in fuel level inspection holes on sides of bowl casting with 5 lbs. fuel pump pressure. Fuel level distance below top edge (gasket seat) of bowl should be 11/16" (Primary), 5/8" (Secondary). See Float Level data for adjustment.

Float Level—*CAUTION—Secondary float intake needle is spring-loaded type and spring must not be compressed when checking float setting.* Remove air horn and bowl cover assembly but DO NOT remove bowl gasket from bowl cover. Invert bowl cover, install Float Setting Gauge No. T-25489 on bowl cover gasket under floats with locating buttons on gauge fitting into two holes along center line of gasket and air horn *(CAUTION*—gauge must seat flat and solidly on gasket). Inner side of each float should just clear upright guide on gauge and be parallel to the guides (floats should move freely with gauge in place). This will insure floats not dragging on sides of bowl in service. Adjust by bending float arm. Check height of each float by using correct size drill rod (see table below) to gauge distance between top of float at center and face of gasket. Adjust by bending float lever. *CAUTION—Both floats of each set must be adjusted exactly alike.*

FLOAT SETTING

Primary Floats

Carb. Code	Float Level	Drill Size
7-92 & 7-92B	3/64"	#56
7-94, A, B, C	5/64"	
7-98	5/64"	#47

Secondary Floats

Carb. Code	Float Level	Drill Size
7-92 & 7-92B	1/32"	#68
7-94, A, B, C	1/16"	
7-98	1/16"	#52

►*FLOAT ASSEMBLY CAUTION*—Different float assemblies and intake needle valve and seat assemblies used on primary and secondary sides af carburetor. Floats can be identified by "marking" figure on float lever as follows:

	Float Assy. Marking	Part No.	Intake Valve & Seat Size	Part No.
Primary	522	385959	.101".	P-22499
Secondary	520	385998	.076".	③385945

③—SPRING-LOADED type needle valve.

Accelerating Pump: Recommended setting is Short Stroke (pump rod connected in inner hole in throttle lever). Not necessary to check pump stroke.

Automatic Choke: Centered (inverted "V" mark on cover in line with end of projection on cover). Thermostat and Cover Assembly stamped "23" (1952-53), "30" (1954). Do not use any other number.

►*ADJUSTMENT CAUTION*—Heat tube connection and cover retainer screws must be loosened for adjustment. Use extreme care not to rotate or distort cover when tightening heat tube connection.

Fast Idle: *CAUTION*—Fast Idle Cam Setting should be checked first before making regular fast idle adjustment (Loose Lever & Lock Lever Clearance).

Fast Idle Cam—Remove air cleaner for access to choke valve. Close the choke valve against correct size drill rod (see table for sizes and changes) placed between center of upper edge of choke valve and air horn wall, hold choke valve firmly against drill. Make certain that fast idle cam spring holds cam up against end of fast idle rod, close throttle until stopscrew contacts fast idle cam. Stopscrew should just clear edge of highest step on cam and come up against second step. Adjust as required by bending fast idle rod at the large curve.

Fast Idle Setting

Carb. Code	Drill Size & Choke Clearance
7-92 & 7-92B	#26 drill (.147")
7-94, A, B, C	①#41 drill (.096")
7-98	#51 (.067")

①—See Note following

►*FAST IDLE CAM SETTING NOTE*—Use of #41 drill rod (above) is part of recommended "Improved Warm-Up & Stalling Elimination" change on first 7-94 and 7-94A carburetors.

Loos Lever & Lock Lever Clearance—After adjusting fast idle rod above, substitute a #53 drill for the drill used in making the rod adjustment. Hold choke valve firmly against the #53 drill, open and close primary throttle valve and note clearance between start-aid lock lever on throttle shaft and loose lever behind fast idle cam. This clearance should be just enough to permit the levers to clear. Adjust by bending end of lock lever up or down.

CAUTION—Use care not to distort fast idle cam return spring or cause bind between rod and slot in cam.

Unloader (Wide-open Kick & Deflooder): Move throttle valves to wide open position, measure choke valve opening (clearance between upper edge of choke valve at center and air horn wall). This clearance should be .221" (use No. 2 drill rod). Adjust as required by bending tongue on throttle lever which contacts arm on fast idle cam. Close both choke valve and throttle valve, then open the throttle against the tension of the start-aid loose lever spring. Lock lever should release the loose lever and the spring tension before stop arm on throttle lever contacts stop boss on throttle body.

Secondary Throttle: *Secondary throttle linkage should be checked and adjusted at two points:*

Wide-open Throttle—Move primary throttle valves to wide-open position. If secondary throttle valves are not wide open, or if secondary shaft lever comes up against its stop before primary throttle valves are wide open, adjust vacuum switch lever as follows: Hold switch lever by applying wrench to flat surface below loose lever, then bend curved end of switch lever up or down as required with pliers so that primary throttle valves are wide open (parallel with walls) and secondary throttle valves are also wide open with inner end of secondary throttle shaft lever bearing against stop boss on body.

Part Throttle—With secondary throttle valves closed, open primary throttle valves just enough to take up all slack in linkage so that secondary valves are ready to open. Check primary throttle valve opening (clearance between lower edge of valves and carburetor wall). This clearance must be 125" minimum, .180" maximum. Adjust as required by bending the throttle control rod at the large curve back of the loose lever. Rod ends should measure 2 11/16" plus or minus 1/32" between centers.

Auxiliary Throttle: *Auxiliary throttle valve closed position, and lock-out action must be checked and adjusted:*

Valve Position—With auxiliary throttle valves closed, clearance between edge of valve and carburetor wall should be .015" measured on longer side of valve at dividing wall between primary and secondary barrels. Adjust by loosening valve attaching screws and shifting valve. Check valves for free operation without binding through entire travel except for lock-out action in closed position

Lock-out Slide Clearance—*Two separate adjustments required as follows:*

Locked Clearance—With auxiliary throttle valves in closed position, close choke valve fully so that locking slide engages auxiliary valve counterweight lever. Check clearance between ear on slide and edge of lever with a feeler gauge. This clearance should be .025" minimum, .060" maximum. Adjust by bending ear on slide.

Unlocked Clearance—With choke valve wide open, move auxiliary throttle valves to wide open position. Clearance between end of locking ear on slide and edge of auxiliary valve counterweight lever

CONTINUED N NEXT PAGE

STROMBERG 4-BARREL 4A (Continued)

should be 3/64" minimum, 5/64" maximum. Adjust by bending choke lever slide actuating arm.

STARTING SWITCH: *See "Stromberg Starter Switch" in Electrical Equipment Section for complete data. Switch setting can be checked as follows:*

Switch Setting (Carburetor on Engine)—On Dynaflow cars, make certain Dashpot and throttle linkage correctly adjusted, place transmission selector lever in neutral and set hand brake firmly to hold car. With engine not running, insert a pin through felt filter and screen to operate vacuum piston, push vacuum piston in and hold it while opening throttle (this will allow slide to engage groove in piston and prevent slide dropping down to complete contact), hold throttle open, remove pin. Place 5/64" spacer between fast idle stopscrew and fast idle cam with fast idle cam in cold idle position. Close throttle so that spacer holds cam in cold idle positon. Turn ignition on, hold spacer, depress accelerator to start engine. Engine should not crank. Repeat above test with 3/64" spacer between stopscrew and fast idle cam. Engine should crank. If engine cranks with 5/64" spacer, bend tang on switch operating lever downward slightly and recheck switch timing. If engine does not crank with 3/64" spacer, bend tang on operating lever upward slightly and recheck switch timing.

OVERHAUL: *CAUTION—When disassembling carburetor, be sure to keep PRIMARY and SECONDARY side parts separate so they will not be confused or interchanged when carburetor reassembled.*

Disassembly: Carburetor consists of three main subassemblies (Air Horn & Bowl Cover, Main Body, and Throttle Body) which can be overhauled separately as follows:

Air Horn & Bowl Cover—First disconnect spring from secondary throttle shaft lever and remove accelerator vacuum switch and gasket by taking out two attaching screws in throttle body. Disconnect fast idle rod from choke shaft lever and pump rod from pump lever. Remove pump lever fulcrum screw (left-hand thread), anti-rattle washer, and torsion spring washer, then disconnect pump lever from pump piston stem and remove lever. Take out all air horn and bowl cover attaching screws, lift air horn just far enough to free lock-out slide, remove slide, then lift air horn straight up *(CAUTION*—use extreme care not to damage floats, pump piston, or vacuum power piston). Invert air horn and remove pump piston assembly. Remove float hinge pins (tap plain end of pin to force serrated end out of hanger), remove float and intake needle assemblies, use wrench T-20140 to remove needle seats and gaskets *(CAUTION*—keep each float assembly, intake needle, and needle seat together, DO NOT mix primary and secondary side parts). Remove float hangers and bowl cover gasket. Remove vacuum power piston (compress spring to obtain grip on outer end of piston stem with pliers, then pull piston straight out to avoid bending piston stem). Remove choke cover and coil assembly by taking out screws and removing retainers. Use wrench T-25047 to remove nut on end of choke shaft, remove lockwashers and serrated washer. Remove choke valve attaching screws, remove valve. Remove choke shaft and vacuum piston and lever assembly.

Main Body—Remove four idle tube sealing plates to avoid losing them during overhaul but DO NOT remove Idle Tubes unless replacement required (see special Idle Tube Installation data below). Take out pump discharge nozzle screw, remove nozzle and gaskets, then invert body and catch valve ball which will fall out of pump discharge passage. Take out retainer clip in bottom of pump cylinder and remove inlet check valve ball located in cylinder below retainer. Take out attaching screws and remove throttle body from main body, remove gasket. Pry snap ring from fast idle cam post, remove cam, lock lever, and spacer washer. Take out main discharge jet plugs (tool T-19099), remove copper gaskets, remove main metering jets (Socket wrench tool T-24924), remove main discharge jets (Jet Remover tool T-24967—screw tool into base of jet and then pull jets straight out of main body). *CAUTION*—Lead gasket at discharge jet seat in main body must be completely removed. Take out small plugs on bottom of main body directly below end of tubes (will allow idle tubes and passages to be cleaned without disturbing tubes).

Throttle Body—Remove both idle adjusting screws and springs. Take out attaching screws and remove auxiliary throttle valve from shaft, pry washer off end of shaft, remove shaft and lever assembly. Mark all throttle valves by lightly scribing line on valve along both sides of shaft and also indicate location to insure re-installing valve in same barrel, take out attaching screws and slide valves out. Disconnect control rod from secondary throttle shaft lever, remove shaft from body. Remove nut, lockwasher, switch lever and loose lever from end of primary throttle shaft, remove shaft and lever assembly from body.

Cleaning & Inspection: Thoroughly clean all parts using Bendix Metalclene or equivalent cleaning solvent, rinse with clear gasoline and dry with air. Blow out all passages in casting with air (pay particular attention to idle tubes and passages—if tubes require removal, see special removal and installation data below), make certain all gum and carbon deposits removed. Check choke shaft and throttle shafts for wear in bearings. Inspect choke thermostatic coil for distortion or damage, see that vacuum piston and cylinder are clean and free of burrs or scores. Replace fuel inlet strainer and pump strainer if clogged or damaged. Check pump piston leather for cracked, creased or turned edges or other damage, make certain relief valve in piston is tight (blow on lower end of piston). Inspect all check ball seats in castings (if seats rough, reface by placing ball on seat and tapping ball lightly, then DISCARD balls after such use). Inspect all jets for wear or damage. Replace all worn or damaged parts.

Idle Tube Removal & Installation: If tubes require removal for any reason, always install NEW tubes as directed below:

Removal—Pry old tube out using a screwdriver blade placed under tube loop *(CAUTION*—use piece of wood under screwdriver blade to avoid marring top edge of main body. DISCARD old tube and wedges.

Installation—Place tool T-25525 on top surface of main body with flat surfaces vertical, place NEW idle tube and wedges in position over tool (tube should loop over tool which will position the tube properly). *CAUTION*—Small diameter end of tube should be inserted in hole which is directly above main discharge jet passage. Hold tube loop down against positioning tool, slide wedges down into holes in main body, use Wedge Driver T-25488 and light hammer to seat wedges snugly in place. Remove positioning tool T-25525 using care not to disturb tube seals.

Reassembly: Use all NEW gaskets. Install all parts in reverse order of disassembly procedure (above) and pay particular attention to the following:

Throttle Valve Installation—Install each valve in same carburetor barrel from which removed (as marked before removal) with dash mark on primary valves and crescent mark on secondary valves toward top of body and on same side as idle ports. Install new valve screws loosely, align scribe marks carefully, then tighten screws. Check valves by sighting through barrel and shifting valves as required until least amount of light visible around edge of valve. After valves properly set, tighten screws securely and stake ends lightly *(CAUTION*—support screw heads on steel block while staking to prevent bending of shaft).

Auxiliary Throttle Valve Installation—Use new screws to attach valves, position valves so that clearance between inner edge of valve and middle wall of carburetor is .015" (measure with a wire gauge). After valves correctly positioned, tighten screws securely and stake ends in same manner as other throttle valve screws above.

Idle Adjusting Screws & Springs—Turn both screws in until lightly seated, then back screws out 1⅛ turns for preliminary adjustment which will allow engine to be started and warmed up (see ADJUSTMENT data for final setting).

Main Discharge Jets—Use new lead gasket on upper end of jet, install by using Remover Tool T-24967 to seat jet in main body. Flat surface of all jets must be parallel to air flow when installed in carburetor *(CAUTION*—Secondary jets only are notched on this upper flat surface).

Main Metering Jets—Make certain that primary and secondary jets are not interchanged (Secondary jets have groove on shank—primary jets not grooved).

Main Discharge Jet Plugs—Use new copper gasket on plugs. Plugs must be tight.

Choke Valve Installation—Use new screws to attach choke valve and position valve so that clearance uniform between valve edges and air horn. After tightening screws, make certain that valve operates freely and falls open of own weight without binding at any point, then stake ends of screws lightly (support screw heads on steel block to avoid bending shaft).

Choke Piston Installation & Adjustment (1952-53)—Install vacuum piston in cylinder *(CAUTION*—do not use any kind of lubricant on piston or cylinder), engage lever on end of choke shaft, then assemble adjusting washer (serrated side toward piston lever), lockwasher, and nut, tighten nut finger-tight only. Adjust piston position as follows: With nut on end of choke shaft finger-tight, install Piston Setting Gauge T-25367 in choke housing so that small hole fits over pin on vacuum piston lever and

CONTINUED ON NEXT PAGE

STROMBERG 4-BARREL 4A (C ntinu d)

the two indicator lines on face of the gauge are centered on end of indicator boss on housing (install two cover washers to hold gauge in this position). Close choke valve tightly against small end of Gauge T-25086 (or No. 29 drill rod) placed between upper edge of valve and air horn wall, tighten locknut on shaft tightly, then remove gauge or drill rod and close choke valve fully, tighten locknut securely. Recheck setting.

Choke Piston Installation (1954)—Install vacuum piston in cylinder (*CAUTION*—do not use any kind of lubricant on piston or cylinder), engage lever on end of choke shaft, install lockwasher and nut. Tighten nut with wrench T-25047.

Vacuum Power Piston Installation—When installing piston in air horn DO NOT use any kind of lubricant on piston. Stake edge of cylinder at three points to retain piston. Make certain that piston operates freely in cylinder.

Float & Intake Needle Valve Installation—When installing float hangers and needle seats, use new gaskets above and below hanger. Make certain that corect float, intake needle, and seat used on primary and secondary sides (see Float data under ADJUSTMENTS above). Intake needle must be clipped to float arm properly and float assemblies must operate freely on fulcrum pins. Adjust float height and float alignment (see Float Level under ADJUSTMENTS above).

Accelerator Vacuum Switch Installation & Adjustment—Use new gasket when installing switch and place long grooved mounting screw on **primary** side, hook secondary throttle shaft lever return spring on this screw). After all linkage assembled, adjust switch as follows: Close primary throttle valve against a No. 41 drill rod, bend tang on switch operating lever until it just touches switch slide. This is an approximate setting only and should be rechecked after carburetor installed on engine. *See Stromberg Starter Switch data in Electrical Equipment Section.*

Carburetor Adjustments—Make all adjustments as listed under ADJUSTMENTS above.

SERVICE PARTS: Gasket Set—Stromberg No. 382361. **Repair Parts Kit**—Stromberg No. RK-171 (1952 Code 7-92 & 7-92B), No. RK-176 (1953 Code 7-94, A, B, C). No. RK-182 (1954 Code 7-98).

STROMBERG "AA" & "BX" CARBURETOR JET SPECIFICATIONS

⑧—Supersedes #56, Part No. P-21657 on first 6-107 carburetors.
⑩—Supersedes #65 By-pass Jet used on early models. Studebaker No. 531497.
⑬—Code No. 6-111C Carburetors.
⑭—Part No. P-23985.
⑱—Discharge Reducer. Also uses Pump By-pass Jet 2#56, Part No. P-24062.
⑲—Secondary Bleeder #38, Part No. P-23658 in Throttle Body.
㉑—Part No. P-22369.
㉒—Pump Discharge Nozzles in Main Body. Pump By-pass Jet #63, Part No. P-23742
㉓—Part No. P-24315. ㉔—#52 in Main Body also.
㊵—Part No. 385852.
㊶—Code No. 205-14A carburetors.
㊷—Code No. 205-14B carburetors.
㊸—#58 in main body also.
㊹—Supersedes #58, Part No. 385056.
㊻—First Code 6-107 & 6-107A carburetors.
㊼—Later Code 6-111 carburetors.
㊽—Supersedes .044" No. P-24473 on first 6-107 carburetors.

1953-54 STROMBERG "WW" (DODGE)

	①Stromberg Model & Code
DODGE V8 1953	
Synchro-mesh Trans.	WW, 3-108, A
Fluid Drive	②WW, 3-105, A
Overdrive	③WW, 3-109, A
Automatic Trans.⑤	④WW, 3-106
DODGE V8 1954	
Synchro-mesh Trans.	WW, 3-108A
Overdrive	③WW, 3-109A
Gyromatic Trans.	④WW, 3-106A
PowerFlite	②WW, 3-105A

①—Code No. stamped on bowl cover above fuel inlet connection.

②—Has Slow-Closing Throttle Dashpot **without** magnetic control.

③—Has Overdrive Kick-down Switch mounted on bracket on main body.

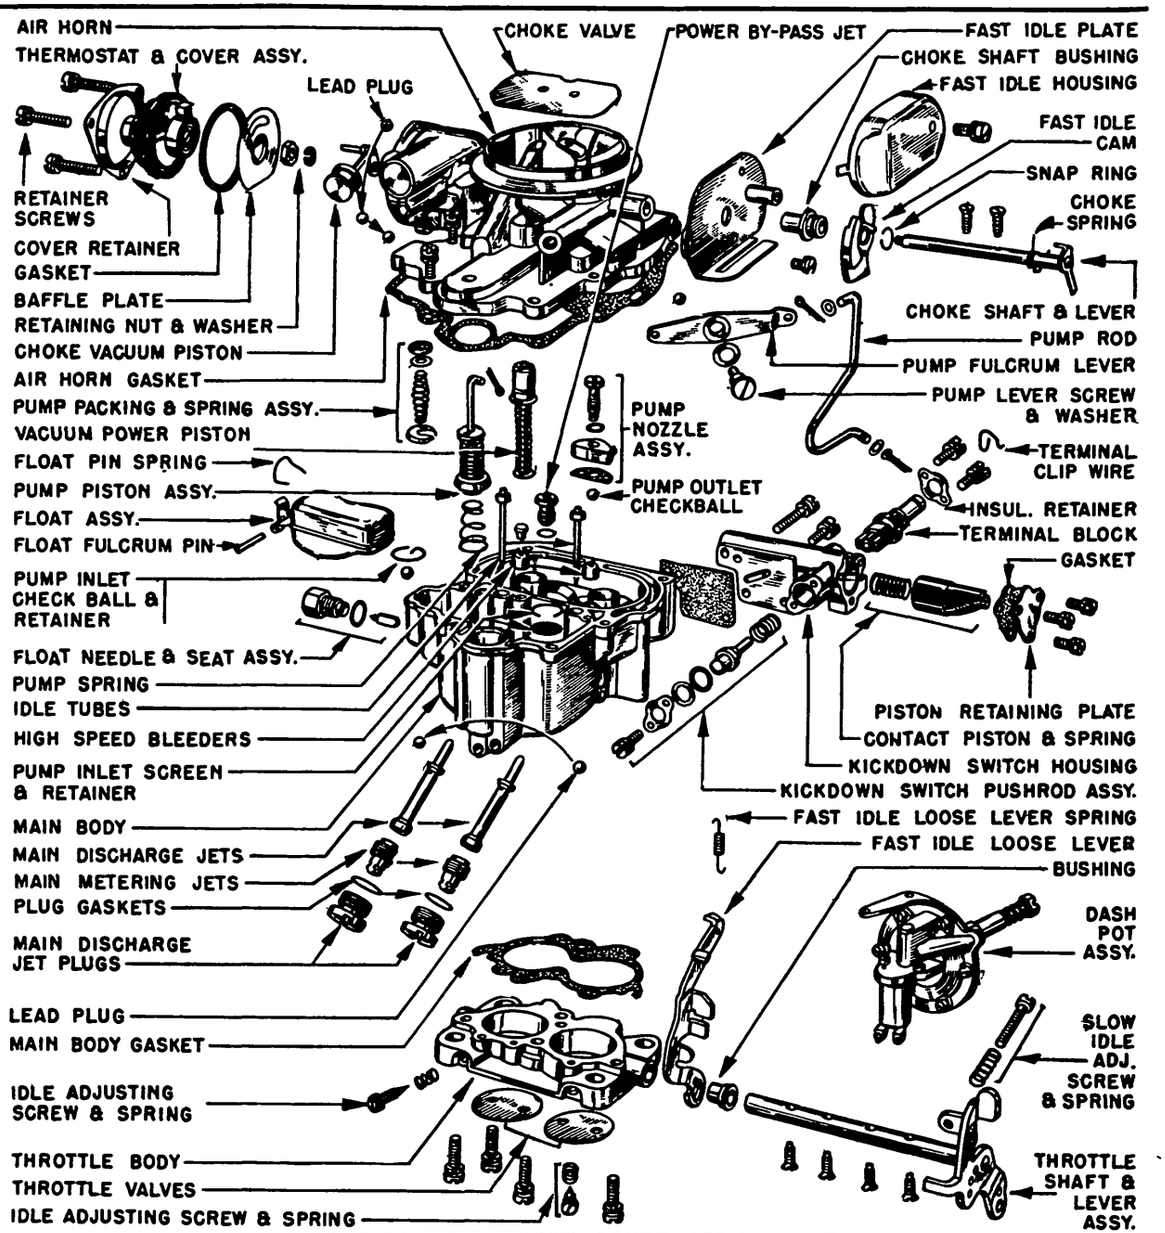
④—Has Slow-Closing Throttle Dashpot **with** magnetic control and Transmission Kick-down Limit Switch mounted on main body.

⑤—Gyro-matic or Gyro-Torque Drive Cars.

DESCRIPTION: "WW" carburetors are dual barrel, downdraft type of new design with vertical air intake. Fuel system is similar to other Stromberg carburetors with usual Float System (single float), Idle System, Main Metering System, Power System (with vacuum piston operated power by-pass jet), and Accelerating System (pump operated by horizontal fulcrum lever with duration spring type pump piston). Carburetor has automatic choke and Fast Idle. ***All models are alike except for added units for each type service as listed above.***

ADJUSTMENTS: ***CAUTION—Make all adjustments exactly as listed below. Kick-down Switches and Dashpot not used on all models (see listing above).***

Idle Setting: First synchronize both idle mixture adjusting screws by turning each screw in until it is lightly seated, then back each screw out exactly one turn. Start engine and run it until it is thoroughly warmed up (water temperature 160°F. or higher) with choke valve wide open and fast idle inoperative. Then adjust idle mixture and idle speed as follows:



Idle Mixture—First check and adjust idle speed (see below). Make trial adjustment by turning BOTH idle adjusting screws in ⅛ turn to lean the mixture and note effect this has on performance.

If engine speed increases and engine is smoother, turn both screws in additional ⅛ turn. If performance improved, reset engine idle speed and make a fine adjustment by turning EACH idle adjusting screw in ⅛ turn and out ⅛ turn to find exact best setting for each screw. Finally reset idle speed.

If engine speed decreases and engine is rougher, turn both screws out ⅛ turn for richer mixture. If performance improved, reset engine idle speed and make a fine adjustment by turning EACH idle adjusting screw in ⅛ turn and out ⅛ turn to find exact best setting for each screw. Finally reset engine idle speed.

►***CAUTION—BOTH idle adjusting screws must be set exactly alike (plus or minus ⅛ turn to allow for final exact setting of each screw).***

Idle Speed—Adjust only with engine at normal operating temperature with choke valve wide open and fast idle inoperative. Turn throttle stopscrew in or out for correct idle speed as measured with tachometer with shift lever in neutral.

STROMBERG "WW" (DODGE) DOWNDRAFT CARBURETOR

IDLE SETTING

	Idle Mixture	Idle Speed
Dodge V8 (All)	¾-1¼ turns open.	475-500 RPM.

Accelerating Pump: ***NOTE***—Pump Seasonal Setting can be changed as required, Pump Stroke Setting should be checked and adjusted whenever carburetor overhauled.

Pump Seasonal Setting—Throttle lever has three holes for pump connector rod engagement:

Center Hole—Normal operating conditions.
Inner Hole—Min. stroke for less discharge.
Outer Hole—Max. stroke for greater discharge.

Pump Stroke Setting—To check pump stroke, back out throttle stopscrew so that throttle valves tightly closed, use scale to measure distance from top of bowl cover at side of pump plunger to top of plunger. This distance should be ¾". Adjust by bending pump connector rod using tool T109-213.

CONTINUED ON NEXT PAGE

1953-54 STROMBERG "WW" DODGE (Cont.)

Float Level: To check float level, remove air horn and bowl cover and air horn gasket. Hold lip of float lever firmly against intake needle valve so that float held up in closed-valve position. Use Float Gauge T-25569 placed squarely on top edge of bowl at center of float. Float should just contact step on gauge. To adjust float level, bend lip on float lever as required using bending tool T-24733.

FLOAT LEVEL

Dodge V8 (All)	3/16"①

①—Top of float below top edge of bowl.

Fast Idle: To check fast idle setting, first remove fast idle cam housing to expose fast idle cam on end of choke valve shaft. Open throttle valve, close choke valve against FIRST STEP of Gauge T-25570 (second step of gauge used for Unloader setting) placing gauge between upper edge of choke valve and air horn wall, then move throttle valve toward closed position. Top of fast idle lever should just enter the first step on the fast idle cam. To adjust, bend lever on fast idle cam. *CAUTION*—hold fast idle counterweight while bending the lever.

Unloader: To check unloader setting, close choke valve, open throttle valves to wide-open position, check choke valve opening by inserting Gauge T-25570 between upper edge of choke valve and air horn wall. Choke valve opening should be equal to SECOND STEP on gauge (first step is used for Fast Idle setting). To adjust, bend choke lever on choke shaft which contacts ear on fast idle lever. Reinstall cam housing after completing adjustment.

Choke Setting: Centered (indicator mark on edge of thermostatic coil cover lined up with projection on top of choke housing). To adjust, loosen heat tube connection on cover and three screws in cover retainer, rotate cover and coil assembly.

▷*CAUTION—Hold heat tube fitting on cover with a wrench while loosening or tightening heat tube connection to avoid damaging or rotating coil assembly.*

Kick-down Switch (Code 3-109 Carb.): Adjust switch position on bracket by backing off one locknut on mounting stem and tightening opposite nut until switch "B" contacts (terminals on opposite end of switch from plunger) are closed with the throttle valves wide open (use test lamp connected to switch terminals to check operation).

Kick-down Limit Switch (Code 3-106 Carb.): Check operation by road-testing car as follows: With car running at 30 MPH. accelerate with approximately ¾ throttle and when car speed reaches 40 MPH., push accelerator pedal to kick-down position. Repeat this test at 45 MPH. and at 50 MPH. *Kick-down should operate below 40 MPH. and should not operate above 45 MPH.*

Dashpot (Code 3-105 & 3-108 Carb.): Check operation by running engine and holding car with the brakes. Shift to driving range and rapidly accelerate and decelerate engine. Engine should not stall when accelerator pedal released quickly. If engine stalls, adjust dashpot for maximum action by turning adjusting screw out until overtravel of plunger (possible inward movement of plunger) is only 1/16" with throttle valves in closed position.

OVERHAUL: *NOTE—Carburetor should be mounted on repair block, Tool C-3225, which will prevent damage to throttle valves while working on carburetor.*

Disassembly: On carburetors so equipped, first remove Dashpot and gasket (two screws in mounting bracket), Kick-down Switch and gasket (two screws in mounting bracket), or Kick-down Limit Switch (three screws and lockwashers in housing). Disconnect pump operating rod from throttle lever, disconnect pump plunger stem from pump rocker arm, take out rocker arm fulcrum screw and spring washer (screw has left-hand thread), remove rocker arm and rod assembly. Remove fast idle cam housing dust cover, disengage fast idle lever return spring from housing and lever. Take out four air horn attaching screws, lift air horn assembly straight up while disengaging fast idle lever from slot in housing by pushing outward.

Air Horn Disassembly—Remove pump compression spring from bottom of pump plunger, slide plunger assembly out of air horn, discard plunger rod felt washer, remove and discard air horn gasket. Remove vacuum power piston by hooking end of small open end wrench under head on piston stem and using wood block on air horn as a fulcrum so that piston assembly can be pulled straight out (*CAUTION*—this assembly is staked in air horn and will be damaged unless removed in this manner). Take out screws in choke housing retainer ring, remove retaining ring, thermostatic coil housing assembly, gasket, and baffle plate. Remove nut attaching choke piston link on choke shaft, take out choke valve attaching screws, remove choke valve. Withdraw choke shaft and lever from air horn and disengage choke piston link, lift out choke piston and link assembly. Disengage spring from choke shaft lever and slide spring off choke shaft. Pry out fast idle cam retaining snap ring, remove fast idle cam. Take out screw and lockwasher attaching fast idle backing plate to air horn, use open end wrench inserted between backing plate and air horn and over choke shaft boss to pry backing plate loose, remove backing plate and choke shaft bushing. Remove lead plug from lower side of choke piston cylinder so that passage can be blown out (plug can be drilled out using No. 44 drill). Remove thermostatic coil and heat retainer plate from choke housing by rapping assembly sharply on palm of hand with coil side down (*CAUTION*—do not attempt to remove coil from heat retainer plate).

Main Body Disassembly—Lift both idle tubes out. Remove attaching screw and gasket in pump discharge cluster, remove cluster and gasket, invert body to drop discharge check ball from discharge passage. Remove fuel inlet needle seat and gasket, lift out inlet needle. Pry out float fulcrum pin retaining spring (*CAUTION*—do not allow spring to fly out), lift out float and fulcrum pin assembly. Remove power by-pass jet and gasket. Pry out snap ring in bottom of pump cylinder, remove strainer screen, remove snap ring retaining intake check ball, invert body to drop out the check ball. Remove both main jet plugs, discard gaskets. Use tool T-24924 to remove main metering jets. Use tool T-24967 to remove main discharge jets by screwing tool into jet and then pulling jet out of the body (threads formed by tool will not damage jet). Take out screws attaching main body to throttle body, lift main body off and discard gasket.

Throttle Body Disassembly—Remove both idle adjusting screws and springs. DO NOT disturb throttle valve and shaft assembly unless new parts must be installed (Manufacturer recommends replacement of Throttle Body Assembly if shaft or shaft hole in body worn). To remove throttle valves, first mark each valve to insure re-installation in same barrel, take out valve attaching screws, slide valves out of shaft slots, withdraw throttle shaft and lever assembly from throttle body.

Cleaning & Inspection: Clean all metal parts thoroughly in suitable cleaning solution. Make certain all carbon and gum deposits removed. Blow out all passages and dry parts with air. Inspect all parts for wear or damage.

Reassembly: Use all NEW gaskets. Install all parts in reverse order of disassembly procedure above and note the following important points:

Throttle Valve Installation—After throttle shaft inserted in throttle body, slide valves in place in throttle shaft lining up marks made before disassembly and with dash stamped on valve toward idle port and visible from top of throttle body, install new screws loosely. Centralize valves by closing valves tightly (throttle stopscrew must be backed off), tap valves lightly and hold them in place by pressing on high side of valves while tightening screws securely. Stake screws by squeezing with pliers.

Main Discharge Jet Assemblies—Engage remover tool T-24967 securely in end of main discharge jet, seat jet firmly in main body with nozzle opening (diagonal end) facing opposite wall of small venturi. Install main metering jet and tighten securely with tool T-24924. Install metering jet plug with new copper gasket and tighten securely.

Accelerating Pump Assembly & Testing—Drop 3/16" intake check ball into recess in bottom of pump cylinder, use tool T-25568 to seat check ball retainer, install new pump strainer, use tool T-25568 to install screen retainer. Drop 1/8" discharge check ball in pump discharge passage in main body, install pump plunger assembly temporarily in pump cylinder, fill carburetor bowl approximately 1/2" deep with clean gasoline. Press lightly on plunger shaft to expel air from pump system, then hold discharge check ball down on seat firmly using a small brass rod, raise pump plunger to fill cylinder and press downward on plunger. No gasoline should pass either the discharge check ball or intake check ball. If check balls are not tight, thoroughly clean pump passages and install new check balls. Install pump discharge cluster with new gasket and tighten screw securely. Check pump action. Identical clear straight streams should be emitted from each pump jet. If either stream diverted or restricted, install new pump discharge cluster. After tests completed, remove pump plunger and pour out the gasoline. Before finally installing pump plunger, flex leather several times and replace assembly if leather hard, cracked or worn. After pump plunger installed in cylinder (with compression spring under plunger), install air horn gasket, then place new metal and felt washer on pump plunger stem before installing air horn.

Vacuum Power Piston Installation—After vacuum piston installed in air horn, lock assembly in place by prick-punching rim at several points. Check piston for free operation and replace if any binding or sticking noted.

Automatic Choke & Fast Idle Assembly—Make certain thermostatic coil and heat retainer plate correctly installed in choke housing with notch in

CONTINUED ON NEXT PAGE

1953-54 STROMBERG "WW" DODGE (C nt.)

plate aligned with lug in housing and retaining spring seated in groove *(CAUTION*—spring must clear notch in plate). Install choke shaft bushing in backing plate, position backing plate on air horn, use tool T-25570 to drive bushing in place in air horn, slide fast idle lever into backing plate slot, install screw and lockwasher. Install fast idle cam on shoulder of choke bushing and secure with snap ring. Slide choke piston into cylinder, slide choke shaft and lever into position *(CAUTION*—make certain spring properly installed on shaft), hook long end of spring in notch of fast idle cam lever. Install choke valve (see below), engage piston link on choke shaft, install lockwasher and nut and tighten nut securely with tool T-25047. Install baffle plate with dimpled side out *(CAUTION*—lever must clear baffle at full travel). Check choke assembly for free operation (valve must open freely of own weight). Install coil housing gasket, coil housing assembly, and retainer ring with indicator mark on housing straight down, turn assembly counter-clockwise until indicator mark on housing in line with projection on air horn, tighten retainer screws securely. Install fast idle lever return spring with long loop hooked to lever and short loop hooked in backing plate Adjust fast idle and unloader before installing fast idle housing cover.

Choke Valve Installation—Slide valve in position in shaft, install new screws loosely, close valve and center it by tapping lightly with a screwdriver, then tighten screws securely and stake screws by squeezing with pliers.

Carburetor Adjustments—See ADJUSTMENT above.

SERVICE PARTS: Gasket Set—Stromberg No 382363 (Code 3-105, A; 3-108, A; 3-109, A). No. 382364 (Code 3-106, A)

Repair Kit Pkg.—Stromberg No. RK-173 (Code 3-108, A, 3-109, A). No RK-172 (Code 3-106, A).

D-55-3 PowerFlite	WW3-122, A, B, C

►CHANGES, CAUTIONS, CORRECTIONS

►*HARD STARTING AFTER WARM UP OR FLOODING CAUTION.* Use of other than mounting Gaskets, Dodge Nos 1615860 or 1634701, can result in restriction or blocking off of hot air passages to choke as well as the vacuum passage to the piston that operates the power by-pass or economizer jet. Incorrect choke setting or incorrect mounting gasket will cause hard starting after normal start and affect economy of operation.

DESCRIPTION: These carburetors are dual barrel, downdraft type of new design with vertical air intake. Automatic choke housing with fast idle cam is located on throttle body on opposite side from throttle lever. Choke valve operated by connecting link. Fuel system is similar to other Stromberg carburetors with usual Float System (single float), Idle System, Main Metering System, Power System, (with vacuum piston operated power by-pass jet), and Accelerating System (pump operated by horizontal fulcrum lever with duration spring type pump piston). All models are alike except for added units for each type service as listed above.

ADJUSTMENTS: *CAUTION—Make all adjustments exactly as listed below. Kickdown switches used only on Overdrive equipped cars. Dashpot only on PowerFlite equipped cars. See table above.*

IDLE SETTING

Idl S tting—Turn both idle adjusting screws in until they bottom lightly then back off 1 turn. Start engine, turn each adjusting screw in equally until engine starts to reduce speed then back off screws to obtain smooth operation and highest vacuum

Idl Speed—Turn throttle stop screw in or out to obtain 450-500 RPM Std. Trans., 475-500 RPM PowerFlite (selector lever in Neutral)

ACCELERATING PUMP

Pump Seasonal Setting—Setting can be changed as required Centered hole for Normal operation, Inner hole for minimum stroke for less discharge, Outer hole for maximum stroke and greater discharge.

Pump Stroke Setting—Hold carburetor in vertical position to properly seat pump check ball. With pump rod in center hole of throttle lever, hold choke valve wide open, travel of accelerator pump, as throttle valves are moved from open to fully closed, should be 13/64-15/64" (6 cyl. carb.), 7/32-1/4" (V8 carb.).

ECONOMIZER SETTING

No adjustment required. Valve opens when manifold vacuum drops to 4-6" (65-70 MPH).

FLOAT LEVEL

3/16" distance from center of float with lip held firmly against needle valve, to top of bowl casting (gasket removed). Use Tool T-25569 placed at center of float and resting on bowl casting (gasket removed). Use Tool T-24733 to bend lever next to float as necessary.

FAST IDLE

►*CAUTION All Fast Idle Adjustments including Unloader Adjustment must be made in the sequence given below.*

1) Fast Idle Speed—With choke cover removed, place one cover screw through Spring Tool T-25906 and attach Tool to housing above choke lever. Hook other end of spring to choke lever. Remove spring from throttle stop screw and replace screw only. Close throttle valves, turn stop screw in until it contacts lever, then continue to turn screw in 4½ turns (V8 Carb.), 5 1/8 turns (6 Cyl. Carb.). Hold choke valve closed and bend cam contact ear so that No. 48 drill rod will just go between ear end of contact lever and first step of fast idle cam *NOTE*—Ear must be parallel to throttle shaft after bending. Replace throttle stop screw spring

2) Fast Idle Cam Position—Open throttle valve to clear fast idle cam, close choke valve tightly. Force throttle closed against tension of cam positioning spring Ear on cam contact lever should just clear high step of fast idle cam (Max. .020") Bend fast idle rod as necessary.

3) Choke Positioning Spring—With Spring Tool T-25906 in position, attach weight Tool T-25864 on choke lever between rod and end of shaft. Hold carburetor vertical, close throttle making sure cam contact lever ear rests on high step of fast idle cam (If necessary rotate fast idle cam to get this position). Apply light closing pressure on throttle valve which should open choke valves against choke positioning spring tension (see Spring Color Caution below), just enough to insert correct size drill rod (see table below), between choke valve and wall of air horn Apply by bending ear of choke lever as required.

►*CHOKE POSITIONING SPRING CAUTION Make sure correct colored spring is used and use correct drill rod specified for that carburet*

Choke Positioning Spring Setting

Carb. Code No.	Drill R d	Spring Col r
WW3-120	#30	Copper
WW3-120 A,B	#24	Copper
WW3-121	#30	Copper
WW3-121A,B	#24	Copper
WW3-122	#28	Silver
WW3-122A,B,C	#24	Copper
WW3-124, 125	#31	Black
WW3-126	#37	Copper
WW3-131,A	#24	Copper
WW3-132,A	#24	Copper
WW3-133	#24	Silver
WW3-133 A, B	#24	Copper

UNLOADER SETTING

Apply light closing pressure to choke valve and open throttle valve to wide open position. Choke valve should open .180-.150" (Distance between choke valve and wall of air horn) Adjust by bending ear of cam lever as necessary

AUTOMATIC CHOKE SETTING

Carburetor Code Number determines correct cover and setting (see table below) Rotate cover clockwise to correct setting and tighten retaining screws. Hold choke open, then open and close throttle valves Failure to obtain full throttle operation indicates faulty assembly or improper adjustment. Hold throttle wide open, then open choke slowly to wide open position. There should be no bind through entire travel of choke mechanism.

CONTINUED ON NEXT PAGE

1955 STROMBERG "WW" DODGE (C nt.)

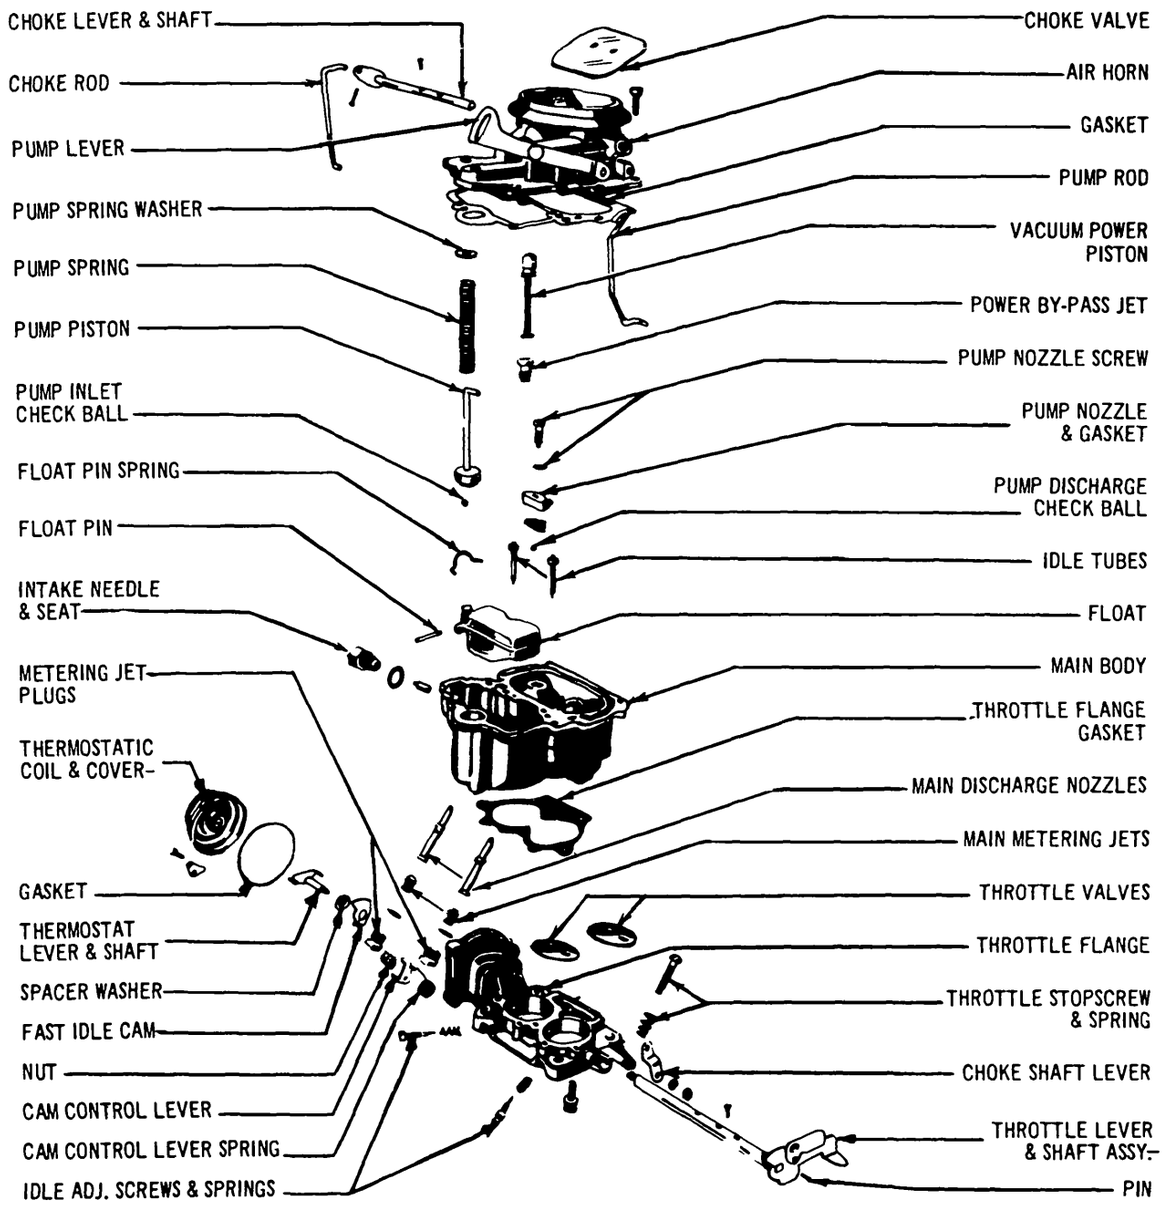
Carb. Code No.	Choke Cov r Cover	Setting
120, A,B	#31	2 points lean
121, A,B	#31	2 points lean
122,A,B	#33	2 points lean
122C	#31	2 points lean
124,125	#32	Centered (At Index)
126	#33	Centered (At Index)
131,A	#31	2 points lean
132,A	#31	2 points lean
133	#33	Centered (At Index)
133A,B	#31	2 points lean

DASHPOT SETTING

Push plunger in to end of its stroke. With throttle stop screw set at normal idle speed, there should be 1/16-3/32" clearance between end of dashpot plunger and ear on throttle lever. Adjust by loosening locknut and turning dashpot in bracket.

OVERDRIVE KICKDOWN SWITCH

Clearance between ear of throttle lever and threaded end of switch housing should be 1/64-1/32" with throttle valves held in wide open position. Adjust by loosening locknuts and repositioning switch.



OVERHAUL: *NOTE*–Throttle valves in open position extend below the throttle flange, making it of vital importance to handle the throttle flange unit with extreme care to prevent damage to valves or their proper position in flange.

Disass mbly: Consists of separating the three units Air Horn, Throttle Flange and Main Body and removing component parts of each unit separately. Release upper end of choke rod and lower end of pump rod and remove rods. Remove Overdrive Unit & Dashpot Control if so equipped. Remove Air Horn attaching screws, Air Horn & gasket. Remove idle tubes, invert carburetor and catch pump inlet check ball. While inverted, remove four throttle body attaching screws, remove Throttle Flange & gasket from Main Body.

Air Horn–Remove accelerating pump piston, and remove washer and spring from pump piston. Remove vacuum power piston with small block of wood and open end wrench as a pry. Remove choke valve screws, choke valve, and choke shaft.

Main Body–Remove pump discharge nozzle, screw and gasket, float needle valve seat, gasket and needle valve. Remove fulcrum pin spring clip, float and fulcrum pin, power by-pass jet and gasket. Invert body and remove accelerating pump and check ball, metering jet plugs and gaskets, (Tool T-19099), main metering jets (Tool T-24924) and main discharge jets (Tool T-24967). Remove lead ball and drive plugs.

Throttl Body–Remove thermostat cover attaching screws, lug washers, thermostat cover assembly, and gasket. Remove nut, lockwasher, and crank lever from end of thermostat lever and shaft. Remove thermostat lever and shaft, spacer washer, and fast idle cam. Remove nut, lockwasher, cam control lever, and spring from end of throttle shaft. *NOTE*–Nut and shaft have left hand thread, and nut is colored black for identification. Remove idle needle valves and springs. Scribe mark on throttle valves along throttle shaft as well as throttle body to assure assembly in same position in same barrel, **particularly on notched throttle valves.** Remove throttle valve screws, valves, throttle shaft and lever.

STROMBERG "WW" (DODGE) DOWNDRAFT CARBURETOR

STROMBERG WW (BUICK) CARBURETORS

BUICK — **Stromberg Carburetor No.**
1955 Series 40 (Dynaflow) — WW7-105

►CHANGES, CAUTIONS, CORRECTIONS

►*LEAN MIXTURE ON MODERATE ACCELERATION CORRECTION:* To eliminate this condition, install repair kit, Buick Part No 1392722, consisting of idle tubes, main metering jets and main discharge jets After installation completed, scribe letter "A" changing carburetor Code (found on air horn directly above float chamber) from 7-105 to 7-105A. *Carburetors with Code 7-105A have these new changes made*

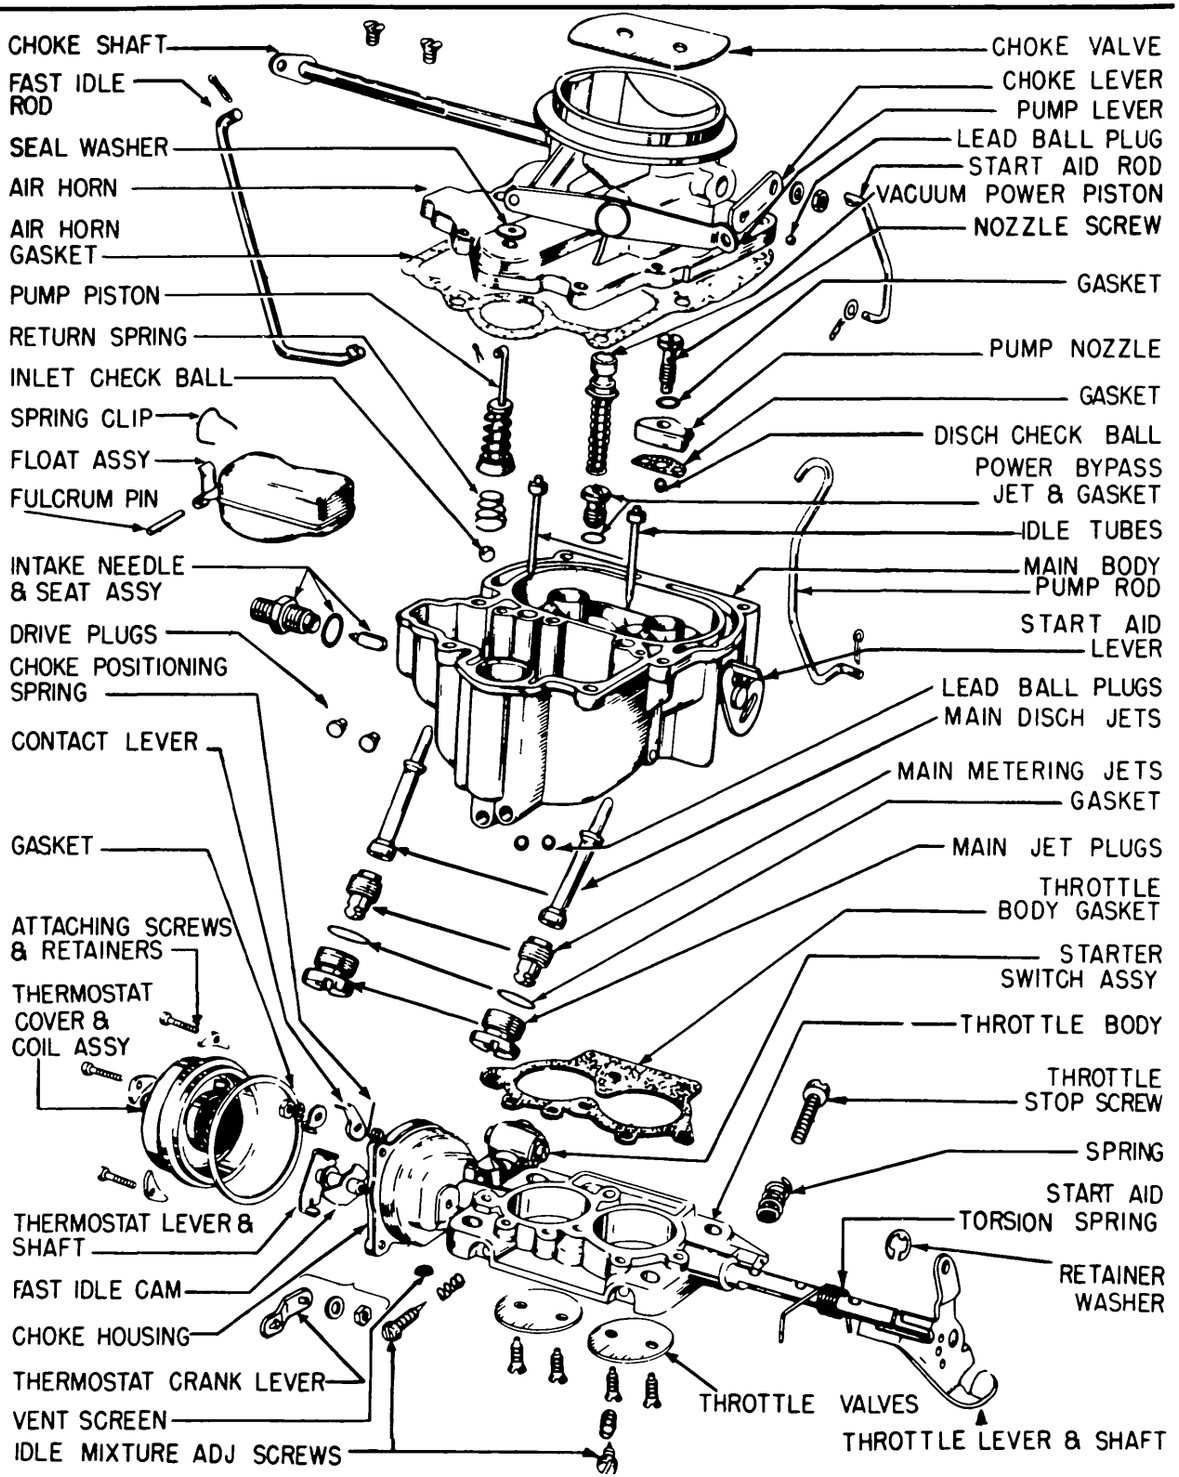
DESCRIPTION: These carburetors are dual barrel type with each barrel having its own idle system, main metering system and throttle valve Automatic choke housing with fast idle cam is located on throttle body on opposite side from throttle lever. Two holes drilled in intake manifold into exhaust gas cross-over permit exhaust gas heat to enter passages around throttles to prevent ice formation around throttle area

ADJUSTMENTS: *Make all adjustments exactly as follows:*

Idle Setting—1¾ turns open Turn each adjusting screw in until it bottoms lightly then back off 1¾ turns

Idle Speed—450 RPM Hot Engine idle, with brakes applied and selector lever in neutral.

Pump Seasonal Setting—One hole in pump lever, three holes in throttle lever **(1955)** Set pump rod in long stroke hole for normal setting



Pump Stroke Setting—**(1955)** 1" from top of plunger offset to bowl cover with pump rod in long stroke hole.

Float Level—3/16" distance from center of float with lip held firmly against needle valve, to top of bowl casting (gasket removed). Use Tool T-25569 placed at center of float and resting on bowl casting (gasket removed) Use Tool T-24733 to bend lever next to float as necessary

►*CAUTION: Make the following adjustments in the same sequence as given*

Fast Idle Speed Setting: Remove thermostat cover, insert one cover screw through loop at end of coil spring (Tool 25906) and attach screw to housing at upper screw position Hook other end of tool to ear of thermostat lever **T l must r main attached f r all adjust-**

CONTINUED ON NEXT PAGE

STROMBERG WW (BUICK) CARBURETORS (Cont.)

ments. Remove throttle stop screw and spring and reinstall screw without spring, close throttle valves (apply pressure on valves not on throttle lever) and turn screw in to point of contact with lever then continue to turn screw in for 5½-5¾ turns (1955) or 6 1/8-6 1/4 turns (1956) carburetors. With choke valve closed and throttle lever held against throttle stop screw, clearance between ear of contact lever and first step of fast idle cam should be. .0760" (No. 48 drill). To adjust bend ear on contact lever (Tool T-25863). *NOTE*–Ear must be parallel to throttle shaft, after bending.

Fast Idl Check n Car–At normal operating temperature, remove choke cover, open throttle slightly, rotate fast idle cam so that ear on the contact lever can come to rest on first step of fast idle cam. If ear on contact arm is properly positioned engine operating speed will be 1700 RPM.

Chok Positioning P riod: Turn throttle stop screw in 6½ to 7 turns from fully closed throttle position. At this position, the spring pick-up lever should be at the point of contact with the choke positioning spring. If pick-up lever does not contact spring or if pick-up lever has moved spring away from choke housing, adjust by bending ear on pick-up lever with long nose pliers.

Cam Position Setting: Open throttle to just clear fast idle cam. Move throttle to closed direction until ear on cam contact lever rests against fast idle cam. In this position ear on cam contact lever should just clear high step of fast idle cam. Clearance must not exceed .020". Bend fast idle rod to obtain correct clearance.

Choke Positioning Spring: Place weight Tool T-25864 on choke lever (center of arm), hold carburetor in vertical position open throttle fully and then close throttle until choke positioning spring just contacts thermostat housing at the lever shaft boss. Hold throttle in this position, clearance between choke valve and wall of air horn should be .159" (No. 21 drill). Adjust by bending ear of thermostat lever as required.

Start Aid Setting: With No. 53 drill (.0595") between choke valve and wall of air horn, hold choke valve closed against rod, make certain that start aid rod is at top of slot in start aid lever, then rotate throttle valves toward open position. Start aid torsion spring should just clear the ear on the start aid lock lever as throttle is opened. To adjust, bend start aid rod as required.

Wide Open Kick Setting: Open throttle valve while holding choke valve closed lightly. Choke valve should open just enough to insert No. 27 drill gauge (.1440") between the choke valve and wall of air horn. Adjust by bending ear on throttle lever. *NOTE*–Start aid rod must be at top of slot in start aid lever.

Starting Switch Setting (On Car): Same as for Carter WCFB except distance between marks should be 3/4-1 1/8".

STROMBERG "WW" (STUDEBAKER)

STUDEBAKER	Stromberg Model WWUVL-26
1953 V8 Model 4H.....	.Code 6-112, 6-112-A, 6-112B
1954 Early	6-112B
1954 Later (Eng. No. V296775 Up)	6-112C
1954 Land Cruiser (Later Cars)①	6-113

1955 (Later—exc. Ultra-Vista)	WW 6-115
1955 (Ultra-Vista—Auto. Trans.)	WW 6-116

①—Beginning Eng. No. 300436 (L.A. 8838927).

►CHANGES & CORRECTIONS

►***ADJUSTMENT CAUTION: Carburetor throttle linkage is new design and must be adjusted exactly as detailed below whenever linkage or settings have been disturbed.***

►***FUEL ECONOMY IMPROVEMENT AT HIGHER CAR SPEEDS (First Code 6-112 & 6-112A Carburetors):*** On cars where considerable operation is at higher car speeds and fuel economy appears lower than normal, the following changes can be made:

1) Cut off exposed end of fuel bowl vent tube in air horn so that end is **square.** ***(CAUTION***—Leave the tube as long as possible). This will provide better uniformity of fuel flow but affects fuel-to-air ratio at higher speeds which must be compensated for.

2) Disassemble carburetor (see OVERHAUL data), remove and discard original #65 Power By-pass Jet, install new #60 jet (Studebaker No. 531497). This jet will provide correct fuel-to-air ratio at higher car speeds.

3) Stamp letter "B" following code number on bowl cover to indicate above changes have been made.

►***CARBURETOR PRODUCTION CHANGE:*** Code 6-112B used in production on later cars have the square-end vent tube and #60 power by-pass jet used for improved fuel economy on earlier carburetors (above).

►***1953-54 COMMANDER HESITATION OR MISS (At 30-45 MPH. with constant throttle):*** May be caused by lean limit carburetor. If not corrected by proper engine tune-up, slightly richer main metering jets (.051" Studebaker No. 533401x5) may be installed.

►***1954 STUDEBAKER LAND CRUISER CARBURETOR NOTE (Code 6-113):*** This carburetor same as Code 6-112C used on other models except for slightly smaller Main Metering Jets (.047"). All settings and service procedures are the same for all models.

►***CARBURETOR POROUS FUEL BOWL CHECK (Draining of fuel from bowl when standing causing excessive engine cranking time):*** With carburetor on bench, remove bowl cover and float, power by-pass jet, pump discharge nozzle, and outlet valve check. Fill bowl with gasoline to normal fuel level. Blow compressed air through spark modifier channel. Air bubbles in fuel indicate a porous casting. Correct by replacing fuel bowl casting.

►***STUDEBAKER COMMANDER CARBURETOR PRODUCTION CHANGES & REPLACEMENT CAUTION:*** Later carburetors (beginning Code 6-112D) have different air flow system requiring different jet calibration and design has been changed to eliminate such parts as Pump Inlet Screen & Retainer Clip, Pump Plunger Link Felt Washer, Pump Inlet Ball Check Retainer Clip *See Stromberg Jet Specification Table for complete jet data.*

Replacement Carburetor Note—Later Code 6-115 carburetor is furnished as service replacement for earlier Code 6-112C, D, E, F carburetors.

DESCRIPTION: WWUVL-26 carburetors are dual barrel, downdraft type of new design with side air intake. Fuel system is similar to other Stromberg carburetors with usual Float System (single float), Idle System, Main Metering System, Power System (with vacuum piston operated power by-pass jet), and Accelerating System (pump operated by horizontal lever with duration spring type pump piston). Carburetor has Automatic Choke (with filtered air system as used on previous Studebaker Commander) and new design Fast Idle mechanism.

CARBURETOR ADJUSTMENT: ***Make all adjustments exactly as follows:***

Idle Setting: Turn both idle mixture adjusting screws in until they are lightly seated, then back each screw out exactly 1¾ turns. Start engine and allow it to run until normal operating temperature is reached. With engine at normal operating temperature (choke valve wide open, fast idle inoperative) and with air cleaner in place, adjust idle speed and mixture as follows:

Idle Mixture—First check and adjust idle speed. Turn BOTH idle mixture adjusting screws in evenly and slowly until engine begins to run unevenly, then turn screws out evenly and slowly until engine again runs unevenly, finally set both screws approximately halfway between these two points where smoothest idling performance is secured. Recheck engine idle speed. ***CAUTION***—BOTH adjusting screws must be turned equally and in the same direction when making above adjustment.

Idle Speed—With engine at normal operating temperature and fast idle cam in slow idle position so that idle adjusting button contacts lowest step of cam, adjust screw for correct idle speed:

Idle Speed

Model	Synchro-mesh	Auto. Trans.
1953	550-600 RPM	ℂ 500-550 RPM
1954	ℂ 550 RPM	ℂ 550 RPM
1955	ℂ 550-600 RPM	ℂ 550-600 RPM

①—With selector lever in "N" position.

Accelerating Pump: Three holes provided in throttle lever for pump connector rod engagement:
Center Hole—Normal operating conditions.
Inner Hole—Shorter stroke, less fuel discharge.
Outer Hole—Longer stroke, more fuel discharge.

Float Level: To check float setting, remove air horn and bowl cover and gasket, hold float lever lip firmly against intake needle valve to place float in closed-valve position. Measure float height by placing Float Level Gauge T-25569 (Studebaker No. J-5475) squarely on top edge of float bowl at center of float. If float not even with step on gauge, bend float lever lip next to float pin as required using bending tool T-24733 (Studebaker KMO-269-S5).

FLOAT SETTING

Studebaker WWUVL-26 ....3/16"①

①—Top of float below top edge of bowl.

Fast Idle Cam Setting: Check with fast idle cam in fast idle position with choke valve fully closed. In this position, one-half of diameter of button on throttle stopscrew should rest on highest step of fast idle cam (button should hang over so that half-diameter travel of fast idle cam will cause screw to drop down on to next-lowest step of cam). If button and cam contact not correct, bend ear on choke lever which contacts fast idle cam up or down as required using bending tool KMO-478. ***NOTE—Throttle stopscrew is adjusted as part of Idle Setting.***

NOTE—Fast Idle setting can also be checked as follows. With slow idle adjusting screw button resting on high step of fast idle cam, apply light closing pressure to choke valve, check remaining opening by inserting a #31 drill rod between lower edge of choke valve and air horn wall (choke opening should be .105-.135"). Adjust by bending ear on choke lever which contacts fast idle cam up or down, as required, using bending tool KMO-478.

Unloader (Dechoke) Setting: To check setting, hold choke valve closed tightly, open throttle valves to point where stop on throttle lever rests against stop on carburetor throttle body and choke valve is opened slightly. Check choke valve opening by inserting #1 drill rod (.228") between lower edge of choke valve and air horn wall. If opening not correct, adjust by bending ear on throttle lever which contacts choke lever using bending tool KMO-478.

Automatic Choke Setting: Centered (arrow on edge of cover aligned with boss on air-cleaner end of housing). Adjust by loosening heat tube connection and three retaining screws and rotating cover and thermostat assembly.

CAUTION—Use care not to rotate or distort cover when tightening heat tube connection.

Thermostat Assembly Identification—Stamped "29."

Throttle Return Check (Cars with Automatic Transmission): Consists of a dashpot unit mounted on the carburetor with the dashpot plunger contacting the throttle lever during the last 3/16" of throttle movement toward closed throttle position. Dashpot will prevent too-rapid closing of throttle and keep engine from stalling. *See Throttle Linkage Adjustment under CARBURETOR on car model page.*

OVERHAUL: Disconnect pump operating rod from throttle lever and pump operating lever and remove rod. Take out air horn attaching screws, lift air horn assembly straight up and off main body, remove spring from end of pump plunger (spring may remain in pump cylinder and can be lifted out). Lift off air horn gasket.

Air Horn Disassembly—Disconnect pump plunger stem from pump operating lever, remove pump assembly. Take out pump lever fulcrum screw (screw has left-hand thread), remove spring washer and lift lever off. Remove felt washer, plain washer and retainer spring from pump plunger stem (duration spring can also be removed by compressing spring and sliding retainer out of groove in stem). Clean up staking around vacuum piston cylinder edge, pull vacuum piston assembly out of cylinder. Take out choke cover retainer screws, remove cover and coil assembly and gasket. Use tool T-25047 to remove nut and lockwasher from end of choke shaft, disengage choke piston link from shaft, remove piston and link assembly. Take out choke valve retaining screws, remove valve, slide choke shaft and lever assembly out of air horn.

Main Body Disassembly—Lift both idle tubes out, invert body and take out four throttle body attach-

CONTINUED ON NEXT PAGE

STROMBERG "WW" STUDEBAKER (Cont.)

ing screws (recessed in bottom face of throttle body), lift throttle body off and remove gasket. Remove both main metering jet plugs and gaskets, use tool T-24924 to remove main metering jets, use tool T-24967 to remove main discharge jets (screw tool into base of jets, pull jets out of body recess). Take out pump discharge nozzle screw and gasket, lift discharge nozzle and gasket off, invert body to drop out discharge check ball. Unscrew fuel inlet fitting on side of bowl, remove retainer and fuel strainer from within fitting. Take out float hinge pin spring clip, remove float and hinge pin assembly, tip casting to remove fuel intake needle. Remove power by-pass jet and gasket. Remove pump intake strainer screen retainer and strainer screen from intake passage at side of pump cylinder. Remove pump intake check ball retainer from bottom of pump cylinder, invert body to drop out the intake check ball. *CAUTION*—Retainer not used on later carburetors and care must be used not to lose ball which will drop out whenever carburetor inverted.

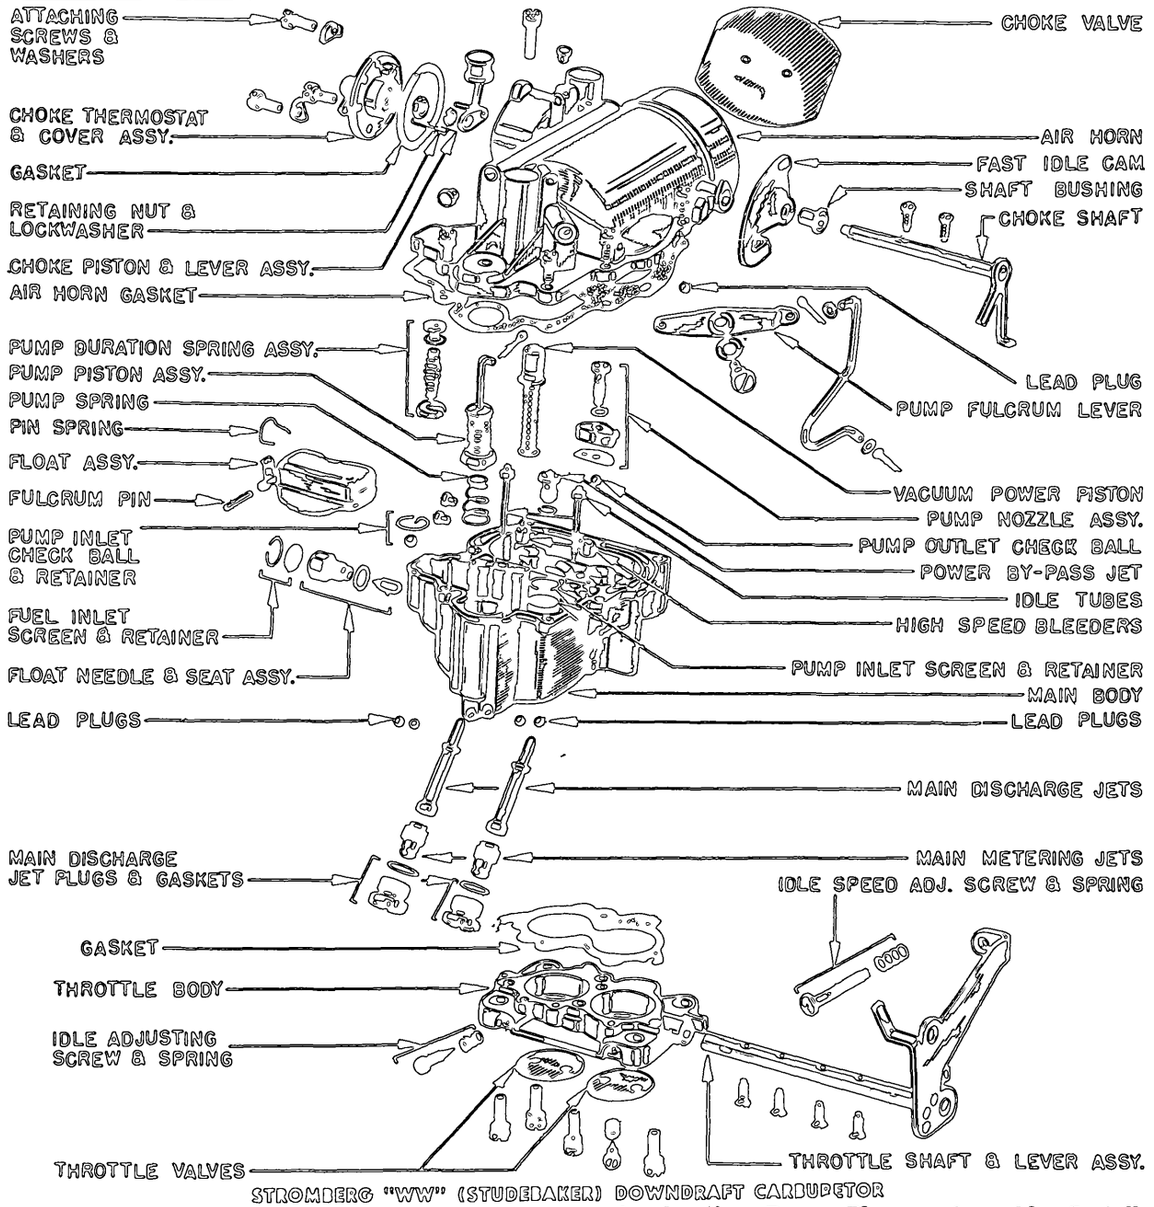
Throttle Body Disassembly—Remove both idle adjusting screws and springs. Do not disturb throttle valve and shaft assembly unless required for replacement of parts. If necessary to remove valves, first mark each valve and mark throttle body correspondingly to insure re-installing valves in same barrel, take out valve attaching screws, slide valves out, slide throttle shaft and lever assembly out of throttle body.

Cleaning & Inspection: Clean all castings and parts thoroughly with Benrix Metalclene or equivalent cleaning solution, rinse with solvent, blow out all passages and dry parts with air. Make certain all carbon and gum deposits completely removed. Inspect all parts for wear and damage.

Reassembly: Use all NEW gaskets. Re-install parts in reverse order of disassembly procedure above and note following important points:

Throttle Valve Installation—After throttle shaft inserted in throttle body, install valves in accordance with markings, insert new screws loosely. Close throttle tightly, centralize valves by tapping lightly to secure best closing position, tighten screws securely and stake the screws.

Accelerating Pump Discharge Nozzle—Install discharge check ball in discharge passage, then install nozzle assembly with new gasket, use new gasket on attaching screw and tighten screw securely.



Accelerating Pump Intake Check & Strainer—Install intake check ball in recess in bottom of pump cylinder, use tool T-25360 to seat the ball retainer clip. Install strainer screen retainer clip

Main Metering Jet Assemblies—Use remover tool T-24967 to seat main discharge jets firmly in main body, tighten main metering jets securely using tool T-24924. Use new gaskets on main metering jet plugs and tighten plugs securely.

Vacuum Power Piston—After installing piston assembly in air horn, seat retaining washer and stake washer in place by prick-punching the edge of the cylinder at two points.

Choke Valve & Shaft Assembly—Assemble choke shaft and choke valve and install new screws loosely, close valve tightly, centralize valve by tapping lightly to secure best closing position, tighten screws securely and stake the screws. Install choke piston in cylinder and engage piston lever on choke shaft. Install spacer, lockwasher, and retainer nut, use tool T-25047 to tighten nut securely. Check choke valve for free operation.

Automatic Choke Assembly—Install thermostatic coil assembly and gasket with coil hook downward, rotate cover counter-clcokwise in direction of arrow on cover until reference mark on cover is aligned with boss on housing, tighten retainer screws securely.

STROMBERG "WW" (STUDEBAKER) DOWNDRAFT CARBURETOR

Accelerating Pump Plunger Assembly—Install duration spring and washer on piston rod, compress spring and engage retainer in groove in rod. Install retainer spring, plain washer, and new felt washer on piston rod. Install plunger assembly in air horn after air horn gasket has been installed. When installing air horn on main body, place pump spring on end of pump plunger, guide piston into cylinder.

SERVICE PARTS: Gasket Set—Stromberg No. 382362. Repair Kit—Stromberg No. RK-175 (All carburetors except Code 6-116).

STROMBERG DUAL "WW" AUTOMATIC CHOKE

DODGE V8	Carburetor Code No.
1953-54	WW3-106, A; 108, A; 109, A
1954	WW3-105, A
STUDEBAKER	
1953-55 Comm. V8	WW6-112, A, B, C, D, E, F
1953-55 Comm. V8	WW6-115
1954 Comm. V8	WW6-113

DESCRIPTION: Automatic choke consists of a thermostatic coil and a vacuum piston assembly linked directly to the choke valve shaft. This assembly is similar to design used on other Stromberg carburetors. Two types of Fast Idle mechanism are used:

Dodge Fast Idle—"External Tooth" type. Consists of a fast idle cam and lever assembly mounted under a cover plate on the opposite side of the air horn from the thermostatic coil assembly. Fast idle cam is mounted on a bushing on the choke shaft and is rotated by the choke shaft lever through a torsion spring. Fast idle loose lever is pivoted on a bushing on the throttle valve shaft with the upper end bearing against the fast idle cam. A lug at the center of the lever serves as a stop for the throttle stopscrew so that the throttle valve position is controlled by the position of the stepped fast idle cam. *NOTE*—A second lug on the loose lever controls the "wide-open kick" or unloader action.

Studebaker Fast Idle—"Internal Tooth" type. Consists of a large cam segment (with steps on inner edge) mounted on the opposite side of the air horn from the thermostatic coil assembly. The throttle stopscrew is mounted on an extension of the throttle lever so that the contact button on the end of the stopscrew contacts the fast idle cam directly. Fast idle cam is mounted freely on a bushing on the choke shaft and tends to rotate to the open position as the choke valve opens.

ADJUSTMENT: *Make all adjustments following*

Automatic Choke Setting: To adjust setting, loosen heat tube connection on cover (see Caution below), loosen three retainer screws around cover rim, rotate cover until mark on scale at cover rim is aligned with boss on edge of housing, tighten retainer screws and heat tube connection.

▶*CAUTION—When loosening and tightening heat tube connection, hold fitting on cover with a wrench to prevent rotating or distorting cover assembly.*

Automatic Choke Setting

All Models	Centered

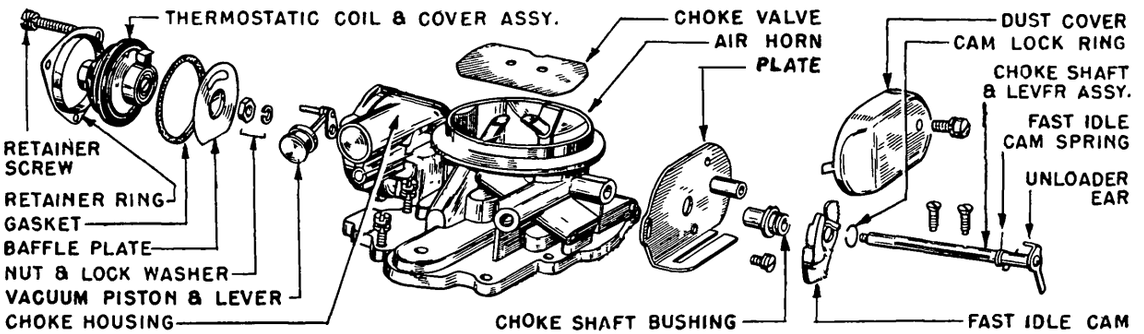
Fast Idle Setting: *Each model adjusted differently:*

Dodge—Insert **first step** of Gauge T-25570 between upper (short) side of choke valve and air horn wall, hold choke valve lightly against gauge and slowly close throttle valve. Top end of fast idle loose lever should just enter first step of fast idle cam. Adjust by bending fast idle cam lever ear as required (*CAUTION*—hold counterweight with thumb while bending ear).

Studebaker—Hold throttle valve open and close choke valve fully so that fast idle cam moves to fast idle position, then close throttle valve. In this position, one-half of the diameter of the button on the end of throttle stopscrew should rest on the highest starting step of the fast idle cam. Adjust by bending choke lever ear (which contacts fast idle cam) up or down as required.

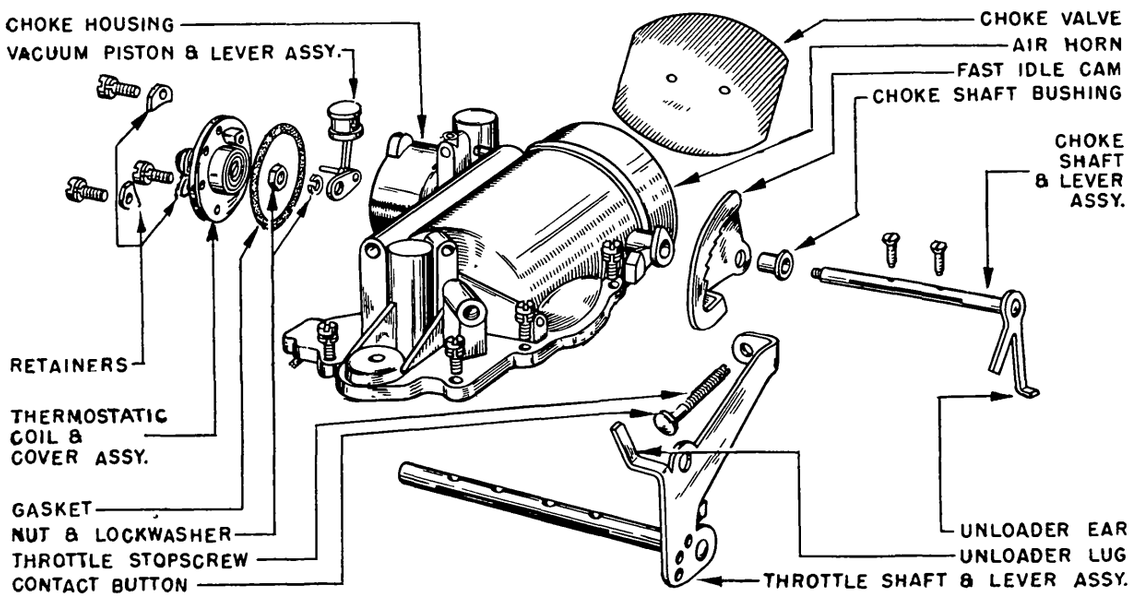
Unloader "Wide-Open Kick" Setting (All Models): To check setting, hold choke valve closed lightly, move throttle valve to wide open position and hold in this position, measure choke valve opening by inserting gauge of correct size (see table below) between edge of choke valve and air horn wall. Adjust by bending ear on choke lever as required. *NOTE*—The unloader ear is the one which contacts the lug on the fast idle loose lever (Dodge) or lug on throttle lever (Studebaker).

Unloader Wide-Open Kick Setting



Car Model	Gauge No. & Size
Dodge	T-25570① (.150-.180")
Studebaker	#1 drill (.203-.265")

①—SECOND step of gauge



REASSEMBLY: Remove retainer screws and clips from around thermostatic coil cover (retainer ring on Dodge), lift off thermostatic coil and cover assembly, gasket, and baffle plate. Use tool T-25047 to remove nut and lockwasher from end of choke shaft. Lift vacuum piston lever off end of choke shaft and remove lever and piston assembly. Mark choke valve location on shaft (scribe valve on both sides of choke shaft), take out attaching screws and remove valve. On Dodge, remove dust cover over fast idle mechanism on opposite side of air horn. On all models, slide choke shaft and lever assembly out of the air horn (CAUTION—on Dodge, disengage fast idle cam spring from fast idle cam). On Dodge, unhook spring from fast idle loose lever, then remove fast idle cam lock ring and remove cam. On Studebaker, fast idle cam is retained by choke shaft bushing.

Cleaning & Inspection: Clean all metal parts with Bendix Metalclene or equivalent cleaner. Blow out all passages with air. Inspect all parts for wear or damage with particular attention to shaft wear in air horn, fast idle cam wear on steps and thermostatic coil distortion.

REASSEMBLY: Use all new gaskets. Install all parts in reverse order of disassembly procedure above and make adjustments as detailed under ADJUSTMENTS.

STROMBERG WW (DODGE) AUTOMATIC CHOKE

STROMBERG WW (STUDEBAKER) AUTOMATIC CHOKE

TILLOTSON MODELS DY-1A, DY-9A, DY-9B, DY-9C

CROSLEY	Tillotson Model No.
1941-42 CB41 & CB42	DY-1A
1946-47-48 CC	DY-9A, DY-9B
1949-51 CD & VC	DY-9C

TYPE: Single barrel, plain tube, downdraft type with high speed (Main), low speed (Idle) adjustments. Carburetor is of special design with concentric float bowl and double floats which allow carburetor to be operated in tilted positions

Fuel System (Idling & Low Speed):—Fuel is metered by restriction at lower end of Idle Tube and flows up through tube (located in main nozzle—see illustration) where it is mixed with air admitted through Idle Air Bleed hole in side of idle tube. Fuel mixture is controlled by Idle Adjusting Screw (at upper end of tube) and flows through Idle Fuel Supply Channel in carburetor casting to Idle Discharge Ports at the throttle edge. For closed throttle idling, all fuel is discharged through lower port. As soon as the throttle is opened for low speed running, additional fuel is discharged through upper port.

Cruising & High Speeds (& Wide Open Throttle operation)—When throttle valve is opened, this causes reduced suction on idle ports and increased suction on main nozzle so that fuel is discharged at main nozzle and idle system drops out. Fuel for main nozzle is metered by Main Adjustment Screw and is mixed with air admitted through holes in nozzle from main nozzle air bleed channel opening into air horn above venturi. This air is metered by Main Nozzle Air Bleed Restriction located in air bleed channel at top of carburetor main casting.

ADJUSTMENT: ***CAUTION—Make adjustments in order as follows:***

Preliminary Adjustment: Close both the Main Adjustment Screw and Idle Adjustment Screw by turning to right or clockwise until they are lightly seated, then back screws out as indicated in table. This will allow engine to be started and warmed up. After engine thoroughly warm, make final adjustments as directed below.

Carburetor	Main Adjustment Setting	Idle Adjustment Setting
Crosley DY-1A, DY-9A, DY-9B	2 turns open	1 turn open
Crosley DY-9C	2¾ turns open	1¼ turns open

Main (High Speed) Adjustment:—With engine warm and running, open throttle approximately ⅓ of full travel. Turn Main Adjustment Screw in or clockwise slowly (¼ turn at a time) until engine slows down due to lack of fuel, then back screw out very slowly (⅛ turn at a time) until maximum speed is secured. Correct setting approximately 1½-1¾ turns open (DY-1A, DY-9A, DY-9B), 2-2⅛ turns open (DY-9C).

Idle (Low Speed) Adjustment:—Set throttle lever stopscrew so that engine runs at faster than normal idling speed. Close throttle. Turn Idle Adjustment Screw in or clockwise to lean mixture until engine begins to miss, then back screw out slowly until engine fires smoothly. Clear manifold by opening throttle momentarily, recheck idle setting. Correct setting approximately 1 turn open.

Idle Speed—Set throttle stopscrew for warm idle speed of 700 RPM. or 7-8 MPH.

PERFORMANCE: Should be satisfactory for operation at altitudes less than 5000 feet if adjustments correctly made as directed above. If performance not satisfactory, check adjustments and tune up engine (see car model page for tune up data). See Trouble Shooting Section below.

FLOAT LEVEL: Fuel Level—Should be 23/32" below top edge of float bowl or just below lower edge of inspection hole on side of float bowl (remove inspection hole plug to check level).

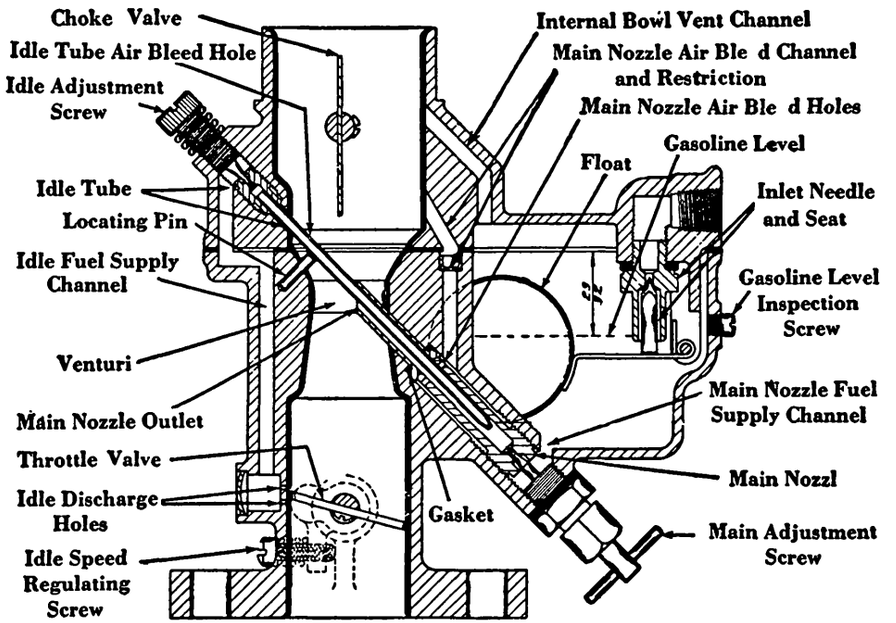
►***CAUTION***—Before removing Upper Body Assembly to check or adjust float level, take out Idle Adjustment Screw and remove Idle Tube from adjustment screw hole. Idle Tube and Main Nozzle will be damaged if this is not done.

Float Level—To check, invert upper body assembly (air horn and float bowl cover with complete float mechanism), measure from face of body gasket to top of raised seam on each float. Distance should be 1 27/64". To adjust, bend each float lever arm **using extreme care to secure equal setting for both floats.**

FAST IDLE (DY-9C): Consists of adjustable rod linking fast idle lever on choke valve shaft to throttle lever so that throttle valve is opened to fast idle position when choke valve closed for cold starting and warming-up.

Adjustment—Back off throttle lever stopscrew so that throttle valve tightly closed. Hold throttle valve in this position, hold choke valve wide open, loosen setscrew on adjusting collar on fast idle connector rod (at throttle lever trunnion), position collar on rod so that it is against the trunnion, tighten setscrew.

►***CAUTION***—**Reset idle speed after making this adjustment.**



CHOKE:—Plain butterfly type. Adjust choke linkage so that choke valve is wide open when dash control button is pushed all the way in.

TROUBLE SHOOTING:—**Engine Stalls**—Check idle speed setting, tighten throttle stop retaining screw, check idling or low speed adjustment, see that idle adjustment screw not ringed, clean idle tube and idle fuel channels with air, check float level (see Fuel Level Note below).

Flatness on Acceleration—Check Idle (Low Speed) and Main (High Speed) Adjustments, check float level (if engine loads up, see Fuel Level Note below), clean idle tube and idle fuel channels with air.

Fuel Level Note—If fuel level in float bowl rises above setting, dismantle needle valve, clean needle valve and seat with a soft clean cloth, reseat needle valve by tapping with finger several times while turning needle around. Reset float level. If level not maintained, install new needle valve and seat.

SERVICING:—Before removing Upper Body Assembly (air horn and float bowl cover), remove Idle Adjustment Screw and spring, unscrew and remove Idle Tube through adjusting screw hole—this is important to avoid damage to tube and nozzle when upper assembly lifted off. Idle tube positioning pin in main

body casting is not removable. Main nozzle outlet and gasket are staked in main body casting and cannot be removed (nozzle base can be removed through main adjustment screw plug hole after adjustment screw assembly removed). Blow out all jets and channels with compressed air—do not use wires or drills to clean passages. See that float bowl vent to air horn is open and clean.

Reassembly—Replace all worn or damaged parts with genuine Tillotson service parts. Use all new gaskets and replace parts in same order as removed. See that nozzles and plugs are tight. Set float level and adjust carburetor.

SERVICE PARTS: Gasket Set—Tillotson Part No. 07144.

Repair Parts Kit (incl. Gaskets)—Tillotson No. 08196 (DY-9A, DY-9B), No. 08613 (DY-9C).

ZENITH 28AVX9R & 228AV10

Model 228AV-10, No. 10760①

Willys Jeep 4 Cyl. Station Wagon 4-63, Jeepster VJ-3, & 6 Cyl. Station Wagon & Sedan 6-63 (1948-50).
①—This Outline No. stamped on metal identification disc pinned on bowl cover (2nd. number on disc is car manufacturers part number). Use in ordering parts.

DESCRIPTION: Single barrel, plain tube, downdraft type with double venturi. Carburetor has vacuum controlled power jet valve system and positively operated accelerating pump linked to throttle lever.

Model 28AVX9R—This model has built-in governor and is similar to other "28 Series" carburetors except for the governor mechanism.

▷*CARBURETOR IDENTIFICATION*—The "228 Series" and "28 Series" carburetors are similar except that the 228 Series have two-hole idle system with idle adjusting screw located in throttle body which controls fuel discharge from lower (closed throttle) idling port.

Fuel System: Consists of an Idle Fuel System, High Speed System (Main Jet System & Power Jet System), and Accelerating Pump System which operate as follows:

Idle Fuel System—Supplies fuel for idling and driving up to approximately one-fourth throttle opening. Fuel is taken from main jet well (below main discharge jet) and is metered by calibrated hole in side of Idling Jet. At this point it is mixed with air admitted through permanent air bleed opening in carburetor air horn. Fuel mixture is then taken down through passage to idle discharge ports at throttle edge. Idle adjusting screw controls fuel mixture discharge through lower (closed throttle) idle port. As soon as throttle is cracked open, additional fuel is discharged through upper idle port

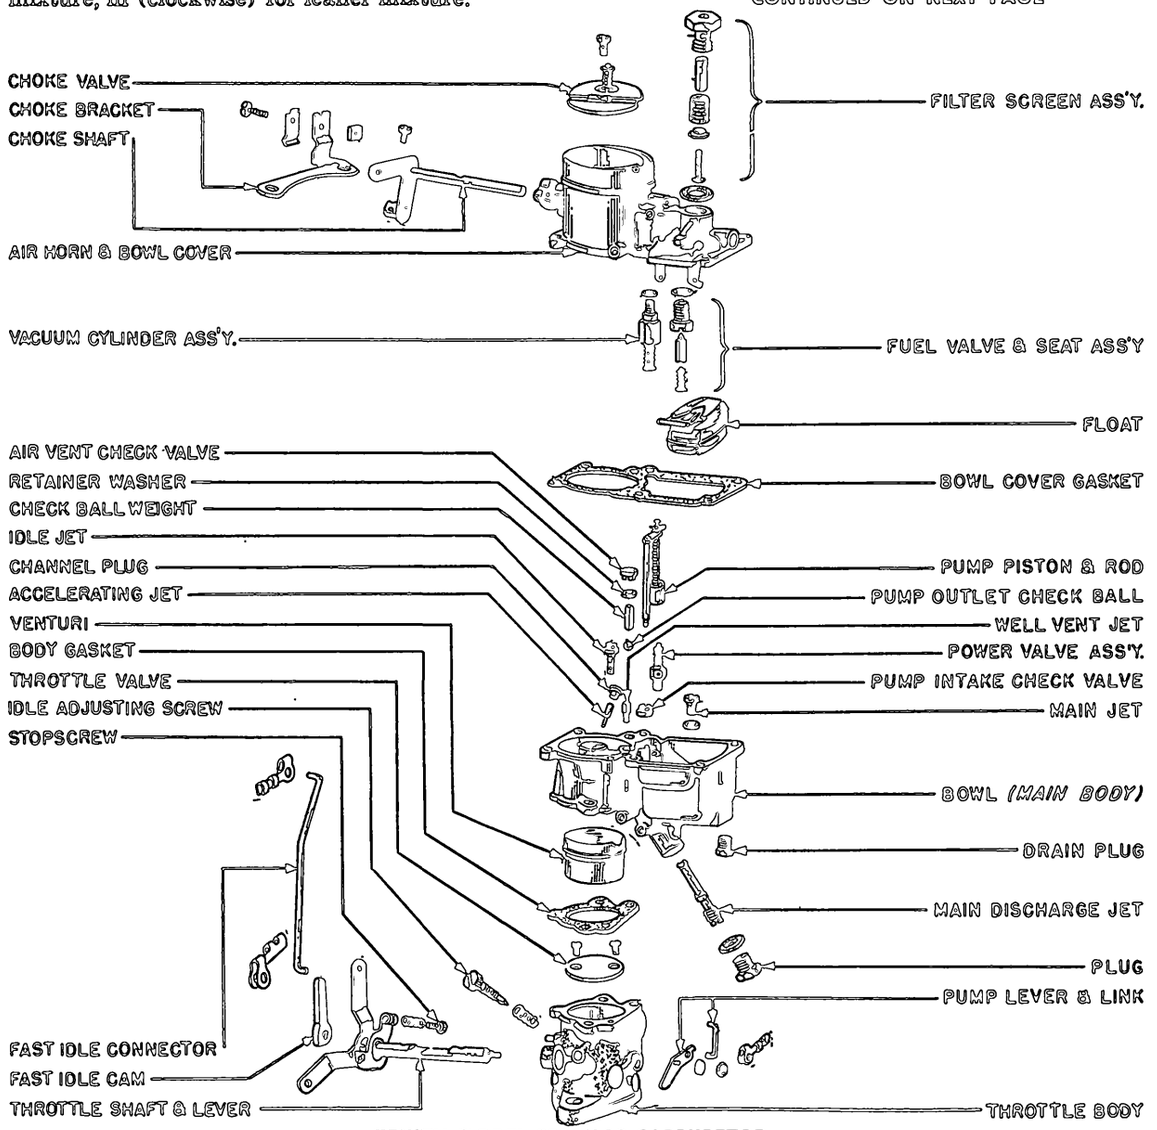
High Speed System—Supplies fuel for driving range above approximately one-fourth throttle opening. Consists of a discharge nozzle or ring slot in throat of secondary venturi through which fuel mixture is discharged into the airstream. This fuel mixture is supplied by Main Jet System (¼ to ¾ throttle opening) and is supplemented by Power Jet System (¾ to full throttle opening) as follows:

Main Jet System—Fuel is metered by Main Jet in bottom of float bowl and flows through Main Discharge Jet where it is mixed with air admitted through Well Vent Jet opening in carburetor air horn. Air enters fuel stream through bleed holes in side of main discharge jet. Fuel mixture then goes to discharge nozzle.

Power Jet System—Consists of a power valve controlled by a spring-loaded vacuum piston assembly which by-passes fuel directly to the main discharge jet. Valve is normally closed (piston held up against spring tension by manifold vacuum) but is opened by the piston stem whenever manifold vacuum drops off (sustained high speed, wide open throttle full-load operation, or sudden acceleration) permitting fuel to flow directly to the main discharge jet.

Accelerating Pump System—Pump arm and plunger stem are positively operated by throttle lever (pump piston is spring-loaded on plunger stem to prolong discharge on sudden throttle openings). Fuel is drawn into pump cylinder through intake check valve in bottom of cylinder when throttle is closed, and is discharged through outlet ball check valve and Accelerating Jet into the throat of the primary (large) venturi when the throttle is opened. This fuel flow through the pump passages closes the Air Vent Check Valve (disc valve directly above outlet ball check) which vents the pump system when it is not in operation.

IDLING ADJUSTMENT: Adjust only when engine is warm (choke valve wide open, fast idle inoperative). Set throttle lever stopscrew for idling speed of 600 RPM. or 8 MPH. Adjust Idle Adjusting Screw for smooth idle, recheck idle speed.



▷*CAUTION*—Idle screw controls fuel mixture and should be turned out (counter-clockwise) for richer mixture, in (clockwise) for leaner mixture.

PERFORMANCE: Should be satisfactory if idling adjustment correctly made. Main metering jet is fixed type and should not be changed for normal operating conditions. See Jet Calibration Table below.

ACCELERATING PUMP: Pump stroke is adjustable for seasonal requirements by engaging hairpin cotter in correct groove of pump plunger stem (directly above pump rod arm—accessible by removing air horn and bowl cover assembly) as follows:

Upper Groove—Minimum Stroke (hot weather).
Center Groove—Medium Stroke (normal operation).
Lower Groove—Maximum Stroke (cold weather).

ZENITH MODEL 228AV-10 CARBURETOR

ZENITH 28AVX9R & 228AV10 (C ntinued)

FLOAT LEVEL: 45/64" plus or minus 1/64" from upper edge of float seam at free end of float to gasket seat on bowl cover with float and bowl cover assembly inverted. When checking float level, remove gasket, invert assembly and allow float to hang freely. Adjust by bending float lever at point next to float body (hold hinge lever firmly with thin-nosed pliers while bending).

►*CAUTION—Do not compress spring in valve stem which will cause incorrect float setting. Allow float to hang freely on inverted cover when checking float level.*

FAST IDLE: Consists of a fast idle cam linked to the choke valve lever. Cam serves as the stop for the throttle lever stopscrew and opens the throttle valve to a fast idle position when choke valve is closed for starting. No adjustment is required—see choke valve data below.

►*CAUTION—Fast idle cam must be in hot or slow idle position (stopscrew resting on flat of cam) when idle speed is adjusted.*

CHOKE: Choke valve is manually controlled and has poppet type relief valve. Adjust control cable so that choke valve is fully closed when choke button is pulled out, and fully open when button pushed in. Check fast idle rod and make certain that fast idle lever on choke valve shaft is positioned so that it allows choke valve to close fully with fast idle cam in fast idle position.

FUEL FILTER: Consists of a filter screen assembled on filter head (large hexagonal plug on bowl cover). Filter screen can be removed for cleaning by taking out screw in lower screen retainer.

DISASSEMBLY OF CARBURETOR: Each section should be separated and disassembled as follows:

Air Intake Body (Air Horn & Bowl Cover): Remove fuel filter assembly by taking out large hexagonal plug on bowl cover, disconnect fast idle connector rod, remove six screws attaching air intake body to fuel bowl assembly. Lift air intake body up slightly, loosen gasket from fuel bowl, lift air intake body straight up to avoid damage to float, remove gasket. Remove float axle (use screwdriver to press against axle at slotted side of hinge bracket, force axle through bracket), remove float, lift out needle valve. Remove fuel valve seat and fibre washer (C161-85 wrench). Remove vacuum cylinder assembly and fibre washer (C161-10 wrench). Take out choke valve attaching screw (CAUTION—file riveted end of screw flat before turning screw out to avoid stripping threads), lift out choke valve, slide choke valve shaft and lever assembly out.

Fuel Bowl (Main Body Casting): Remove main discharge jet plug and gasket on bottom of fuel bowl, disconnect accelerating pump link retainer and remove pump link, remove accelerating pump piston and rod assembly from pump cylinder (CAUTION—file burrs and rough spots off link connector end of pump rod before attempting to remove assembly). Take out two screws attaching fuel body to throttle body and separate these sections. Lift out venturi and gasket. Remove all jets, check valves, and channel plugs as follows:

Idling Jet—Use a screwdriver.

Well Vent Jet—Use special wrench C161-80.

Main Jet & Washer—Use a screwdriver.

Power Jet Valve Assy.—Use wrench C161-9.

Main Discharge Jet—Use wrench C161-1.

Pump Intake Check Valve—Bend back ears on upper end of valve, remove valve disc, screw special check valve tool, C161-5, securely into check valve body, remove valve by moving sliding weight on tool up against stop bar sharply.

Pump Air Vent Check Valve & Outlet Check Valve—Remove air vent check valve with tool C161-5 (see intake check valve removal above), invert assembly and remove retainer washer, weight, and ball.

Fuel Channel Plugs—Remove four lead channel plugs and accelerating jet channel plug by center-punching each plug and drilling #46 hole through plug (CAUTION—use care not to damage casting when drilling), pull plugs with special extractor tool C161-21 (lead plugs), C161-15 (accelerating jet channel plug).

►*CAUTION*—Do not remove idle channel bushing or nozzle bushing (these parts pressed in and need not be removed for carburetor servicing).

Throttle Body: Remove pump lever nut on end of throttle shaft, pull lever off shaft. Take out two screws in throttle valve (CAUTION—File riveted end of screws flat before turning screws out to avoid stripping threads), remove valve, slide throttle shaft and lever assembly out. Remove idle adjusting screw and spring.

CLEANING & INSPECTION OF PARTS: Remove corrosion and dirt from passages in fuel bowl casting with a ⅛" drill (grind cutting edge blunt to avoid damaging casting). Clean all metal parts thoroughly with cleaning solution and rinse in solvent. Blow out all passages with air. Inspect all parts for wear and damage, check jets and other calibrated parts for correct size (see Zenith Jet Specifications), use NEW PARTS as listed below when reassembling carburetor.

►*CAUTION—Do not use wire or drills to clean jets.*

New Parts—Install following new parts each time carburetor is overhauled (in addition to other parts being replaced because of wear or damage): Fuel Valve & Seat Assy., Power Jet Valve, Vacuum Cylinder Assy., Pump Intake Check Valve and Air Vent Check Valve, all Gaskets. NOTE—These parts included in Service Parts Kit.

REASSEMBLY OF CARBURETOR: After cleaning and inspecting all parts, reassemble carburetor by reversing disassembly directions and note following important points:

Throttle Shaft Bushing Replacement—Special tools must be used to install and line-ream bushings as follows: Counterbore Reamer C161-73-2, Bushing Driver C161-72-3, Line Reamer C161-71-3.

Throttle Valve Installation—Install valve attaching screws with heads upward (away from mounting flange), turn screws in loosely, close valve, tap valve lightly on mounting flange side to centralize it in bore, maintain pressure on valve while screws are tightened securely. Do not attempt to rivet ends of screws.

►*CAUTION—Above procedure necessary to insure correct flush fit of beveled edges of valve in bore.*

Pump Intake Check Valve Installation—Place new check valve on formed end of special tool C161-53. Invert fuel bowl assembly, insert tool in pump cylinder with guide bar in pump rod passage, press on tool to start check valve, then turn assembly over and drive check valve down to seat by striking tool with light hammer.

Pump Air Vent & Outl t Check Valve Installation—Insert valve ball, weight, retainer washer in passage in fuel bowl casting, start air vent check valve evenly in counterbore above retainer washer by hand (CAUTION—flat head of valve must face upward toward top surface of casting), fit machined end of stop bar on special tool C161-5 into upper end of check valve, drive check valve down into place. See that valve seats evenly in counterbore and is not cocked.

Accelerating Pump Check—After completing pump installation, check assembly for leaks by filling bowl with gasoline and forcing pump piston downward in cylinder. Fuel should be discharged through accelerating jet and no leakage should be noted at air vent check valve or intake check valve (leak at this point would result in fuel flowing back into bowl).

SERVICE PARTS: Gasket Set—Zenith No. C181-94. **Repair Kit**—Zenith No. K-746.

ZENITH JET SPECIFICATIONS

Carb. Model 228AV-10, Outline No. 10760

Part	Size	Part No.
Venturi	#28	C38-72—8
Main Jet	#26	C52-7—26
Main Discharge Jet	#80	C66-70-2—80
Well Vent Jet	#28	C77-14—28
Accelerating Jet	#13	C55-8—13
Power Jet Valve	#17	C97-12—17
Idle Jet	#12	C56-3—12
Fuel Valve & Seat①	#35	C81-53—35

①—Matched Valve & Seat Assy. (spring-loaded type needle valve).

ZENITH MODEL 28BV10

Part No.① Used On:

10569-A—Willys Jeep Station Wagon, Model 4-63 (Late 1948)—Serial No. 54134 Up.

①—Outline No. stamped on round metal tag riveted on top of float bowl cover. Use in ordering parts.

▷REPLACEMENT CARBURETOR No. 10569B. This field replacement carburetor omits some parts used in original equipment carburetor No. 10569A and has the following new parts: Air Intake Body No. A4-15, Choke Plate No. C101-1, Choke Plate Screw No. T11S6-5, Choke Bracket No. C109-1, and Choke Shaft & Lever No. C108-7.

DESCRIPTION: Single barrel, plain tube, downdraft type with double venturi. Carburetor has vacuum controlled power jet valve system and positively operated accelerating pump linked to throttle lever.

IDLING ADJUSTMENT: Adjust only when engine is warm (choke valve wide open, fast idle inoperative). Set throttle lever stopscrew for idling speed of 600 RPM. or 8 MPH. Adjust Idle Adjusting Screw for smooth idling (screw controls air and should be turned in for richer mixture, out for leaner mixture). Recheck idle speed.

ACCELERATING PUMP: Pump stroke is adjustable for seasonal requirements by engaging hairpin cotter in correct groove of pump plunger stem (directly above pump rod arm—accessible by removing air horn and bowl cover assembly) as follows:

Upper Groove—Minimum Stroke (hot weather).

Center Groove—Medium Stroke (normal operation).

Lower Groove—Maximum Stroke (cold weather).

FLOAT LEVEL: 29/64" from upper edge of seam at free end of float to gasket seat on bowl cover with needle valve seated (bowl cover and float inverted, float hanging freely).

▷*CAUTION—Do not compress spring in valve stem which will cause incorrect float setting. Allow float to hang freely on inverted cover when checking float level.*

FAST IDLE: Consists of a fast idle cam linked to the choke valve lever. Cam serves as the stop for the throttle lever stopscrew and opens the throttle valve to a fast idle position when choke valve is closed for starting. No adjustment is required.

CHOKE: Choke valve is manually controlled and has poppet type relief valve. Adjust control cable so that choke valve is fully closed when choke button is pulled out, and fully open when button pushed in. Check fast idle rod and make certain that fast idle lever on choke valve shaft is positioned so that it allows choke valve to close fully with fast idle cam in fast idle position.

FUEL FILTER: Consists of a stack of filter discs assembled on the filter head which provide edge filtering of fuel (fuel flows in through discs to channel in filter head and out through side hole to channel in carburetor casting).

Cleaning Filter—Remove filter head and element. Clean sump with soft cloth (use care not to wipe dirt or water into fuel channel in carburetor casting). Remove disc element from head (discs can then be separated slightly), wash element in gasoline, blow out with compressed air (CAUTION—use only moderate pressure).

CARBURETOR DISASSEMBLY: Disconnect fast idle rod, remove fuel filter head (see above), remove bowl cover and air horn attaching screws. Raise bowl cover slightly, loosen gasket (to avoid damage to float), lift off bowl cover and float assembly. Remove float by pushing axle pin out of slotted end of hinge bracket. Remove fuel valve seat (use Tool C161-85). Remove vacuum cylinder assembly (use Tool C161-10 or 7/16" thin-wall box wrench). Remove idle adjusting screw and spring, main jet plug, pump lever nut and lockwasher (loosen lever on shaft), and bowl casting-to-throttle body casting screws. Lift bowl casting off and at the same time disengage pump lever from throttle valve shaft. Push pump arm down and disengage link from lower end. Remove large venturi and gasket. Pull pump rod and pump assembly out (CAUTION—file off any burrs on lower end of rod at link hole first). Remove main discharge jet (use Tool C-161-1), power jet and valve assembly (use Tool C-161-9), main jet and gasket (use screwdriver), idling jet, well vent (use Tool C-161-80 or 3/16" wrench), pump channel plug and accelerator plug (use Tool C-161-21 Extractor), pump air vent check valve assembly (use Tool C-161-5). Invert bowl and allow retainer washer, weight, and discharge check ball to drop out. Remove pump inlet check valve (bend retainer lugs up, remove valve disc, remove valve assembly with Tool C-161-5—Do not remove valve seat). Remove pump channel lead plugs (use #46 drill and C-161-21 Extractor). If Choke Valve & Throttle Valve to be removed, see data under Carburetor Assembly below.

CAUTION—Do not remove the following parts: Pump Intake Check Valve Seat, Secondary Venturi, Idle Channel Bushing, Priming Plug (see Throttle Valve Data).

CARBURETOR REASSEMBLY: After cleaning all parts, reassemble carburetor using new jets, plugs, and gaskets and note the following important precautions:

Throttle Valve & Shaft—Idle ports in priming plug are drilled in assembly after throttle valve installed and correct relationship between valve and ports must be maintained in service. If necessary to replace valve, before removing old valve, back off stopscrew so that valve completely closed, mark inside wall of throttle body at throttle valve edge. File off riveted ends of throttle valve screws, remove screws and valve, withdraw shaft. When installing new valve, check valve position with relation to mark on carburetor wall and select a valve which fits close to mark when installed. Rivet ends of throttle valve attaching screws.

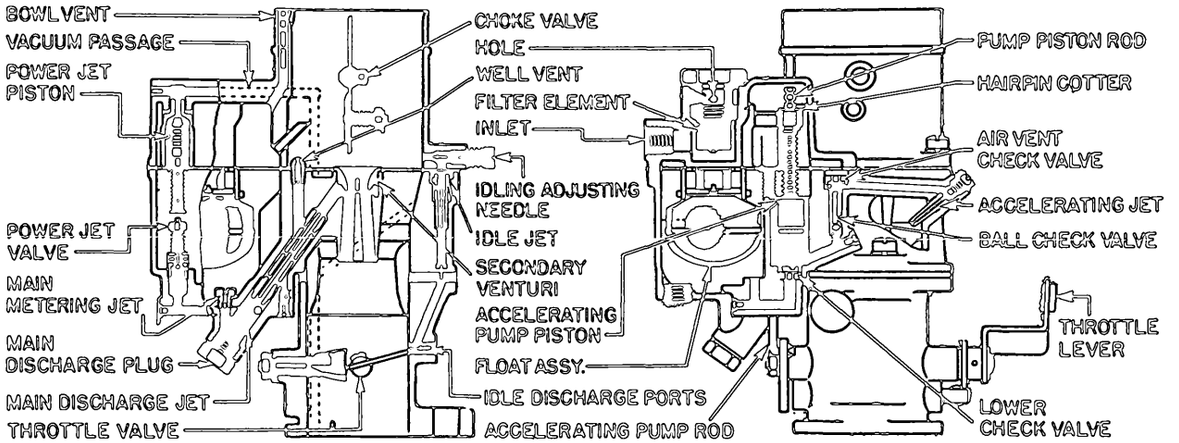
▷*CAUTION—Use extreme care not to spring shaft (use small mandrel in vise and light hammer*

Choke Valve & Shaft—If old valve to be removed, file off riveted end of valve attaching screws before removing screws. New screws must be riveted after valve installed.

▷*CAUTION—Use extreme care not to spring shaft (use small mandrel in vise and light hammer*

Main Jet—Use new gasket with this jet.

▷*CAUTION—Main Jet is marked by Star on head to prevent confusion with Compensator Jets used in other carburetors. Use only star-marked jets (compensator jets have shorter calibration length and will change metering characteristics of carburetor if installed by mistake).*



Power Jet Valve—Do not use a gasket under this valve. Do not attempt to change spring tension of valve or vacuum piston assembly.

Main Discharge Jet—Do not use a gasket with this jet. Use tool C-161-1 to tighten jet securely.

Well Vent—Do not use a gasket under this vent. Use tool C-161-80 or 3/16" wrench to install vent.

Idling Jet—Do not use a gasket under this jet.

SERVICE PARTS: Gasket Set—Zenith No. C181-94. Repair Kit—Zenith No. K-741.

ZENITH DOWNDRAFT

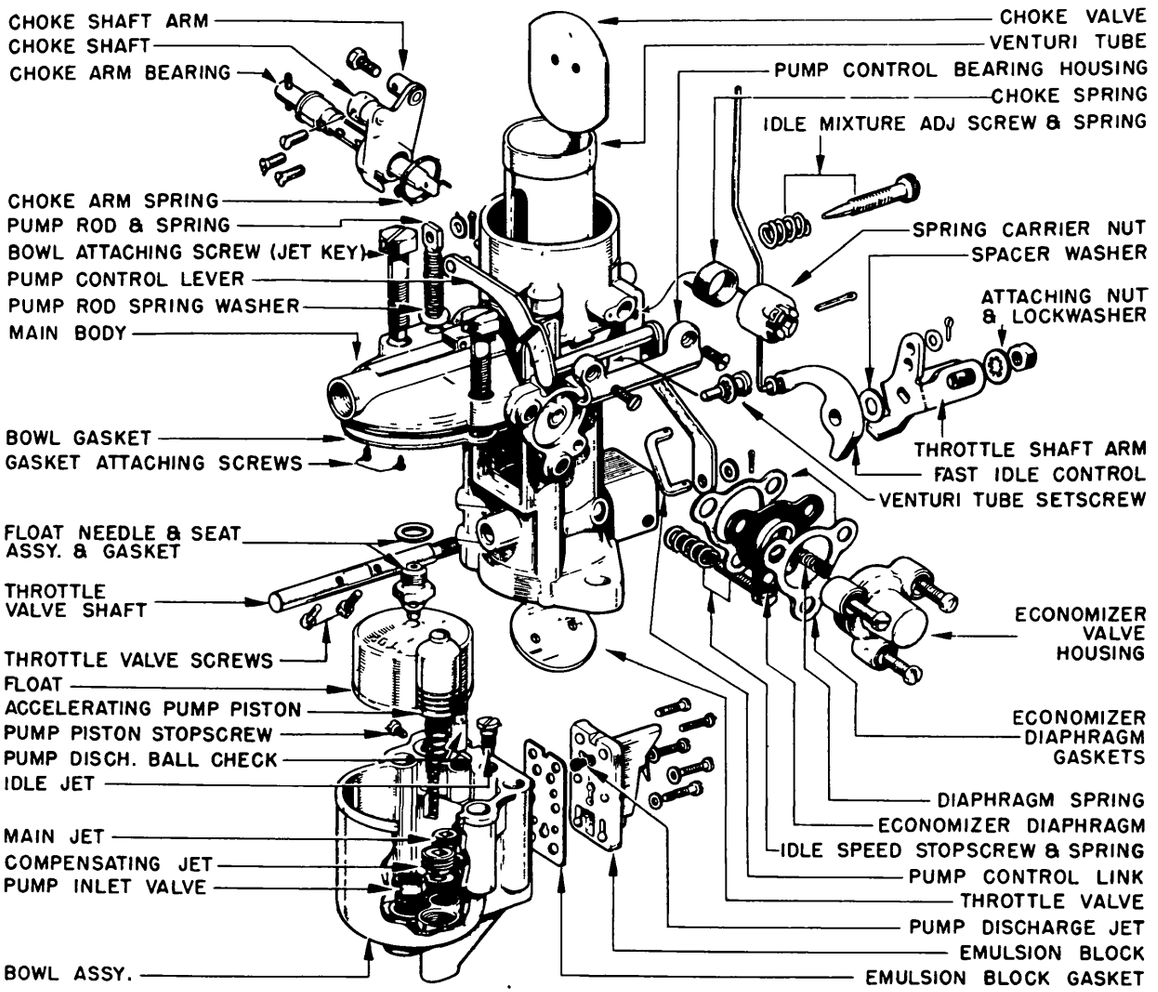
METROPOLITAN	Zenith Model
1954 Nash & Hudson Model	30 VIG-8
1955 Nash & Hudson Model	30 VIG-10

DESCRIPTION: The Zenith Model 30 carburetor is a single barrel downdraft type with manual choke control and inter-connected fast idle device.

Fuel System: Carburetor has Idle Fuel System, Main & Compensating Fuel System, mechanically operated Accelerating Pump, and diaphragm type Economizer which operate as follows:

Idle Fuel System—Fuel for idling is taken from the Main Well into the Idle Jet Well and then up through the Idle Speed Jet which meters the fuel. At the upper end of the idle jet, fuel is mixed with air admitted through an air bleed in the emulsion block opening into the air horn above the venturi. An additional air bleed controlled by the Idle Mixture Adjusting Screw also admits air into the idle mixture passage. From this point the fuel mixture flows down to the Idle Discharge Ports at the throttle edge. Fuel is discharged through the lower port for closed-throttle idling. As soon as the throttle valve is opened, fuel is discharged from the upper idle port also.

Main & Compensating Fuel System—Both the Main Jet and Compensating Jet are located in the bottom of the fuel bowl and fuel metered by these jets flows through separate passages to the Main Well in the emulsion block (located between bowl casting and main casting). From this point, the fuel flows through a passage to the main nozzle and is discharged into the air stream at the venturi nozzle bar. A capacity well in the bowl casting controls the fuel discharge (see Economizer) and acts as an air bleed for the main system with additional air being introduced through the idle system and pump system while the main nozzle is operating.



Economizer—Diaphragm type vacuum controlled valve which regulates the Capacity Well Air Bleed. At part throttle, with high vacuum in manifold, the economizer opens a large air bleed to the capacity well resulting in a leaner fuel mixture. At full throttle, the valve closes supplying a richer mixture for full power operation.

Accelerating Pump—Mechanical type with spring-loaded pump plunger operated by a pump rod linked to the throttle lever. Fuel flows into pump cylinder through a disc type Pump Inlet Valve in the bottom of the fuel bowl. As the throttle is opened, fuel is forced out past a ball type Pump Discharge Check Valve and is discharged through a Pump Discharge Jet located at one end of the nozzle bar.

ADJUSTMENTS: Adjust carburetor as follows:

Idle Adjustment: Adjust only with engine at operating temperature with choke valve wide open and fast idle inoperative. If preliminary adjustment required to warm up engine, turn idle mixture adjusting screw until lightly seated, then back off screw ½ turn. With engine warmed up, turn screw in or out for smooth idling performance. *CAUTION— Screw controls idle air bleed and should be turned IN for richer mixture.*

Idle Mixture Setting—0 to 1 turn open.

ZENITH DOWNDRAFT CARBURETOR

Idle Speed Setting—500 RPM. at normal operating temperatures.

Accelerating Pump Setting: Two holes provided in throttle lever for pump link. Connect link as follows: **Upper Hole**—Maximum stroke (Winter or cold weather operation), **Lower Hole**—Minimum stroke (Summer or warm weather operation).

Float Level: Non-Adjustable. Float is free type (guided by sides of bowl) and acts directly on fuel intake needle valve in bowl cover.

Fast Idle: Consists of an inter-connected linkage between choke valve lever and throttle valve lever which opens the throttle valve 1/32" when choke closed for cold starting. To adjust fast idle, remove cotter pin from grooved nut controlling the choke spring, turn nut clockwise until spring tension is just relieved, then with choke valve closed, turn nut ½ turn counter-clockwise and secure setting with cotter pin. This will provide correct throttle valve opening.

Choke Valve Linkage: Adjust so that choke valve is fully closed when button on instrument panel is pulled out.

OVERHAUL: With carburetor off engine, separate bowl assembly from main body by removing two bowl attaching screws, and sliding bowl downward carefully to avoid damage to emulsion block and main nozzle. Then disassemble as follows:

Bowl Disassembly—Lift float out. Use one of bowl attaching screws ("Jet Key" screw with square end) to remove main jet and compensating jet from bottom of bowl. Remove idle jet from top of bowl casting (jet is slotted for screwdriver blade). Remove emulsion

CONTINUED ON NEXT PAGE

ZENITH DOWNDRAFT (Cont.)

center screw first, remove the other four screws, finally remove this lower center screw, which acts as a puller for the block). Remove pump inlet check valve from bottom of bowl and discharge ball check valve from top of bowl casting Remove pump piston locating stopscrew, remove pump piston and spring. Remove air inlet orifice plug from top of capacity well *NOTE*—It is not necessary to remove pump discharge jet from emulsion block (can be cleaned from rear of block)

Main Body Disassembly—Remove three screws retaining economizer diaphragm housing on main body, carefully remove housing, diaphragm, diaphragm spring, and gaskets Remove fuel intake needle and seat assembly from bowl cover. Remove idle adjusting screw block from side of bowl. (*CAUTION*—Loosen lower and spring. Remove bowl gasket from cover by using pliers to remove the gasket retaining drive screws Cleaning & Inspection—Clean all parts thoroughly, clean and blow out all passages in carburetor castings. Inspect all parts for wear or damage.

▷*BOWL COVER GASKET NOTE:* If care is used to locate gasket properly when installing bowl on main body casting, it will not be necessary to use the locating drive screws which are installed in production to hold the gasket in place.

SERVICE PARTS: Repair Kit Metropolitan No. 8111493.

Reassembly—Install all parts and assemble carburetor by reversing disassembly procedure above. Use all new gaskets and install gaskets without any sealing compounds.

ZENITH MODEL 31 A11

WILLYS	Zenith Assy. No.
1950-51 673-SW & 673-VJ	11119
1951 673-SW & 673-VJ	11307

▷CHANGES, CAUTIONS, CORRECTIONS

▷*1950-51 WILLYS IDLE DIFFICULT TO ADJUST (No. 11119 Carburetor):* If carburetor does not respond to idle adjustment, cause may be fuel discharging from accelerating pump jet at idle Check by removing air cleaner and noting if fuel discharge apparent at pump jet with engine idling Correct as follows
1) Remove air intake assembly, accelerating pump spring, invert lower assembly and catch pump spacer and pump guide which will fall out
2) Install new type Pump Guide, Zenith No C131-30 (this guide 334" in diameter with reduced section at end—previous guide 303" in diameter) with same pump spacer inside guide
3) Reassemble carburetor and adjust after installation on engine

▷CARBURETOR FLANGE GASKET CAUTION—Correct type of flange gasket must be used when installing carburetor on engine. Gaskets must not be interchanged as use of gasket which blanks off vacuum channel into intake manifold will result in failure of the accelerating pump and constant operation of the vacuum power valve with consequent rich mixture and poor gasoline economy.
Gasket No. C141-18—Use on engines without governor. Gasket has four cut-out slots at rim of center hole to provide opening for vacuum channel regardless of gasket position on manifold flange.
Gasket No. C141-4-3—Use only on engines with "samdwich" type governor. This gasket has slotted hole at either end designed to complete vacuum channel to manifold through governor body.

DESCRIPTION: Single barrel, plain tube, downdraft type with double venturi and vacuum controlled accelerating pump and power jet system. Carburetor is balanced with float bowl vented in air horn.

IDLING ADJUSTMENT: Adjust only when engine is warm (choke valve wide open, fast idle inoperative). Set throttle lever stopscrew for correct idle speed, adjust idle adjusting screw for smooth idling, recheck idle speed.
Idle Screw Setting—Approximately 1½ turns open.
CAUTION—Screw controls fuel mixture and should be turned OUT for richer mixture.
Idle Speed—600 RPM. or 6 MPH.

POWER JET (ECONOMIZER): No adjustment required. Power valve is normally closed and opens when manifold vacuum falls below 6".

ACCELERATING PUMP: No seasonal adjustment provided. Pump stroke is adjustable by changing stroke spacer in pump spring guide.

NOTE—Pump must be disassembled (see Overhaul data) to make this change.

FLOAT LEVEL: Use Float Level Gauge C161-169 to check float level. Remove air horn and bowl cover, remove gasket. Install gauge on top edge of bowl over center of float, press down firmly on float arm directly over intake needle. Top of float should be flush with bottom edge of gauge (plus or minus 1/32").

FAST IDLE: Consists of a fast idle cam (advance lever) linked to the choke valve and serving as a stop for the throttle stopscrew. Cam is rotated when the choke is closed for starting and opens the throttle to the fast idle position. No adjustment is required.

▷*CAUTION—Fast idle cam must be in the hot or slow idle position (stopscrew resting on low point of cam) when adjusting idle speed.*

CHOKE: Choke valve is manually controlled. Valve is spring-loaded on shaft and is free to open slightly against spring tension when engine begins to fire. Adjust control cable so that valve is fully closed when choke button is pulled out and is fully open when button pushed in. See that fast idle cam is rotated to the point where throttle stopscrew rests on high point of cam when choke valve is fully closed.

DISASSEMBLY: The three main castings are separated and disassembled and reassembled as units:

Air Horn & Bowl Cover—Take out fast idle cam screw, disconnect connector rod at choke valve lever. Remove air horn and bowl cover attaching screws, raise assembly slightly to free cover gasket, then lift straight up using care not to damage float and other protruding parts. File off riveted end of choke valve screw, remove screw, unhook and remove spring. Withdraw choke shaft and lever, lift out choke valve.

▷*CAUTION*—Do not remove bowl vent tube in air horn, pump guide tube, channel plugs, choke shaft plug, or identification disc.

Fuel Bowl (Main Body)—Lift out metering well, well vent and idle tube (single assembly), remove cork gasket from top of unit. Lift off bowl cover gasket. Lift out flexible pump piston, piston guide, pump stroke spacer, and pump spring as a unit (CAUTION—use fingers only, do not pry these parts out). Lift out accelerator jet and check valve assembly and cork washer. Remove float, float axle, retainer plugs, and intake needle as a group by inserting forked end of tool under float axle and prying axle and retainers up out of bowl. Remove intake needle seat and fibre washer (C161-85 wrench). Remove power jet valve and fibre washer from bottom of pump cylinder (C-161-121 wrench). Remove pump intake check valve from bottom of bowl by screwing C161-25 extractor firmly into valve and striking cross-bar sharply to pull valve (CAUTION—be sure check valve disc is removed from channel). Remove main jet passage plug and fibre washer from outside of casting under bowl, then remove main jet and fibre washer from this channel (C161-83 wrench). Remove filter plug and fibre washer from under float bowl, take off filter screen. Remove two lead channel plugs by drilling #46 hole in each plug and using C161-21 extractor tool to pull plugs out. Take out fuel bowl-to-throttle body

CONTINUED ON NEXT PAGE

ZENITH 31A11 (C nt.)

attaching screws, lift fuel bowl off, invert bowl and remove venturi from lower end. Do not remove idle channel bushing unless replacement required.

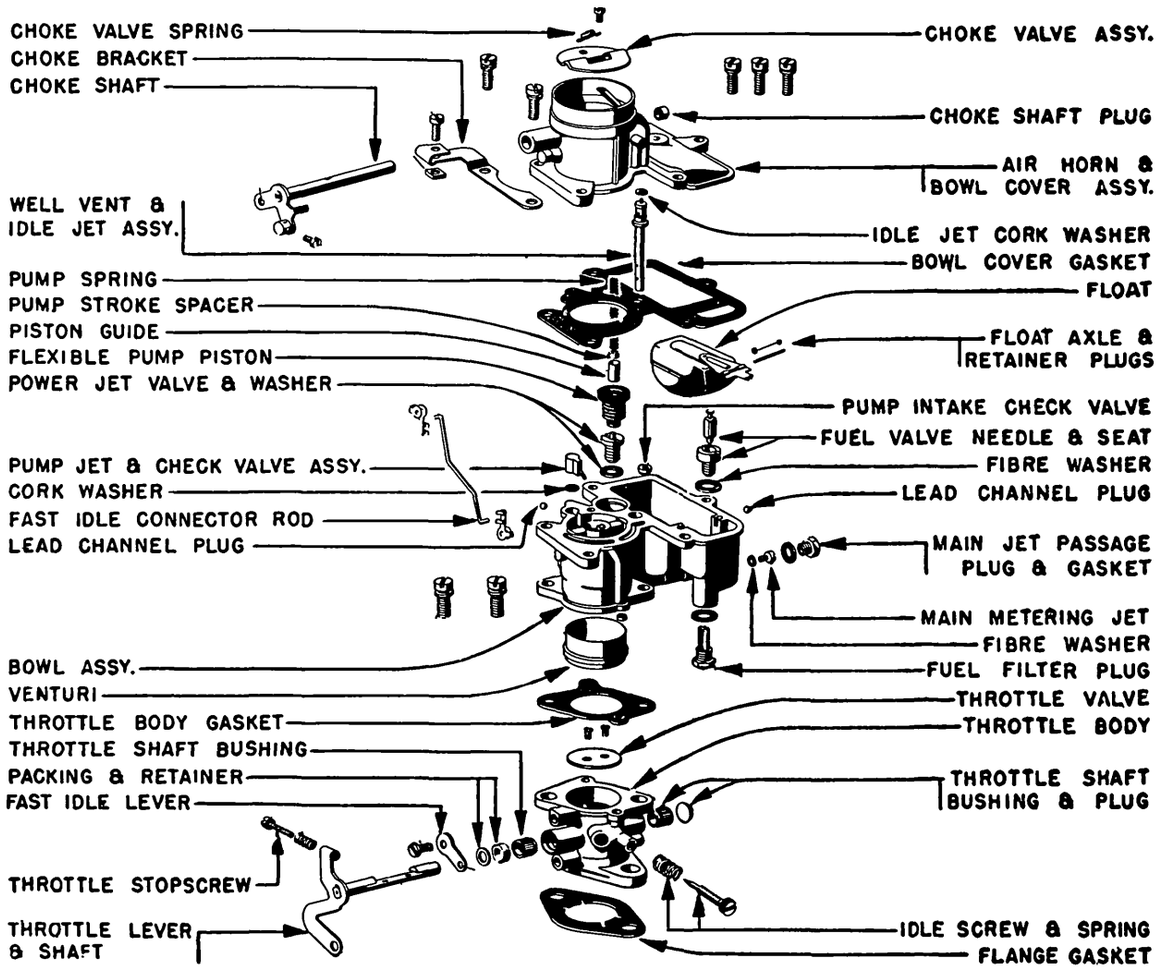
►*CAUTION*—Do not remove secondary venturi (pressed in fuel body) or accelerator channel brass plug.

Throttle Body—Unscrew idle adjusting needle and spring. File off riveted ends of throttle valve screws, remove screws, lift out throttle valve. Withdraw throttle shaft and lever, remove shaft packing washer and retainer from lever end of shaft recess. Use 5/16" rod inserted through shaft hole to drive out plug in opposite shaft hole.

►*CAUTION*—If throttle shaft and bushings being replaced, remove old bushings only as new bushings installed (old bushing must be used to line-ream new bushing). See Reassembly data.

CLEANING & INSPECTION OF PARTS: Clean all metal parts with cleaning solution and rinse in solvent. Blow out all passages with air and clean carbon deposits from carburetor bore and idle ports. Do not use wire or drills to clean jets or metering restrictions. Inspect all parts and replace if worn. Replace following parts whenever carburetor is being overhauled: Intake Needle & Seat Assy., Flexible Pump Piston, Power Valve & Jet, Choke Valve Spring, Pump Intake Check Valve, Pump Outlet Check Valve & Jet, all Gaskets and Fibre Washers.

REASSEMBLY: Reassemble carburetor by reversing disassembly procedure and note following important points:



Throttle Shaft Bushing Replacement—Remove one old bushing by threading 3/8" fine thread tap into bushing and using 5/16" rod inserted through opposite shaft hole to drive bushing out. Install new bushing using C161-72-3 driver. Line-ream this bushing with C161-71-3 reamer using opposite bushing as a guide. Repeat this procedure to install opposite bushing. Install plug in shaft hole (opposite end from throttle shaft lever) and stake plug in place.

Throttle Valve—Install throttle shaft with packing and retainer in throttle body, turn shaft to wide open position with cut-out on shaft facing away from idle discharge ports, insert throttle valve with bevel on leading edge away from idle ports, close throttle valve and center the valve so that bevel fits carburetor bore snugly, start throttle valve screws, tighten screws **while pressing in on end of shaft** to insure packing being in place.

Float & Intake Needle Valve—Engage slotted end of float lever with knot end of intake needle, slip float axle through float lever, lower axle into casting slots, install axle retainer plugs using a flat end punch to seat plugs in slots. Plug height tolerance is 1/64" above machined surface of casting.

Pump Inlet Check Valve—Install valve with disc side down, use C161-161 driver to seat valve flush with casting.

Pump Outlet Check Valve & Jet—Install cork washer first, then install check valve and jet assembly **with open end down.** Assembly should extend approximately 1/64" above surface of bowl casting.

ZENITH MODEL 31A11 CARBURETOR

Accelerating Pump Assembly—Install flexible pump piston, piston guide, pump stroke spacer (see note), and pump spring in this order in the pump cylinder.

►**Pump Stroke Spacer Note**—This part controls pump stroke and pump discharge. Parts used as regular equipment on Willys is Part No. C63-193-2 and provides one-half stroke.

Metering Well, Well Vent, & Idle Jet Assy.—This unit should be installed **after** the bowl gasket has been installed and shoulder should seat on top of gasket.

Choke Valve—With choke valve in closed position and choke shaft rotated clockwise until lever is against its stop, install screw through eye of choke valve spring but **do not tighten** screw completely (spring must be free). Rivet the end of the screw using a flat end punch held in a vise as a mandril to support the screw and to prevent bending the choke shaft. Then hold choke in open position and hook end of spring over anchor clip on valve.

SERVICE PARTS: Gasket Set—Zenith No. C181-313.

Repair Parts Kit—Zenith No. K-11119 (11119), No. K-11307 (11307). *NOTE*—If Basic Repair Kit No. K764 used, additional parts listed below will be required:

ZENITH JET SPECIFICATIONS

③—Provides ½ pump stroke.

KAISER SUPERCHARGER

Kaiser Manhattan Model K542 (1954-55)

DESCRIPTION & OPERATION: Model VS-57A. Centrifugal type mounted on engine and belt driven from the crankshaft. Supercharger has two step-up speeds: (1) Variable ratio drive pulley with belt tensioner, and and (2) Planetary drive system between input and output shafts. A control system governs the shift from LOW BLOWER to HIGH BLOWER and limits HIGH BLOWER boost output by governing the sliding flange of variable ratio pulley. LOW BLOWER step-up speed ratio is 1-5.7 and HIGH BLOWER 1-10. Planetary drive system consists of front and rear outer ball races, five steel balls, ball retainer and inner race which is milled in the output shaft. Drive is from input shaft to ball retainer to steel balls to output shaft with ratio of 1-4.44. Spring tension from race load assembly applies pressure (from assembly) to front race, reducing space between front and rear outer races, forcing ball pressure on output shaft. Balls are forced to rotate around output shaft as well as on own axis causing output shaft to turn. The impeller fits on hub of output shaft and is driven by two dowel pins.

Lubricating System—Oil supply is contained in oil sump. A piston type oil pump driven off camway ground in input shaft supplies lubrication direct to input shaft bushing and to output shaft pilot bushing in rear end of input shaft. Seepage past these bushings supplies lubricant to input shaft roller bearings, air piston and air chamber, and to planetary drive balls and races. A dipstick is provided to check oil level and the oil level should be checked every 1000 miles. *See LUBRICATION below.*

Control System—Consists of an air pressure valve affected by spring pressure and a Solenoid Regulator. The electric switch for the Solenoid Regulator circuit can be operated either by intake manifold vacuum or by accelerator pedal (kickdown). A spring loaded diaphragm limits air pressure build-up by permitting valve to open at adjusted spring pressure.

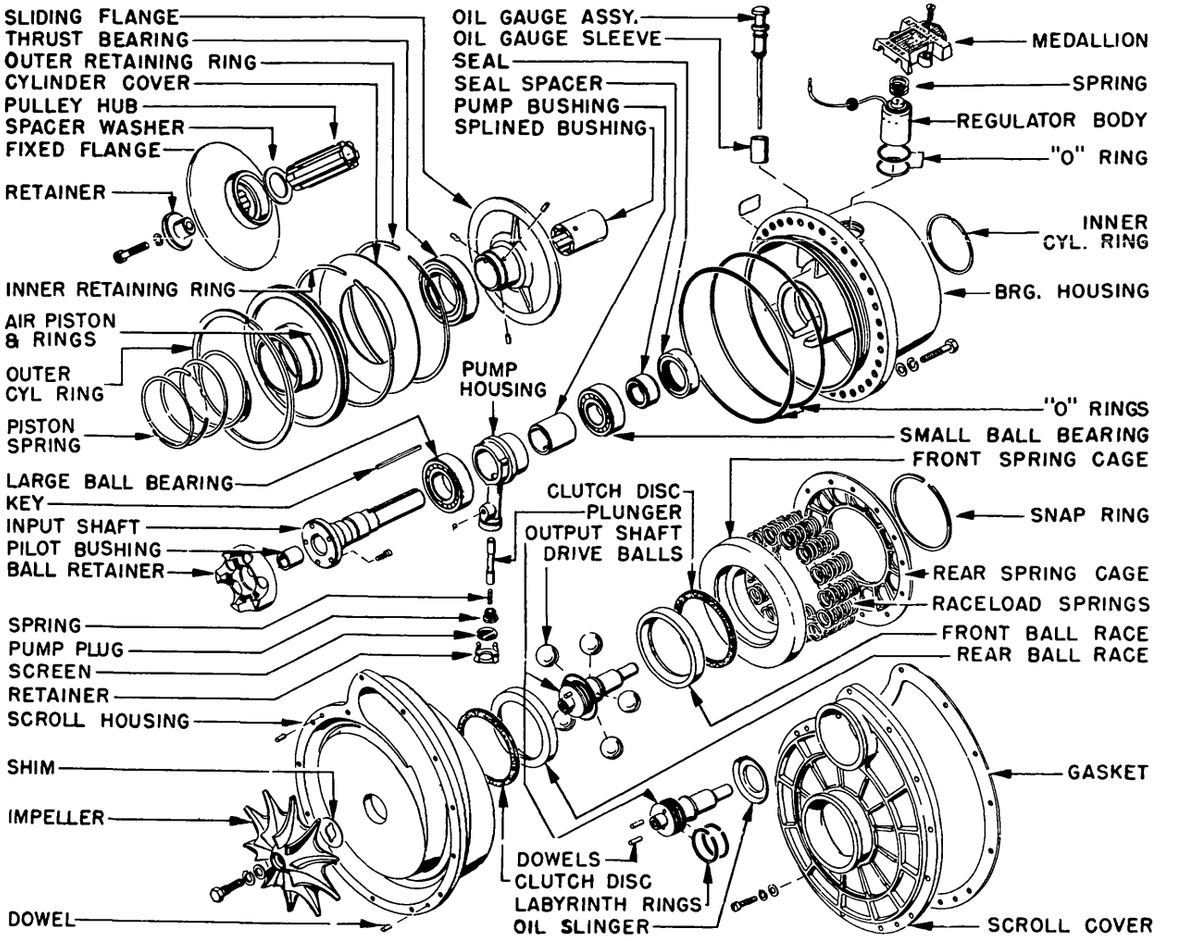
Solenoid Regulator Operation—There are three phases:

1) Low air pressure, no circuit to Solenoid Regulator, spring between valve head and Solenoid Armature forces valve open permitting air pressure to enter air chamber forcing air piston and floating pulley flange forward causing shift to Low Blower.

2) Low air pressure, Solenoid energized, forcing Armature up, compressing valve spring and sealing off air passage to air piston resulting in shift to High Blower by the belt tensioner.

3) High air pressure against diaphragm offsets diaphragm spring pressure forcing diaphragm away from valve head. With Solenoid Armature in up position (energized), valve is now permitted to raise sufficiently to open air passage partially. Air piston moves forward reducing input shaft speed ratio and impeller speed, controlling pressure build-up.

ADJUSTMENT: Solenoid Regulator. Adjustment must be made exactly as listed below. The spring tension governing the diaphragm position is controlled by a socket-head screw acting against top of spring over diaphragm. Turn screw in or out to either increase or reduce output level. Read pressure output level with supercharger operating in High Blower with engine turning at 3000 RPM under load as follows:



1) Bring engine and supercharger to operating temperatures before attaching tachometer and pressure gauge (Pressure gauge to intake manifold).

►*CAUTION:* Readings must be made under actual driving (under load) conditions (Dynamometer or road driving).

2) Remove medallion and retaining spring. Back out adjusting screw (No. 54 Allen wrench) until screw head is flush with top of regulator. Turn screw in to just touch spring collar. Then add three turns.

3) Replace retaining spring and medallion. Run engine at 3000 RPM for 15 minutes and read pressure. NOTE: Pressure should be less than 4 lbs. (psi). Remove medallion, retaining spring, back out screw ½ turn and replace spring and medallion. Check pressure. Final setting should read 4 lbs. (psi) in intake manifold at 3000 RPM under load conditions. Regulation tolerance will be from 3½-4½ lbs. (psi).

►*CAUTION:* Do not adjust regulator to higher setting. Use G-E Glyptol or equivalent to cement adjusting screw to fixed setting. Retain the setting.

KAISER SUPERCHARGER ASSEMBLY

LUBRICATION: Check oil level by means of dipstick on left side of housing every 1000 miles. Drain and refill sump at 25,000 mile intervals. Dipstick is marked to indicate "safe" oil level and "add oil" points.

Capacity & Recommended Lubricant—8 ozs. Use Mobiloil ATF200 or Type A Automatic Transmission fluid.

OVERHAUL: *Supercharger is a precision unit with micro-finished surfaces and all precautions listed below must be followed when disassembling unit and handling parts.*

►*CAUTION:* Remove unit from engine before disassembling. Clean exterior thoroughly with solvent, wiping dry with rags or industrial wipers. DO NOT immerse unit in the solvent and avoid use of compressed air during cleaning operation. Work on clean surface with clean tools, using clean solvent and oils. Proper tools eliminate possible damage to precision built parts. Do not handle micro-finished drive line parts with bare hands (output shaft, drive balls, and ball races) to avoid rust and oxidation on these parts. Use clean dry cloth

CONTINUED ON NEXT PAGE

KAISER SUPERCHARGER (C ntinued)

gloves or oiled patches of clean cloth (lint free paper wiping towels such as Scott Industrial Wipers etc. may be used).

1) Remove dipstick gauge and drain oil sump. Remove retainer and pull front flange of pulley (Tool No. 37272). Remove sliding flange (pulls off hard). Remove splined hub (Tool No. 37273, if necessary).

2) Force hub of air piston in and pry off cover retaining ring (notch at bottom of bearing housing). Remove cover and inner retaining ring. *CAUTION*–Release spring behind air piston gradually to save possible personal injury. Remove piston and spring from housing.

3) Remove medallion and regulator retaining spring. Remove solenoid regulator with vise grip pliers. Remove two "O" rings. Remove retaining screws and lift (not twist) scroll cover from housing. Hold impeller wheel (Tool No. 37274) and remove retaining screw. Remove impeller wheel (Tool No. 37261) from output shaft with shim or shims.

►*CAUTION:* Nicks, scratches or any damage to impeller wheel affects balance. Replace, do not repair, if damaged.

4) Replace scroll cover and retain with four equally spaced screws, lockwashers and flat washers (flat washers against scroll surface). Install assembly in fixture (Tool No. 37271). Remove screws and washers. Screw removal handles into bearing housing and twist bearing housing free of scroll housing. Remove two "O" rings.

►*CAUTION:* Pry housing apart or rocking bearing housing back and forth may damage scroll housing, bend or damage input or output shafts and cause loss of concentricity.

►*INPUT & OUTPUT SHAFT REMOVAL CAUTION:* To avoid damage to internal parts handle input and output shafts, balls and ball races with soft cloth gloves (see CAUTION under DISASSEMBLY PROCEDURE). Do not throw balls, ball races or other parts into container causing scratches, pits or other surface damage. Keep internal steel parts submerged in clean oil following removal to avoid rusting. Do not use steel wool or or other abrasive material to clean or polish contact surfaces of planetary system. Parts oxidized or rusted must be replaced.

5) Remove input shaft and oil pump assembly (Can be tapped out with rubber mallet). Remove race load assembly from scroll housing.

►*CAUTION:* Use arbor press to diassemble race load assembly to avoid personal injruy.

6) Lift output shaft until drive balls clear rear ball race and pull output shaft free of scroll housing. Lift ball races and clutch discs from their respective seats. *NOTE*–Do not drive them free, but heat surrounding metal to 110°F. Expansion will free ball races.

7) Remove hub key, seal and spacer from input shaft. Pull bearing (Tool No. 37273) from shaft. Remove screen retainer and screen. Screw out spring retainer and remove spring, and plunger. Hold pump body steady, rotate input shaft to highest point of cam and remove pump body from input shaft. Can only be removed from this position. Remove bushing out past staking tang. Remove inner bearing (Tool No. 37273). Remove 5 retaining screws and remove ball driver.

►*CAUTION: DO NOT DISASSEMBLE SOLENOID REGULATOR.*

REASSEMBLY: *CAUTION–A clean area for assembly is important. All parts must be thoroughly cleaned and well oiled. Lint and dust must be held to absolute minimum when assembling internal drive parts.*

1) Install scroll cover with four retaining screws and fit assembly in Fixture (Tool No. 37271). Place a clutch disc in position and press ball race over clutch disc. Race should bottom against disc. Assemble labryinth rings in first and third grooves of output shaft with ring grooves in line. Insert shaft, dowel pins down, in center opening of housing. Shaft will angle slightly with ring gaps up. Push shaft gently into opening and straighten to vertical. Tapered face of opening compresses rings as shaft seats. Lift shaft and insert drive balls. *NOTE*–Move shaft sideways, balls will enter freely. Insert clutch disc and ball race in race load assembly (seat well) and place race load assembly in position with ball race down over drive balls.

2) Attach ball retainer or driver to input shaft (30 lbs. torque), press large ball bearing on shaft against shoulder. Slide oil pump body with bushing onto shaft. *CAUTION*–Bore in Pump body must align with camway in shaft. Press small ball bearing in place and assemble plunger, spring, retainer etc. to pump body. Place assembled input shaft down over pilot boss of output shaft. Rotate shaft to seat drive balls in drive ball retainer.

3) Install inner air piston ring on boss of bearing housing, insert seal with sealing face to front of supercharger. Install "O" rings (2) in inside and outside grooves of housing shoulder. (Not in center groove). Oil "O" rings lightly to aid in installation. Install bearing housing on scroll housing and secure all six screws, using lockwashers and plain washers. Plain washers against housing. *CAUTION*–Tighten evenly to prevent loss of concentricity (100 inch lb. torque).

4) Install outer air piston ring. (Place piston spring in nose section and slide piston in place. Compress spring and install rear retaining ring. Place shaft sealing spacer over pulley end of input shaft and push into place under shaft seal. Install air cylinder cover and outer retaining ring.

5) Place key in input shaft, slide splined hub in place, position sliding flange of pulley to hub and push flange down to seat thrust bearing in air piston. Insert special washer (chamfered inner edge at rear of flange). Add fixed flange and retainer. Torque screw to 200 inch lbs. torque. Sliding flange must be free on sleeve (no bind).

6) Install impeller with sufficient shims to give .012" clearance. (Measure depth of output shaft shoulder under face of diffuser and add .012" for shim pack). Tighten screw with flat and lock washer in place to 200 inch lbs. torque. Check impeller to diffuser clearance at several points. (.009" GO, .016"NO GO). *CAUTION*–All bearing to scroll housing screws must be tightened to 100 inch lbs. torque. Assemble scroll cover (flat washers against cover) and tighten retaining screws.

7) Insert "O" rings (lightly oiled) in regulator well. Position regulator in well against seat, add retaining ring over shoulder and install medallion. *CAUTION*–Never operate supercharger with medallion removed.

8) Check for freedom of rotation before installing on engine. It should turn hard but not bind, drag, grab or ratchet. Assemble to mounting bracket, add 8 ozs. lubricant (see lubrication), turn supercharger at least 12 revolutions to prime pump. DO NOT adjust Solenoid Regulator until engine and supercharger have been brought to operating temperature. Idle supercharger until pump has had time to deliver adequate lubrication to all working parts.

AC FUEL PUMPS

DESCRIPTION: All AC fuel pumps are mechanically operated, diaphragm type, and operate on the same basic principle. Pumps are driven by a special cam built into the engine camshaft. A rocker arm built into the pump rides the cam, or on some engines a push rod rides the cam which in turn operates pump rocker arm. Pump diaphragm is fastened to a pull rod which is connected to the rocker arm by a linkage. Various linkage types are used. Movement of the diaphragm is controlled by the rocker arm travel on inlet stroke, and by a drive spring on the return stroke. Pumps are equipped with a sediment bowl or built-in sediment chamber and filter screen. On early type pumps the diaphragm was fastened to the pull rod by a nut and washer, later types use one-piece diaphragm and pull rod assembly. Fuel pump pressures range from 2½ lbs. to 5½ lbs. depending on the type of pump used.

OPERATION: Operation of pumps is similar although different types of bodies, valves, linkage are used. In all pumps the down stroke of the diaphragm is positive, being pulled down by the operation of the rocker arm, through the linkage. On the down stroke a vacuum is created above the diaphragm and fuel is drawn into the pump chamber through the pump inlet, sediment chamber, filter screen, and inlet valve. On the return stroke the driving spring forces the diaphragm up, the pressure closing the inlet valve and the fuel is forced out through the outlet valve to the carburetor. The rocker arm is forced to follow the cam at all times by means of the rocker arm spring. The amount of fuel delivered by the pump is governed by the carburetor float needle valve. The pressure is controlled by the drive spring forcing the diaphragm up on the return stroke. The diaphragm can move up on the return stroke only when fuel is flowing out of the pump.

AC COMBINATION FUEL & VACUUM PUMPS

DESCRIPTION: A fuel and vacuum pump are combined in one unit on combination pumps. A single rocker arm operates both pumps. The fuel pump section is similar to the single unit type fuel pump. The vacuum pump is diaphragm type and is used to furnish vacuum for windshield wiper operation when manifold vacuum is low.

OPERATION OF VACUUM PUMP: The vacuum pump consists of a vacuum chamber containing the inlet and outlet valves and is closed at the upper end by the pump diaphragm. A spring is assembled in the center of the pump under the diaphragm. The operating shaft on the upper surface of the diaphragm assembly is connected to the pump rocker arm through the linkage. In operation when the rocker arm is actuated by the eccentric on the camshaft the vacuum pump diaphragm is forced down, expelling any air in the pump chamber through the outlet valve into the manifold. When the rocker arm moves back (freeing the pump linkage), the driving spring under the diaphragm forces the diaphragm upward, creating a vacuum in the chamber, opening the inlet valve, and operating the windshield wiper. Whenever the engine is operated with the windshield wiper turned off the vacuum in the vacuum chamber will hold the diaphragm at its lowest position (with the driving spring compressed) and the vacuum pump will not operate. Whenever the manifold vacuum is higher than the pump vacuum the pump will likewise be inoperative and the windshield wiper will be operated by the manifold vacuum straight through the pump with both valves open. At other times pump acts as a booster to operate windshield wiper.

FUEL PUMP TESTING

NOTE: AC Fuel Pump Analyzer No. 44 consisting of gauge, 1 pint measure, hose and adapter fittings is recommended for use in testing fuel pumps.

TESTING: Static Pressure Test—Disconnect the carburetor fuel line at the pump. Connect Pressure Gauge to pump outlet using adapter fitting. Start engine on fuel remaining in carburetor and run engine to 30 MPH speed. Pressure reading on gauge should be within specified limits. *See Fuel Pump Static Pressure Table.*

Capacity Test—Note: Pressure must be within specified limits before making a capacity test. To test capacity, disconnect carburetor fuel line at pump. Insert a Tee fitting in pump. Connect carburetor fuel line to one Tee outlet and a length of hose to the other outlet. Start engine and run at 450 RPM. Hold a one-pint measure approximately the height of the carburetor bowl and fill the measure from the hose on the Tee. Check the time required to fill the measure, using the following table:

FUEL PUMP CAPACITY

Type	Minimum Capacity
A, B	1 Pint in 1 Minute
C, D	1 Pint in 45 Seconds
E	1 Pint in 1 Minute
F, G, I	1 Pint in 45 Seconds
J, L, N, O, P, R, S, T, V, W, X, Y	1 Pint in 1 Minute
AA, AB	1 Pint in 45 Seconds
AC, AD, AE, AF	1 Pint in 1 Minute
AG, AH, AJ, AK	1 Pint in 45 Seconds
AL, AM, AR, AS, AT	1 Pint in 1 Minute
AU, AW, AX	1 Pint in 45 Seconds

NOTE: Adequate fuel delivery is available when the pint measure is filled in the time shown below according to engine size:

1 Minute—engine under 225 cu. ins. displacement.
45 seconds—engine 225 to 400 cu. ins. displacem't.
30 seconds—engines over 400 cu. ins. displacement.
See car page for displacement under Engine Specifications.

FUEL PUMP TROUBLE SHOOTING

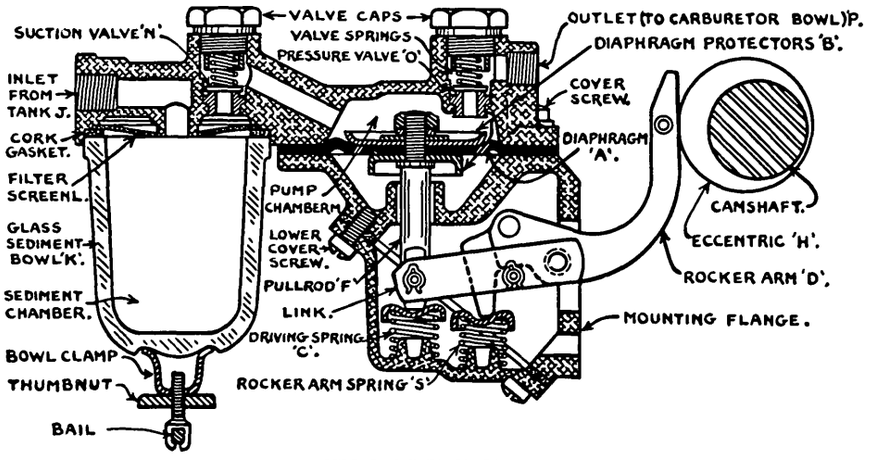
TROUBLE SHOOTING: If the pump action is not satisfactory, check in accordance with the following:

No Fuel or Insufficient Fuel at Carburetor:
(1) Gasoline tank empty.
(2) Plugged fuel line. (Disconnect line at tank and blow out line from pump end, otherwise dirt will be blown back into tank).
(3) Bent, kinked, leaky tubing or connections. Tighten all connections. Check condition of tubing. Replace if necessary.
(4) Clogged filter screen or leaky cork bowl gasket in pump. Remove bowl or sediment chamber cover and remove screen. Always use a new cork gasket when bowl or sediment chamber cover is removed. A leaky gasket will cause loss of pump vacuum.
(5) Dirty or warped valve, broken valve springs, or loose valve cages. Remove pump for inspection.
(6) Worn pump linkage, which cuts down pump pressure and capacity. (Check capacity and pressure).

Fuel Leakage through Vent in Pump Body:
(1) Worn or punctured diaphragm. Replace diaphragm.
(2) On early models a loose diaphragm nut or gasket on pull rod will cause leakage.

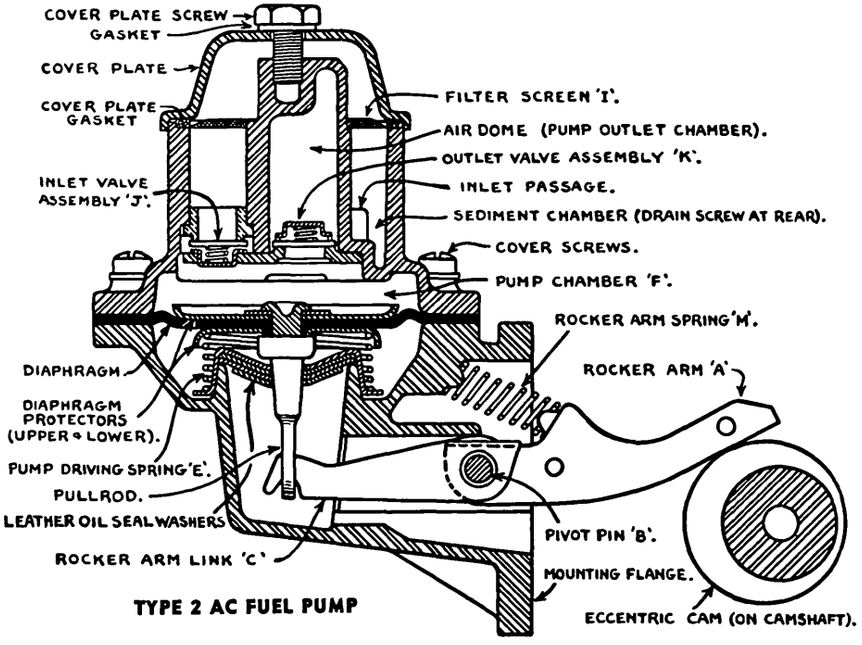
Carburetor Flooding:
(1) Carburetor needle valve not seating. Check for worn valve or seat, sediment or other obstruction preventing seating of valve, or wrong needle valve and seat assembly. Check float level.
(2) Excessive pump pressure. Check pressure. Too high pump pressure can be caused by wrong diaphragm driving spring (too strong).

VACUUM PUMP TESTING



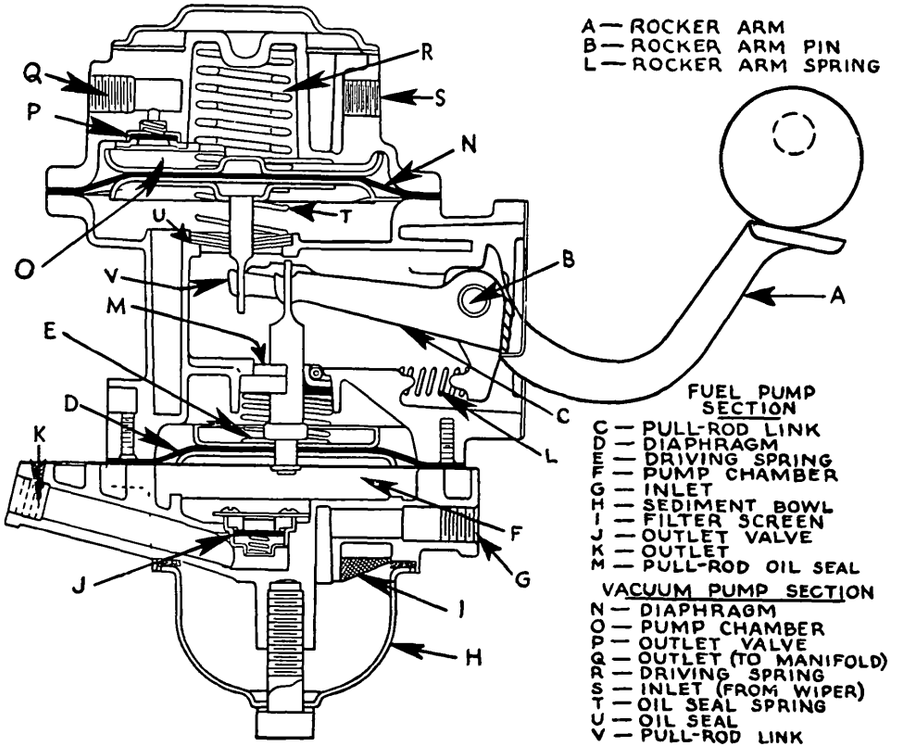
CHECKING WITH VACUUM GAUGE: Due to the strength of the spring used in the vacuum pump unit, it is not practical to check the pump off the engine.
(a) Disconnect both inlet and outlet lines at pump.
(b) Attach vacuum gauge to inlet port (side attached to wiper line).
(c) Operate engine at equivalent of 20 MPH road speed and the gauge should show 7 to 12 inches of vacuum.
(d) If less than 7 inches of vacuum are produced, the vacuum section of the pump is inoperative.
(e) Always test the vacuum pump with the outlet open because internal pressure due to closing the outlet will damage the mechanism.

CHECKING WITHOUT VACUUM GAUGE:
(a) Disconnect manifold line from pump.
(b) Operate engine from idle, through slow acceleration to about 40 MPH.
(c) The wiper should start operating on pump vacuum at about 15 MPH engine speed and reach full speed at about 40 MPH. This indicates the vacuum section is operating correctly.
(d) If wiper does not operate, detach windshield wiper line at pump and join it to the already detached manifold line with a piece of rubber hose.
(e) SLOWLY operate engine from idle to about 25 MPH and the wiper should run at full speed, operating on the engine vacuum only. If it does not, the wiper motor or tubing is defective. The pump vacuum section is inoperative if the windshield wiper operates on engine vacuum, but not on pump vacuum.



VACUUM PUMP TROUBLE SHOOTING

Excessive Oil Consumption: May be caused by a punctured vacuum pump diaphragm. The intake manifold line will suck oil through the punctured diaphragm from the linkage housing. Test vacuum pump to determine if pump is operating properly. A check can also be made before removing pump, by disconnecting the line bteween the pump and manifold, operating the pump, and holding a piece of paper over the pump outlet. Oil spray from the pump outlet onto the paper indicates a punctured diaphragm.



Poor Idle Due to Defective Vacuum Pump: In case the diaphragm of the vacuum pump is punctured it will allow air to be sucked in from the crankcase through the diaphragm and into the intake manifold. This will cause the two cylinders (nearest the manifold leg where the vacuum line connects) to miss when idling.

FUEL PUMP OVERHAUL

NOTE—THE FOLLOWING DISASSEMBLY AND RE-ASSEMBLY INSTRUCTIONS ARE GENERAL AND APPLY TO ALL TYPES OF AC PUMPS. CARE SHOULD BE TAKEN TO NOTE POSITION OF COVER ASSEMBLY AND LINKAGE BEFORE DISASSEMBLY TO INSURE CORRECT REASSEMBLY. (SEE ILLUSTRATIONS FOR FOUR BASIC TYPES.)

TYPE 1 FUEL PUMP

DISASSEMBLY: File mark across diaphragm flanges at heat stud position (if one used). Remove screws holding cover to body and remove cover. Remove valve caps and air dome and remove inlet and outlet assemblies. Remove nut from pull rod and take out diaphragm and protectors. Remove lower cover and drive springs (on some types), then remove rocker arm pin by driving pin out through side of body (usually "swedged" in position) and take out rocker arm assembly. Disassemble rocker arm by taking out "hairpin" keepers in pins and remove links.

REASSEMBLY: (Pump Body)—Assemble the two links with one link pin and attach the two links to pull rod with pin and insert "hairpin" clips to retain pin position. *(NOTE*—Links should be installed with cut-off corners toward diaphragm.) Install assembly in pump body inserting rod through hole provided. *(NOTE*—Be sure the two links will swing to one side toward rocker arm pin hole. This is necessary so that rocker arm pin will pass through pin holes at end of links.) Hold pull rod in position and slip rocker arm through slot. Be sure arm slides between the two links and that projecting hook goes over link pin. Insert small end of assembly Tool PT-6 through body, link, and rocker arm and push in position. Maintain a slight pressure on assembly pin while driving it out through body with permanent rocker arm pin. Peen edges of pin hole over both ends of pin with Tool PT-3. If pin is type which uses rings to hold it, slip the two spring clips into grooves at each end of pin. If the pin has a head at one end and a tapered hollow end at the other, install a washer over taper and spread hollow part.

Diaphragm: Install diaphragm on pull rod in following order: Pull rod gasket, lower diaphragm protector, fabric diaphragm (use a new one and be sure tab does not interfere with bowl when in postion), upper diaphragm protector, alignment washer (six sided), lockwasher and nut. Hold hexagon washer with wrench PT-7 while tightening pull rod nut. Alignment washer must be held steady to avoid damage to diaphragm. Hold lower cover so rocker arm spring and diaphragm spring can be placed over bosses inside cover, then install two spring caps over springs with rims down. Replace gasket on cover, then hold pump body over lower cover and bring them together. Be sure that spring cap fits around end of pull rod and around end of rocker arm, and install cover screws.

Pump Cover: Install inlet and outlet valve assemblies in pump cover and install chamber plugs. *(NOTE*—When an air dome is used it is always placed over the outlet valve.) Place pump body in vice, line up the file marks on flanges, level the diaphragm by moving rocker arm and hold it in this position while installing all screws and washers finger tight. Be sure they pass through holes in diaphragm without chewing fabric. Actuate rocker arm several strokes, releasing with a snap. Tighten cover screws, alternating from one side to the other. Replace screen, gasket and pump bowl and install bail.

TYPE 2 FUEL PUMP

DISASSEMBLY: File mark across diaphragm flanges to insure correct reassembly. Remove cover from pump body. Remove capscrew securing cover plate to pump cover and remove plate, gasket and retainer. Remove valve retainer screw and retainer and then lift inlet and outlet valve assemblies from cover. File the peened end of rocker arm pin until flush with flat washer and drive pin out of body with a punch, then lift rocker arm and spring from body. Compress the diaphragm and disengage pull rod from inner rocker arm. *(CAUTION—DO NOT TILT OR TWIST DIAPHRAGM AND PULL ROD ASSEMBLY. DAMAGE TO INNER OIL SEAL WILL RESULT.)* See Note below for different type oil seals.

▷OIL SEAL NOTE—Two types of oil seals are used:

1. Compression type consisting of two leather washers or a rubber disc retained between metal discs and held in place with a compression spring.
2. Integral type consisting of a seal "staked" into pump body. Diaphragm assembly must not be titled or twisted during removal or reassembly with this type seal to avoid damage.

NOTE—Manufacturer recommends that a new Fuel Pump Repair Kit be used when repairing pumps.

REASSEMBLY (Pump Body): Assemble rocker arm and link, retain with bushing, if one used. Slide assembly into body and retain with thin end of Tool PT-6. Replace rocker arm spring. Replace large coil diaphragm spring on staked-in oil seal, (if other type seal used, replace seal and seal retainer, then install spring). Push diaphragm pull rod straight through oil seal (Use extreme care not to damage seal). Press on diaphragm to title pull rod slightly away from link, then turn pump body over while holding diaphragm, so link will fall into engagement with pull rod, then turn pump body so push rod will hook onto link. Push assembly pin through body so large end is holding arm and link in position. Maintain a slight pressure on assembly pin and drive it out with permanent rocker arm pin. For "bullet" type pins, "peen" or "stake" the edges of both pin holes with Tool PT-3. If pin has a head on one end and tapered hollow at other end, install a washer over taper and spread hollow part to retain in position.

Pump Cover: Place cover on bench with flange up and drop fibre valve seat gaskets into the two valve pockets. Drop inlet and outlet valve assemblies into valve holes on top of gaskets, (valve legs UP for inlet valve and DOWN for outlet valve. Place valve cage retainer on valves so that the two pairs of arms rest on edges of valve assembly, and so the two small holes in retainer line up with screw holes in casting (NOTE—This retainer is slightly curved. Install so the hump is up). Replace bowl cover gasket and screen. The two projections on screen should be on top side when installed. Install bowl, bowl gasket and retaining screw.

▷*VALVE ASSEMBLY NOTE—If* valve assembly is not a unit, install the separate parts in the following order: (OUTLET) Valve spring retainer, spring, valve, and valve plate. (INLET) Valve, and valve spring. Then install retainer plate, screws and lockwashers.

Final Assembly: Clamp pump body in vice, then line up file marks on flanges. Level diaphragm by moving rocker arm, and hold in this position while installing screws and lockwashers. Be sure they pass through holes in diaphragm without chewing fabric. Tighten only enough so screws touch lockwashers. Push rocker arm back and forth several strokes, releasing with a snap. Tighten screws, alternating from side to side so cover is pulled down evenly.

TYPE 3 FUEL & VACUUM PUMP

DISASSEMBLY: File marks across upper and lower diaphragm flanges to insure correct reassembly, then remove fuel body and vacuum body from pump body. Remove cover plate from vacuum body and retaining screw from valve retainer, then take out valves. Remove glass bowl, or cover plate, from fuel body and take out gasket, screen, retaining screw and plate. Remove inlet and outlet valves. To avoid damaging seals, remove rocker arm pin (hollow type, file pin flush with washer and then drive out; if solid "staked" type, drive pin out with punch). Disengage inner rocker arms from pull rods and remove vacuum and fuel diaphragms.

REASSEMBLY (Fuel Cover): Replace the small fibre valve gaskets in valve seat, then replace one valve-and-cage assembly (if valve assembly is not a unit, see Valve Note below) in valve seat nearest the outlet hole (Three legged side DOWN into chamber). Replace other valve-and-cage assembly in other seat (three legged side UP in chamber). Install valve cage retainer (with hump up) and retain with screw. Install new bowl gasket and bowl.

Pump Body: Slide spacer over short rocker arm inner link so holes line up. Spacer should hang down from link so it points in opposite direction to link hook. Projection on spacer should point to hook end of link. Replace one long link on each side of spacer and line up the holes. Be sure hook ends of long links come together so long links surround short links. Also be sure hooks of two long links point in same direction as hook on short link. Place spacer washer on outside of each long link (if required), lining up all holes. Slide this whole assembly between the jaws of rocker arm. The flat surface of rocker arm should face same direction as link hooks. Slide the pin bushing (hollow steel tube) through holes in rocker arm, spacer washers, long links, spacer and short link. Stand pump body on bench with fuel flange down, then replace rocker arm coil spring in rocker arm slot and set end of spring over cone (or stud) cast into body. Slide rocker arm assembly into slot (NOTE—The outer end of rocker arm spring slips over projection on link spacer). Push rocker arm assembly in until pin bushing lines up with pin holes in pump body. Insert small end of Tool PT-6 through hole to retain assembly in body. Replace diaphragm spring on metal casing of oil seal, install retainer (dish down) on top of spring. Push diaphragm pull rod straight through oil seal, then push down on diaphragm to tilt pull rod slightly away from link. Raise pump body until it is upside down so link will fall into engagement with pull rod. Bring diaphragm back

CONTINUED ON NEXT PAGE

FUEL PUMP OVERHAUL (C nt.)

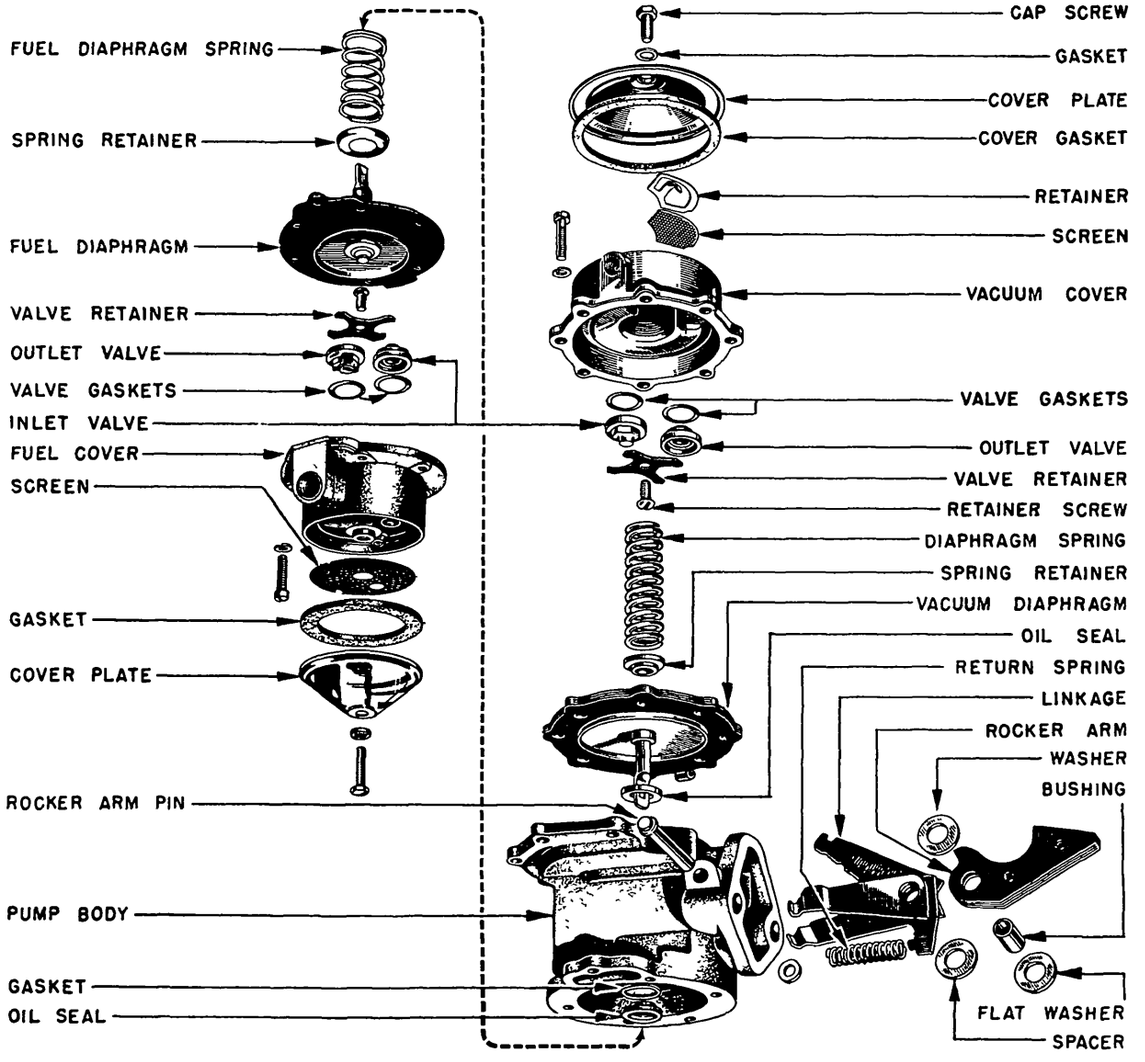
to level position to hook pull rod on link. Push assembly Tool PT-6 through body so large end is retaining assembly, then drive tool out with permanent pin. Install washer over hollow end of pin and spread or mushroom pin over washer with ball peen hammer.

►*OIL SEAL NOTE*—This seal can be removed and replaced with special tools provided by pump manufacturer.

Attaching Fuel Cover to Pump Body: Line up file marks on edge of flanges, then maintain a pressure on rocker arm so that diaphragm is level with flange and install all screws and lockwashers, tightening only enough for head to touch lockwasher. Pump rocker arm several full strokes, then tighten cover screws, alternating from side to side.

Vacuum Cover: Lay cover casting, diaphragm side down, on bench and replace screen over valve hole and install retainer. Replace cover and gasket and tighten securely. Turn cover over and replace inlet and outlet valve gasket in valve recess. Install valve-and-cage assembly (if valve assembly is not a unit, see Valve Note below) in valve seat nearest outlet hole (three legged side DOWN in chamber). Replace other valve-and-cage assembly into other chamber (Three legged side UP in chamber), then install valve cage plate with hump up and retain with screw.

►*VALVE ASSEMBLY NOTE*—If valve is not "unit" type assembly, install separate parts in following order: **(Outlet Valve)** Valve spring retainer with three legs, valve spring, valve. **(Inlet Valve)** Valve and valve spring. Retain both valves with valve plate and gasket, securing in position with three screws.



Attaching Vacuum Cover to Pump Body: Lift pump body above eye level so you can see inside through center hole from vacuum side. Put the pull rod up through this hole and slip the pull rod slot over hooks on two long links. Do not force vacuum links down by operating rocker arm. The vacuum links should be left free so they rise naturally when pull rod is engaged. Applying force to the links will distort pull rod. Hold vacuum diaphragm assembly in place while pump body is placed in vice with vacuum side up. Push rocker arm until diaphragm is level with flange on which it rests. Hold rocker arm at this point and slip Tool PT-8 in between body casting and rocker arm. Release rocker arm against leveling tool and the diaphragm will remain in level position. Install circular spring seat on center of diaphragm retainer and install spring, then drop vacuum cover over the spring (do not try to press cover all the way down). Make sure spring seat is down against diaphragm protector, then line up file marks on flanges and insert two long (10-32x1½") screws in two opposite holes in cover flange, and turn down as far as they will go without forcing. Cover will be pulled down so short screws will take hold. Install screws with lockwashers and tighten screws only enough so they press lightly against lockwashers. Remove the two long screws and replace with short ones. Remove leveling tool. Diaphragm will then flex the correct amount. Tighten the cover screws, alternating from side to side.

TYPE 4 FUEL & VACUUM PUMP (DOUBLE ACTING VACUUM PUMP)

DESCRIPTION: Type 4 combination fuel and vacuum pump is the same as type 3 except it has a glass bowl and is double-acting on the vacuum side. Where the type 3 pump has one inlet and one outlet valve above the diaphragm, the type 4 pump has an inlet and an outlet valve on both sides of the diaphragm.

OPERATION: Engine vacuum holds diaphragm practically neutral when windshield wiper valve is closed or when engine vacuum is sufficient to operate windshield wiper. When engine vacuum is insufficient or the wiper valve is opened, additional vacuum is produced by the movement of the diaphragm. As the diaphragm moves up it exhausts air from the upper chamber into the intake manifold while drawing air into the lower chamber from the windshield wiper. As the diaphragm moves down, air is exhausted from the lower chamber into the engine crankcase while drawing air into the upper chamber from the windshield wiper.

DISASSEMBLY & REASSEMBLY: Same as for Type 3 Pump as given above.

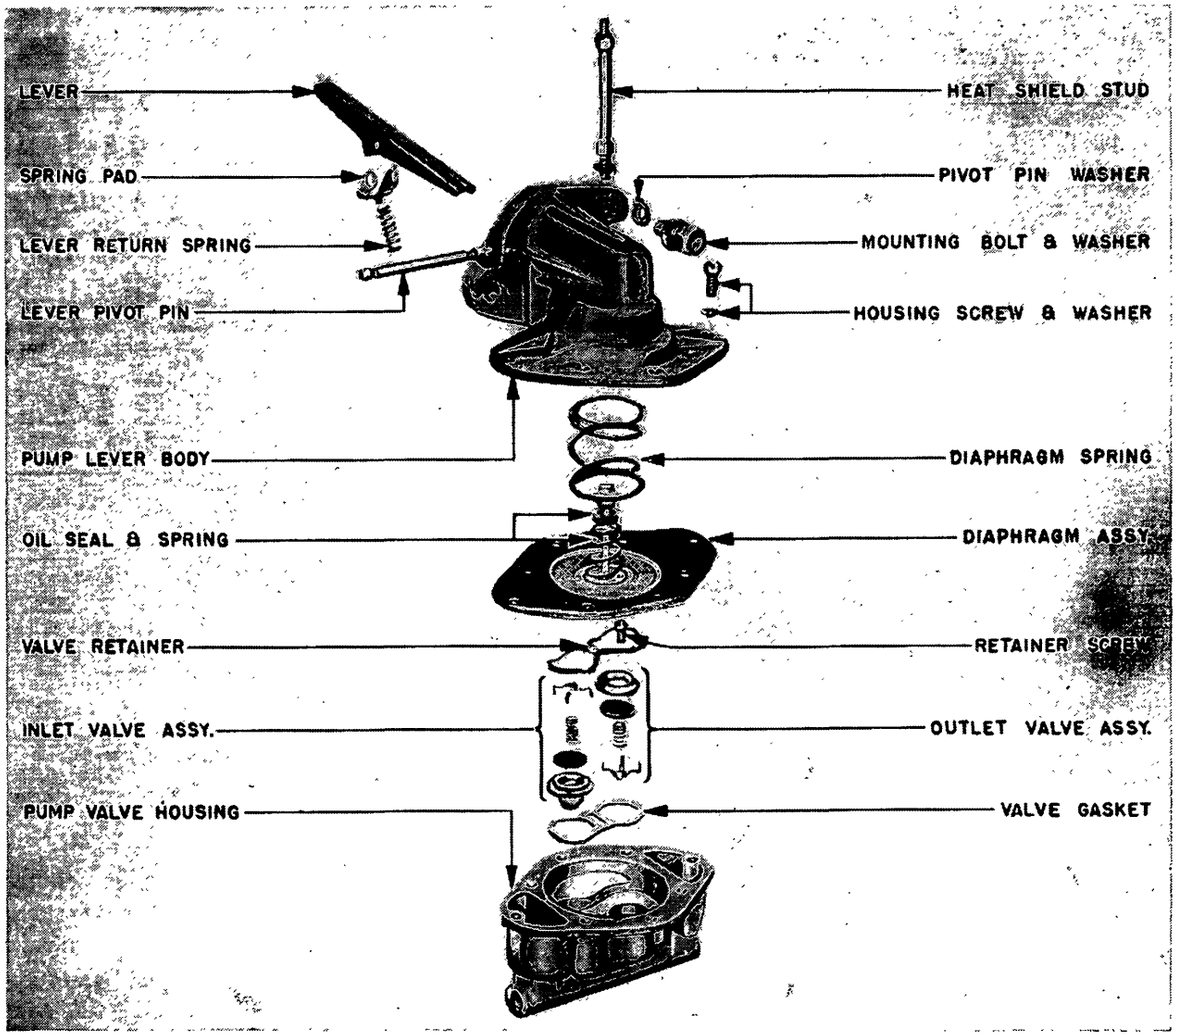
AC COMBINATION FUEL & VACUUM PUMP (TYPICAL)

AUTO-LITE MECHANICAL PUMP

DESCRIPTION: The Auto-Lite fuel pump is a mechanically operated diaphragm type pump, driven by a special cam on the engine camshaft. Operating principle is similar to the AC type pumps. Pump has one piece cam lever (rocker arm), one piece diaphragm and pull rod assembly. "Cage type" valves are used and a filter screen is incorporated in the inlet valve unit.

OPERATION: Suction stroke of pump is positive (eccentric on camshaft causes cam lever to pull up on diaphragm assembly), delivery stroke is powered by a spring on diaphragm shaft which is compressed back during suction stroke. Fuel delivery is controlled by a back pressure in the line and, whenever carburetor float needle valve is closed, the diaphragm assembly remains at the end of its stroke with the spring compressed. Under these conditions the cam lever slides up and down on the diaphragm shaft (lever return spring keeps cam lever in contact with eccentric on camshaft).

DISASSEMBLY & INSPECTION: Mark cover and housing to insure correct location when re-assembling pump. Remove all cover screws. Drive the rocker arm pivot pin through the retaining washer with a center punch. Remove washer and drive pin back to its original position. Remove burrs from pin and drive pin out. With the pin out the rocker arm, arm spring and pad can be removed. Diaphragm can now be removed from the housing. Inspect lever housing for cracks, make sure housing diaphragm flanges are smooth and flat. Inspect diaphragm for cracks around screw holes. Inspect pull rod oil seal and examine rubber carefully by pinching with fingers to determine if it is cracked or punctured. Inspect rocker arm pin for wear and for snug fit in housing. A loose fitting pin will cause an oil leak at that point.



Installing New Diaphragm: Hold diaphragm assembly and diaphragm spring in position in the housing with oil seal and seal spring properly placed. Insert lever and lever spring pad, install a loose dummy pin through lever and housing as a guide to hold parts in place. Drive in new pin, install washer and stake end of pin. Install lever return spring.

Valves: Remove and clean valves in gasoline and allow to dry. **Do not blow off valves with air.** Inspect valve seats and discs. These should be smooth and flat. Inspect valve disc springs for good seating of the discs. When installing valves use new gaskets. The inlet valve screen should be down and be on the "in" side of the housing. The outlet valve should be installed with the spring and disc down. Install valve retainer. Be sure retainer is bearing on both sides of each valve.

REASSEMBLY: Install valve housing in place on lever housing so that the untapped hole in the valve housing lines up with the tapped hole in the lever housing directly under the lever. Install flange screws loose. Mount pump in vise and press rocker arm down beyond normal stroke and tighten all screws.

CAPACITY TEST: Install pump on engine, connect fuel lines. Install a Tee connection in fuel line at the carburetor and connect a line to the Tee. Install a #44 carburetor float seat orifice on the end of the line with a shut-off valve between the Tee and the orifice. Start the engine and operate at idle speed. Open the shut-off valve and measure the amount of fuel which flows from the orifice in a quart measure. If the amount of fuel is 1½ pints or more in one minute the pump capacity is sufficient.

PRESSURE TEST: Connect a pressure gauge to Tee, operate engine at idle. Pressure should be 3 to 5 pounds. Repeat test at 40 MPH speed. If pressure is low use a stiffer diaphragm spring. If pressure is high, remove pump and loosen all diaphragm cover screws and press operating lever beyond normal stroke and retighten screws. If pressure is still too high, disassemble pump and install a weaker diaphragm spring.

AUTO-LITE FUEL PUMP

CARTER MECHANICAL FUEL PUMP
COMBINATION (FUEL & VACUUM) & SINGLE (FUEL) PUMPS

DESCRIPTION: Mechanically operated, diaphragm type pump mounted on side of engine block and driven by eccentric on camshaft. Pump has one-piece cam lever, intake and discharge air domes (discharge air dome is diaphragm sealed type to prevent loss of air cushion) Valves (early type) are "cage assemblies" and are replaceable; (later type) are enclosed in fuel pump body and are not replaceable. Diaphragms are furnished as an assembly and consist of diaphragm, shaft, spring and oil seal.

Vacuum Pump (Combination Type Pump): Diaphragm assembly consists of diaphragm and shaft. Vacuum pump valves and vacuum strainer are retained in valve housing by welch plugs and are not replaceable. Diaphragm shaft oil seal, breather vent filter, breather plate and retainer are located in pump body.

OPERATION: Suction stroke of pump is positive (eccentric on camshaft causes cam lever to pull up on diaphragm assembly), delivery stroke is powered by spring on diaphragm shaft which is compressed during suction stroke. Fuel delivery is controlled by back pressure in the line and, whenever carburetor float needle valve is closed, the diaphragm assembly remains at the end of its stroke with the spring compressed. Under these conditions the cam lever slides up and down on the diaphragm shaft (lever return spring keeps cam lever in contact with eccentric on camshaft).

Vacuum Pump (Combination Type Pump): Diaphragm assembly shaft is held against cam lever by return spring and is actuated on pressure stroke by cam lever, and by return spring on vacuum stroke.

TESTING (FUEL PUMP): Connect a Tee in the fuel line at the carburetor. Use this Tee connection when making following tests:

Capacity Test: Connect short piece of hose to Tee in fuel line. Operate engine at 500 RPM. allowing fuel to flow through hose into measuring container. Pump should fill one-quart measure in 1 minute or less.

Pressure Test: Connect pressure gauge to Tee in fuel line. Run engine at 500 RPM. Pressure should be 3½ lbs. (minimum) to 5 lbs. (maximum).
CAUTION—Gauge pressure line (Tee to gauge) should not be more than 6" long for accurate testing.

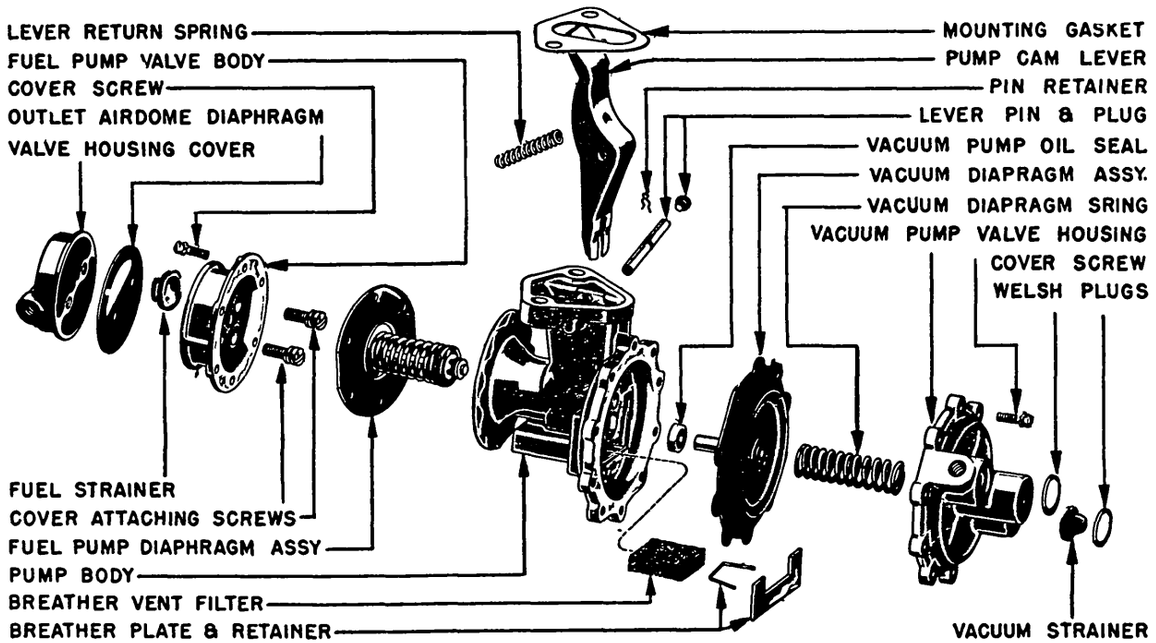
Vacuum Test: Disconnect fuel line from inlet side of pump and connect vacuum gauge at pump inlet connection. Vacuum reading should be 10" or greater at engine speed of 500 RPM.

TESTING (VACUUM PUMP): Check pump on the engine. First idle engine and turn on windshield wiper to make certain wiper is in operating condition. Then disconnect vacuum line at intake manifold, plug manifold fitting hole, but **do not plug** the vacuum line. Run engine and note windshield wiper operation. Pump is satisfactory if wipers operate (wipers may slow down slightly but should not stop).

OVERHAUL: ***NOTE—See "Repair Package" data below for sub-assemblies furnished for these pumps.***

Disassembly: Make certain that pump body and pump valve housing marked to insure correct reassembly, remove rivet plug (or setscrew used on some models) which retains cam lever pin, remove pin, withdraw cam lever, spring retainer, and return spring. Remove bowl cover retaining capscrew, lift off bowl cover, gasket, cover screw packing, and strainer. Remove bowl retainer screw, lift off bowl assembly and outlet air valve diaphragm. Remove capscrews and lockwashers around pump body flange, separate body and valve housing, lift out diaphragm assembly. Remove valve cage assemblies. Remove vent packing retainer ring and take out packing in recess in side of pump body.

Vacuum Pump (Combination Type Pump): Remove vacuum pump valve housing cap screws and remove housing and diaphragm spring. Take out diaphragm assembly and then remove breather vent filter, plate and retainer. Take out diaphragm shaft oil seal.



Cleaning & Replacement of Parts: See "Repair Package" data below for new parts which should be installed when rebuilding pump. Clean all other pump parts with gasoline, blow out all passages, and dry parts with air. Replace all worn or damaged parts.

Reassembly: Install packing and retainer in vent recess in body. Use Valve Cage Assembly Tool, T109-191, to install new intake and outlet valve cage assemblies in valve body. Place new diaphragm assembly in position in pump body with diaphragm flats at fuel line connections, install valve body (line up marks made before disassembly), turn capscrews in loosely around flange. Install cam lever, return spring retainer, and spring making certain that end of lever engages diaphragm shaft, install lever pin and pin rivets (or one rivet and one retaining screw on models where setscrew used). Use Diaphragm Flexing tool, T109-192, to hold diaphragm flexed at end of stroke while tightening capscrews around flange evenly and securely (CAUTION—This is necessary to insure full stroke of the pump in service). Install bowl assembly with new outlet air dome diaphragm between bowl and valve body, tighten bowl retainer screw. Install strainer and bowl cover using new cover screw packing, cover gasket, and cover screw gasket.

Vacuum Pump (Combination Type Pump): Install oil seal, breather vent filter, breather plate and retainer. Insert diaphragm shaft through oil seal, then install valve housing in correct position (marks on diaphragm flanges made at disassembly). ***CAUTION***—Use Diaphragm Flexing tool, T109-192 to hold diaphragm flexed at end of stroke while tightening cap screws around flange.

REPAIR PACKAGE: Gasket & Diaphragm Kit.

Carter Kit No.	for Pump No.
M20004	M594S

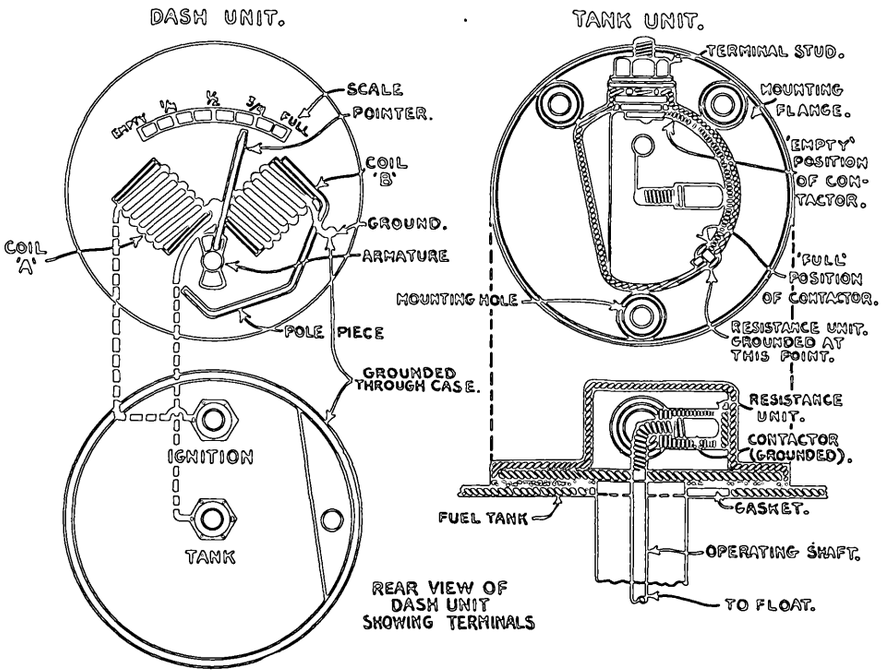
CARTER COMBINATION FUEL & VACUUM PUMP
(SIN LE FUEL PUMP SIMILAR)

AC TYPES

DESCRIPTION: AC Electric Gasoline Gauge is of the balanced coil type and consists of two units, a dash unit or recording gauge and a tank unit or measuring device mounted on top of the gasoline tank. The dash unit mounted on the instrument panel consists of two coils mounted at an angle of 90 degrees. The gauge pointer is attached to an armature which is pivoted at the intersection of the coil axes. The dash unit is connected to the coil side of the ignition switch and to the tank unit through insulated wires. The dash unit is grounded through the mounting screws to the instrument board and car frame.

Tank Unit:—Gearless type with integral float arm and contactor arm (rheostat ground brush). Float arm is pivoted in lower end of tank unit case so that movement of the arm (with the rise and fall of the float in the tank) causes the upper end of the arm to sweep across the tank unit resistance coil. Except for this float arm construction and separately mounted fuel outlet pipe (some models), all types are similar. NOTE—On first type gauges, float mechanism in tank unit is 'geared' type with float arm clamped to gear pivoted on tank unit bracket so as to mesh with gear on contactor operating shaft. Both types of gauges operate in the same manner.



OPERATION: The upper terminal of dash unit marked "Ignition" is connected to the coil side of the ignition switch (or to the 'auxiliary' terminal of lock switch coils) so that the gauge is operative whenever the ignition switch is turned on. Current flows through coil 'A' of the dash unit to the center terminal marked 'Tank'. The second coil 'B' is connected to this terminal. The other end of this coil winding is grounded to the gauge case. The 'Tank' terminal of the gauge is connected to the terminal on the tank unit and circuit is completed to ground through the tank unit resistance winding. This resistance winding in the tank unit is grounded through the movable contactor so that the resistance is cut in or out of the dash unit coil circuits as the float rises and falls with the gasoline level in the tank.

INSTALLATION: Both dash unit and tank unit are grounded and care must be taken whenever the units are installed or replaced that a ground is provided. On the tank unit it will be sufficient to remove paint and carefully clean the tank under the tank unit flange.

TROUBLE SHOOTING: Defective units should be replaced and service operations will be confined to locating trouble in dash unit or tank unit. Check gauge operation from following table:

1. Pointer does not move when ignition is turned 'on'.
   The line from the ignition switch to the dash unit is open. Check connections and supply new lead from switch to 'IGN' terminal on gauge.
2. Gauge indicates 'Full' at all times.
   The line between dash unit and tank unit is open. Check connections and replace line with insulated wire.
   Tank unit burned out. Replace tank unit.
   Tank unit not grounded. Check by supplying new ground from tank unit to car frame.
3. Gauge indicates 'Empty' at all times.
   Wires reversed on dash unit. See that connections are made as indicated above on diagram.
   Dash unit is not grounded. See that dash unit is properly grounded. Check by supplying special test ground to car frame. If dash unit does not register correctly, it must be replaced.

SERVICING:—No service operations required other than to see that wires are properly connected and terminals are tight. Defective units (as determined by tests given below) should be replaced.

AC GASOLINE GAUGE TESTING

NOTE: Manufacturer recommends that AC Gas Gauge Tester, Part 1516000, or HMO-204 be used to make tests. Tester similar to gas gauge Tank Unit equipped with test leads and an operating handle by which the resistance can be cut in and out of the gauge circuit in a similar manner to the operation of the tank unit on the car.

TESTING: Make the following tests in order given which will completely check all gas gauge units and wiring.

DASH UNIT

With ignition switch 'off', disconnect tank wire at terminal on back of dash unit, connect RED tester lead to this terminal, ground BLACK tester lead to frame. Turn ignition switch 'on', move Tester arm up and down. Gas gauge dash unit should register 'Full' and 'Empty'. If operation is O.K., disconnect tester and reconnect tank wire. If dash unit pointer does not register correctly, check feed wire by connecting 6 volt test lamp between dash unit Ignition Terminal (second terminal on back of dash unit) and ground. If test lamp does not light, circuit from ignition switch is defective and ignition switch and connecting wire should be checked or replaced. If lamp lights (gauge circuit O.K.) and dash unit does not operate, replace dash unit and reconnect wires.

GAUGE WIRING

Disconnect tank unit wire at nearest point to tank unit (bayonet type snap connector or junction block). Attach Red tester lead to wire running back to dash unit, ground BLACK tester lead to the car frame. Turn ignition 'on'. Move tester arm up and down and watch dash unit pointer which should move from 'Empty' to 'Full'. If dash unit reads 'Empty' at all times, or if reading is lower than when dash unit tested alone (dash unit test above), check wire for shorts or leaks (broken insulation, short junction block terminals, un-insulated connectors touching body or frame, etc.). If dash unit reads above 'Full' at all times, or if reading is higher than when dash unit tested alone, check wire for open-circuits (break in wire, loose connections, corroded terminals, etc.). If dash unit and wire tests O.K., check tank unit.

TANK UNIT

Remove tank unit, clean tank unit terminal and mounting flange thoroughly, connect tank unit to wire running to dash unit, ground tank unit by connecting jumper wire from tank unit mounting flange to car frame. Turn ignition 'on'. Move tank unit float arm up and down. Dash unit pointer should move from 'Empty' to 'Full'. If dash unit reading indicates tank unit defective, replace tank unit. Always check tank units before installing in tank and make certain that float arm is free (check for freedom of movement by noting that float arm falls back to empty position when released in various positions). See that gasoline tank and tank unit mounting flange are clean (tank unit grounded to frame through tank) and that a good ground contact exists between tank and frame.

AUTO-LITE "TWO-WIRE" TYPE

IMPORTANT SERVICE NOTE: Three dash unit types have been used as described below and special precautions must be observed when tightening connections at dash unit terminals on each model. Excessive tightening will loosen terminal stud and destroy the accuracy of the gauge requiring replacement of the dash unit (see also Calibration Adjustment below).

First Type Dash Unit—No identification marks. No terminals staked to prevent turning. Use great care when tightening connections, particularly at 'IGN.SW.' terminal.

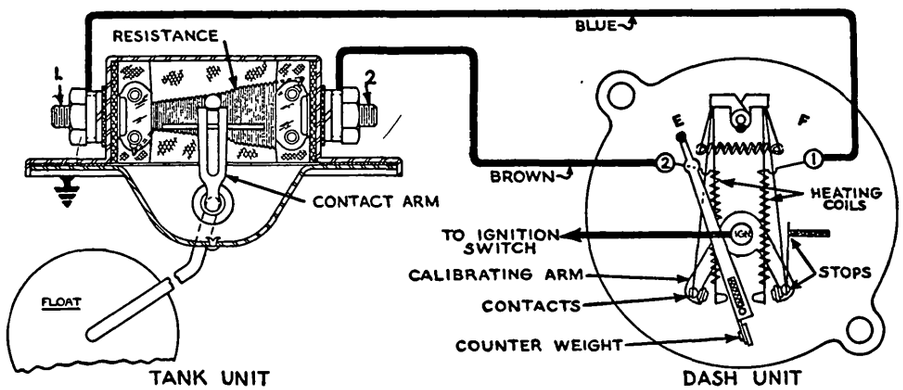
Second Type—May be identified by radio resistor terminal at top of gauge between '1' and '2' terminals and use of round insulating washers on each of these terminals. The 'IGN.SW.' terminal is staked to prevent turning. Other terminals are not staked.

Latest Type—May be identified by radio resistor terminal and insulating strip extending across between '1' and '2' terminals (replaces individual insulating washers used on other types). All three terminals staked to prevent turning.

DESCRIPTION: Gauge consists of a bimetal or thermostatic arm dash unit and a rheostat type tank unit connected together by two wires.

Dash Unit—Pointer actuated by the two bimetal arms on which heating coils are wound (these arms hinged at upper end with lugs to engage pointer at lower end). The two outer bimetal arms (without heating coils) compensate the dash unit for temperature changes (left hand arm controls dash unit contacts, right hand arm has insulated stop at each side to limit motion in each direction) and the contacts compensate for battery voltage variations (remain closed at 5 volts or less, open and close at voltages above 5 volts to maintain constant gauge input). The circuit through the dash unit is from the 'IGN.SW' terminal through the contacts and then through each heating coil to terminals '1' and '2'.

Tank Unit—Consists of a resistance coil wound on a flat form and connected between the two tank unit terminals. Contact arm is grounded and circuit from each terminal is through the resistance to ground at the contact arm. Contact arm is mounted on the float lever and moves across the resistance as the float rises and falls so that resistance is cut out of one dash unit heating coil circuit and in on the other heating coil circuit with this movement.



OPERATION: When ignition switch is turned on, current flow through heating coil on each bimetal arm in the dash unit depends on contact arm position in tank unit (contact arm controls amount of resistance in each heater coil circuit) and the unequal current flow through each coil causes an unequal deflection of the bimetal arms so that the pointer is moved on the scale. Any change in the position of the tank unit contact arm (caused by float movement) causes a like change in the bimetal arm deflection and pointer reading of the dash unit. When voltage at gauge exceeds 5 volts, or if bimetal arms become overheated, contacts open and close to maintain constant input so that readings are accurate regardless of voltage fluctuations (pointer position entirely dependent on division of current between heating coils on bimetal arms as controlled by tank unit. Contact opening and closing is sufficiently rapid so that pointer does not change). External temperature changes (affecting outer unwound bimetal arms) cause a slight rotation of the hinge so that position of inner bimetal arms and pointer remains unchanged. Gauge design results in a lag or damping action so that pointer fluctuations due to fuel tank surges are minimized. When ignition switch is turned off, bimetal arms flex away from pointer which is then returned to the empty position by the counterweight at the lower end.

TESTING: Disconnect leads from #1 & #2 terminals of dash unit and turn on ignition switch. Any movement of the gauge indicates an internal ground in dash unit. With ignition switch in "ON" position, ground #2 terminal, and allow approximately one minute for gauge to complete movement. It should read full. Ground both terminals. Gauge should read ½ full. If gauge does not read correctly remove it for check and adjustment.

If gauge reads correctly reconnect leads to both terminals of dash unit and disconnect leads from tank unit. Gauge should not move. Any reading of the gauge with both wires disconnected indicates a ground in one or both wires. If no reading with wires disconnected, ground #2 wire, and proceed with test as given above. Failure to have correct reading indicates open circuit or broken wire. If gauge reads correctly for both tests given above any misoperation of the system can be attributed to a defective tank unit.

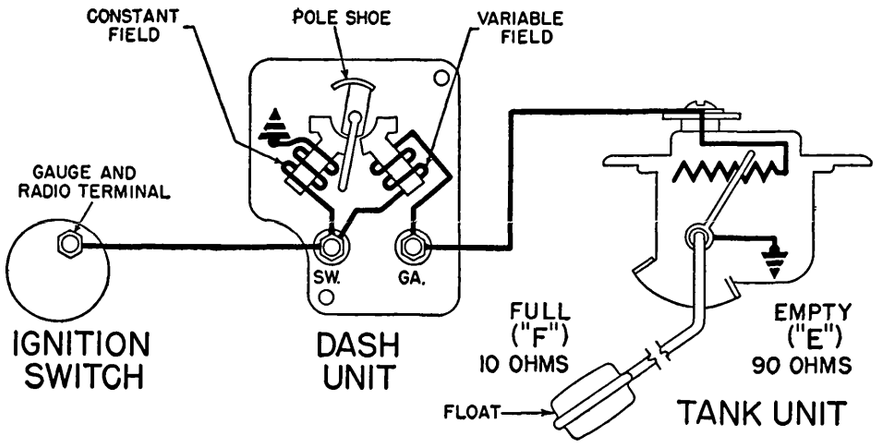
Note: Should #1 & #2 wires be crossed on units, readings will be reversed.

TROUBLE SHOOTING: Erratic or incorrect indications may be caused by a loose connection or ground in the wiring or terminals, while a fluctuating pointer is usually caused by dirty contacts in the dash unit. Sticking pointers may be caused by a bent pointer or frame or by interference between the gauge and panel. Remove the gauge from the panel and inspect for a bent pointer or pointer bearings. Check to see that there is a slight amount of end play in the pointer shaft and that the pointer turns freely. Clean the contacts by drawing a strip of bond paper between them.

AUTO-LITE "TWO-WIRE" GAUGE WIRING DIAGRAM

CALIBRATION ADJUSTMENT: If pointer position not correct Empty or Full or if gauge reads inaccurately, dash unit should be calibrated as follows: Remove dash unit from car, connect to tank unit known to be in good condition and to a battery (see illustration for connections). Loosen both nuts on 'IGN.SW' terminal (inner nut is staked on later type units) to release calibrating arms. Set tank unit float in Empty position, move left hand calibrating arm (on which stationary contact is mounted) to right to raise pointer reading, or to left to lower pointer reading. Move tank unit float arm to Full position, mov right hand calibrating arm to right to raise pointer reading, or to left to lower pointer reading. Recheck gauge at Empty position (setting may be changed by the Full adjustment). Tighten nuts on 'IGN.SW' terminal to lock calibrating arms in position using extreme care not to shift arms while tightening inner nut.
NOTE—When making this adjustment, or when testing dash unit on the bench, unit must be shielded from air currents which might cause unequal cooling of the bimetal arms and affect the gauge reading. Allow 1 minute for bimetal arm heating coils to heat up, after moving tank unit float, before checking dash unit pointer position.

AUTO-LITE (MOTOMETER) "ONE-WIRE" TYPE



DESCRIPTION: This electro-magnetic fuel gauge uses one wire only between the dash unit and tank unit. This type gauge responds instantly to any change in fuel level in the tank, and when driving on rough roads or turning sharp curves the needle will fluctuate. A radio suppressor is not required for this type gauge, since no contacts are used in the dash unit.

TESTING: See diagram for connections. All terminals must be clean and electrically tight and both units properly grounded.

Dash Unit: Disconnect lead from "GA" terminal. With ignition switch "ON" gauge should show empty. Ground terminal "GA". Gauge should show full. Reconnect lead to "GA" terminal and disconnect lead at tank terminal. Repeat above test. Failure of gauge to read full with lead grounded indicates open circuit or broken wire.

Tank Unit: Connect tank unit (known to be good) or unit removed from tank if none available. Ground tank unit, and operate float arm. Gauge should read empty to full as arm is operated. If gauge does not operate correctly recalibrate dash unit. No movement of gauge indicates defective tank unit. ***Note: If constant field winding is open in dash unit, gauge will read full over most of movement of arm.***

CALIBRATION (DASH UNIT): Moving the pole shoe toward the armature increases its effect. For example, decreasing gap between the armature and variable field pole increases the readings over the entire range, while decreasing the gap at the constant field decreases the indications, and decreasing the gap at the upper pole reduces the amount of pointer movement. Proper calibration is obtained by adjusting all three poles to give correct readings over the entire scale.

ELECTRO-MAGNETIC FUEL GAUGE CIRCUIT

AUTO-LITE "ONE-WIRE" GAUGE WIRING DIAGRAM

STEWART GASOLINE GAUGE

DESCRIPTION: This electric gauge is of the "balanced" coil type and consists of a dash unit or recording device and a tank unit or measuring device. The two units are connected by an insulated wire and each unit is grounded. The feed wire on the dash unit is connected to the accessory terminal of the ignition switch (or coil side of switch) so that the gauge is operative only with the ignition turned 'on'.

OPERATION: The two coils in dash unit are connected in parallel to the switch terminal (1) on the gauge case. Coil (A) is grounded to the gauge case so that the current flow through this coil is constant. The other end of coil (B) is connected to the tank terminal on the gauge case so that the coil is in series with the resistance unit in the tank unit. The resistance unit is grounded through the contactor on the upper end of the gasoline tank float rod so that the resistance is cut in or out of the coil (B) circuit as the float rises and falls.

MOUNTING: Both the dash unit and tank unit are grounded through the case and a good ground must be provided when they are mounted on the car. Remove all paint and grease from under the mounting flange.

TANK UNIT NOTE: Tank units furnished in both gear type (for tanks greater than 12" in depth or where baffles prevent installation of lever type) and Lever Type (for tanks of 12" depth or less). Tank units furnished with floats not attached to arm and should be installed as follows:

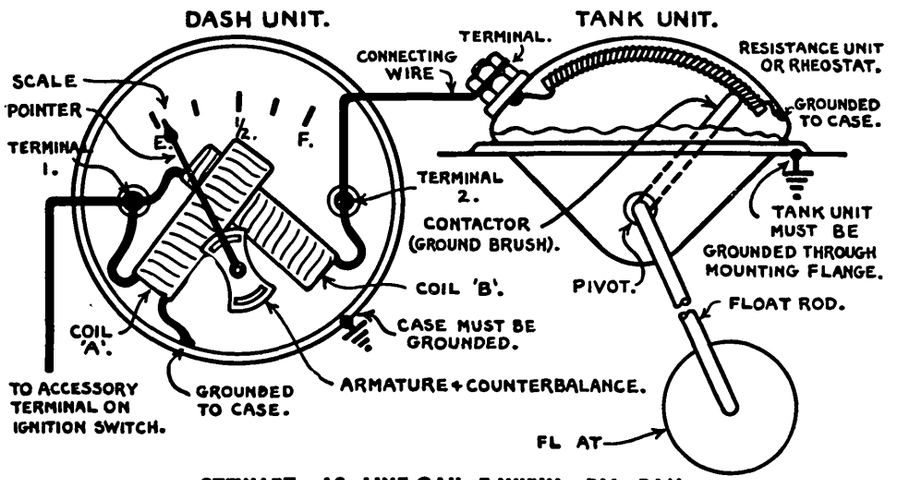
Gear Type—Travel limited to 52½° above and below horizontal position of arm. When installing, cut off float arm to correct length required for depth of tank and solder float on arm in horizontal position.

Lever Type—Furnished with float arm 12" long. Cut off float arm to correct length and solder float on arm at right angles to arm and with long diameter of float horizontal.

TROUBLE SHOOTING: If gauge operation not satisfactory, make following tests:

Gauge Reads 'Full' at all times

1. Lead between dash unit and tank unit is grounded. Check by disconnecting lead at each end and substituting a test jumper wire. If gauge operates correctly, replace lead.
2. Connections on dash unit reversed. Reverse wires and note performance.
3. Coil (A) in dash unit open-circuited. To check, disconnect tank unit lead on dash unit momentarily. Pointer should move to 'Empty' end of scale. This coil should draw .13 ampere at 6.0 volts (between switch terminal on dash unit and ground on case with tank unit lead disconnected).
4. Resistance unit in tank unit short-circuited. Check with voltmeter and battery between tank unit terminal and ground on case with dash unit lead disconnected. Resistance of unit should be 110 ohms.



Gauge Reads 'Empty' at all times

1. Dash unit not grounded. Examine ground contact or run extra ground lead from case to car frame.
2. Open-circuit between dash unit and tank unit. Check by connecting jumper wire between terminals on units and noting gauge performance.

Gauge Reading Inaccurate

Mechanical defect in dash unit or tank such as tight pivot bearings, armature counterbalance binding or incorrectly positioned, bent dial pointer, or bent float rod.

SERVICING:—Replace all defective dash units and tank units.

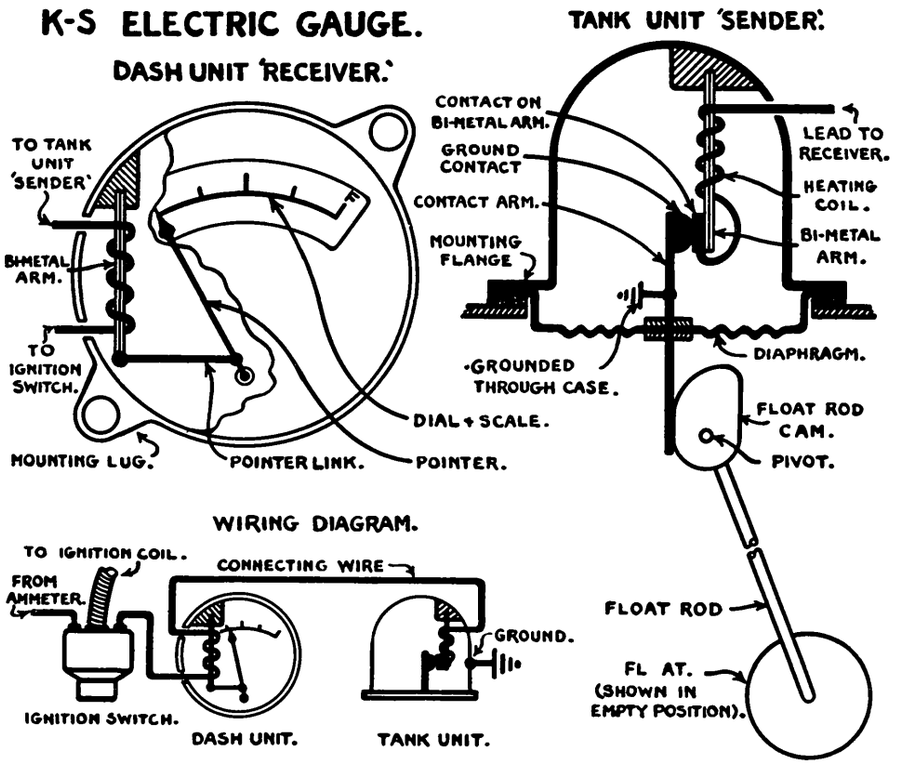
STEWART AS LINE GAU E WIRIN DIA RAM

KING-SEELEY ELECTRIC TELEGAUGE

DESCRIPTION:—This is an electric type gauge of a new type using bi-metal arms on which heating coils are wound in both the tank or engine unit 'Sender' and the dash unit 'Receiver'. The two heating coils are connected in series and the gauge circuit is completed to ground through a set of contacts in the Sender unit (one of which is mounted on the bi-metal arm). The feed wire on the Receiver unit is connected to the accessory terminal of the ignition switch so that the gauge registers only with the ignition on.

Gasoline, Oil, Water Level—For this purpose the ground contact in the Sender is mounted on a movable arm (arm mounted through diaphragm forming lower cover of Sender unit and flexes diaphragm as it is moved). The lower end of the ground contact arm is actuated by a cam on the upper end of the float rod pivot. When the float moves up to follow the gasoline, oil, or water level, the cam moves the arm so that contact pressure and length of time contacts remain closed is increased.

OPERATION:—When the Sender contacts are closed a current flows through the heating coils of both the Sender and Receiver units. This causes the bi-metal arm in the Receiver to bend, moving the pointer, and indicating a reading on the gauge dial. At the same time the heating coil in the Sender unit causes its bi-metal arm to bend, opening the contacts and interrupting the current flow. When this occurs the heating action stops and the cooling of the bi-metal arm causes it to flex in the opposite direction and again close the contacts. In operation, this cycle takes place very rapidly (approximately once each second for the gasoline gauge with tank **empty), and a steady reading is obtained on the Receiver dial.**



TROUBLE SHOOTING:—**Gasoline, Oil, Water Level Gauges**—Manufacturer recommends use of extra or test Sender and Receiver to check operation of units which do not perform satisfactorily. Make tests as directed below:

Testing Sender:—Disconnect lead of Sender unit on car, connect this lead to test Sender and ground this Sender to the car frame. Turn on ignition, move Sender float up to 'full' position and note reading on Receiver. Receiver should read full or 'F' after 10-15 seconds time. If Receiver reading is correct, check following points before replacing Sender unit.

1. Ground. Sender is grounded through case| See that all paint and grease are removed under flange and both surfaces make good contact.

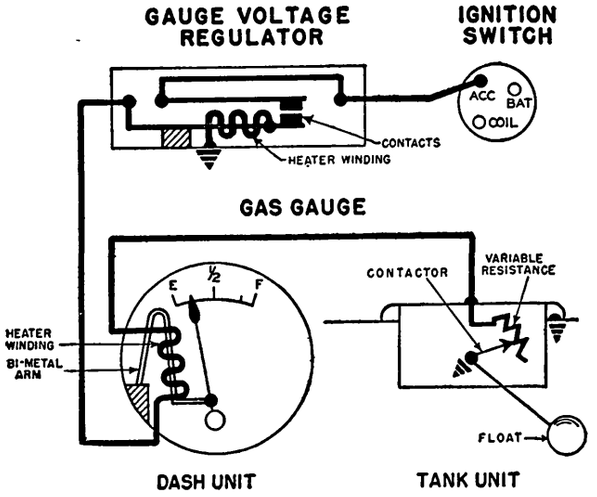
2. Radio By-pass Condenser Shorted. If by-pass condenser is connected at Sender on cars with radio, test for short-circuit by disconnecting condenser and noting gauge operation. If gauge is satisfactory, replace condenser. Use only condenser of .05 microfarad capacity (manufacturer recommends Cornell Dubilier Corp. Condenser No. 22-259).

If reading is secured with test Sender is same as that with Sender on car, check wire connecting Sender and Receiver and replace if found to be open-circuited or grounded.

Testing Receiver—Disconnect wires on Receiver on car and connect to same terminals on test Receiver. Turn on ignition switch and note reading on gauge. If test Receiver reading is correct, replace Receiver on car. If test Receiver reading is same as car Receiver, repeat tests on Sender and wiring.

SERVICING:—No service operations are required other than to see that wires are properly connected and terminals are tight. No repair operations are possible and defective Senders and Receivers should be replaced.

KING-SEELEY "CV" TYPE ELECTRIC TELEGAUGE



DESCRIPTION & OPERATION: King-Seeley "CV" or constant-voltage gauges differ from previous types in that the tank unit (sender) consists of a variable resistance (rheostat) which regulates the current in the heating coil of the receiver (dash unit) and controls the deflection of the bi-metal arm linked to the gauge pointer. All dash units are of similar design. The feature of these gauges is the "Gauge Voltage Regulator" which regulates input voltage in the gauge circuits and insures accurate gauge readings regardless of the line voltage fluctuations.

Gauge Voltage Regulator: Consists of a vibrating unit (contacts controlled by bi-metal arm on which a heater winder is located), connected in the line between the ignition switch and the gauge. Regulator produces a pulsating voltage, at an effective constant amperage value, of 5.0 volts for all normal input voltage variations (between 5.6 and 8.0 volts). Input voltages lower than 5.0 volts will result in proportionately lower gauge readings while voltages greater than 8.0 volts will not affect gauge accuracy but will overload regulator contacts and may cause premature wear. Regulator is temperature compensated and is intended to be mounted near the gauge dash unit and at approximately the same ambient temperature.

Gauge Indicator (Dash Unit): Gauge pointer is linked to a bi-metal arm on which a heater coil is wound. This coil is connected in series with the tank rheostat so that the gauge reading is in proportion to the current in the circuit (zero reading with maximum resistance and minimum current, high reading with minimum resistance and maximum current).

Fuel Tank Gauge Unit: The rheostat contactor acts as a ground for the gauge circuit and is linked to the gauge float so that it sweeps across the resistance as the float follows the level of fuel in tank. When tank is empty, entire resistance is in gauge circuit and current is at a minimum. When float rises as tank is filled, resistance is cut out of gauge circuit and the increase in current causes dash unit to read higher.

TROUBLE SHOOTING: Units should not be removed from car until testing has been done to determine which unit is defective. See Testing (following).
Gauge Reads Too High or Too Low—Gauge regulator defective (see Voltage Regulator below) or not properly grounded (regulator must be grounded). Battery voltage at regulator (or ignition switch) below 5.0 volts (check with voltmeter).

CAUTION—Gauge Voltage Regulator provides an intermittent voltage averaging 5.0 volts and regulator output voltage can not be tested with a voltmeter.

TESTING: Use a Fuel Level Gauge Tank Unit that is known to be OK, as a test unit. Connect one test lead to terminal on tank unit and a second lead to gauge case to act as a ground. (Gauge will not operate if not properly grounded.) Make test as follows.

Voltage Regulator: Requires use of an OK dash unit also. Connect these test units together in normal manner and ground tank unit. Connect the other dash unit terminal to the output terminal of voltage regulator. Check battery voltage (must be within operating limits). Hold tank unit float in EMPTY position, turn on ignition switch, note reading on test dash unit (should read EMPTY). Start engine and run at faster than normal idle speed. Gauge reading should not change if voltage regulator functioning normally. Move tank unit float to FULL position. Dash unit gauge should read FULL. If voltage regulator not operating correctly, replace unit.

Gauge Unit: Disconnect lead at tank unit on car and hook test unit in circuit at this point. (Make certain test unit is grounded). Move test unit float to EMPTY position, turn on ignition switch, note dash unit reading (gauge pointer should be at lower end of scale). Move float to FULL position, gauge pointer should then be at upper end of scale. If dash unit reads OK in both positions, replace original tank unit with correct type unit. If dash unit does not test OK, connect test unit directly to terminal on dash unit (eliminating the car wire). If dash unit then tests OK, check lead between dash unit and tank for broken wire or shorted wire. If dash unit still does not function normally, replace original dash unit with correct type unit.

REPAIRING UNIT: Repair or calibration of units is not practical in the field and defective units should be replaced.

LINCOLN & MERCURY AUTOMATIC HEADLIGHT DIMMER

Linc In (1955)
Mercury (1955)

DESCRIPTION: The Automatic Headlight Dimmer is an electronic device that automatically switches headlamps between the upper and lower beams in response to light from an approaching car and to the tail lights on cars being overtaken. Unit consists of switch and control assemblies.

OPERATION: With headlights turned on, and the pilot light indicating automatic control, light striking the photo-multiplier tube of the control assembly causes generation of a weak electrical current. This current is electronically amplified and used to actuate relays in the switch assembly. The relays then switch headlights from high to low beam. When light source is removed, headlights return to high beam. Foot dimmer switch can be used to override automatic control at any time. When foot switch is pushed, the circuit switches off of automatic and green indicator light in control head goes out. Foot switch must be pushed again to return to automatic control. High beam indicator light indicates actual position of headlight beam whether circuit is on manual or automatic.

Switch Assembly: A three position switch, located on left side of control head assembly has positions marked "FAR", "NORM" and "NEAR". With switch on "NORM" position, working against standard rated oncoming bulbs on low beam, headlights will dim when approaching lights are 1100-1200 ft. away. Changing switch to either "FAR" or "NEAR" changes dimming distance by approximately 200 ft. in direction indicated.

OPERATIONAL CHECK: Switch the circuit to automatic (green pilot light on), block out light to control tube. *NOTE*–Light can be effectively blocked by covering control head lens with one hand and the opening about the "FAR-NORM-NEAR" switch with the other (this procedure will not work in bright sunlight as enough light passes through the hands to cause tube to hold headlights on low beam). With lens covered, headlamps will switch to high beam automatically. If they do not, unit is not functioning properly. *CAUTION*–Unit developes high operating voltages. Control head is normally grounded to prevent high voltage danger. Red wire at switch assembly connector must be disconnected before removing head, thus breaking ground connection.

TROUBLE DIAGNOSIS: Leveling–With headlight circuit on automatic, with dim and hold sensitivity adjustments correct, the head pointing downward will result in reduced dim and hold distances, and cause automatic circuit to hold low beam from reflection of its own headlights. If head aimed too high, dim and hold distances will be reduced, sensitivity to tail lights will be reduced and, in extreme cases, unit will not dim on tail lights.

Dim Sensitivity: With head properly leveled, insufficient dim sensitivity will result in reduced dimming distance. Too much dim sensitivity will result in increased dimming distance.

Hold Sensitivity: With head properly leveled, and dim sensitivity properly adjusted, insufficient hold sensitivity will result in excessive high beam operation and excessive hold sensitivity will cause automatic circuit to operate excessively on low beam and, in extreme cases, system will lock on low beam because of reflection from its own headlights.

TROUBLE SHOOTING: Unit Will Not Dim Within Range Of Dim Sensitivity Adjustment–Defective phototube (control assembly); defective control tube; defective circuit.

Unit Will Not Respond To Hold Adjustment: Defective control tube; defective circuit.

Unit Stays On Low Beam In Automatic Position: Head not level; fuse blown; vibrator, ballast tube, control head, or control tube defective.

Pilot Light In Head Inoperative: Light defective.

Unit Dims Automatically, Then Locks In Low Beam: Head not level; control tube defective, improper headlight alignment (dimming on vehicles own headlights).

►*CONTROL TUBE CHECK:* Disconnect red and green wires at switch assembly connector and use a 45 volt dry cell to make test. Ground positive battery terminal and connect negative terminal to switch assembly end of green lead with a jumper wire. If headlamps dim, switch assembly is satisfactory and control tube should be replaced. If lights do not dim, replace switch assembly.

ADJUSTMENTS: Service on the automatic headlight dimmer control is limited to leveling the control assembly, adjusting the dim and hold sensitivity within the switch assembly and elemental trouble shooting (see above). To make adjustments, follow procedures outlined in instructions accompanying the test equipment.

SERVICE PARTS: Indicated as follows:

Part	Part No.
Control Tube Assembly	FDK-13691-A
Ballast Tube Assembly	FDK-13692-A

Control Assembly	FDK-13650-A
No. 82 Bulb	8A-13464
No. 51 Bulb	48-15021

1952-53 AUTRONIC EYE

Cadillac, All Models (1952-53)—Optional
Chevrolet, All Models (1952-53)—Optional
Oldsmobile, All Models (1952-53)—Optional
Pontiac, All Models (1952-53)—Optional

►**NOTE**—*All cars listed above had 6-volt in 1952. In 1953 Cadillac and Oldsmobile had 12-volt type, Chevrolet and Pontiac 6-volt type.*

►CHANGES, CAUTIONS, CORRECTIONS

►*PARTS INTERCHANGEABILITY CAUTION:* 6-Volt and 12-Volt Power Relay and Amplifier Unit assemblies are not interchangeable. When replacing parts be sure proper 6-volt or 12-volt types are used.

►*PONTIAC PHOTOTUBE HORIZONTAL AIM CORRECTION:* Phototube must be aimed parallel to centerline of car if switching from upper to lower beam is to be done at proper time. To check, place two pieces of tape 22" apart on wall at hood height. Position car 25-50 ft. back from wall with centerline of hood aimed at right hand tape. Sight down rib on top of Phototube Unit to see if it is pointing at left hand tape. If incorrectly aimed, remove Phototube Unit from instrument panel. Elongate upper or forward hole 1/8" maximum, in direction 45° to left of line through hole parallel to car centerline and toward left rear of car. Then elongate lower or rear hole 1/16" maximum in direction of line through hole parallel to car centerline and toward rear of car.

DESCRIPTION: The Autronic Eye is an electronic device that automatically switches headlamps between the upper and lower beams in response to light from the approaching car. It consists of a Phototube Unit, Amplifier Unit, Power Relay, and an auxiliary Foot Control Switch.

OPERATION: Headlamps are controlled automatically in only one position of standard beam selector switch. Other position of the switch provides lower beam only. The Auxiliary Foot Control Switch functions only in "automatic" position of standard beam selector switch. In "automatic" position the Autronic Eye provides complete automatic switching of headlight beams. Light from the headlamps of an approaching car strikes the Phototube Unit causing the Autronic Eye to switch headlamps to lower beam. At this time, if driver of approaching car had on upper beam, he would normally switch to lower beam; thus, greatly reducing amount of light falling on Phototube Unit. The Autronic Eye is designed to maintain headlamps on lower beam even with this reduction in light. When light is removed from Phototube Unit, the Autronic Eye returns its vehicle headlamps to upper beam. If approaching vehicle fails to switch to lower beam, Auxiliary Foot Control Switch may be operated to provide an upper beam for signalling purposes.

CHECKING AND TROUBLE DIAGNOSIS: To determine if difficulty is more serious than can be corrected by simple aiming and sensitivity adjustments pull light switch to full "on" position. With car in lighted area, headlamps should remain on lower beam, regardless of position of standard beam selector switch. Depress Auxiliary Foot Control Switch. Headlamps should change to upper beam, if standard beam selector switch is in "automatic" position. If not, trip standard beam selector switch and again depress auxiliary switch. Lights should now change to upper beam and back to lower beam when auxiliary switch is released. Next, cover

CONTINUED ON NEXT PAGE

1952-53 AUTRONIC EYE (C ntinu d)

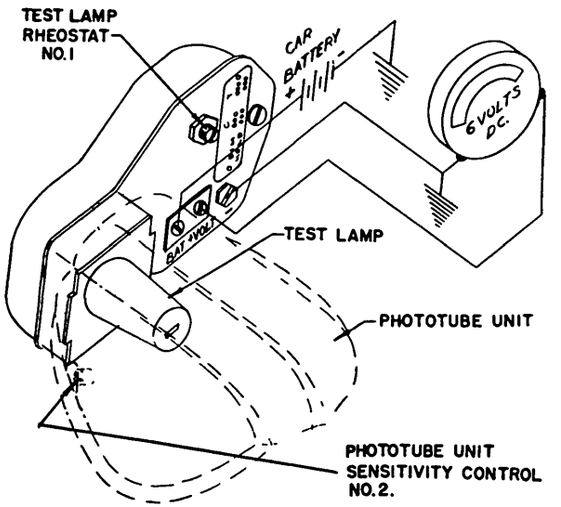
Phototube Unit lens with a heavy black cloth. Headlamps should switch to upper beam and back to lower beam when cloth is removed, if standard beam selector switch is in "automatic" position. If lights do not operate as described above follow **"Minor Corrections"** and **"Trouble Diagnosis"** procedures outlined below.

Minor Corrections: ***CAUTION—Headlamps must be turned "OFF" before any connections are tightened, made or broken. Battery ground strap must be disconnected before removing or tightening Phototube Unit. This unit develops 1000 VOLTS.*** Check all external connections for tightness and correctness (be sure to check plug-in connections of Phototube Unit under instrument panel). Turn on headlamps and check amplifier for vibrator buzz. If vibrator does not buzz inspect for blown 14 amp. fuse. ***Do not use higher than 14 amp. fuse.*** Be sure that vibrator is firmly seated in socket. Replace vibrator with new 4 volt vibrator. ***Do not use standard radio 6 volt type vibrator.*** Inspect tube filaments for glowing (except Amperite and Phototube). Check or replace one tube at a time in amplifier with known good tube. ***If tube is replaced "Lower Beam" sensitivity must be rechecked.***

Trouble Diagnosis: To isolate trouble to one of the four major components of Autronic Eye before removing any units from car:

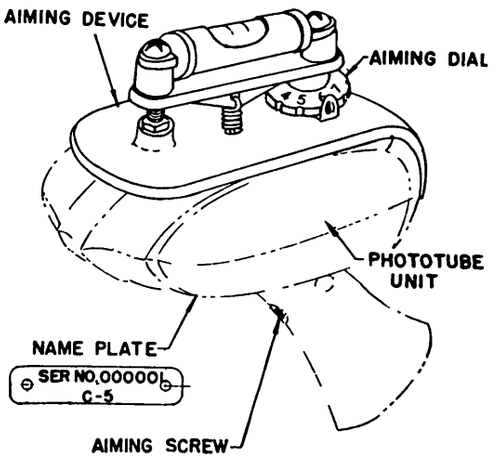
(1) Check units outside electronics circuits by removing fuse from Amplifier Unit. Headlamps should switch between upper and lower beams by operating standard beam selector switch. If not, trouble is in Power Relay, standard beam selector switch, or Amplifier Unit harness from standard beam selector switch to Power Relay.

(2) Check Amplifier Unit (150 volt section) by replacing fuse, disconnecting Phototube Unit and Auxiliary Foot Control Switch from Amplifier Unit. Headlamps should be on upper beam in "automatic" position of standard beam selector switch. If this test is satisfactory connect black wire to white wire in Amplifier Unit harness. Headlamps should remain on lower beam in both position of standard beam selector switch. If headlamps remain on lower beam connect red Amplifier Unit wire to ground (with black and white wires connected). Headlamps should switch to upper beam with standard beam selector switch in "automatic" position. If Autronic Eye fails in any of above steps trouble is usually in 150 volt section of Amplifier Unit.



(3) Check Amplifier Unit (1000 volt section) by disconnecting Phototube Unit, connecting a 2 megohm resistor from black wire in Amplifier Unit harness to ground. With a 20,000 ohm per volt D.C. Voltmeter capable of measuring 1000 volts, voltage across 2 megohm resistor should be at least 850 volts. If not, trouble is probably in 1000 volt section of Amplifier Unit. NOTE—***If necessary seal on high voltage control inside amplifier may be broken and control adjusted to voltage marked inside cover.***

(4) Check Phototube Unit by connecting it to amplifier, if Amplifier Unit is functioning properly. With light entering Phototube Unit, headlamps should be on lower beam in both positions of standard beam selector switch. With no light entering Phototube Unit, headlamps should be on upper beam when standard beam selector switch is in "automatic." If not, trouble is in Phototube Unit.

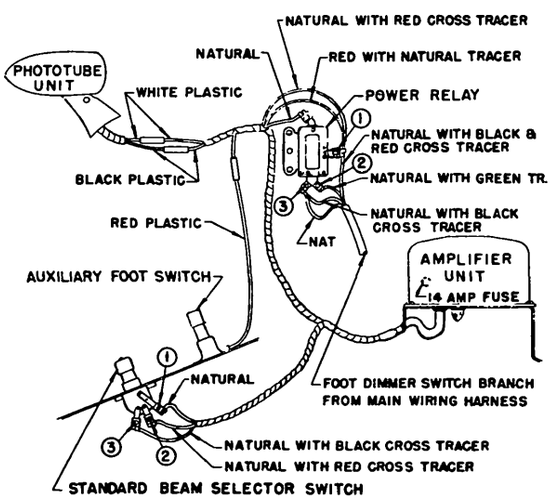


(5) Check Auxiliary Foot Control Switch by connecting it to Amplifier Unit. With light entering Phototube Unit, headlamps should be on lower beam in both positions of the standard beam selector switch. If above check is correct auxiliary foot switch should be depressed and should cause upper beam to be "on" in "automatic" position of standard beam selector switch.

(6) Defective Auxiliary Foot Control Switch or Power Relay should be replaced. Phototube Unit or Amplifier Unit should be removed from car and serviced if trouble is found in either.

(7) Conversion to operation of headlamps by standard selector switch can be accomplished by disconnecting wires 1, 2, and 3 (see diagram) from Power Relay and connecting them to their respective terminals on standard beam selector switch.

SENSITIVITY ADJ. EQUIPMENT



AIMING ADJ. EQUIPMENT

Phototube Unit Aiming Procedure: ***NOTE—Due to normal settling of car springs it is recommended that aiming procedure be followed at time of 2000 mile inspection.*** Car should be unloaded, trunk empty except for spart tire, tires at correct pressure, and gas tank at least half full. Place car on level floor (level within ¼" fore and aft). Rock car to normalize springs. Adjust dial on Aiming Device to number stamped on name plate on bottom side of Phototube Unit. Position Aiming Device on top of Phototube Unit, using care to center it on raised ridge. Then move it to rear until it contacts lens. Adjust Phototube Unit aiming screw until bubble is centered in level. If level floor is not available, perform operations above and mark location of front and rear wheels on floor. Turn car end for end, placing front wheels where rear wheels were, and rear wheels where front wheels were. Readjust aiming dial until bubble is centered in level. Difference in two readings made is twice error in floor level. Adjust aiming dial midway between the two readings and adjust phototube aiming screw until bubble is centered in level again. **NOTE—Phototube must be accurately aimed. If too low, back reflections from car on which Autronic Eye is installed will hold headlamps on lower beam. Also, unit must be aimed as low as possible to allow maximum tolerance for car loading.**

Sensitivity Adjustments: ***CAUTION—Autronic Eye develops 1000 VOLTS. Car lights must be turned "OFF" before removing cover from Phototube Unit.***

(1) **Lower Beam Sensitivity Adjustment:** Remove two oval head screws from bottom of Phototube Unit. Lift off cover, remove lens and replace with Test Lamp. Replace cover and screws. Connect a wire between "BAT" terminal of Test Lamp to positive (+) side of car battery. Connect a wire from "+ volt" terminal of Test Lamp to positive (+)

CONTINUED ON NEXT PAGE

AUTR NIC EYE WIRING DIAGRAM

1952-53 AUTRONIC EYE (Continued)

side of D.C. voltmeter. Connect a wire from one terminal of the Test Lamp to the minus (—) side of D.C. Voltmeter. From this same terminal of voltmeter attach a wire to ground. Turn Test Lamp rheostat (No. 1) all the way counterclockwise to obtain minimum voltage reading. Turn on headlights and set standard beam selector switch on "automatic." Wait at least one minute to allow amplifier to stabilize. Turn rheostat (No. 1) clockwise slowly just to point where headlamps switch to lower beam. Note voltage of Test Lamp. Turn rheostat (No. 1) counterclockwise slowly just to point where headlamps switch to upper beam. Note voltage of Test Lamp. Voltages noted should be within 0.2 volt of the values "Dim" and "Hold" marked on Test Lamp. NOTE—Use marking "C" for clear and "T" for tinted windshields. If "Lower Beam" sensitivity requires adjustment rotate Phototube Unit Sensitivity Control (No. 2) counterclockwise to end of adjustment, using screwdriver with 1/16" blade. Also rotate rheostat (No. 1) counterclockwise to end of adjustment so that headlights are on upper beam. Rotate rheostat (No. 1)clockwise to obtain voltage reading on voltmeter corresponding to "Dim" voltage reading marked on Test Lamp ("C" for clear and "T" for tinted windshields). Carefully and slowly turn phototube sensitivity control (No. 2) clockwise just to point where headlamps switch to lower beam. *Do not go beyond this setting.* Turn rheostat (No. 1) counterclockwise carefully and slowly just to point where headlamps switch to upper beam. Voltage should be within 0.2 volt of "Hold" voltage marked on Test Lamp. If not, adjust amplifier for "Holding" sensitivity.

(2) Holding Sensitivity Adjustment: *NOTE—This adjustment should not be made until "Lower Beam" sensitivity is adjusted correctly.* Turn off headlamps. Remove amplifier. Turn amplifier over and attach jumper wire between case of amplifier and ground on car. Turn "Hold" control (located on bottom side of Amplifier Unit) clockwise to end of adjustment. Use screwdriver with 1/16" blade. Do not remove acorn nut to adjust "Hold" control. Turn headlamps on and allow one minute for amplifier to stabilize. Rotate rheostat (No. 1) clockwise until headlamps switch to lower beam. Rotate rheostat (No. 1) counterclockwise to obtain voltage reading on voltmeter corresponding to "Hold" voltage marked on Test Lamp ("C" for clear and "T" for tinted windshields). Turn "Hold" control counterclockwise slowly to point where headlamps switch to upper beam. Turn off headlamps, remove jumper wire, and reinstall amplifier.

1954 AUTRONIC EYE

Cadillac (1954)
Chevrolet (1954)
Oldsmobile (1954)
Pontiac (1954)

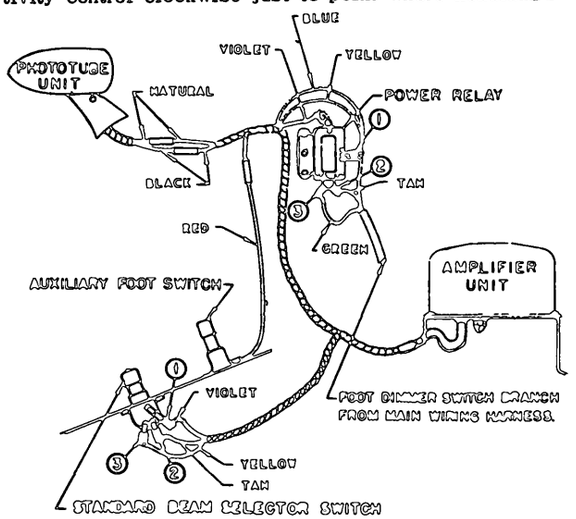
▷CHANGES & CAUTIONS

▷*PARTS INTERCHANGEABILITY CAUTION:* 6-Volt and 12-Volt Power Relay and Amplifier Unit assemblies are not interchangeable. When replacing parts be sure proper 6-volt and 12-volt types are used.

▷*1954 FUSE ELIMINATION PRODUCTION CHANGE:* 14 ampere fuse used previously in Amplifier Unit no longer used.

▷*1954 TESTING EQUIPMENT CHANGE:* AE Tester replaces testing equipment previously used. Testing procedures are greatly simplified. Aiming element replaces Phototube Unit cover for testing purposes.

DESCRIPTION: Similar in design in 1952-53 models except that 14 ampere fuse has been eliminated.



CHECKING & TROUBLE DIAGNOSIS: *Proceed as outlined under "1952-53 Autronic Eye" with following exceptions (USING SAE TESTER):*

Minor Corrections: If vibrator does not buzz be sure vibrator is firmly seated in socket. If so, replace vibrator with new 6 or 12 volt vibrator (DO NOT USE RADIO 6 OR 12 VOLT TYPE VIBRATOR).

Trouble Diagnosis: Instead of removing and replacing fuse as outlined, disconnect blue feed wire in amplifier unit in step (1), and replace same wire in step (2). In step (2), if initial test satisfactory, connect 2 megohm resistor between black wire and natural wire in amplifier unit harness instead of connecting black wire to white wire. Remainder of procedure remains unchanged.

Sensitivity Adjustments: Proceed as follows:

(1) Lower Beam Sensitivity Adjustment—With test lamp in place, turn headlamps "ON" for at least four minutes to allow amplifier to stabilize. On tester, turn zero corrector on face of meter until pointer on zero set line, turn intensity rheostat all the way counter-clockwise and selector switch to "DIM" position. (*NOTE*—Be sure to use correct "DIM" position for clear or tinted windshields). Insert Tester connector into cigar lighter receptacle (*CAUTION*—Push straight in). Check car battery voltage. If less than 6 volts (6 volt battery) or 12 volt (12 volt battery), operate engine at fast idle when making sensitivity adjustment. Turn intensity rheostat clockwise slowly just to point where headlamps switch to lower beam. Meter pointer should fall within "DIM" sensitivity adjustment line. If not, adjust rheostat to high side of "DIM" sensitivity adjustment line. Rotate phototube unit sens tivity control counterclockwise to end of adjustmert with special 1/16" screwdriver provided in Tester. Momentarily switch selector switch to "off" position so headlamps are on upper beam; then turn selector switch to "DIM" position. Carefully and slowly turn phototube unit sensitivity control clockwise just to point where headlamps

AUTRONIC EYE WIRING DIAGRAM

switch to lower beam. *Do not go beyond this setting.* Turn intensity rheostat all the way counter-clockwise, momentarily switch selector switch to "off" position and back to "DIM" position. Turn intensity rheostat clockwise slowly just to point where headlamps switch to lower beam. If "DIM" sensitivity has been adjusted correctly, meter pointer should fall within "DIM" sensitivity adjustment line. If not, repeat adjustment beginning with rotation of phototube unit sensitivity control.

(2) Holding Sensitivity Adjustment—Turn on headlamps and wait four minutes to allow amplifier to stabilize. Turn hold control on bottom (outside) of amplifier unit clockwise to end of adjustment (Use small offset screwdriver). Rotate intensity rheostat clockwise to end of adjustment. Turn selector switch to "DIM" momentarily to switch headlamps to lower beam; then switch selector switch to "HOLD" position. (*NOTE*—Be sure to use correct "DIM" position for clear or tinted windshields). Adjust intensity rheostat until meter pointer is in center of the "HOLD" sensitivity adjustment bar on meter scale. Turn "HOLD" control on amplifier counterclockwise slowly just to point where headlamps switch to upper beam. If headlamps do not switch to upper beam when the "HOLD" control is turned completely counterclockwise, rotate intensity rheostat counter-clockwise until headlamps switch to upper beam. If meter pointer is within "HOLD" sensitivity adjustment bar, amplifier unit is within tolerance. Again check "HOLD" sensitivity adjustment by rotating intensity rheostat clockwise to end of adjustment. Turn selector switch to "DIM" position momentarily to switch headlamps to lower beam, then turn selector switch to "HOLD" position (*NOTE*—Be sure to use correct "HOLD" position for clear or tinted windshields). Turn intensity rheostat counter-clockwise carefully and slowly just to point where headlamps switch to upper beam. Meter pointer should fall within the "HOLD" sensitivity adjustment bar on meter scale, if adjustment was made correctly. Turn off headlamps, disconnect Tester. Remove test lamp, replace lens, cover and screws.

▷*OTHER "AUTRONIC EYE" DATA:* See *"1952-53 Autronic Eye".*

1955 AUTRONIC EYE

Cadillac (1955)
Chevrolet (1955)
Oldsmobile (1955)
Pontiac (1955)

►CHANGES, CAUTIONS, CORRECTIONS

►*1955 AUTRONIC EYE PRODUCTION CHANGES:* Early in production, several major changes were made in the Autronic Eye. These changes include a completely new wiring circuit, Amplifier and Phototube unit Alternating instead of direct current is used. "Dim" and "Hold" adjustment knobs are now located on underside of amplifier (1954 and Early 1955 "Dim" adjustment was on phototube unit)

►*1955 ADJUSTMENT CAUTIONS:* Early 1955 "Dim" and "Hold" adjustments are made differently than later 1955 adjustments. *For early 1955 adjustments see "1954 Autronic Eye", later 1955 adjustments, see below.* *NOTE*—There is a possibility that minor circuit changes were made during the model year. It is suggested that reference be made to printed circuit diagram, located on inside of amplifier cover, before performing any service operations on the autronic eye.

DESCRIPTION: Similar in design and operation to previous models *See Changes above.*

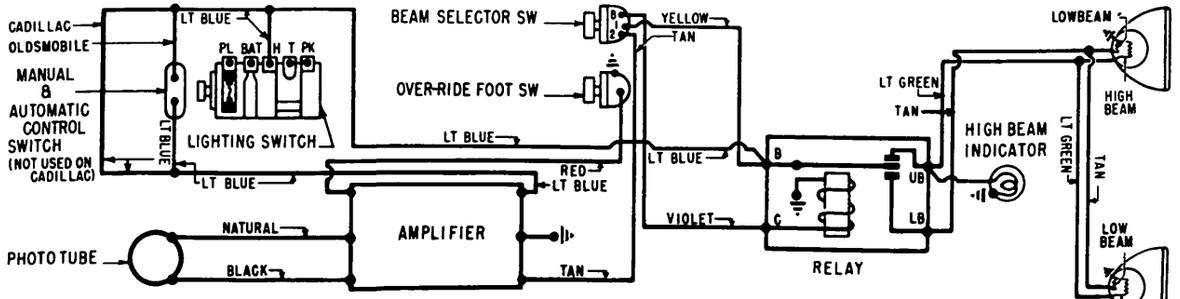
TESTING: Test for "Hold" Sensitivity and "Dim" Sensitivity are made as follows:

►*NOTE: For early 1955 Autronic Eye Tests, see "1954 Autronic Eye". See Changes, Cautions, Corrections above*

Hold Sensitivity Test (Later Units): *CAUTION—The "Autronic Eye" develops 800 volts. Turn headlamps "OFF" before removing cover from Phototube unit*

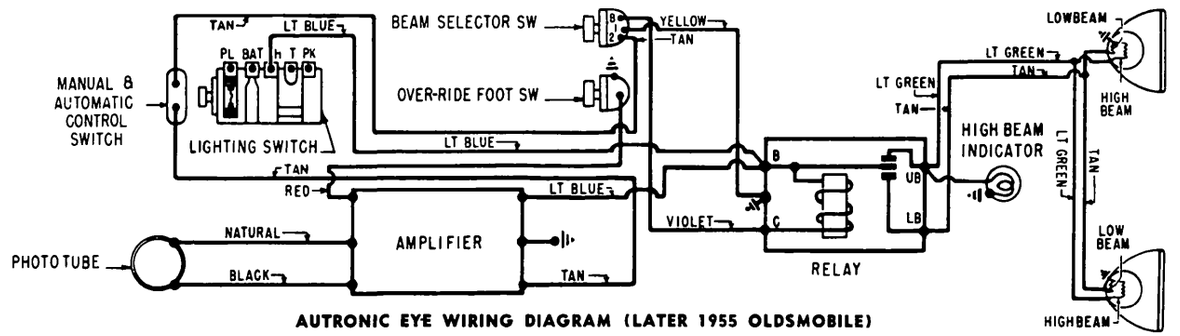
1) Install Aiming Device AE-4.

2) Turn headlamps "ON" and **wait at least four minutes** for amplifier to stabilize. Set standard foot dimmer switch to "Automatic" position. *(NOTE*—Headlamp switch provides "Automatic" and "Manual" controls. With switch set to "Automatic" upper beam will be on).



3) Turn Zero Corrector on face of meter until meter pointer is on zero set line. Turn Intensity Rheostat of tester counter-clockwise Insert tester connector into cigar lighter receptacle. *CAUTION*—Push straight in.

4) Check car battery voltage. If less than 12 volts, operate engine at fast idle while making sensitivity tests and adjustments.



5) Turn tester Selector Switch to "Dim" position (Be sure to use proper "Dim" position for clear or tinted windshield) Turn Intensity Rheostat all the way clockwise to end of adjustment to obtain a lower beam. Turn tester Selector Switch to "Hold" position

6) **Slowly** turn Intensity Rheostat counter-clockwise just to point where headlamps switch to upper beam. Meter pointer should now read in the "Hold" Sensitivity Adjustment Bar on meter scale. To adjust, see "Hold Sensitivity Adjustment" below.

Dim S nsitivity T st (Later Units): 1) Rotate Intensity Rheostat completely counter-clockwise. Turn Selector Switch to "Dim" position. Headlamps should now be on upper beam.

AUTRONIC EYE WIRING DIAGRAM (CADILLAC, CHEVROLET, PONTIAC, EARLY OLDSM BILE)

AUTRONIC EYE WIRING DIAGRAM (LATER 1955 OLDSMOBILE)

2) Turn Intensity Rheostat **slowly** clockwise, stopping at the exact point where headlamps switch to lower beam. Meter pointer should read within "Dim" Sensitivity Adjustment Line To adjust, see "Dim Sensitivity Adjustment" below.

ADJUSTMENTS: *NOTE—For early 1955 "Dim" and "Hold" Sensitivity Adjustments, see "1954 Autronic Eye".*

Aiming Adjustments: Replace Phototube cover with Aiming Device AE-4 *(CAUTION*—Turn lights "OFF", before removing cover). With car at curb weight, tire pressures correct, place car on floor, level within ¼" fore and aft. To adjust vertically, adjust aiming dial to number stamped on name plate of Phototube unit, then adjust aiming screw until bubble is centered in level. To adjust horizontally, aim over sights of Phototube unit. Adjust unit so it is aimed at a point within 4" of line parallel to centerline of car with car 25 ft. from aiming point

Hold Sensitivity Adjustment (Later Units): *NOTE*—This adjustment must be made **before** the "Dim Sensitivity Adjustment" is made

1) Turn "Hold" Adjustment (on underside of amplifier) clockwise to end of adjustment. Rotate Intensity Rheostat all the way clockwise

2) Turn Selector Switch momentarily to "Dim" position to switch lights to lower beam, then switch back to "Hold" position *(NOTE*—If lights do not switch to lower beam, "Dim" control must be turned clockwise to end of adjustment and then readjusted after "Hold" adjustment is correct).

3) Adjust tester Intensity Rheostat until meter pointer is in center of "Hold" Sensitivity Bar.

4) Turn "Hold" control counter-clockwise **slowly** just to point where headlamps switch to upper beam.

5) Rotate tester Intensity Rheostat clockwise to end of travel, then turn Selector Switch momentarily to "Dim" position and back to "Hold" (Headlamps should now be on lower beam).

6) Recheck "Hold" adjustment by turning Intensity Rheostat **slowly** counter-clockwise just to point where lamps switch to upper beam. Meter pointer should now read in "Hold" Sensitivity Adjustment Bar if adjustment correct, If not, repeat procedure starting with with Step 1).

Dim Sensitivity Adjustment (Later Units): *NOTE*—"Hold Sensitivity Adjustment" must be made before making this adjustment

1) Rotate "Dim" control completely counter-clockwise.

2) Momentarily turn tester "OFF", then back to "Dim" position (Headlamps should now be on upper beam).

3) Adjust Intensity Rheostat until meter pointer reads in the right hand edge of the "Dim" Sensitivity Adjustment Line.

4) **Slowly** rotate "Dim" control clockwise just to point where headlamps switch to lower beam **D n t g beyond this setting.**

5) Turn tester Intensity Rheostat completely counter-clockwise, then momentarily turn tester "OFF" and back to "Dim" Rotate Intensity Rheostat **sl wly** clockwise just to point where headlamps switch to lower beam. If adjustment correct, meter pointer will read within "Dim" Sensitivity Adjustment Line. If not, repeat Steps above.

6) **Turn headlamps "OFF",** disconnect tester from cigar lighter receptacle. Remove tester and Aiming Device from Phototube unit. Replace lens, cover, and screws.

DIRECTION SIGNALS

GENERAL INFORMATION: Direction Signals consist of right and left Front and Rear flashing lamps which light up when steering column control switch is operated to indicate that a turn is to be made. These signals operate in conjunction with Pilot Indicator lights on instrument panel, or on control switch.
Front Direction Signals—The front parking lights with an additional 21 cp. bulb filament added (21-3 cp. bulb), or separate lights are used. When Direction Signals are installed on cars in service the parking lights are modified by installing a special new double filament socket, included in the kit.
Rear Direction Signals—Separate signal lights are used on some models, and others use the rear stop lights for this purpose. Where the stop light is used, the light on the side signalled flashes, while the other acts as a normal stop light.
Control Switch—On some cars the control switch is built into the upper end of the steering column, others using a side mounted switch, bolted or clamped to the column. Switch has three positions, Right, Left, and Off. On some accessory types all switch movement is made manually. On standard equipment types the switch is returned to the "Off" position automatically after the turn is made, by a cam and ratchet, or contact pin device mounted on the steering worm tube.
Wiring—*See individual car wiring diagrams in Car Model Section.*
Flasher—A flasher (sealed unit) acts as the circuit interrupter. It consists of two pairs of points operating together, one set for the signal lights, the other for the pilot indicator lights. Flasher unit flashes (with normal load) between 80 and 100 times a minute. Decreasing the load on the flasher causes it to operate more rapidly. Flasher units cannot be repaired; replace when defective.
Direction Signal Fuse and Circuit—In most cases current for Direction Signals is supplied from the Ignition Circuit when the ignition key is turned on. On some models a fused lead between the ignition switch and flasher unit is used; on others, it is connected to a circuit breaker. *See car wiring diagrams.*

Pilot Indicator Lights—Various hook-ups are used for these lights. These hook-ups are known as the single light type, two light parallel type, and two light cross-over type. See Diagram. On the cross-over type the pilot lights have insulated sockets. Pilot lights indicate Right or Left turn signal, as the case may be. On the cross-over type hook-up, the Left pilot light grounds through the Right side front signal light filament, and the Right Pilot grounds through the Left signal light. A burned out signal light bulb will cause the opposite pilot light to fail to light.

TESTING: Flasher Units. Connect the "Plus" terminal of flasher to positive side of a battery. Connect two 21 cp. bulbs in parallel between the negative side of a battery and the "L" terminal of the flasher. Connect a No. 55 2-cp. bulb between the negative terminal of battery and the "P" terminal of flasher. Lights should go on and off normally. Disconnect one 21 cp. bulb. The 2 cp. bulb should go out and the remaining 21 cp. bulb should flash much more rapidly than normal.

TROUBLE SHOOTING: A burned out signal light bulb will cause flasher to operate much more rapidly due to the decreased load. It is a good idea to check all bulbs first when shooting trouble, unless the trouble is very obvious. See that bulbs are good, and the correct type. On cars using the single pilot light, and where the pilot flashes just once and no more when the control switch is set to signal, it indicates a burned out bulb or open circuit to signal light on that side. In some cases the pilot may not light at all due to this condition. The same information applies to the two light, parallel type, except that only the pilot light on side affected will not operate. On cars with cross-over type pilot lights, if the Right front signal light is burned out it will cause the Left pilot light to fail to operate, and vice versa. See Pilot Indicator Lights above. If a rear bulb burns out both Pilot lights may flash in unison (dimly) at double speed.

HUDSON SIGNAL LIGHTS

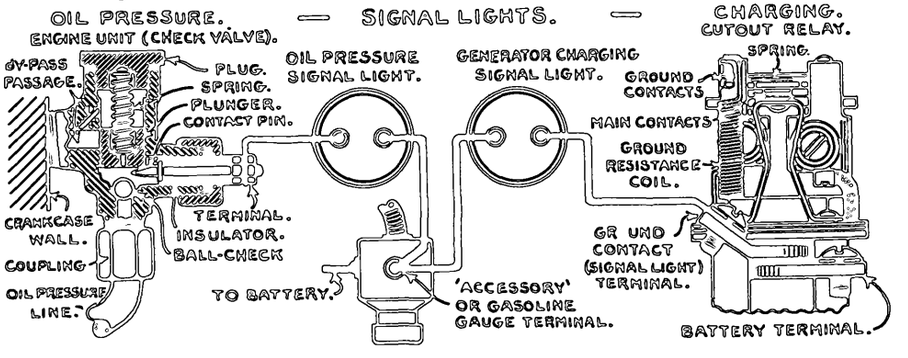
DESCRIPTION: These signal lights consist of a Battery Charge Tell-tale and Oil Pressure Tell-tale on the instrument panel which are used instead of gauges to indicate when generator is charging battery and if oil pressure is satisfactory. They are regular lamp bulbs connected to the accessory terminal of the ignition switch (operative only with ignition switch turned 'on') and are controlled by the generator cutout relay and oil line check-valve as described below.

GENERATOR CHARGE TELL-TALE: The cutout relay is provided with an extra set of ground contacts above the armature and the tell-tale lamp lead is connected to this contact 'T' terminal on the regulator case. The lamp circuit is completed to ground through these contacts. See car wiring diagram on car model page for complete wiring circuits.

Operation:—The ground contacts are normally closed with the main contacts open and open when the main contacts close. When the ignition is turned on, the tell-tale lamp lights and remains lighted until the main contacts close and the generator begins to charge the battery. The lamp should not remain lighted after the car speed is brought up beyond the cut-in point (approximately 10 MPH).

Trouble Shooting:—If the tell-tale lamp does not light when ignition is turned on, ground tell-tale lamp lead 'T' terminal on regulator to the engine (not to 'B' terminal). If lamp does not light, check for burned out bulb or loose wiring connections (see car model page wiring diagram). If lamp lights (indicating that ground contacts open), main contacts are fused or armature spring is weak or broken. If tell-tale lamp does not go out at speeds above cut-in point, ground contacts are not opening when main contacts close. Check generator performance by connecting accurate test ammeter in charging line. If trouble in regulator, car manufacturer recommends that a new or replacement regulator be installed (regulator case is sealed, do not break seal).

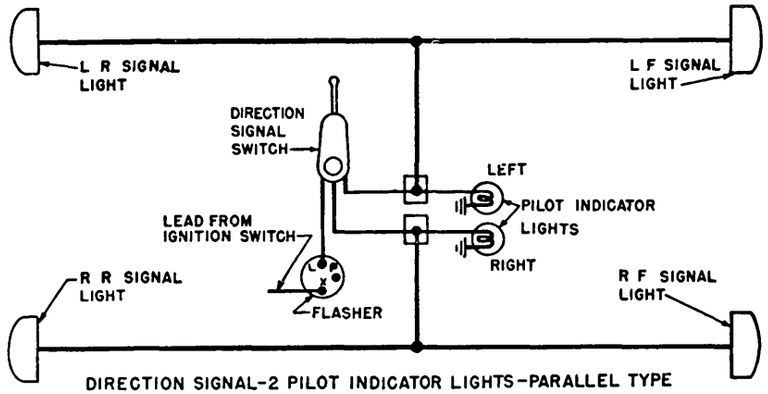
OIL PRESSURE TELL-TALE (1948 & Earlier 6 Cyl.): Check valve on right of crankcase is provided with an insulated terminal pin which is grounded by the check-valve plunger when no pressure exists in the oil line. The oil pressure tell-tale lamp lead is connected to this terminal. A small hole in the check-valve plunger and a by-pass in the body allow the passage of sufficient oil so that the plunger alternately opens and closes the circuit at idling speeds, causing the tell-tale lamp to flash.



Operation:—The plunger rests normally against the pin when no pressure exists in the oil line so that the tell-tale lamp will light when the ignition is turned on. At idling speeds the plunger alternately opens and closes the circuit so that tell-tale lamp flashes. At speeds above idling (approximately 7 M.P.H.), the oil pressure holds the check-valve plunger off its seat so that the tell-tale lamp does not burn or flash.

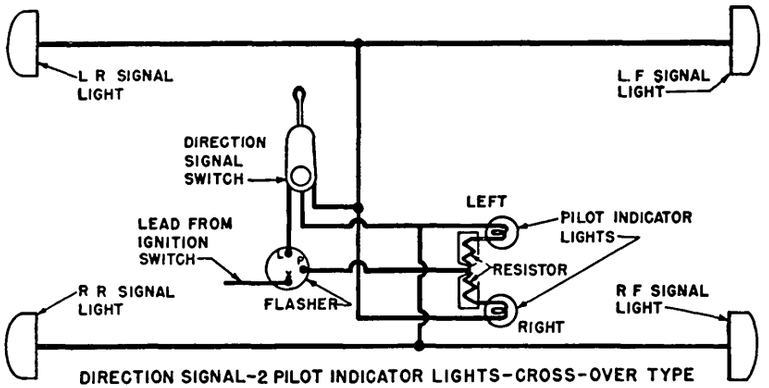
Trouble Shooting:—If the tell-tale lamp does not light when the ignition is turned on, ground check-valve terminal to engine. If lamp does not light, replace bulb. If lamp does light, remove terminal pin and see that it is straight and clean. Take off plug on top of check-valve housing, remove plunger and see that it is clean and moves freely up and down. Examine spring above plunger. If tell-tale lamp does not flash at idling speeds, see that small hole in plunger is clean and open.

OIL PRESSURE TELL-TALE (1948 & Later 6 Cyl.): Operates in same manner as on other cars (above). A new unit (Carter No. A658S Oil Pressure Warning Switch) is used and this unit is mounted on engine separately from the check valve or oil pressure regulator.



Trouble Shooting: Warning switch contacts open (causing oil pressure tell-tale lamp to go out) when oil pressure reaches normal operating pressure of 11-15 lbs.

▷*CAUTION—Warning Switch is set and sealed at the factory and no adjustments are necessary.*



Form 38B—1956-M

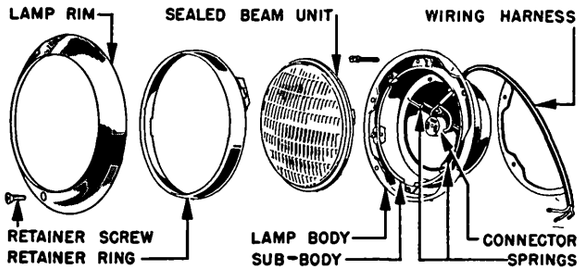
SIX WIRE TYPE SWITCH WITH SINGLE INDICATOR

SIX WIRE TYPE SWITCH WITH "CROSS-OVER" INDICATORS



SEALED BEAM HEADLAMPS

REPLACEMENT NOTE: Three Types of Sealed Beam Lamp Units are available for replacement as follows:
1)—Composite type with metal reflector and glass lens (has conventional lamp bulb assembled in unit).
2)—All glass type with hard glass reflector and no lens (no lamp bulb used, filament mounted directly on reflector).
3)—New "Shielded Filament" type in which there is a metal shield over the filament which blocks light directed upward from filament. This type has increased wattage and projects passing beam a greater distance ahead. ***All types and all makes are fully interchangeable on all car models equipped with Sealed Beam Headlights.***

DESCRIPTION: Sealed Beam Headlamps, as used on cars so equipped, consist of a reflector, lens, and lamp filaments assembled as a single sealed unit. This excludes all dirt and moisture so that the original effciency of the lamp is retained throughout the life of the filaments. When replacement is required, the entire sealed beam unit is discarded and a new unit is installed. No attempt should be made to disassemble the sealed beam unit.

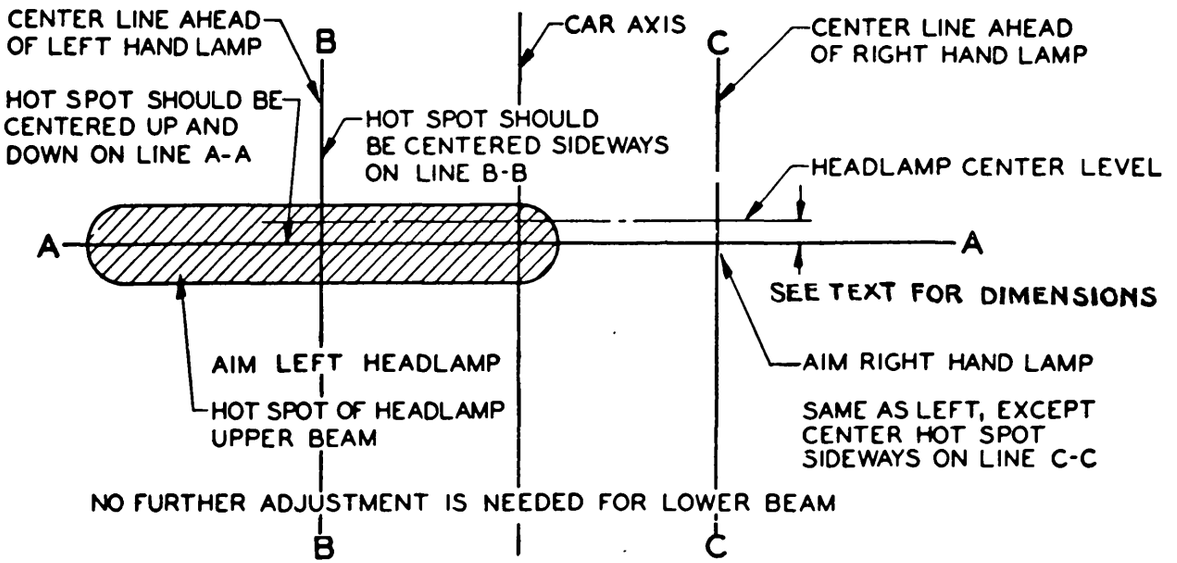
OPERATION: Sealed Beam lamps have double "bar" type filaments (filaments are parallel and slightly offset so that lower "Traffic" beam deflected slightly toward right side of road. Beams are controlled by a Beam Selector Switch on the toe-board in the usual manner.

INSTALLATION & REMOVAL: On all cars, a sub-body or housing is provided in the headlamp for the sealed beam unit mounting. This sub-body is retained in the headlamp by the two adjusting screws and by two sets of two springs which are hooked to the sub-body diametrically across from each screw. The sealed beam unit seats directly in the sub-body and is positioned by three heavy lugs which fit into slots in the sub-body. A retainer ring is fitted over the outer edge of the sealed beam unit. This retainer ring has three lugs which engage three clamp screws on the sub-body rim so that the retainer ring and sealed beam unit are securely clamped in place when the clamp screws are tightened (on some cars a gasket is used between the retainer ring and the sealed beam unit). A lamp rim which fits over the retainer ring in such a manner as to conceal the clamp screws and adjusting screws completes the assembly.

SEALED BEAM HEADLIGHT UNIT

Removing Sealed Beam Units—Remove headlamp rim (retained by screws and clips). Loosen but do not remove three clamp screws which engage retainer ring or remove spring (some models) which is attached to retainer ring. In first type rotate retainer ring to release retainer and in both types remove unit connector and unit.

Installing Sealed Beam Units—Terminal clips on sealed beam units and cable plug are designed so that plug can be connected only in correct position. Plug terminals (facing end of plug) are as follows: **Left Side**—Upper Country Beam. **Center (Top)**—Lower Traffic Beam. **Right Side**—Ground wire connected to lamp sub-body or lamp housing. When installing new sealed beam unit, connect plug, see that sealed beam unit lugs properly engage slots in sub-body, install retainer ring and rotate ring clockwise until lugs on ring engage under clamp screw heads on sub-body, or connect spring which secures retainer, tighten clamp screws securely. Then adjust headlamps as directed below.



ADJUSTMENT: All sealed beam lamp units are "prefocused" type so that the only adjustment required is to aim the lamp beam for correct horizontal and vertical position.

Headlamp Adjustm nt (All Cars)—Use conventional headlamp adjusting screen with vertical lines drawn directly ahead of each lamp center-line and horizontal line drawn 3" below (except "Shielded Filament" type) 2" below "Shielded Filament" type, and parallel to lamps centerline. Place car at 25 feet distance from screen, turn on lights and make certain that Upper Country Beam (lower filament) is lighted. Aim each headlamp as follows:

Horizontal Adjustment—With headlamp rim removed, turn adjusting screw at one side of lamp sub-body (do not confuse with retainer ring clamp-screws) until hot spot is centered on vertical line directly ahead of this lamp. Adjust other headlamp in same manner (both lamps aimed straight ahead).

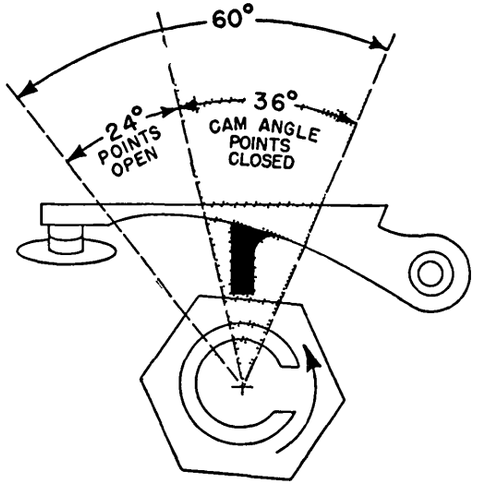
Vertical Adjustment—With headlamp rim removed, turn adjusting screw at top or bottom of lamp sub-body (do not confuse with retainer ring clamp-screws) until hot spot is centered on horizontal line specified above, below lamp center height. IMPORTANT—Beam may be directed downward as required by state laws, but should never be aimed higher than Specification above, below lamp center height.

►*SPECIAL AIMING EQUIPMENT NOTE:* T-3 Safety Aimer available for aiming "Shielded Filament" type units without use of screen. Follow Aimer Manufacturer instructions contained in Tool shipment when using this aimer.

SEALED BEAM HEADLAMP AIMING CHART

BREAKER POINT CAM ANGLE

CAM ANGLE (or DWELL): Cam Angle is the term used to indicate the number of degrees the distributor cam turns while the contact points are closed, during the ignition function for one cylinder of an engine. On a six cylinder distributor 60° covers the ignition function for one cylinder (1/6 of 360°), on an eight 45° (1/8 of 360°). On the six with a 36° cam angle this means the points are closed 36° (of the 60°) and open 24°. *See Diagram.* With the distributor in good condition the manufacturers specified point gap clearance provides the necessary cam angle for good coil operation throughout the speed range. Correct point closed period (cam angle) is important because it governs the time allowed for current to saturate the coil, which in turn governs coil output. As the speed of the engine increases the closed period time is also shortened, resulting in a weaker spark at high speeds. Although the coil output drops at high speeds there is sufficient spark strength to cover the engine requirements **providing the point gap and cam angle are set correctly.** At high speeds compression pressure tapers off due to decreased volumetric efficiency, and the weaker spark is still sufficiently strong enough to operate the engine satisfactorily.



Changing the Cam Angle—Increasing the point gap setting decreases the cam angle, and vice versa. Worn distributor parts causing sloppy point action also decreases cam angle.

Checking Distributor Condition with the Cam Angle Meter—Cam angle readings should not vary over 2° when the engine is accelerated from idle to high speed. A greater variation indicates worn distributor parts, high resistance, weak breaker arm spring, sloppy breaker plate bearings, etc.

Setting Point Gaps—Setting points with a cam angle meter, disregarding gap clearance is not recommended due to the many variables affecting cam angle readings. Point gaps must be set within the manufacturers specified limits. Using a dial gauge clamped to the distributor housing with the dial pointer (in line with the contacts) resting on the breaker arm, is the most accurate method of measuring gap clearance. Feeler gauges can also be used, but are not as accurate as the dial gauge.

AUTO-LITE

AUTO-LITE CONTACT GAP SETTINGS: Auto-Lite contact gap settings generally include a range such as .013-.017". The preferred setting in this case would be .015". Where one figure only (for example .017") is given, this is the preferred setting. A .002" plus or minus deviation from this setting is permissible, to allow for distributor wear.

TYPICAL 6 CYL. CAM ANGLE

Installing New Points—To allow for wear-in of the breaker arm rubbing block an additional .002" wider gap (over the preferred setting) is recommended, when installing new points.

DELCO-REMY

CAM ANGLE: For greater accuracy Delco-Remy specifies a Cam Angle Range to be used in checking distributors. This cam angle varies with different distributors although the point gap setting may be the same.

Delco-Remy Cam Angle Specifications are listed as specifications covering the different distributors. The cam angle range shown in the table is broad enough to cover the variables affecting cam angle readings. The cam angle range shown is a test setting. With the specified point setting shown in the table the cam angle should be within the range shown in table.

►***Distributors that are set to the test point setting, and do not fall within the cam angle range specified should be removed and checked on a distributor testing machine for worn parts, weak breaker arm springs, high resistance, etc.***

►**Point Settings**—***The point settings given in the table are not the operating settings of the points, but are used for test purposes only.***

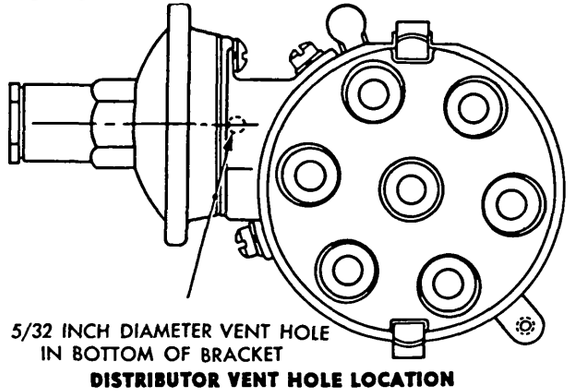
►***It is most important that the operating point gap be within limits specified by the manufacturer.***

Setting Point Gap—In setting the point gap a feeler gauge can be used, but use of a dial gauge is the most accurate method, clamping the gauge to the distributor housing with the dial pointer resting against the breaker arm in line with the contacts. It will be noted on some of the Car Pages that the operating point setting is shown as well as the test or range setting.

AUTO-LITE "IAR" & "IAP" DISTRIBUTORS

"IAP" & "IAR" CAP POPPING OFF CORRECTION

►**DISTRIBUTOR CAP POPPING OFF CORRECTION (Early "IAP" & "IAR" Distributors):** May be caused by one or both of the following conditions and can be corrected as indicated:



Distributor Cap Hold-down Spring Clips Incorrectly Formed—Lip at upper end of spring clip fitting into recess in cap may have too large a radius to permit spring to seat securely in cap recess. Correct by pinching the spring together at the end.

Ruptured Vacuum Control Unit Diaphragm (allowing fuel vapor to collect in distributor and blow cap off when ignited by spark)—Install new vacuum control unit and make certain that mounting bracket has ventilating hole on underside (see illustration). If bracket does not have this ventilating hole, **drill a 5/32" hole at this point.**

NOTE—This ventilating hole provided in production on later distributors.

DISTRIBUTOR PRODUCTION CHANGES

►**DISTRIBUTOR DRIVE SHAFT & CAM PRODUCTION CHANGE (All Distributors listed below):** A change was made in the following parts from staked to welded construction: **Drive Shaft & Weight Plate Assy.** and also **Distributor Cam Assembly.** Both type parts will be found in service and are interchangeable providing that correct washers (and anti-rattle spring in some cases) are used as listed below. When installing above parts, determine type of construction by inspection and select proper washers for use with these parts as follows:

DISTRIBUTOR VENT HOLE LOCATION

Thrust Washer Below Weight Plate①

Distributor	Staked Shaft	Welded Shaft
IGC, IGS, IGT, IGW	IG-90	IGS-104
IGB, IGC, IGP, IGR, IGS, IGT	IGB-162	IGS-104
IGW	IGW-46	IGS-104

Thrust Washer Abov Weight Plate②

IGC, IGP, IGR, IGS, IGT	IGK-26	IGS-99
IGW	IGW-36	IGW-92
IGW	IGW-59	IGW-92

Anti-rattle Spring

L.H. (all)	IGE-36	IGT-69
R.H. (all)	IGE-35	IGT-70

①—Between distributor base and weight plate on shaft.

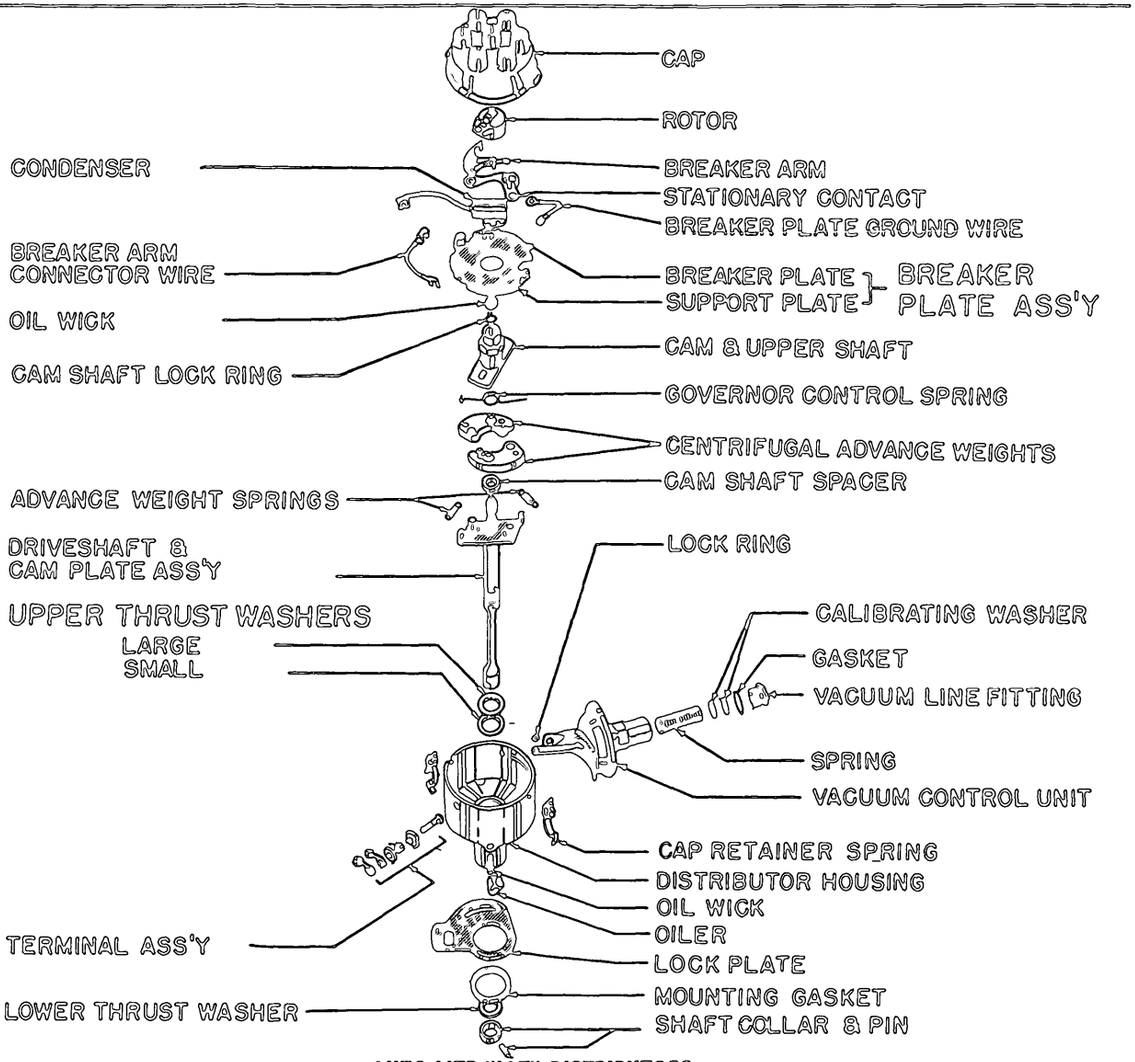
②—Between weight plate on shaft and cam assembly.

Staked Cam & Welded Shaft—When installing welded shaft in distributor with staked cam, change both washers as indicated above.

W lded Cam with Staked or Welded Shaft—Change anti-rattle spring (if used) as indicated above.

AUTO-LITE "IAT" TYPE

▷EARLY "IAT" DISTRIBUTOR BREAKER PLATE BINDING (Causing Low Gas Mileage, Spark Knock, or Engine Noise): Caused by breaker plate ground wire screw being too long and binding on support plate (preventing proper advancing and retarding of breaker plate by the vacuum control unit). Correct this condition by removing ground screw and grinding off lower end sufficiently to provide clearance when screw tightened down.



NOTE—Later "IAT" distributors have oblong slot in support plate at this breaker plate ground wire screw to provide clearance.

DESCRIPTION: Auto-Lite "IAT" distributors have new type breaker plate-and-support plate assembly for vacuum spark control (vacuum control unit mounted on distributor housing and linked directly to breaker plate). This assembly consists of a support plate rigidly mounted in the distributor housing and a separate breaker plate on which the contact assembly and condenser are mounted. Breaker plate is pivoted on support plate at a point under the condenser and rests on brass supports on the support plate. A tension spring on the underside of the support plate provides constant uniform friction between the two plates and governs the action of the vacuum unit in rotating the plate to advance or retard the spark.

▷*REPLACEMENT NOTE*—Breaker plate and support plate not furnished separately and must be replaced as an assembly if either part damaged or worn.

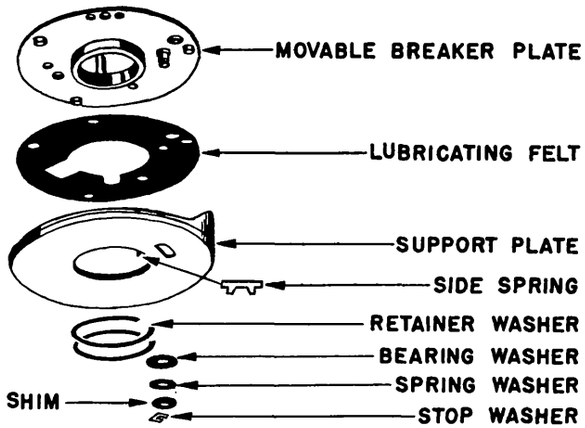
DISASSEMBLY: Remove distributor cap and rotor. Remove wire clip from vacuum unit link post on breaker plate, take out vacuum unit mounting screws on side of housing, tip vacuum unit to disengage link from breaker plate, remove unit (see Vacuum Unit data below for disassembly of this unit). Disassemble and remove terminal screw, take out three support plate mounting screws (including two cap spring clips), lift breaker plate assembly out. To disassemble breaker plate, remove terminal screw to disconnect connector wire and condenser pigtail, lift breaker arm off its pivot, take out condenser mounting screw and remove condenser, remove contact plate lockscrew and plain washer (this is also ground wire screw) and lift stationary contact plate off, disconnect ground wire from support plate (CAUTION—this completes breaker plate disassembly sinces plates not furnished separately). Remove oil wick from center of cam, remove spring lock from upper end of shaft (below wick in cam), lift cam out. Disconnect and remove weight control spring from cam, unhook both weight springs from anchor posts, lift advance weights out. Remove cam spacer from shaft. Drive out pin in collar at lower end of shaft, press shaft out of collar and housing. Remove upper and lower thrust washers.

OVERHAUL: Replace housing and bushings or install new bushings when shaft sideplay exceeds .005". Fit new bushings to .0005" maximum clearance. Use special tool (Auto-Lite LH-222) when installing upper bushing to insure proper positioning of the bushing in the housing bore and drill the oil feed hole at the oiler location through the bushing. Soak both bushings in engine oil for 15 minutes and drain before installing shaft. Shaft endplay should be .003" minimum, .010" maximum (with shaft collar riveted in place).

AUTO-LITE "IAT" DISTRIBUTORS

REASSEMBLY: Install all parts in reverse order of disassembly data above and note the following important points:

Lubrication—When assemblying parts, place a small amount of grease in bearing bore just above bearing and apply light film of grease to upper drive shaft washer, lubricate advance weight mechanism sparingly with medium engine oil, place one drop of light oil on each of the breaker plate support bearings and on pivot bearing (press on retainer spring under support plate to expose slight gap between spring and washer and apply drop of oil to washer). After assembly completed, place one drop of light oil on breaker arm pivot pin (operate arm several times, then remove excess oil), place 5 drops of medium oil on felt in center of cam and 3-5 drops in oiler on side of housing, apply light film of grease to breaker cam.



Cam & Advance Weight Installation—After advance weights and weight springs installed, install weight control spring on cam plate, position the cam on the shaft so that flat on cam is on same side as thicker portion on end of drive shaft and free end of weight control spring is against driving lug so that spring is under tension. Install spring lock on upper end of drive shaft to retain cam.

VACUUM CONTROL UNIT: Disassembly is limited to removal of the vacuum line fitting which will permit withdrawal of the calibrating washers and spring. Performance is controlled by the number and thickness of these calibrating washers which are furnished in thicknesses of .010", .032", .065". When reassembling unit, use same number and thickness of washers as were removed.

DESCRIPTION: These vacuum spark control type distributors have new "center-bearing" breaker plate assembly which supersedes earlier type mounted on three balls. Breaker plate assembly consists of a support plate rigidly mounted in the distributor housing and a separate breaker plate on which the contact assembly and condenser are mounted. Breaker plate rests on three bakelite buttons which slide on support plate when breaker plate is rotated by vacuum control. An oil-soaked felt between the plates provides lubrication for the buttons and plates are held together by a breaker plate post which extends down through a slot in the support plate with washers and tension adjusting shims on the post below the support plate on the first design (type A), while in the later design (type B) the post extends up through both the plates and has tension spring on top of movable plate. An additional "side" spring in the inner rim of the support plate assists in preventing tipping of the breaker plate in service. Spiral spring used on type B in place of bearing and spring washers.

DELCO-REMY "CENTER BEARING" BREAKER PLATE ASSEMBLY

BREAKER PLATE SPRING POST ASSY. (TYPES A & B)

►*REPLACEMENT NOTE*—Breaker plate and support plate are not serviced separately and entire Breaker Plate Assembly should be replaced if either part worn or damaged.

LUBRICATION: In addition to normal distributor lubrication, apply 3-4 drops of light engine oil (SAE 10W) to felt between plates at 5000 mile intervals.

DISASSEMBLY OF BREAKER PLATE: With assembly removed from distributor housing, remove stop washer ("C" washer) from post extending through support plate, remove adjusting shim (see Adjustment data), spring washer and bearing washer. Remove retainer washers, lift off breaker plate and lubricating felt. *NOTE:* Do not remove "C" washer and spiral spring from type B while assembly is in distributor as post will drop down into distributor bowl. Examine parts for wear of bakelite buttons or for grooving of support plate under buttons.

REASSEMBLY—Reverse disassembly instructions. Check movement of base plate and support plate. See breaker plate tension.

►*REASSEMBLY CAUTION*—Make certain that side spring is in place in support plate recess, lubricate felt with light engine oil, install all parts in correct order (See Illustration).

BREAKER PLATE TENSION: Breaker plate must have sufficient tension on support plate to prevent tipping or side movement of the plate but friction between plates must not be excessive (will interfere with correct operation of vacuum control). Whenever distributor being serviced or breaker plate reassembled, check and adjust tension as follows:

Checking—With breaker plate assembly out of distributor housing, support assembly in hand, hook spring scale to vacuum unit link connector post on breaker plate, measure pull required to rotate breaker plate on support plate. Check vertical movement by applying a spring scale (use "C" hook) at the stabilizing spring post and note force required to start vertical movement of the post. Minimum force required to rotate movable plate on support plate type "A" 20 ounces, type "B" 15 ounces. Force required to move assembly vertically on stabilizing spring post type "A" from 32 to 56 ounces, type "B" from 18 to 24 ounces.

►*CAUTION—Spring scale must be held parallel to plane of breaker plate for true reading of breaker plate tension.*

Adjustment—To change tension on type "A" increase or decrease number of tension washers, on type "B" increase tension by carefully stretching spring or replace it.

►*NOTE*—Adjusting shims are .010" thick (Delco-Remy Part No. 1912225).

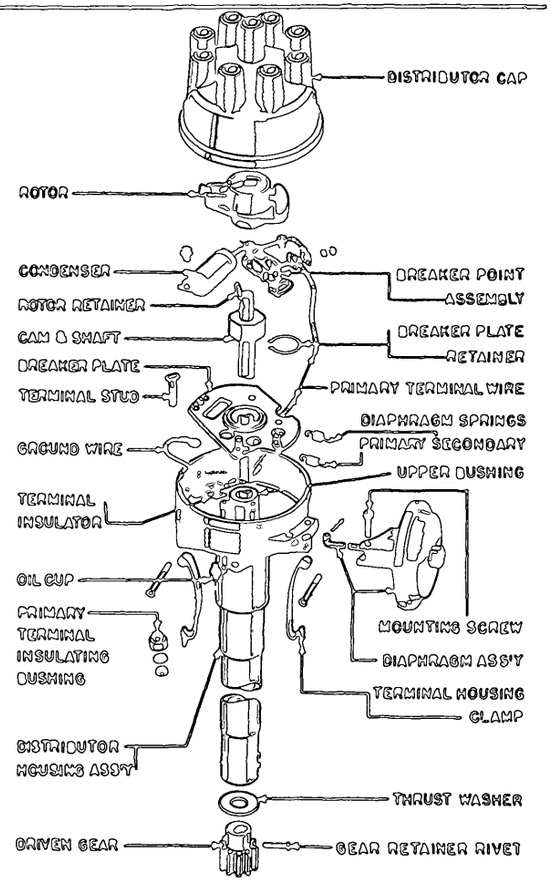
▷CHANGES, CAUTIONS, CORRECTIONS

▷*LINCOLN (FAF-12127-B), MERCURY (FAE-12127-C) DISTRIBUTOR OVER-ADVANCE WHEN ENGINE STARTED AT LOWER TEMPERATURE CORRECTION:* This condition noted when engine detonates excessively after starting under low temperature conditions Install new Pin & Post Assembly, Part No FDC-12357-A (as indicated below), which limits advance to 15°-15½° Earlier distributors that have been reworked in production are identified by the part number prefix "ED" *CAUTION—When calibrating a corrected distributor, refer to Automatic Advance Table FDD-12127-A (Lincoln), FDC-12127-A (Mercury).*

Pin & Post Assembly Installation—Remove distributor from engine Remove rotor and turn primary spring adjustment post (post farthest from diaphragm) counter-clockwise with Manzel Tool 12150-D, to remove all tension from spring and remove spring from post Support distributor in holding fixture and with a 1/16" pin punch, carefully remove fixed adjusting post Install new Pin & Post Assembly Part No 12357-A so that pin is parallel to breaker plate slot when in full advance position Attach primary spring and re-calibrate distributor to specification for FDD-12127-A (Lincoln), FDC-12127-A (Mercury) distributor *See Car Model pages for specifications.*

▷*FAA-12127-A DISTRIBUTOR PRODUCTION CHANGE (Converting No. FAA-12127-A to FAA-12127-C Distributor)*—To improve performance of 6 cylinder OHV 215 cu in engine Primary Spring, Part No 7HA-12225, on FAA-12127-A replaced by Primary Spring, Part No FAA-12225-A This change converts FAA-12127-A to FAA-12127-C New distributor must be calibrated to specifications below To identify, new spring has 5 coils instead of 7 When change made scribe or restamp suffix on identification plate to read "C" instead of "A"

▷*7RA-12127C DISTRIBUTOR CONVERSION TO LATER NO. 8BA-12127:* This change can be made by replacing the original No 7RA-12192 Distributor Primary Spring and the No 8BA-12225 Distributor Diaphragm Spring using TWO No 8EQ-12192 Distributor Primary Springs and adjusting the advance curve to the 8BA-12127 specifications See ADJUSTMENT data below When this change made, scribe or stamp "8BA" over the "7RA" designation on the distributor plate



▷Ford & Mercury Distributor Replacement Note—When replacing distributors of the 8BA, 0BA, 7RA, and 0CM types proper Cylinder Front Cover Assemblies must be used (below) *CAUTION* Distributor No OBA-12127 has shorter housing and shaft has extension below drive gear which is piloted in machined hole in cover This distributor will not operate satisfactorily if installed in cast iron cover (no provision for lower bearing)

Distributor	Front Cover No.	Front Cover Composition
8BA-12127	8BA-6059	Cast Iron
0BA-12127	0BA-6059-A	Aluminum
7RA-12127-C & D	8BA-6059	Cast Iron
OCM-12127 & B	0BA-6059-A	Aluminum

▷Excessive Pinging Correction—May be caused by obstructions in vacuum passages in carburetor interfering with correct operation of distributor advance mechanism Correct by disconnecting vacuum line and cleaning out all passages.

▷Mercury Distributor Timing Caution—Clearance between distributor vacuum diaphragm housing and water pump outlet or fan belt on engine should be ¼" to preclude interference in service Distributors with less clearances should be replaced.

CAUTION—When setting ignition timing, initial setting should be as near as possible to specified setting (see Car Model Page for instructions) but AT LEAST ⅛" CLEARANCE must be maintained between vacuum diaphragm and water outlet or fan belt.

FORD V8, LINCOLN, MERCURY DISTRIBUTOR
(FORD 6 CYL. SIMILAR)

▷*DISTRIBUTOR MODIFICATION & PRODUCTION CHANGE (Distr. Nos. FEC-12127-A & B5S-12127-D on Early 272 Special and Interceptor 292 Engines)* To minimize detonation, particularly in areas where fuel octane rating is below average, above distributors can be modified by replacing secondary spring (nearest vacuum chamber) with new spring, No 8EQ-12225, and recalibrating distributor advance as indicated in MODIFIED Advance Performance Table See Car Model Page *NOTE*—Later B5A-12127-F & B5S-12127-E Distributors have this spring and MODIFIED advance performance

▷*CAUTION* Above modification must NOT be made on 272 Std Engine Distr B5A-12127-B (will result in excessive spark advance and cause detonation)

DESCRIPTION: This "Loadomatic" or Pressure Type distributor is a full-automatic advance type in which the entire advance is provided by action of the vacuum diaphragm unit linked to the breaker plate (no centrifugal weights used) This advance action is controlled by the two diaphragm springs on the breaker plate which oppose diaphragm

CONTINUED ON NEXT PAGE

FORD, LINCOLN, MERCURY DISTRIBUTORS (C nt.)

movement. Springs may be of equal or unequal weight, but act together to produce the desired advance curve.

►*1953 LINCOLN DISTRIBUTOR:* This distributor has a DOUBLE diaphragm unit (units are in tandem and linked to breaker plate through a single link). Each carburetor port is connected to an individual vacuum diaphragm chamber through a separate vacuum line *See Diaphragm Testing data below.*

►*1955 LINCOLN & MERCURY DISTRIBUTOR:* A hex-type oil pump drive replaces the tang and slot drive used on previous models.

OPERATION: The diaphragm vacuum line is connected to the carburetor and terminates in two separate ports: 1) Upper Port in carburetor venturi tube, 2) Lower Port in carburetor throat just above throttle valve edge. Vacuum at these ports, and consequent suction in line, varies in accordance with engine operating conditions to provide correct advance as explained below. *NOTE*—On 1953 Lincoln with double diaphragm unit, the two carburetor ports are connected separately by individual lines to the Primary Distributor Vacuum Diaphragm (connection on end of unit), and to the Secondary Distributor Vacuum Diaphragm (connection on side of unit)

Idling Speed (Closed Throttle)—Vacuum is at minimum at both carburetor ports (lower port above throttle valve) and breaker plate is retarded by springs. Spark occurs at the initial timing point with no automatic advance.

Normal Driving (Part Throttle)—Vacuum is high at both carburetor ports and vacuum diaphragm unit advances timing progressively until maximum advance point is reached at 18-35 MPH.

Acceleration—Vacuum at upper (venturi) port is high but vacuum at lower (carburetor throat) port decreases under these conditions. This results in a lower vacuum at the diaphragm unit and timing is retarded by breaker plate springs from the normal road load point.

Wide open Throttle (High Speed): On 1952-55 Lincoln, and 1950-55 Mercury (1950 carburetors stamped "6-50" and later), a nylon ball check valve is located in the carburetor passage between the lower and upper ports (controls lower port only). At nearly wide open throttle, the ball will be drawn up and seated at the upper end of the passage which reduces the "bleed" effect of the lower port. This results in a higher distributor vacuum and maintains maximum spark advance.

►*SPARK CONTROL VALVE (1952-55 Lincoln, 1954-55 Ford & Mercury):* Spark control valve is normally closed whenever the engine is not running which closes off the lower (manifold vacuum) port in the carburetor from the distributor vacuum line (except for small by-pass passage in the valve which has a metering restriction). With the engine running at normal road load, manifold vacuum in sufficently high to overcome the valve spring tension (spring is calibrated to provide the correct vacuum) and the valve is normally open so that the distributor advance is controlled by the balanced action of the two ports (above). During acceleration when throttle valve is open wider than normal (for existing engine speed), the drop in manifold vacuum causes the spark control valve to close preventing excessive spark advance and engine ping.

TESTING

►*TEST EQUIPMENT NOTE:* Testing and adjustment of these distributors requires use of special test equipment which includes the following units:

(1) Vacuum Pump—Should be capable of producing vacuum up to 21" of mercury and have a control to regulate vacuum in the test line.

(2) Vacuum Gauge—Must be accurate to small readings required in checking vacuum advance and adjusting advance springs. Mercury manometer or other type gauge can be used.

(3) Tachometer.

(4) Distributor Test Fixture or Stroboscope—Must accurately indicate distributor advance performance.

Distributor Vacuum Line Test: This test can be made on the engine to determine if vacuum at distributor is within specified limits for proper operation of the distributor vacuum advance *(CAUTION*—This test can be made only if vacuum diaphragm test indicates no leaks exist—see above). Connect a "T" test fitting in vacuum line to distributor, connect vacuum gauge to this fitting, operate engine at speeds listed in table below and check vacuum reading. If vacuum readings not within limits shown, blocked passages in carburetor throttle body are indicated. *NOTE*—Carburetor idle mixture adjustment and ignition timing must be correctly set before test is made.

DISTRIBUTOR LINE VACUUM

Ford 6 Cyl. (1949-51)		Ford V8 (1949-53)	
Eng. RPM①	Vac. (" of HG)	Eng. RPM①	Vac. (" of HG)
800	.5-.7	800	2.0-2.9
1000	1.2-1.6	1000	3.5-4.8
2200	4.8-6.6	2200	4.7-6.4
2400	4.9-6.7	2400	4.6-6.2

Lincoln (1950-51)		Mercury (1949-51)	
Eng. RPM①②	Vac. (" of HG)	Eng. RPM①②	Vac. (" of HG)
800	0.25	800	0.95
1000	0.80	1000	2.25
1200	1.70	1200	3.30
1400	2.40	1400	4.15
1600	2.80	1600	5.10

①—"No load" operation.

②—Allowable variation plus or minus 0.5".

Vacuum Diaphragm Test: Operate vacuum pump and adjust line vacuum to exactly 7" (with line closed). Connect vacuum line to distributor vacuum unit connection. Vacuum gauge should indicate 7". Lower reading indicates leak in vacuum unit (punctured diaphragm etc.).

►*1953 LINCOLN "DOUBLE DIAPHRAGM" VACUUM UNIT CAUTION:* Test procedure and vacuum gauge reading (above) are correct when checking Primary Diaphragm Unit, connection on end of vacuum unit). When checking the Secondary Diaphragm Unit (connection on side of unit), vacuum reading should be **not less than 4"** (with closed line reading of 7"). This lower reading is caused by inherent leakage at the diaphragm rod seal and does not mean that the diaphragm unit should be replaced.

Distributor Advance Test: Install the distributor on the test fixture, connect vacuum pump line to distributor vacuum unit. Regulate distributor RPM. and vacuum, and check advance performance. If advance not correct, primary and secondary springs should be adjusted. See ADJUSTMENT data below.

►*SEE INDIVIDUAL CAR MODEL PAGES FOR ADVANCE DATA ON EACH DISTRIBUTOR MODEL.*

ADJUSTMENT

ADJUSTMENT: Distributor Breaker Gap, Contact Dwell, Spring Tension, and Advance Specifications *—See individual car model pages in Car Model Section*

►*CAUTION—Do not disturb spring tension adjustment (slotted eccentric spring posts on breaker plate) unless Stroboscope used to check advance performance.*

Automatic Advance Adjustment (All Models except 1953 Lincoln Double-Diaphragm Distributor): Install distributor on test fixture, adjust distributor speed to 200 RPM. Hold distributor breaker plate in full retard position against the stops and line up zero degree on scale with timing light flash, tighten distributor holding clamp. Release tension on both breaker plate springs by turning adjusting posts, then adjust Primary and Secondary Springs in order and exactly as follows. *NOTE—See illustration for location of Primary & Secondary Springs on each distributor.*

Primary & Secondary Spring Adjustment—*(NOTE —See Car Model pages for distributor vacuum and advance specifications).* Adjust the primary spring first, for the low vacuum setting, and the secondary spring last, for the high vacuum setting. *NOTE— If it is impossible to adjust both springs to give the correct spark advance throughout the range as specified on the Car Model page, one or both springs should be replaced and the spark advance readjusted.*

Final Performance Check—Check vacuum advance at various speeds. The degrees advance should be within the limits given in distributor specification tables *(see individual car models in Car Model Section).* If the spark advance is not within these limits at low vacuum, the primary spring is at fault. If not within limits under high vacuum, the secondary spring is at fault.

Automatic Advance Adjustment (1953 Lincoln Double-Diaphragm Distributor): *CAUTION—Spark control cable assembly must be removed from distributor (see OVERHAUL Note below) to prevent inaccurate spring adjustment due to breaker plate rubbing against cable.* Mount distributor on test fixture, connect vacuum line to PRIMARY diaphragm (fitting on end of unit). Regulate vacuum and distributor RPM. and adjust spring tension to secure the advance performance listed below. Then connect vacuum line to SECONDARY diaphragm (fitting on side of unit), and spot check the advance at several of the calibration points listed in the table. After adjustment completed, connect spark control cable and recheck distributor advance performance to insure that breaker plate does not bind or stick.

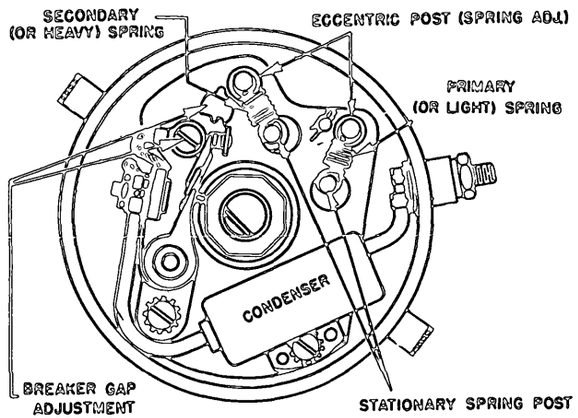
FORD, LINCOLN, MERCURY DISTRIBUTORS (Cont.)

OVERHAUL

OVERHAUL: *NOTE*—Holding Fixture 12131-N or T52L-12132-CGD (Ford 6 Cyl.); T52T-12132-DJD (Ford 8 Cyl.); 12132-B (1950-51 Lincoln & Mercury); 12132-D (1953-55 Lincoln & Mercury is recommended to enable distributor to be clamped in vise for service work.

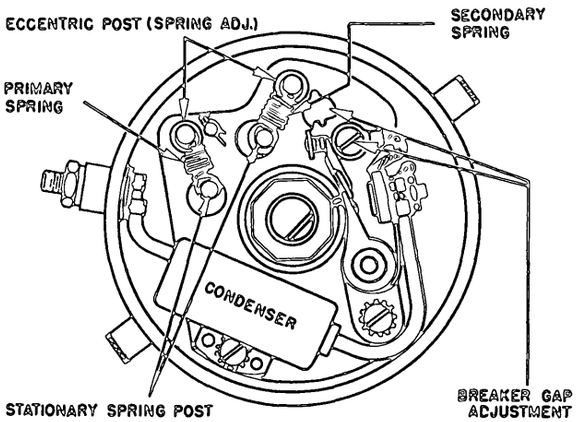
▷*1953 LINCOLN CAUTION*—This distributor has a spark control cable which must be disconnected and removed as follows: Rotate breaker plate clockwise to the stop position, use small screwdriver to pry end of cable from between two tines below breaker plate, loosen Allen setscrew at side of distributor housing, slide cable out.

Disassembly: Remove distributor point assembly and condenser. Release tension on breaker plate springs by turning spring adjustment posts counterclockwise (use tool 12150-N or 12150-D), unhook springs from fixed studs *(CAUTION*—Use care to avoid stretching or distorting springs). Remove hairpin retainer linking vacuum diaphragm rod to breaker plate and push rod end out of plate. Remove lock ring from groove in upper end of distributor shaft upper bushing, lift breaker plate out. File off peened end of distributor drive gear pin, support gear on suitable fixture *(See Holding Fixture Note above)* and drive pin out, remove gear from shaft (use puller if gear tight on shaft). *(NOTE*—On some distributors, remove collar pin and collar in same manner as for gear removal). Slide shaft assembly out through top of housing.



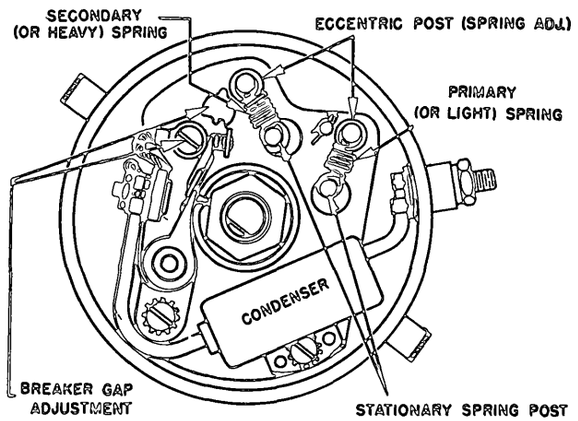
Bushing Replacement: If distributor shaft and bushings worn, replace bushings as follows:

Bushing Removal (All Distributors)—Use driver, Ford No. 12132 or 12132-B1, Lincoln & Mercury No. 12132-B1. On all distributors except 1952-55 Lincoln, insert driver through top bushing and drive lower bushing out through bottom of housing, then reverse housing and drive top bushing out through top of housing (upper bushing only on Lincoln 1952-55 distributor).



Bushing Installation (Except 1952-55 Lincoln)—Use installing tool, Ford No. 12132-P or 12132-A, Lincoln & Mercury No. 12132-A, to press lower bushing in until bottom of bushing flush with lower end of housing. Use same tool with correct spacer or adapter to install upper bushing (lock ring end up). The tool spacer will correctly position the bushing in the housing. Burnish new bearings to correct size using Burnisher Tool, Ford No. 12132-Q or 12132, Lincoln & Mercury No. 12132.

Bushing Installation (1952-55 Lincoln—Use tool 12132-A (see Tool Note below) to install new bushing in upper end of distributor housing. Tool will correctly position bushing. Burnish bushing to size with Burnisher Tool No. 12132.



▷Bushing Installing Tool Note—Sleeve section of tool (which fits over bushing) must have 60° chamfer at lower end to allow it to bottom against distributor housing. Grind this 60° chamfer on sleeve before using it on this type distributor. Later tool sleeves have this chamfer.

Reassembly: Install all parts in reverse order of disassembly procedure above. If old shaft and gear being re-used, install as follows:

Distributors Without Shaft Collar & Pin—Press gear on shaft until hole in shaft and gear is aligned, install new pin and peen end of pin securely. Check endplay with feeler gauge inserted between gear thrust washer and distributor housing. Endplay should be .002-.005". If endplay not correct, new shaft must be installed.

Distributors With Shaft Collar & Pin—Press collar on shaft until hole in shaft and collar is aligned, install new pin and peen securely. Check endplay with feeler gauge inserted between collar and housing. Endplay should be .020-.024". If endplay not correct, new shaft must be installed. Align mark on gear with mark on shaft and press gear on until pin holes aligned, install pin and peen end of pin securely. Check gear position on shaft using Gauge 12390-D, or measure from bottom of gear to lower face of distributor mounting pad. This distance should be 4.991-4.996".

New Shaft & Gear Installation (Distributors Without Shaft Collar & Pin)—Align marks on gear and shaft, press gear on shaft until .002" feeler gauge is just tight between thrust washer and housing. Use a No. 30 drill (.1285") to drill new pin hole in shaft (drill half-way through from each side), install new pin and peen end of pin securely. Recheck endplay.

New Shaft & Gear Installation (Distributors With Shaft Collar & Pin): Attach distributor shaft supporting tool to distributor and place the assembly in holding fixture. Clamp it in vise. Insert a .020" feeler gauge between backing screw of holding fixture and end of distributor shaft. Tighten backing screw to remove all endplay. Remove gauge and allow shaft to rest on backing screw. Place collar in position on shaft, against the distributor housing and drill a ⅛" hole through shaft and collar using hole in collar as a pilot. Install pin and peen it securely in place. Check shaft endplay which should be .020" to .024". Before installing distributor gear, remove all endplay by tightening backing screw. Press gear on shaft until distance from bottom of gear to lower face of distributor mounting pad is 4.991-4.996", or use Gauge 12390-D to measure this distance. Drill a ⅛" hole through shaft using the pin hole in gear shoulder as a pilot. Drill only halfway through from each side. Install pin and peen securely.

Adjustment: Make all adjustments as listed under ADJUSTMENT above.

LUBRICATION: *CAUTION—Oil or grease on contacts usually caused by use of wrong type or excessive amount of lubricant.*

►CHANGES, CAUTIONS, CORRECTIONS

►**POLARIZING GENERATOR:** Generator should be polarized each time it has been disconnected before using. Connect jumper wire momentarily from starting switch battery connection to generator 'A' terminal (after all connections have been made). This momentary surge of current through generator windings will polarize generator for correct operation.

►**REGULATOR PRODUCTION CHANGES & NEW SPECIFICATIONS:** Changes made in production on various units as follows:

►"VRP" SERIES

►**"VRP" SERIES REGULATOR WIRING CHANGE**—New type current regulator winding (single heavy winding—see illustration) used on following regulators:

Beginning Dec. 1947 (Serial #12B Up)—VRP-4002B; 4004B, 4C, 4C-1, 4CX, 4D, 4E, 4G, 4H, 4K; 4005B, 5C, 5D; 4006A, 6AP, 6B, 6C, 6D, 6E, 6G; 4007A, 7D; 4009A, 9B, 9D; 4010A.

Beginning Sept. 1948 (Serial #9C Up)—VRP- 4001A, 1AX, 1B, 1C, 1D, 1E, 1F, 1G; 4002A, 2C, 2D; 4003A; 4004E, 4F, 4F-1, 4F-2, 4FX, 4J; 4007B, 7C, 7C-1, 7C-2; 4008A, 8B, 8C, 8D; 4009C; 4011; 4301AM; 4401C; 4402A, 2B; 4403A; 4404A; 4501C; 4502A, 4503A, 3AX.

All units of following models—VRP-4103A, 3B; 4104A, 4B, 4B-1; 4105A, 5AM; 4107A; 4302AM, 2BM; 4303AXM, 3BM; 4304AM; 4402C; 4405A; 4503B, 3BX, 3C; 6001A, 1B; 6002A.

All units of following models (with Single Resistor "R1")—VRP-4101A, 4102A, 4102AX, 4106A, 4106B.

►"VRR" SERIES

►**VRR-4006A, 7A Regulator Voltage Setting Caution**—Before testing or adjusting voltage regulator on these models, regular TC-51 resistor (1.85 ohms) should be replaced by TC-51T (20 ohm). CAUTION—Replace the regular TC-51 (1.85 ohm) resistor after adjustments completed.

DESCRIPTION

DESCRIPTION: These two-unit (VRR), and three-unit (VRP, VAV, VBA) regulators are similar in design to previous type regulators except for production changes (noted above) and following new features:

CONTINUED ON NEXT PAGE

AUTO-LITE REGULATORS VAV, VRP, VRR, VRS, VRT, VRU, VRW, VRX TYPES (Cont.)

Cutout Relay—New type armature with contact mounted on spring so that armature seals against yoke after contacts close. Designed to produce wiping action of contacts.

Current Regulator Winding—Single winding used on VRP-4100 Series, VRP-4302A, VRS Series, VRU Series, VRW Series. Two windings used (as shown in illustration) on VRP-4000, 4200, 4300 (except VRP-4302A), and VRX Series.

ARMATURE SPRINGS

Armature Springs (All Units)—Several different types of armature springs are used and correct type spring must be used on each unit as follows:

Model	Cutout Relay	Voltage Reg.	Current Reg.
"VAV" Series	10½ turns	14½ turns	⑥14½ turns
"VBA" Series	10¾ turns	14½ turns	14½ turns
"VRP" Series	①10¾ turns	14½ turns	②14½ turns
"VRR" Series	①10¾ turns	14½ turns	
"VRS" Series	①10¾ turns	14½ turns	②14½ turns
"VRT" Series	①10¾ turns	14½ turns	
"VRU" Series	①10¾ turns	14½ turns	⑤10¾ turns
"VRW" Series	①10¾ turns	14½ turns	③14½ turns
"VRX" Series	①10¾ turns	14½ turns	10¾ turns

①—Beginning Serial No. 12X-000001 (12¾ turns before this number).
②—Beginning Serial No. 8B-. 10¾ turns (Serial No. 12X- to 8B-), 12¾ turns (before Serial No. 12X-000001).
③—Beginning Serial No. 8B-. 10¾ turns (Serial No. 12T- to 8B-), 12¾ turns (before Serial No. 12T-000001).
⑤—On VRU-4001A, was 12¾ turns before Serial No. 12T-000001.
⑥ Before serial date 8B, was 10¾ turns.

CHECKING & ADJUSTMENT

CHECKING & ADJUSTMENT: Check each unit as directed below.

CUTOUT RELAY

Model	Voltage Winding Resistance	Contact Gap	Air-Gap
All VAV, VRP & VRR Series	29.8-33.0 ohms	.015"	②.031-.034"
All VRS 4000 to 6000 Series	118-132 ohms	.015"	.031-.034"
All VRT, VRU Series	118-132 ohms	.015"	.031-.034"
All VRW Series	29.8-33.0 ohms	.015"	.031-.034"
All VRX Series	111-132 ohms	.015"	.031-.034"

②—On VRP-4200 Series original Air Gap Setting was .034-.038".

Winding Resistance—Use Ohmeter (ST-284) to measure resistance directly, measure from regulator 'A' terminal to ground with voltage regulator lead disconnected from cutout relay yoke.

Air Gap—Use flat gauge ST-281-9 (.031-.034"), ST-281-3 (.034-.038"), ST-281-7 (.048-.052") to measure between magnet core and armature at point as close to armature hinge as possible with contacts open. Adjust by bending armature stop and make certain that stop does not rub against edge of armature.

NOTE—Armature 'seals' against yoke after contacts close and air gap must be measured with contacts open.

Contact Gap—.015" Min. (all models). Gap must not be less than .015" but may exceed this figure in service. With correct adjustment, contacts will close and armature will then 'seal' against yoke. CAUTION—If contact gap too large, contacts will not close before armature seals against yoke (armature must have further travel to effect this sealing).

Closing Voltage—Connect ammeter in charging line at regulator 'B' terminal, connect voltmeter between 'A' terminal and ground. Operate generator and increase speed slowly until contacts just close but without sealing against yoke, note voltmeter reading at this point (NOTE—a 2000 ohm earphone connected between 'B' terminal and ground may be used to check closing. a click will be heard as the contacts close). To adjust, use tool ST-283 and adjust armature spring tension by bending lower spring hanger. Increase spring tension to increase closing voltage, lower spring tension to decrease voltage. CAUTION—Closing voltage must always be set .5 volts less than Voltage Regulator setting

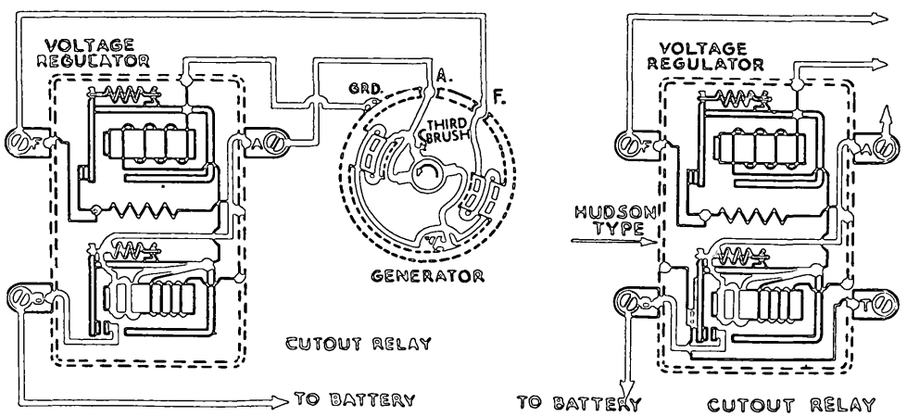
Opening Voltage or Amperage—Connect meters as for Closing Voltage Check (above), decrease generator speed slowly and note voltmeter (or ammeter) reading as contacts open. Adjust by changing contact gap (see above).

CUTOUT RELAY SETTING

Model	Contact Closing Voltage	Contact Opening Voltage
VBA-4001A	6.3-6.8	4.1-4.8
VAV-4000 to 7000 Series	6.3-6.8	③4.1-4.8
VRP-4000 to 8000 Series	6.3-6.8	③4.1-4.8
VRR-4000 to 5000 Series	6.3-6.8	③4.1-4.8
VRS-4000 to 6000 Series	⑤13.0-13.75	⑥8.2-9.3
VRT-4000 Series	⑤13.0-13.75	⑥8.2-9.3
VRT-4102A	12.8-13.5	⑥8.2-9.3
VRU-4000 to 5000 Series	⑤13.0-13.75	⑦8.2-9.5
VRW-4000 to 8000 Series	6.3-6.8	③4.1-4.8
VRX-4000 to 6000 Series	⑤13.0-13.75	⑨8.2-9.3

③—4 to 6 amps. approximate discharge current.
⑤—Operating range of the following units is 12.8-13.50 volts: VRS-4015AX, 4201A,AX, 6005AXT, VRU-4004AX, 5004AX, VRX-4001B,BX, 4003AX,BX,B,C, CX, 4004A,5A,5AX, 5003CX.
⑥—1.0-5.0 amps. approximate discharge current.
⑦—1.0-4.0 amps. approximate discharge current.
⑨—Contacts open 3 to 5 amperes discharge.

VOLTAGE REGULATOR



Model	Winding Resistance	Contact Gap	Air Gap
All 'VAV' & 'VBA' Types	10.8-12.0 ohms		.048-.052"
All 'VRP', 'VRR' Types	10.8-12.0 ohms	.012" Min.	.048-.052"
All 'VRS', 'VRT' Types	43.7-49.3 ohms		.048-.052"
All 'VRU' Types	43.7-49.3 ohms		.048-.052"
All 'VRW' Types	10.8-12.0 ohms		.048-.052"
All 'VRX' Types	43.7-49.3 ohms	.012" Min.	.048-.052"

Air Gap (All Series)—.048-.052" (pin gauge ST-281-7). Measure at stop pin on contact side with contacts just opening. Test air gap by connecting test lamp and battery between 'F' terminal and ground. Insert low limit pin gauge, depress armature by hand, lamp should dim or go out. Repeat test with high limit pin gauge. Lamp should remain lighted. To adjust air gap, loosen screw holding upper contact bracket, use tool ST-282 to raise bracket (to increase gap), tap top of bracket to lower contact (to decrease gap), tighten screw. See that contact spring is straight and parallel with armature.

Contact Gap (VRP & VRR Series)—.012" min. holding armature down against stop pin (CAUTION—do not press on contact spring, press down on armature evenly on both sides of spring). Gap may vary in service, if gap variation too great stop pin is wrong length and unit should be replaced.

Voltage Setting Check—Connect ammeter in charging line at regulator 'B' terminal (ammeter must read to 1 ampere and internal resistance must not

VOLTAGE REGULATOR CIRCUITS

AUTO-LITE REGULATORS VAV, VRP, VRR, VRS, VRT, VRU, VRW, VRX TYPES (C nt.)

exceed .01 ohm, use short heavy leads for connections), connect voltmeter between regulator 'B' terminal and ground (meter must read to .1 volt). Make certain that car battery is fully charged with gravity reading of 1.275-1.280 (substitute fully charged battery if car battery run down). Run engine at speed equivalent to 30 MPH for at least 15 minutes with generator charging battery to bring regulator up to operating temperature. Then note voltmeter reading which should agree with table below.

Adjustment—Use tool ST-283 to vary armature spring tension by bending arm at lower end of spring. Increase spring tension to increase voltage, decrease tension to decrease voltage. Replace cover and recheck performance.

VOLTAGE & CURRENT REGULATOR

AUTO-LITE REGULATORS VAV, VRP, VRR, VRS, VRT, VRU, VRW, VRX TYPES (Cont.)

CURRENT REGULATOR TEST (Not Temperature Compensated): Connect test meters as directed for Voltage Regulator Check (above). Then connect load in excess rated capacity of regulator at point between regulator and battery (use bank of headlamp bulbs, or turn on all lights and accessories). Note ammeter reading with current regulator operating. Generator must be within 5% of rated capacity of regulator under test.

▷*CAUTION—All regulator tests must be made with regulator cover in place.*

▷NOTE—When adjusting current regulator, the voltage regulator can be prevented from operating by installing a jumper across the voltage regulator points.

CURRENT REGULATOR SPECIFICATIONS

Model	Current Setting	Contact Gap	Air Gap
All 'VBA' Types	See Table		.048-.052"
All 'VRP' Types	See Table	.012" Min.	①.048-.052"
All 'VAV' Types	See Table		.048-.052"
All 'VRS' Types	See Table		②.048-.052"
All 'VRU' Types	See Table		③.048-.052"
All 'VRW' Types	See Table		.048-.052"
All 'VRX' Types	See Table.	.012" Min.	.048-.052"

①—After Serial No. 5U-000001. Before this No., Air Gap was .034-.038".

②—After Serial No. 12T-000001. Before this No., Air Gap was .034-.038".

Armature Spring Note—Different springs used. See Armature Spring Table.
Contact Gap—Set in same manner as for Voltage Regulator.
Air Gap—To check air gap, use pin gauge ST-281-7 (.048-.052") or ST-281-6 (.034-.038"). Check and adjust gap in same manner as for Voltage Regulator.

FINAL "FLASH" TEST: After adjusting regulator, final flash test should be made after regulator cover replaced, by operating generator and noting regulator performance immediately.

CURRENT REGULATOR

NOTE—Data below applies to types with separate Current Regulator only.

REGULATOR RESISTORS: One resistance unit used on 'VRR' regulators, two used on 'VAV', 'VBA', 'VRP' models (see VRP illustration for resistor locations). Resistors should be checked for correct resistance by testing with ohm meter (ST-284).

VOLTAGE REGULATOR RESISTORS

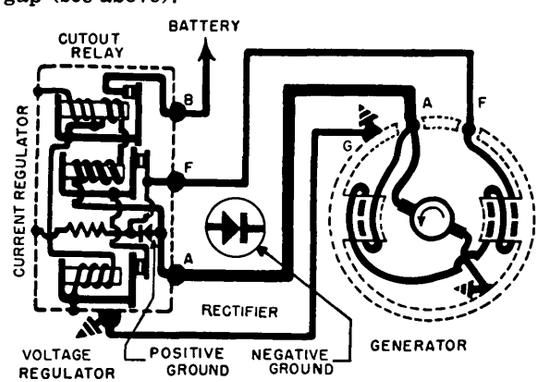
①—For Negative Ground, use VAV-6002A.
②—For Negative Ground, use VBA-4104A.
③—For Negative Ground, use VBA-4104B
④—For Negative Ground, use VBA-4204A
⑤—For Negative Ground, use VAV-6002B
⑥—Replaced by VBF-6002A

►*6 & 12 VOLT REGULATOR NOTE:* Specifications and data for both 6 and 12 volt units is given below.

►*GENERATOR & REGULATOR POLARITY CAUTION:* Regulator and battery ground polarity must be the same. See individual car model table above for Generator and Regulator type and battery ground data

DESCRIPTION: The Regulators that follow are all of the "Temperature Compensated" type consisting of a CUT-OUT UNIT, a VOLTAGE CONTROL UNIT and a CURRENT REGULATING UNIT. When correctly adjusted, test readings will be the same as appear in the tables below.



CHECKING & ADJUSTMENT (CUT-OUT RELAY): Check and adjust contact gap and air gap first before checking closing and opening voltage.

Air Gap: .031-.034" (All Models). Use flat gauge (ST-281-9—.031-.034") to measure between magnet core and armature at a point as close to armature hinge as possible **with contacts open.** Adjust by bending armature stop and make certain that stop does not rub against edge of armature.
NOTE—Armature 'seals' against yoke after contacts close (measure air gap with contacts open).

Contact Gap—.015" Min. (all models). Gap must not be less than .015" but may exceed this figure in service. With correct adjustment, contacts will close and armature will then 'seal' against yoke. CAUTION—If contact gap too large, contacts will not close before armature seals against yoke.

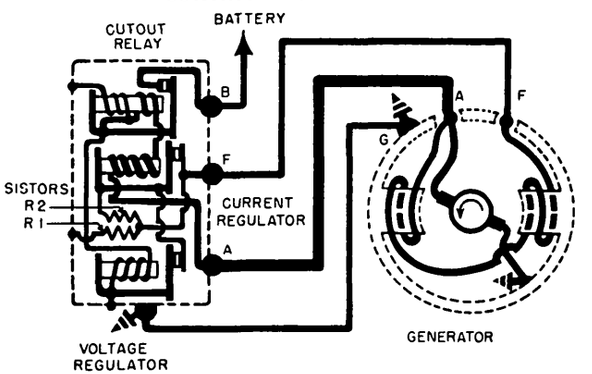
Closing Voltage—Connect ammeter in charging line at regulator 'B' terminal, connect voltmeter between 'A' terminal and ground. Operate generator and increase speed slowly until contacts just close **but without sealing against yoke,** note voltmeter reading at this point. To adjust, use Tool ST-283, adjust armature spring tension by bending lower spring hanger. *CAUTION*—Closing voltage must always be .5 volt less than voltage regulator setting.

Opening Voltage or Amperage—Connect meters as for Closing Voltage Check (above), decrease generator speed slowly and note voltmeter (or ammeter) reading as contacts open. Adjust by changing contact gap (see above).

"VBF" REGULATORS

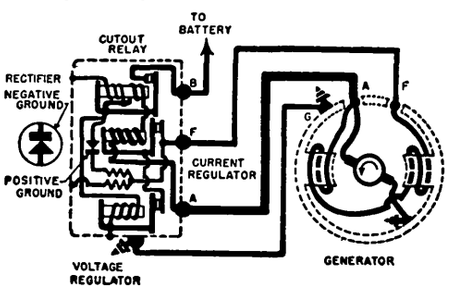
Cutout Relay Settings

Model	Contact Closing Voltage	Contact Opening Voltage
VAV	6 3-6 8	4 1-4 8
VBA	6 3-6 8	4 1-4 8
VBE	6.3-6 8	4.1-4 8
VBF	6 3-6 8	4 1-4 8
VRP	6 3-6 8	4 1-4 8
VRX (12 Volt)	13.0-13.75	⑨8.2-9 3



⑨—Contacts open 3 to 5 amperes discharge.

CHECK & ADJUST (VOLTAGE REGULATOR):



Air Gap (All Series)—.048-.052" (pin gauge ST-281-7). Measure at stop pin on contact side with contacts just opening. Test air gap by connecting test lamp and battery between 'F' terminal and ground. Insert low limit pin gauge, depress armature by hand, lamp should dim or go out. Repeat test with high limit pin gauge. Lamp should remain lighted. To adjust air gap, loosen screw holding upper contact bracket, raise bracket to increase gap, lower bracket and contact to decrease gap. Contact spring must be straight and parallel with armature.

Voltage Setting Check—Connect ammeter in charging line at regulator 'B' terminal (ammeter must read to 1 ampere and internal resistance must not exceed .01 ohm, use short heavy leads for connections), connect voltmeter between regulator 'B' terminal and ground (meter must read to .1 volt). car battery must be fully charged (substitute fully

charged battery if car battery run down). Run engine at speed equivalent to 30 MPH for at least 15 minutes with generator charging battery to bring regulator up to operating temperature Then note voltmeter reading (see voltage table below).

Adjustment—Use tool ST-283 to vary armature spring tension by bending arm at lower end of spring. Replace cover and recheck performance

CHECK & ADJUST (CURRENT REGULATOR):

Air Gap (All Series): 048- 052" (pin gauge ST-281-7) Check and adjust as for voltage regulator (above)

Testing "Temperature Compensated" Current Regulators: *CAUTION—Tests are made in two steps "Test A" and "Test B" as listed below.* Connect test meters as directed for Voltage Regulator Check (above).

Test A—Operate generator for 15 minutes charging at ½ maximum rate (VAV, VBE, VBF, VRP Regulators), at 10 amperes (VBA, VRX Regulators), then note ammeter reading with current regulator operating Should agree with "Test A" figure in table below

NOTE—If regulator not cold at start of test, Test A reading may be slightly less than specified due to higher temperature.

►*TEMPERATURE CAUTION*—When checking regulator temperature with a thermometer, hold thermometer two inches away from regulator (must not touch regulator).

Test B—Add load on battery to hold voltage to "Test B" Table below to insure current Regulator operation Run generator for 15 minutes with current regulator operating, then note ammeter reading Should agree with "Test B" figure in Current Setting Table below

"B" Test Voltage.

AUTO-LITE REGULATOR VRY TYPES

IMPORTANT SERVICE CAUTION: These regulators must always be used with th generators for which they are intended as these units are not wired in the same manner as other Auto-Lite units. Do not operate a regulator or generator of this type with other type units either on the car or on the test bench.

Regulator Model	Battery Ground Polarity
VRY-4101A; VRY-4201A, B, C; VRY-4202A	Positive
VRY-4203A, B, C, D, E, F, G; VRY-4204A	Negative

DESCRIPTION: Regulators are of the "three-unit" type (separate Cutout Relay, Voltage Regulator, and Current Regulator units). Units are similar design to other Auto-Lite regulator units but are wired differently. See car model pages for internal wiring diagram of regulator and generator. Regulators are designed for use with Positive or Negative battery ground

OPERATION: Similar to other three-unit regulator and shunt type generator installations except that the regulator "feeds" the generator field and the other end of the field winding is grounded to the generator frame. This is reversed from other types (where field "feed" is directly from the generator main brush and the field is grounded through the regulator) and is the reason these special type regulators and generators must always be used together. Regulators are vibrating type (current regulator has second winding to accelerate action of the current regulator armature). Voltage regulator is compensated for temperature (nickel-iron magnetic bypass type).

CHECKING & ADJUSTMENT: Before checking and adjusting the individual regulator units, make a complete visual inspection of the entire regulator and each unit as follows:

Regulator Inspection—Check for burning or other evidence of high temperature at coils, contacts, insulation, terminals, and other points. Check for loose connections, loose mounting nuts, rivets or screws, corrosion or other water damage, broken or incorrect resistors, loose or incorrect resistors, loose or incorrect wiring connections, defective gaskets.

Regulator Units Inspection—Check each unit for contact misalignment, burnt or dirty contact surfaces, bent armature or field yoke, bent or reversed armature hinges (bimetal hinges on Cutout Relay must be assembled with brass side up), broken leads, incorrect placing of shunt leads on Cutout Relay (these leads must not bind armature or touch tension spring).

CUTOUT RELAY

Model	Voltage Winding Resistance	Contact Gap	Air Gap
VRY-4101A	15.2-18.0 ohms	.015" Min.	.060-.065"
VRY-4200 Series	15.8-17.4 ohms	.025" Min.①	.0595-.0625"

①—Supersedes .015" originally specified for VRY-4201A, B.

Winding Resistance—Use accurate Ohmeter. Disconnect voltage winding ground connection and measure between this lead and stationary contact.

Air Gap—Check with flat feeler gauge inserted between contact side of brass pin in winding core and armature with contacts open. Adjust by raising or lowering the stop at the contact end of the armature.

Contact Gap—Check with flat feeler gauge inserted between both sets of contacts at the same time. Gap may be found to be larger than minimum specification (.015" or .025"—see table above). Adjust by bending supporting arms of stationary contacts. IMPORTANT—Adjust both sets of contacts exactly alike and make certain that they close at the same instant. Alignment can be checked with a straightedge across both contacts.

Cutout Relay Performance Specifications

Regulator Model	Contacts Close	Contacts Open
VRY-4101A	6.5-7.0 volts	0.5-4.0 amperes disch.
VRY-4200 Series	6.5-7.0 volts①	0.5-6.0 amperes disch.

①—Supersedes 6.4-6.6 volts originally specified for VRY-4201A, B.

Closing Voltage—Connect ammeter in charging line at regulator "B" terminal, connect voltmeter between regulator "A" terminal and ground. Operate generator for 15 minutes charging a battery to bring units up to operating temperature (regulator cover must be in place). Then slowly increase generator speed and note voltage reading at instant cutout relay contacts close (NOTE—a 2000 ohm earphone can be connected between regulator "A" and "B" terminal for accurate check—a click will be heard when contacts close). Adjust by turning screw at lower end of armature spring. Increase spring tension to raise closing voltage, decrease spring tension to lower closing voltage. IMPORTANT—Cutout relay closing voltage must always be 0.5 volts lower than voltage regulator operating voltage.

Opening Voltage or Amperage—With meters connected as for closing voltage check (above), decrease generator speed slowly and note voltmeter and ammeter readings as contacts open (ammeter reading will be "reverse" or discharge current). Adjust by varying relay contact gap by raising or lowering the stationary contact.

Final Flash Test—After all relay adjustments have been made, recheck relay performance by making a final flash test (operate generator and regulator, use test meters to check performance).

VOLTAGE REGULATOR

Regulator Model	Winding Resistance	Contact Gap	Air Gap
VRY-4101A	4.3-4.7 ohms	.010" Min.	.0395-.0425"
VRY-4200 Series	4.3-4.7 ohms	.010-.012"	.040-.042"

Winding Resistance—Use accurate Ohmeter. Disconnect both voltage regulator winding leads at the regulator base and check between these leads.

Air Gap—Check with pin gauge on contact side of brass armature stop pin in coil core with contacts just separating. Test air gap by connecting test lamp and battery between regulator "A" and "F" terminals. With low limit pin gauge in place between armature and core (use Gauge ST-281-1 for VRY-4200 Series Regulators), depress armature. Lamp should go out. Insert high limit pin gauge, depress armature. Lamp should remain lighted. Adjust by loosening screws holding stationary contact and raising or lowering the contact. CAUTION—Make certain that screws are properly tightened, that movable contact spring is straight and parallel with the armature.

Contact Gap—Check contact gap with a feeler gauge with armature held down against the stop pin (CAUTION—do not press on contact spring—press down on armature evenly on both sides of spring). If gap is too small, make certain that bridge carrying nickel-iron shunt was properly pushed down in assembly (if bridge up too high, armature rivets will strike it and prevent full armature travel). If gap varies widely from specifications, armature stop pin is wrong length and unit should be replaced.

Contact Spring Pressure—To check, disconnect spiral spring from armature, remove adjustable armature stop. Use spring scale hooked under contact spring, hold armature firmly, note scale reading at instant contacts open. Spring tension should be 7-8 ounces. NOTE—Make certain that fibre bumper block is in place when reassembling stop. With contact spring against the bumper block, gap between top of spring and armature stop should be .010-.016".

Voltage Regulator Performance Specifications

Operating Voltage (All VRY-4100 & 4200 Series)—7.41 volts (50°F), 7.38 volts (60°F), 7.35 volts (70°F), 7.32 volts (80°F), 7.29 volts (90°F), 7.26 volts (100°F), 7.23 volts (110°F), 7.20 volts (120°F).

NOTE—Allowable variation in operating voltage is plus or minus .15 volts.

Checking Voltage Setting—Connect test voltmeter between regulator "B" terminal and ground. Operate generator and note regulated voltage. To adjust, vary armature spring tension by turning adjusting screw at lower end of spring. Increase spring tension to increase operating voltage, decrease spring tension to decrease operating voltage.

Final Flash Test—After making adjustments, replace regulator cover, make flash test by stopping generator and then noting regulator operating voltage immediately after generator is restarted.

CURRENT REGULATOR

Regulator Model	Current Setting	Contact Gap	Air Gap
VRY-4101A	See Table	.010" Min.	.0465-.0495"
VRY-4200 Series	See Table	.030-.033"	.047-.049"

Air Gap, Contact Gap, Contact Spring Pressure—Check and adjust in same manner as for Voltage Regulator unit (above).

Current Regulator Performance Specifications

Model	Maximum Amperes	Model	Maximum Amperes
VRY-4101A	25-27	VRY-4202A	25-27
VRY-4201A, 1C	25-27	VRY-4203A,B,C,D,E,F,G	40-42
VRY-4201B	32-34	VRY-4204A	40-42

Checking Current Setting—Connect test ammeter in charging line at regulator "B" terminal. Connect load (lamp bank, or suitable resistance connected across battery) to cause current regulator to operate. Note ammeter reading. Reading should agree with rated capacity of regulator above (minus 0%, plus 10%). Adjust regulator and make final flash test as directed for voltage regulator

REGULATOR RESISTORS: Three resistors used on all models. (R1) and (R3) on all models are 76-84 ohms—marked "80". (R2) on VRY-4101A is 5.5-6.5 ohms—marked "6", (R2) on all VRY-4200 Series is 6.5-7.5 ohms—marked "7".

►CHANGES, CAUTIONS, CORRECTIONS

►**1940 REGULATOR PRODUCTION CHANGE:** Regulator Springs. Two springs of different weights (one light spring, one heavy spring) used on 1940 Voltage Regulators (both springs same weight on Current Regulators). On all regulators with one light and one heavy spring, all adjustments should normally be made on the light spring only. If springs being replaced, or if correct adjustment cannot be secured by light spring adjustment, heavy spring should be adjusted (as directed under Spring Adjustment below). *See Special Note under Voltage Regulator Spring Adjustment instructions when adjusting the heavy spring on this type*

►**REGULATOR CHECKING CAUTIONS:** For unsatisfactory performance complaints. When checking regulators, and before making adjustments to correct complaints, note the following points:

High Charging Rate & High Voltage Complaints—May be caused by shorts or grounds in generator. Check for grounded field coils or grounded leads before changing regulator settings. To check, disconnect lead from regulator 'F' terminal with generator operating. If output drops off, trouble is in regulator. If output does not drop off, check generator for grounded field coils and leads.

Voltage Setting Change to Correct Continuous Battery Overcharge—Where overcharged battery condition encountered and regular voltage settings do not correct this condition (due to unusual operating conditions), voltage setting may be reduced to 6.9 volts min. (6 volt units), 13.7 volts min. (12 volt units). Cutout relay cut-in setting must also be reduced to 6.2 volts (6 volt units), 12.3 volts (12 volt units). Do not reduce voltag setting unless abs lutely necessary.

Open Circuit Caution—Generator must never be perated on open circuit which will damage Generator or Regulator and cause burnt generator windings or regulator windings, burnt field resistance, or fused contacts. If these conditions found in service, check wiring circuits for open circuits or high resistance

Regulator Seals—Regulator covers are sealed to indicate they are adjusted to original factory specifications. Warranty is void if unit is damaged by improper servicing (adjustments may be made by competent operators).

►**GROUND TERMINAL CAUTION:** Each regulator designed to be used with the particular battery terminal grounded as shown in table above. When installing regulator, make certain that correct battery terminal is grounded and always repolarize generator whenever generator or regulator has been disconnected.

►**POLARIZING GENERATOR:** After generator and regulator installed, connect jumper lead between regulator 'BAT' and 'GEN' terminals momentarily. This will allow momentary flow of current through generator windings and cause generator to assume correct polarity for operation on car.

DESCRIPTION: Single Core Regulators differ in design from previous Double Core Regulators (without "IGN" terminal) as follows:

Windings—All windings for each unit (Cutout Relay, Voltage Regulator, Current Regulator) are wound on a single core.

Cutout Relay—Has double contacts. Both sets of contacts must be set so as to open and close together.

Regulator Armature Springs—Two armature springs used (both springs same weight on Current Regulators & Voltage Regulators (except first 1940 units which had one light and one heavy spring on Voltage Regulators only).

TROUBLE SHOOTING:—To quickly locate trouble on the car, make the following tests before removing the generator or regulator for further testing and adjustment on the bench. Check battery condition with hydrometer, note whether battery low (discharged) or high (fully charged), operate engine and note charging rate as follows:

Fully Charged Battery & Low Charging Rate—This indicates that Voltage Regulator is operating normally. To check Current Regulator operation, connect test ammeter in charging line at regulator 'BAT' terminal, use starter motor to crank engine for about 15 seconds (disconnect high tension lead to prevent engine starting) to bring battery down, then run engine at medium speed, turn on all lights and accessories to start Current Regulator operating and note ammeter reading (see Current Regulator Setting Table below). Charging rate will taper off to original low rate after short period of time.

Fully Charged Battery & High Charging Rate—Check battery temperature (charging rate will be higher with hot battery). If charging rate xcessive, operate generator at medium speed with ammeter in charging line at regulator 'BAT' terminal and note ammeter reading as follows: Disconnect lead from regulator 'F' terminal. This opens field circuit and generator output should drop off (indicating that trouble is in regulator). If output does not drop off, disconnect this lead at generator 'F' terminal. If this causes output to drop off, this lead is grounded in harness and should be replaced. If output does not drop off, check generator for grounded field leads or windings. If trouble is located in regulator, reconnect field lead at regulator 'F' terminal, remove regulator cover, depress voltage regulator armature so as to open regulator contacts manually. If output drops off, regulator has not been functioning correctly and should be adjusted. If output does not drop off, check field circuit within regulator for shorts and grounds, see that all insulators in place and regulator contact support bushings and insulators are properly installed.

Discharged Battery & Low Charging Rate or No Output—Check entire charging circuit for loose connections, damaged or broken wires, and short-circuits. If entire charging circuit in good condition and no high resistance in circuit, ground regulator 'F' terminal and operate generator, increase speed slowly and note generator output (CAUTION—Do not operate generator at excessive speed —generator is operated with no regulation when 'F' terminal is grounded and output may cause generator to burn out if speed increased excessively). If output increases with speed, regulator is defective and should be checked for incorrect setting or dirty or burnt contacts. If output does not increase beyond a few amperes, check generator for grounded or open field coils, dirty or burnt commutator, defective armature or brushes. If no output is noted, quickly disconnect lead from regulator 'GEN' terminal and flash this lead to ground. If no spark is noted, generator is defective. If spark occurs, check Cutout Relay for burnt contacts, open shunt winding, high voltage setting or grounds.

CAUTION—Do not operate generator more than momentarily with lead disconnected from regulator 'GEN' terminal. This is open-circuit operation.

ADJUSTMENT: Check all specifications for each unit first, then adjust each unit as follows:

CUTOUT RELAY

Contact Gap—.020". Adjust by bending upper armature stop (see Air Gap Adjustment). Both contacts must have same gap to insure opening and closing together.

C NTINUED ON NEXT PAGE

DELCO-REMY SINGLE CORE CURRENT & VOLTAGE REGULATORS (Continued)

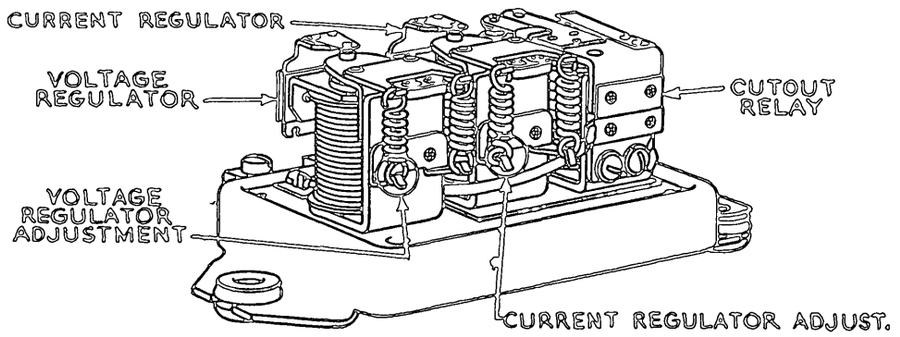
Air Gap—.020". To check, press armature down so contacts just close. If both contacts do not close simultaneously, bend spring fingers until they do. To adjust air gap, loosen two screws on hinge bracket at back of relay, raise or lower armature and hinge assembly.

Cut-in Voltage & Cut-out Amperage—To check, connect ammeter in charging line at regulator 'BAT' terminal, voltmeter between 'GEN' terminal and ground. Operate generator and gradually increase speed until relay contacts close, note voltmeter reading. Decrease speed slowly and note reverse current reading on ammeter when contacts open. To adjust closing voltage, bend spring post down (to decrease voltage), up (to increase voltage).

Cut-in Setting Note—Check only with unit HOT (at operating temperature).

CUTOUT RELAY SETTING

Model	Cut-In Voltage (Hot)
All 1118200 Six-volt Units (except as noted below)	6.2-6.7 volts
All 1118200 Twelve-volt Units (except as noted below)	12.4-13.4 volts



Other 1118200 6-volt Units

Model	Cut-In Voltage (Hot)
1118203, 4, 13	6.3-6.6 volts
1118224	6.3-6.9 volts
1118243	6.3-6.6 volts
1118244, 51	6.1-6.4 volts

Other 1118200 Units

Model	Cut-In Voltage (Hot)
1118255	17-20 volts
1118262	25.5-26.8 volts
1118281	24.8-26.0 volts
1118285	12.4-13.0 volts
1118286	12.4-13.0 volts

Torrid Climate Setting—To correct overcharged battery condition where regular atmospheric temperatures are 95° to 100° and above, adjust Cutout Relay to close at 6.4-6.6 volts (6 volt units).

DELCO-REMY SINGLE CORE CURRENT & VOLTAGE REGULATOR

VOLTAGE REGULATOR

1118269, 70, 73, 74, 77	14.0-14.2
1118278	7.2-7.4
1118279	14.0-14.2
1118280	14.0-14.2
1118281	27.1-27.7
1118282	14.0-14.2
1118285	13.6-13.8
1118286	13.6-13.8

Torrid Climate Setting—To correct overcharged battery condition where regular atmospheric temperatures are 95° to 100° and above, set Voltage Regulator to operate at 6.8-6.9 volts hot (see Cutout Relay setting note also).

Important Note—Regulator over-compensated for temperature and must be checked only when hot and with cover in place (setting higher when cold).

Checking Voltage Setting—Connect ammeter and variable resistance of 'AVR' set in charging line at regular 'BAT' terminal, or disconnect charging line and ground the 'BAT' terminal through ¾ ohm fixed resistance (6 volt units), 1½ ohm fixed resistance (12 volt units). Resistance must be capable of carrying 10 amperes and must not change in value during temperature changes. Connect voltmeter between 'BAT' terminal and ground. Operate generator and increase speed to point where rated output normally produced (see car model 'T&E' page for generator data), adjust variable resistance of 'AVR' set so that charging current is 8-10 amperes (not required if fixed resistance method used). When regulator reaches operating temperature (150° or very hot to the touch) with regulator cover in place, cycle generator by decreasing speed to point where relay contacts open, then increase speed to original figure and note voltmeter reading. Adjust regulator if voltage not correct as shown in table above.

CAUTION—Do not change setting to correct High Voltage without first checking generator for grounded fields—see 'Important Service Note' above.

Adjustment—Bend spring hanger at lower end of one spring only down to increase spring tension and raise voltage setting, or up to decrease tension and lower voltage setting. If correct adjustment can not be secured on one spring, or if new springs are being installed, adjust second spring as follows:

IMPORTANT NOTE—On types with one light and one heavy spring (early 1940), above adjustment should be made on the light spring only.

Spring Adjustment—With one spring disconnected, connect voltmeter between regulator 'GEN' terminal and ground. Open regulator contacts by hand (press down on regulator armature), operate generator and slowly increase speed until voltmeter reading is 3 volts (6 volt units), 6 volts (12 volt units), release armature. Adjust spring tension by bending hanger at lower end of spring which is connected until voltage is 4 volts (6 volt units). Then connect second spring and adjust this spring as directed under 'Adjustment' above (do not touch first spring when making this final adjustment).

IMPORTANT NOTE—On types with one light and one heavy spring (early 1940), above adjustment should be made on the heavy spring only (with light spring disconnected). Voltmeter reading should be 4.5-5.0 volts (6 volt units) 8.5-9.0 volts (12 volt units). Then connect light spring and complete adjustment by setting this spring as directed above.

Contact Servicing—Contact points must be clean (dirty or oxidized points will cause reduced generator output and rundown batteries). To clean or surface contacts, remove upper contact support and service each contact separately. Use a thin, fine-cut contact file and file each point separately using great care not to file smaller rounded point excessively. If flat point has a cavity, use a 'spoon' or 'riffler' file to clean cavity out so that good contact secured between contact points (do not file contact excessively to remove cavities). When reinstalling upper contact support, make certain that all insulators correctly installed and adjust air gap. CAUTION—Do not use sandpaper or emery cloth

Air Gap—.070" measured at center of core with contacts just closing.

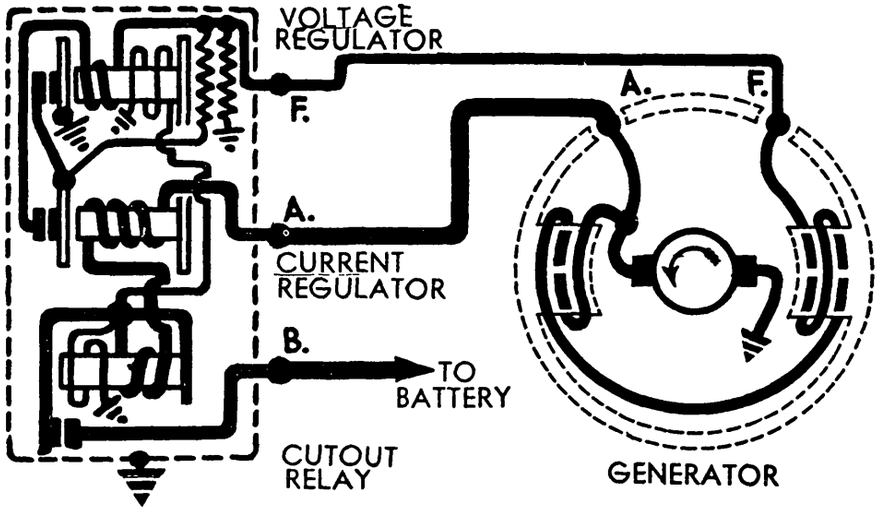
Air Gap Adjustment—To check, press armature down and allow it to come back until contacts just close, measure air gap at center of core with armature in this position. To adjust, loosen two screws on upper contact support bracket, move bracket up or down being careful to keep contacts lined up.

CURRENT REGULATOR

NOTE—Data below applies only to 3 unit Regulators (with separate Current Regulator Unit). Disregard this current regulator data when adjusting 2 unit Regulators (no Current Regulator) used with third-brush generators.

Checking Current Setting—Remove regulator cover and connect short jumper from voltage regulator frame to upper contact support bracket (this will short out voltage regulator while current regulator being checked). Connect ammeter in charging circuit at regulator 'BAT' terminal. Turn on lights, radio and other accessories (to provide load which will bring current regulator into operation), operate generator and increase speed until output remains stationary. With regulator at operating temperature (150° or very hot to the touch) and cover in place, ammeter reading should agree with setting given above.

CAUTION—Do not change setting to correct High Charging Rate without checking generator first for grounded fields—See "Important Service Note" above.



Adjustment—Bend spring hanger at lower end of one spring only down to increase tension and increase current setting, up to decrease tension and de-

DELCO-REMY SINGLE CORE CURRENT & VOLTAGE REGULATORS (C ntinued)

crease current setting. If adjustment cannot be secured on one spring, or new springs are installed, proceed as follows:

Spring Adjustment—With one spring disconnected, operate generator at medium speed, adjust hanger at lower end of spring until output is regulated at approximately half rated output (17 amperes on 1118201,2). Then connect second spring and adjust this spring as directed above (do not touch first spring when making this final adjustment).

DELCO-REMY SINGLE CORE CURRENT & VOLTAGE REGULATOR CIRCUIT

Contact Servicing—Same as for Voltage Regulator (above).
Air Gap—.080" measured at center of core with contacts just closing.
Air Gap Adjustment—Same as for Voltage Regulator (above).

①—Supersedes original 32-34 ampere setting.
②—Supersedes original 19-21 ampere setting.

DELCO-REMY GENERATORS

"ALTERNATE WOUND" GENERATORS: Generators used on some 1951 and 1952 cars have armatures noted as "2½" or "3½" turn alternate wound types (3½ turn type consists of alternate 3 and 4 turn windings in adjacent slots).

►*TESTING CAUTION*—When these armatures are tested on a growler, a variation in readings will be noted from bar to bar consisting of two low readings and two high readings in succession around the commutator. This variation is normal for this type armature, and a damaged winding will cause a wide deviation from the regular pattern of readings. Also, after short usage, commutator bars may tend to blacken unevenly due to slight differences in voltage between the coils. This uneven discoloration will be noted only on new or newly cleaned commutators and color will be uniform after longer usage.

"EXTRUDED FRAME" GENERATORS: These generators differ in appearance from previous types in that the frame is not cut out at the commutator end and no commutator cover band is used. Brush holder assemblies are serviced through the open end of the generator frame. It will be necessary to remove the generator from the car for this work (end frame must be removed for access to brushes).

►***CAUTION—Generator Armature and Field terminals on Extruded Frame Generators are reversed from locations on previous type generators.***

Brush Spring Tension Check—Use a special spring scale (J-5184 etc.) with offset hook to engage brush tension arm next to brush while pull on scale is directly in line with brush holder.

GENERATOR SHORT-CIRCUIT CORRECTION: On late 1951 generators (Serial 1F1 to 1M1 stamped on nameplate), check positioning of field cross-over lead with relation to insulated brush holder and if this lead touches or nearly touches the brush holder, push the lead back toward the field coils (*CAUTION*—Lead must not touch the generator frame or armature). Contact between the cross-over lead and brush holder will result in a short-circuit causing excessive field current, burned regulator contacts, high cut-in speed, and a low or discharged battery. ***IF THIS CONDITION FOUND ON ANY GENERTOR, CHECK FOR BURNED REGULATOR CONTACTS AS FOLLOWS:***

►***CHECKING REGULATOR (for oxidized regulator contacts)***—Connect ammeter in charging line at regulator "BAT" terminal. Turn on headlamps to provide load, operate engine at speed which will provide charging current of approximately 5 amperes as noted on test meter. Ground regulator "F" terminal (use short test lead with clip to engage "F" terminal). If output increases more than 2 amperes, remove regulator, clean contacts, adjust settings.

See "Delco-Remy 1118300 & 1118700 Regulators" in previous release for complete data.

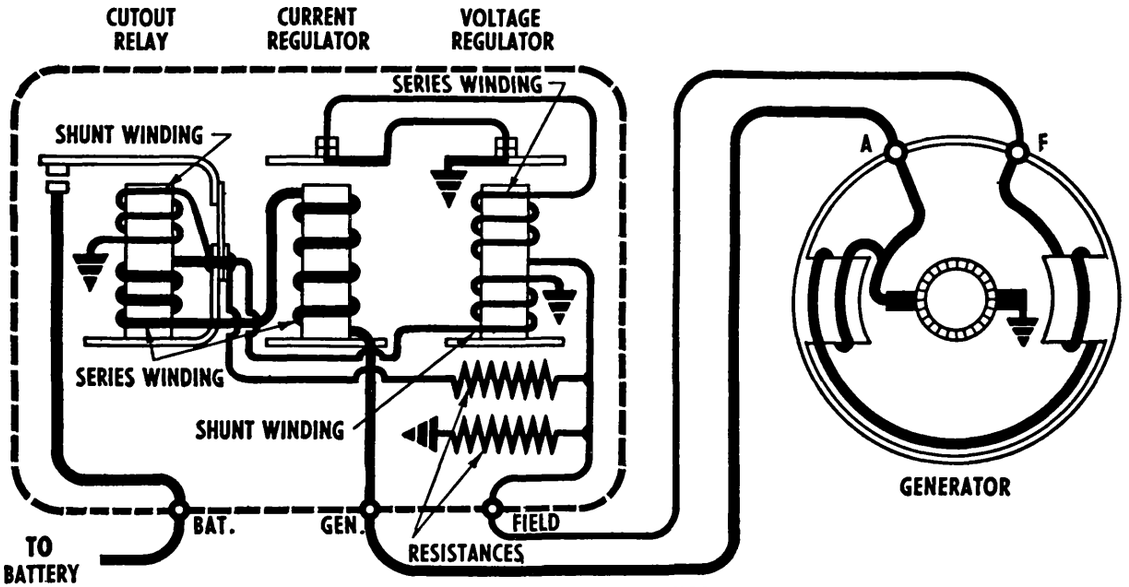
①—1102005 is 1102002 less fan & pulley.

►**REGULATOR POLARITY CAUTION**—Regulator ground polarity and battery ground polarity must be the same. Regulator polarity is stamped on end of regulator base together with model number.



►***CAUTION—Regulator contacts will pit and will have short life if wrong polarity regulator is used.***

►**GENERATOR REPOLARIZING CAUTION**—Whenever regulator or generator leads disconnected, generator must be repolarized **after leads reconnected but before engin is run as follows:** Connect jumper wire between "GEN" and "BAT" terminals on regulator momentarily.

►***CAUTION—Failure to repolarise generator may cause severe damage (reversed polarity will cause vibration and arcing or burning of relay contact points).***

DESCRIPTION: "1118300" Series Regulators differ from previous designs in that adjusting screws for changing armature spring tension are provided, and resistor connections changed. *See illustration.*

DELCO-REMY "1118300" & "1118700" REGULATORS (C nt.)

TROUBLE SHOOTING: If generator and regulator operating satisfactorily, generator charging rate will be low when battery fully charged, and high when battery is discharged. If performance not correct, check as follows to determine trouble:

Fully Charged Battery & High Charging Rate—May be caused by defective regulator, incorrect voltage regulator setting, poor regulator ground, ground in field "F" lead, or high battery temperature.

NOTE—In testing for above conditions, run engine at medium speed, momentarily disconnect lead at regulator "F" terminal. If charging rate drops to zero, trouble is in regulator. If it remains high, field lead, "F" terminal, or field coils grounded.

Discharged Battery & Low Charging Rate or No General Output—May be caused by loose drive belt, low regulator settings, resistance in charging circuit, defective generator, or dirty regulator contacts.

NOTE—With drive belt adjusted and engine running at medium speed, momentarily ground generator "F" terminal. If charging rate increases to a high rate, trouble is in regulator or field lead is broken. If no charge, generator is defective.

Burnt Resistance, Windings, or Contacts—Caused by open circuit operation, open-circuited or broken resistors, or high resistance in circuit.

►***CAUTION—Do not replace regulator until above conditions have been corrected (will cause failure of replacement regulator also).***

CHECKING & ADJUSTMENT (CUT-OUT RELAY): Air Gap and Contact Gap should be checked and adjusted with battery disconnected.

Air Gap: Press on armature directly above core until contacts just close (CAUTION—both sets of contacts must close simultaneously—see Contact Gap data below), measure air gap between armature and center of core with a feeler gauge.

CUT-OUT RELAY AIR GAP

Models 1118346, 47, 78, 79, 86	.017"
Models 1118375	.013"
All Other "1118300" Series	.020"

Models 1118742, 48	.027"
All Other "1118700" Series	.020"

Adjustment—Bend upper armature stop up or down as required (use special bending tool). Equalize contact gaps by bending contact fingers.

Cut-In (Closing) Voltage: Connect regulator to proper generator and to battery with voltmeter connected between regulator "GEN" terminal and ground on regulator base, and ammeter in series in charging circuit at regulator "BAT" terminal. Increase generator speed slowly and note voltage at instant relay contacts close. Decrease generator speed until contacts have opened. Adjust and recheck.

Adjustment—Turn adjusting screw under end of armature spring clockwise for increased voltage, counter-clockwise for decreased voltage.

CHECKING & ADJUSTMENT (VOLTAGE REGULATOR:) Examine condition of regulator contacts and resurface if necessary (see Servicing data). Check and adjust Air Gap with battery disconnected (regulator off car), check and adjust voltage setting.

Air Gap: Press armature down toward core as far as possible, then allow armature to move upward until contacts just close. Measure air gap between armature and center of core (use wire feeler gauge).

VOLTAGE REGULATOR SETTING

Regulator	Regulator Voltage Setting	Operating Range
1118300, 1, 2, 9, 10	7.4	7.0-7.7
1118303, 11	7.2	6.8-7.5
1118304, 12	14.3	13.9-14.9
1118307	7.6	7.25-7.95
1118313, 14	7.2	6.8-7.5

REGULATOR AIR GAP

All "1118300 Series" Regulators	.075"
Model 1118730	.068"
Other "1118700" Series Regulators	.075"

Adjustment—Loosen two stationary contact mounting screws (on front side of regulator frame), move contact bracket up or down as required.

Voltage Setting: ***CAUTION—Two different methods can be used to check voltage setting as follows:***

(1) Fixed Resistance Method—Disconnect charging line at regulator "BAT" terminal, connect special fixed resistance (see Note below) between this terminal and ground on regulator base, connect voltmeter between these same two points. With generator and **regulator at operating temperature, and with regulator cover in place,** run generator at speed 25% in excess of rated output speed (see generator data on individual car model pages), note voltmeter reading. If not within "operating range" figure in table below, adjust as directed under "Variable Resistance Method" following.

►**Resistance Note**—Resistance used when checking regulator by "fixed resistance method" above must be capable of carrying 10 amperes without change in resistance due to temperature increases and should have the following values:

Type of Regulator	Resistance Value
6 Volt (less than 15 amp. rating)	1½ Ohms
6 Volt (more than 15 amp. rating)	¾ Ohms
12 Volt (less than 15 amp. rating)	2¼ Ohms
12 Volt (more than 15 amp. rating)	1½ Ohms

(2) Variable Resistance Method—Connect ammeter and ¼-Ohm Variable Resistance in series in charging line at regulator "BAT" terminal (CAUTION—do not connect these units at "Gen" terminal which will affect generator output), connect voltmeter between regulator "BAT" terminal and ground on regulator base. With generator and **regulator at operating temperature, and with regulator cover in place,** run generator at speed 25% in excess of rated output speed (see generator data on individual car model pages). If output less than 8 amperes (4 amperes on units rated less than 15 amperes), turn on car lights which will increase output, then increase variable resistance until output is reduced to 8-10 amperes (4-6 amperes on units rated less than 15 amperes). With regulator at operating temperature, "cycle" generator by decreasing speed until cutout relay contacts open, then increase speed to former figure. Note voltmeter reading. If not within "operating range" figure in table below, adjust as follows:

Voltage Setting Adjustment—Turn adjusting screw on armature spring bracket clockwise to increase voltage, counter-clockwise to decrease voltage. Check voltage with cover in place. After adjusting, "cycle" generator and recheck setting.

CHECKING & ADJUSTMENT (CURRENT REGULATOR): Current regulator used only with "three-unit" type regulators (two-unit regulators use generator third-brush current control).

Air Gap: Checked and adjusted in same manner as Voltage Regulator (above).

REGULATOR AIR GAP

All "1118300" & "1118700 Series	.075"

CONTINUED N NEXT PAGE

DELCO-REMY "1118300 & 1118700" REGULATORS (Cont.)

Current Setting: ***CAUTION—Voltage regulator must be prevented from operating while checking current regulator. "Short out" voltage regulator as follows:***

(1) Insert screwdriver blade through slot in base of regulator (keep screwdriver at right angles to base) so that blade makes firm contact with base and with shield which protects resistor unit. This will short out voltage regulator.

(2) Remove regulator cover, connect short jumper across voltage regulator contacts (from armature to stationary contact bracket).

(3) Partially discharge battery by cranking engine for 30 seconds with ignition turned off.

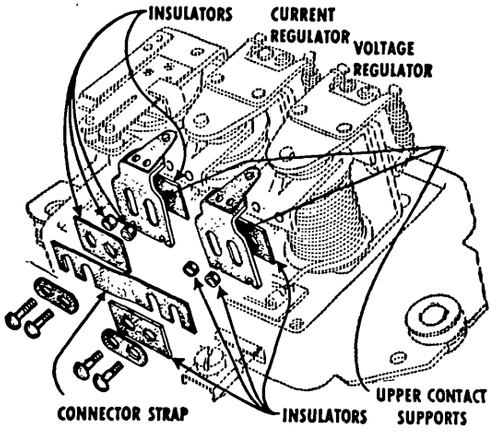
(4) Connect 45 ampere load across battery (use carbon pile rheostat). This will prevent voltage regulator from operating.

Checking Current Setting—With voltage regulator shorted out (use any of above methods), connect ammeter in charging line at regulator "BAT" terminal, turn on car lights and accessories to prevent high voltage during test. With generator and **regulator at operating temperature,** run generator at speed 50% in excess of rated output speed (see generator data on individual car model pages), note ammeter reading. If not within "operating range" figure in table below, adjust as follows:

Current Setting Adjustment—Same as for Voltage Setting Adjustment (above). Turn screw clockwise to increase current setting, counter-clockwise to decrease current setting.

CLEANING REGULATOR CONTACTS: Clean up contacts when required with a contact file. Use a **spoon or riffler file on the flat contact** (flat contact is located on armature on all negative-ground regulators, on stationary contact bracket on all positive-ground regulators). Access to contacts is secured by loosening contact adjusting screws on stationary contact bracket and tilting or removing bracket. Adjust air gap after cleaning contacts.

►***CAUTION—Do not use emery cloth or sandpaper to clean contacts, do not use flat file on contacts.***



CONTACT SUPPORT BRACKET REPLACEMENT: Assemble brackets, insulators and bushings in order as shown on illustration. Always use new bushings.

REGULATOR SPRING REPLACEMENT: When installing new springs, first hook lower end of spring on lower spring support, then stretch spring until upper end can be hooked over armature lug. Check and adjust regulator setting after spring installed.

►***CAUTION—Do not pry spring into place—this may distort or damage spring support.***

CURRENT REGULATOR SETTING

Regulator	Setting	Regulator Amperes Operating Range

REGULATOR CONTACT ASSEMBLY

DELCO-REMY "1118825" & "1118900" SERIES REGULATOR

►*Data following covers both 6-volt and 12-volt Regulators.*

►*"1118825" & "1118900" SERIES REGULATOR NOTE:* Regulators of these series *with letter "B" following Model Number* differ from the "1118825" & "1118900" Series in that the direction of current flow through the Current Regulator Contacts has been reversed (see Wiring Diagram below). The molded insulator formerly located between connector strap and Current Regulator Support has been relocated between the attaching screw washer and the connector (both molded insulators are now on the same side of the connector strap).

►*ADJUSTMENT CAUTION:* When checking current regulators having the "B" suffix, DO NOT USE THE "Quick Check Method" outlined below for previous regulators of these series. Using a screwdriver inserted in hole in regulator base to short out voltage regulator will short out BOTH the voltage and current regulators and allow generator to operate without control.

DESCRIPTION: Regulators in series starting with Model 1118825 differ from previous models in that they do not include an accelerator or series winding on the voltage regulator unit. This difference makes necessary a different method of checking and adjusting voltage setting. "Circuit A" type regulators are used with generators having field insulated and grounded in Regulator.

TROUBLE SHOOTING: The existing conditions determine the "Normal" or "Abnormal" operation of Generator or Regulator as follows:

"Normal" Operation

1)–Battery fully charged and Low charging rate.

2)–Low battery and High charging rate.

"Abnormal" Operation

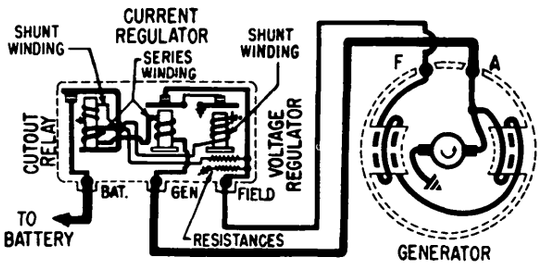
1)–Battery fully charged and High charging rate denotes defective or improperly adjusted Voltage Regulator unit, grounded field (Generator, Regulator, or Wiring), or high battery temperature permitting battery to accept high charging rate with "Normal" regulator setting.

2)–Low battery and low charging rate denotes loose connections or damaged wiring, defective battery, high circuit resistance, low regulator setting, oxidized Regulator points, defective Generator, Cutout Relay not closing, open series circuit in Regulator, or Generator, not properly polarized. Momentarily grounded "F" terminal. Generator O.K. if output increases with increased Generator speed.

3)–Burned Resistances, Windings, or Contact Points are caused by: Open circuit operation, open Resistance units or loose or intermittant connections in charging circuit. Check car wiring before installing new Regulator.

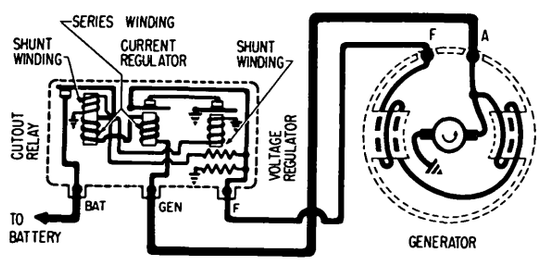
4)–Burned Relay Contact Points are due to reversed Generator polarity.

CHECKING & ADJUSTMENT



Regulator checks and adjustments should be made in the following sequence: Voltage Regulation, Cutout Relay Operation, and Current Regulation.

►*REGULATOR "NORMALIZING":* Before making any tests, it is important that regulator must be at **operating temperature.** Normalize regulator as follows: Connect ¼-Ohm resistor in series with battery (if variable resistor used, set to 1-10 ampere charging current), operate generator for 15 minutes at specified speed **with Voltage Regulator operating** (to normalize Voltage Regulator), or **with Current Regulator operating** (to normalize Temperature Compensated Current Regulators). This procedure not required for Non-temperature compensated Current Regulators.



"Specified Speed" Note–Generator RPM for checking and adjusting regulators should be: **Voltage Regulator**-3500 RPM. (car & truck units), **Current Regulator**-sufficient speed to produce current in excess of specified current regulator setting.

►*GENERATOR REPOLARIZING CAUTION:* Repolarize generator each time regulator leads have been disconnected. Connect jumper lead momentarily between regulator "Bat" and "Gen" terminals. Incorrect polarity will cause vibration and arcing and burning of Cutout Relay contacts.

►*POLARITY CAUTION:* Regulators are designed for a particular battery ground polarity as stamped on end of regulator base. Use of wrong polarity regulator will cause pitting of regulator contacts and shorten regulator life.

DELCO-REMY "1118825" & "1118900" SERIES (NO SUFFIX LETTER) REGULATOR WIRING

DELCO-REMY "1118825" & "1118900" SERIES (WITH SUFFIX LETTER) REGULATOR WIRING

VOLTAGE REGULATOR: Make checks and adjustments in the following order:

Air Gap–.075" (All models except 1118942 & 1118947), .063" (1118942 & 1118947). To check, press down on armature so that contacts just touching, measure air gap between armature and core. To adjust, raise or lower mounting bracket.

Voltage Setting (6 & 12 volt units)–Use either method as follows:

Fixed ¼-Ohm Resistanc M th d

1)–Connect ¼ Ohm–25 watt (Min.) resistance in charging circuit at regulator "Bat" terminal **in s ri s with with battery.**

►*CAUTION: Battery must remain in charging circuit. DO NOT disconnect battery as in checking procedure for previous series regulators.*

2)–Connect voltmeter from "Bat" terminal to ground.

3)–Normalize regulator (see above). Limit electrical load to Ignition only.

4)–Cycle generator using either of the following methods: **(a)** Move voltmeter lead from "Bat" to "Gen" terminal of regulator, retard generator speed until generator voltage is reduced to 2 volts (6 volt units), 4 volts (12 volt units), then move voltmeter lead back to regulator "Bat" terminal, bring generator back to specified speed and note voltmeter reading. Or, **(b)** Connect variable resistance in field circuit (disconnect generator field lead at regulator "F" terminal, connect resistance between this lead and "F" terminal). With all resistance turned out, operate generator at specified speed, slowly increase resistance until generator voltage reduced to 2 volts (6 volt units), 4 volts (12 volt units), then turn out all resistance and note voltmeter reading. In each case, final voltage reading (after cycling generator) will be the voltage regulator setting.

5)–Adjust voltage regulator setting as follows: Remove cover, turn adjusting screw on armature spring lower support clockwise to increase voltage setting, or counter-clockwise to decrease setting. After making adjustment, replace cover, cycle generator (step 4 above), and recheck voltage setting.

►*CAUTION*–Final setting should always be made by **increasing** spring tension (never by decreasing tension). If voltage setting too high, decrease spring tension below desired setting, and then increase spring tension for desired setting. If spring support does not return when screw backed off, back off screw for clearance between screw head and support, then bend support up carefully until it contacts screw head.

►*VOLTAGE SETTING CORRECTION FOR TEMPERATURE:* See "Regulator Settings" table (below) for voltage regulator setting range. Any setting within the range indicated is satisfactory provided battery and voltage sensitive equipment is operating properly and without damage. Before operating voltage is compared with specifications in the table, allowances must be made for variation in temperature (see table following). For regulator ambient temperatures below 125° F. SUBTRACT from operating voltage. For ambient temperatures above 125°F. ADD to operating voltage. The

CONTINUED ON NEXT PAGE

DELCO-REMY "1118825" & "1118900" SERIES REGULATOR (C nt.)

adjusted operating voltage must be within the specified range indicated.

Voltag Allowances for Temperature

Ambi nt Temp ratur ①	6-Volt	12 Volt
55°	−.52	−1.05
65°	−.45	− .90
75°	−.37	− .75
85°	−.30	− .60
95°	−.22	− .45
105°	−.15	− .30
115°	−.07	− .15
125°	0	0
135°	+.07	+ .15
145°	+.15	+ .30
155°	+.22	+ .45
165°	+.30	+ .60

①AMBIENT TEMPERATURE is the temperature of the air surrounding the regulator approximately 1/4" from cover when regulator is at operating temperature ("Normalizing" procedure as given above should result in an ambient temperature of 125°F) and can be measured by placing a thermometer 1/4" from cover.

V ltag S ttings for Unusual Conditions: If battery is being **Ov rcharg d** (Using too much water) or stays **Und rcharg d** (¾ charge or less), vary specified voltage regulator setting as follows:

Ov rcharg d—Reduce Voltage Setting 0.1-0.2 volts and check after reasonable service period. Repeat until "Overcharge" corrected (water use normal). *NOTE*—Recheck cutout relay setting. Keep it 0.5 volts less than Voltage Regulator Setting.

Undercharg d—Increase Voltage Setting 0.1 volt and recheck and repeat as above until condition corrected.

►*CAUTION: Avoid s ttings so high that damage may be caus d to lights or other sensitive equipment during c ld weath r op ration. Before changing standard v ltag r gulator s tting, correct all battery conditions such as: Sulphat d Plates, Overheating due to operating locati n, r Damag caused by overheating.*

Variabl Resistance Method

1)—Connect variable resistance (25 watt Min.) and ammeter in series at "Bat" terminal of regulator and **in seri s with batt ry.**

►*CAUTION—Batt ry must remain in charging circuit. DO NOT disconn ct battery as in checking procedure for previous s ri s r gulators.*

2)—Operate generator and adjust resistance to 10 ampere charging rate. Operate generator for 15 minutes with regulator cover in place to attain operating temperature.

3)—Cycle generator and adjust regulator voltage in same manner as in "Fixed Resistance Method" (steps 4 & 5) above.

CUTOUT RELAY: Air Gap and Contact Gap should be checked and adjusted with "Bat" lead disconnected from regulator.

Air Gap—.030" (All Models). To check, press down on armature until contacts just close (both sets of contacts must close at same instant), measure gap between armature and center of core. To adjust, loosen two armature hinge screws on back of frame, raise or lower armature as required.

Contact Gap—.020" (All Models). Adjust by bending upper armature stop.

Closing (Cuts-in) Voltage—Connect regulator to proper generator and battery, connect Voltmeter between regulator "Gen" terminal and ground. Check closing voltage by either of the following methods: **(a)** Slowly increase generator speed and note voltmeter reading at instant points close, then decrease generator speed and make certain that points open. Or, **(b)** With same connections as above, connect a variable resistance in the field circuit (disconnect generator field lead at regulator "F" terminal, connect resistance between this lead and "F" terminal—see note below for resistance values), operate generator at medium speed with all resistance cut in field circuit, slowly cut out resistance until cutout relay points close, note voltmeter reading, then slowly cut in resistance to make certain that points open. Adjust cut-in voltage by turning adjusting screw under armature spring clockwise to increase cut-in voltage, or counter-clockwise to decrease cut-in voltage.

CURRENT REGULATOR: Make checks and adjustments in the following order:

Air Gap—.075" (All Models). Check and adjust in same manner as Voltage Regulator (above).

Current Setting—Any of the following methods can be used. All methods require that the Voltage Regulator be prevented from operating as detailed in the checking procedure.

Quick Check Method

►*CAUTION: Do not use this method on 1118825 and 1118900 Series Regulators with letter "B" following Model Number. See "Adjustment Caution" above.*

1)—Connect ammeter in charging circuit at regulator "Bat" terminal. Turn on all lights and accessories to provide load and cause current regulator to operate.

DELCO-REMY "1118825" & "1118900" SERIES REGULATOR (C nt.)

2)—Normalize regulator (see above). This procedure required for Temperature Compensated Current Regulators only (Non-temperature compensated units operate same cold or hot).

3)—Insert screwdriver blade through hole in regulator base and hold firmly with blade touching base and shield at same time. This will short out Voltage Regulator.

4)—Cycle generator (see Step 4 of Voltage Regulator Adjustment above), note ammeter reading which will be Current Setting.

5)—Adjust current regulator setting in same manner as voltage regulator (see Step 5 under Voltage Regulator above).

Load Method

1)—Connect ammeter in charging circuit at regulator "Bat" terminal. Connect load across battery equal to current regulator setting (use carbon pile or bank of lights).

2)—Normalize regulator (see above). This procedure required for Temperature Compensated Current Regulators only (Non-temperature compensated units operate same cold or hot).

3)—Cycle generator (see step 4 of Voltage Regulator Adjustment above), note ammeter reading which will be Current Setting.

4)—Adjust current regulator setting in same manner as voltage regulator (see Step 5 under Voltage Regulator above).

Jumper Lead Method

►*CAUTION—DO NOT use this method on Temperature Compensated Current Regulators.*

1)—Connect ammeter in charging circuit at regulator "Bat" terminal.

2)—Remove regulator cover and connect jumper lead across Voltage Regulator contacts (use short lead clipped to regulator armature and to stationary contact support).

3)—Turn on all lights and accessories, OR connect load across battery equal to current regulator setting (use carbon pile or bank of lights).

4)—Operate generator at specified speed and note ammeter reading which will be Current Setting.

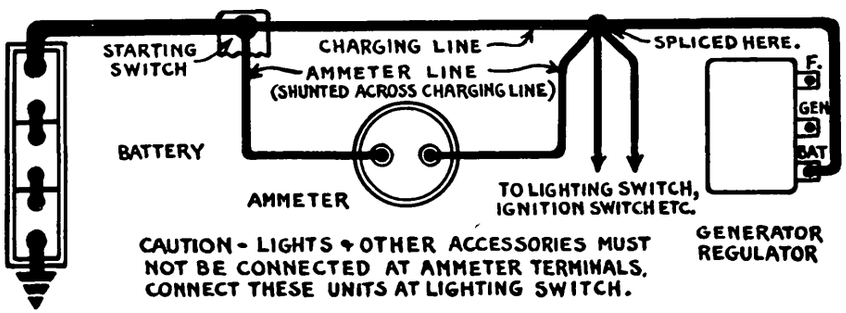
5)—Adjust current regulator setting in same manner as voltage regulator (see Step 5 under Voltage Regulator above).

►*RADIO BY-PASS CONDENSER CAUTION:* Installation of such condensers on FIELD terminal of either the Regulator or Generator will cause regulator contacts to burn and oxidize which will reduce generator output. All such condensers should be disconnected and regulator contacts should be inspected and cleaned.

SHUNT TYPE AMMETER

Cadillac, All Series (1949)

Oldsmobile 6 & 8, All Models (1949-55)



►***CAUTION—When testing voltage regulators on the above cars with shunt type ammeters, and the "BAT" lead is removed from the regulator for the test, it is of utmost importance that the other leads on same terminal be bolted to the "BAT" lead when it is removed. Failure to do this may result in burning up th wiring harness.***

IMPORTANT NOTE: Accessories must not be connected at ammeter terminals as ammeter circuit wires are inadequate to carry more than designed load and any change in ammeter circuit will cause ammeter to read incorrectly.

ACCESSORY CONNECTION CAUTION—When installing accessories, connect as directed in installation instructions in accessory package (should be connected to accessory terminal of lighting switch, gauge terminal of ignition switch, etc.). **Do not conneet accessories at ammeter terminals.**

DESCRIPTION: External shunt type ammeter with push-on type terminals This design lessens number of connections in generator charging circuit and results in better generator performance (less chance for loose or corroded connections and high resistance in circuit).

OPERATION: Ammeter operates in usual manner except only a portion of the charging current (approximately 10%) goes through the ammeter, remainder of charging current being 'shunted' around ammeter through regular charging line (see illustration). Ammeter dial is calibrated so that it indicates entire charging current (25-30 amperes) rather than current actually in ammeter circuit. Correct ammeter operation is dependent on proportional amount of current in each branch of the circuit (through ammeter and through the external shunt) and any disturbance of this balance (such as connection of accessories at ammeter terminals) will cause ammeter to read incorrectly.

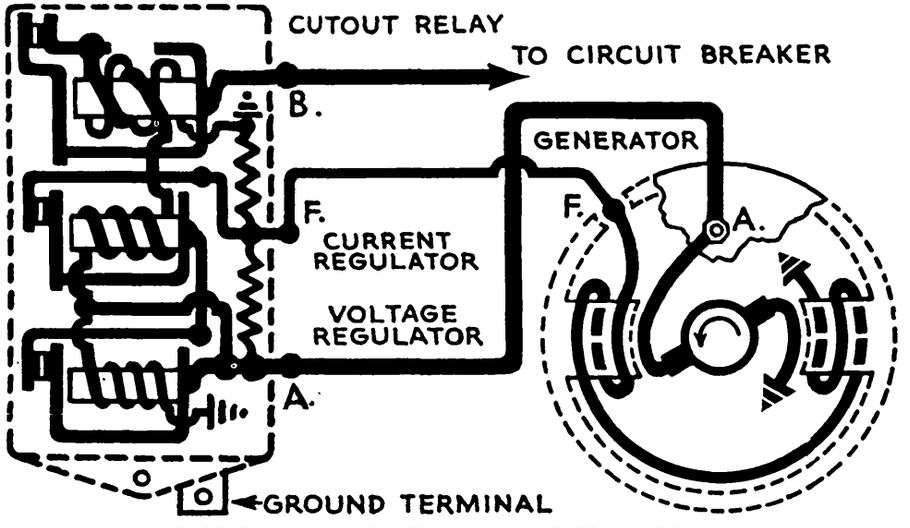
①—Service Replacement for 51A-10505-C.
④—With 40 ampere output.
⑤—With 45 ampere output.
⑥—Use FAA-10002-B as service replacement.
⑦—Use FAA-10002-A as service replacement.

►CHANGES, CAUTIONS, CORRECTIONS

►**PRODUCTION CHANGE NOTE:** Regulators with several minor differences will be found in service as follows:



Regulator Ground Lead—On 1949 and earlier regulators, ground consists of braided pigtail connected to a lug on the regulator case by which the regulator is grounded directly to the engine dash. The regulator case ground lug is attached to the regulator case by the cover rivet and this ground connection is disturbed by removal of the regulator cover. On other regulators, the ground connection consists of a separate wire which is connected to the regulator case and grounded to a terminal screw on the generator frame. CAUTION—Ground lead must be in place when regulators are tested. If ground disturbed by removal of regulator cover, re-install ground lead before making regulator tests.

►**REPLACEMENT GENERATOR NOTE:** FAA-10002-A or B production generators replace generator 8BA-10002-A, 8BA-10002-B, 8BA-10002-D.

►**REGULATOR CONTACT DESIGN CHANGES:** Contact assemblies used on earlier regulators can be replaced with later design contacts as follows:

Current Regulator Later Design Contacts: Following parts required:
No. 01A-10551-A—Armature with silver contact.
No. 01A-10653-A—Contact screw with silver contact (screw .41" long).
No. 01A-10568-A—Spacer (additional spacer installed bet. armature & frame).

Voltage Regulator Later Design Contacts: Following parts required:
No. 01A-10551-B—Armature with tungsten contact (brass rivet under arm).
No. 01A-10653-B1 or B2—Contact screw with platinum contact.
No. 01A-10568-B—Spacer (replaces original spacer on box type shunt regulators, or used together with old spacer on old type voltage regulators).

FORD THREE-UNIT VOLTAGE-CURRENT REGULATOR CIRCUIT

See "CONTACT REPLACEMENT" following for installation of these parts.

►**REGULATOR & GENERATOR GROUND CAUTION:** Regulator and generator grounds must be in place when units operated (regulator may be grounded through mounting screw or separate ground lead). See car page wiring diagram for data.

DESCRIPTION

DESCRIPTION: 3 unit (Cutout Relay, Voltage Regulator, Current Regulator) regulator with separate voltage and current regulator units (these units were combined on previous 2-unit regulators). Regulators are vibrating type and charging rate is normally controlled by Voltage Regulator. Current Regulator operates when current reaches value in excess of rated capacity and limits current to this figure. Both regulators operate in the same manner by cutting the resistance in and out of the field circuit and control the generator output

CONTINUED ON NEXT PAGE

FORD, LINCOLN, MERCURY REGULATORS (C nt.)

by regulating the field current. Cutout Relay is compensated for temperature by means of a bi-metal clip on the armature spring (1949 and earlier).

►*CAUTION*—Ford Generators and Ford Regulators are not wired in the same manner as units of other makes and cannot be operated in conjunction with units of other makes. Always operate Ford Generators & Regulators together.

CHECKING GENERATING CIRCUIT

CHECKING GENERATING CIRCUIT: Preliminary check of Battery, Charging Circuit Resistance, and Generator Output should be made to locate trouble if generating circuit faulty.

Battery: If specific gravity below 1.250, recharge battery or install fully charged battery.

Generator Output: Connect jumper between "A" and "F" generator terminals. Connect ammeter in charging line at generator (see Ford Note below) by disconnecting lead at generator "A" terminal and connecting ammeter between this terminal and the lead. Run engine, increase engine speed to 1500 RPM. and note ammeter reading which should be at least 35 amperes (Ford & Mercury), 40 amperes (Lincoln). If output less than this figure, repair or replace generator.

Ford Testing Note—Generators can be tested without regulator and car wiring in circuit by disconnecting lead at regulator "ARM" terminal and leaving this lead disconnected during test. Connect negative lead of test ammeter to generator "A" terminal and **immediately after starting engine** connect ammeter positive lead to the battery. Generator will charge directly through the test ammeter to the battery. Disconnect ammeter as soon as engine is stopped to prevent battery discharging through generator windings.

►*CAUTION—Stop the engine and remove test leads as soon as test completed to prevent overheating of the generator (with above connections generator operates without regulation).*

Charging Circuit Resistance: Check for high resistance in charging circuit as detailed below (high resistance will reduce charging current to battery and may cause high voltage).

Ford Models—Connect voltmeter between generator "A" terminal and negative (ungrounded) battery post. Discharge battery partially by cranking engine for approximately 15 seconds with ignition switch OFF. Then run engine at 1500 RPM. and note voltmeter reading. Voltage drop in charging line should be less than 0.6 volt. If drop exceeds 0 6 volt, locate trouble by checking voltage drop between the following points (touch test leads to points indicated, voltmeter reading will be voltage drop in this part of circuit and should not exceed figure listed). Then check ground circuit.

1)—Generator "A" terminal & Regulator "ARM" terminal—0.1 volt max.

2)—Generator "A" terminal & Regulator "BAT" terminal—0 35 volt max.

Ground Circuit Resistance—After checking charging line resistance (above), connect voltmeter between battery positive (grounded) post and ground terminal on generator frame. Voltmeter reading should be less than 0.1 volt.

Lincoln & Mercury—Connect test ammeter in charging line at generator (disconnect lead at generator "A" terminal, connect ammeter between this lead and the terminal), connect voltmeter at charging lead (same point as ammeter connected) and to ungrounded battery post. Connect jumper wire between generator "A" and "F" terminals (will short out regulator). Run engine so that generator charges at exactly 35 amperes. Note voltmeter reading which will be voltage drop in charging circuit and should not be greater than 0.8 volts. If drop exceeds 0.8 volts, locate trouble by checking voltage drop between the following points (touch test leads to points indicated, voltmeter reading or voltage drop in this part of circuit should not exceed figure listed). Then check ground circuit.

1)—Generator charging line & Regulator "ARM" terminal—0.15 volt max.

2)—Regulator "ARM" terminal & Regulator "BAT" terminal—0.3 volt max.

3)—Regulator "BAT" terminal & Battery negative post—0.35 volt max.

4)—Generator "F" terminal & Regulator "F" terminal (jumper between generator "A" & "F" terminals removed)—very slight movement of pointer.

Ground Circuit Resistance—Connect ammeter in charging line at regulator (disconnect lead at regulator "BAT" terminal, connect ammeter between this lead and the terminal), connect voltmeter between grounded battery post and generator frame. Connect a jumper wire between generator "A" and "F" terminals. Operate engine and adjust speed so that the generator ouput is 35 amperes. Voltmeter reading should be less than 0.1 volt. If higher (indicating voltage drop in ground circuit), check generator mounting on bracket and bracket mounting on engine for poor electrical contact, check generator, regulator, and battery ground connections.

CHECKING & ADJUSTING REGULATOR

CHECKING & ADJUSTMENT OF REGULATOR: Use special test set (with an adjustable field rheostat—see Ford Test Note below). If separate test meters are used to check performance, a variable field rheostat should be used so that generator output can be varied when making tests.

Ford Test Note—Ford Test Set has a variable field rheostat (connected between regulator "F" terminal and generator field lead) and a ¾ ohm fixed resistance through which the generator charges (resistor and ammeter connected in series to regulator "B" terminal while regular charging line is disconnected from this terminal) and a carbon-pile rheostat (in parallel with the ¾ ohm fixed resistance) which can be cut in to the circuit by a push button to provide sufficient load to enable current regulator to be adjusted (carbon-pile rheostat is variable and resistance should be slowly decreased until current regulator operates). This enables all tests to be made with generator operating at 1500 RPM.

►*NOTE*—Regulator should be at normal operating temperature when checking regulator settings.

►*CAUTION*—Ground connection must be in place when generator and regulator are operated. If ground wire disturbed by removal of regulator cover, *make certain that regulator and generator are both grounded whenever these units are being operated.*

REGULATOR SETTINGS

Relay Cut-in Voltage—Connect ammeter in charging line at regulator "BAT" terminal (disconnect lead at this terminal, connect one ammeter lead to this lead, connect other ammeter lead to terminal). Connect voltmeter between regulator "ARM" terminal and ground on regulator base. Connect jumper wire between generator "A" and "F" terminals. Start engine and slowly increase speed until relay contacts close, note voltmeter reading (pointer will drop back slightly at this point). Cut-in voltage should be within limits shown in table below. To adjust, remove regulator cover, bend support at lower end of relay armature spring in to increase tension and raise cut-in voltage, bend support out to decrease tension and lower cut-in voltage.

Relay Cut-out Reverse Current—After checking cut-in voltage above, increase engine speed until generator charges at approximately 10 amperes, then slowly decrease engine speed and note reverse or discharge current reading on ammeter at instant relay contacts open. If this reverse current not within limits shown in table below, check relay air gap and armature stop setting (see Specifications below).

Cutout Relay Settings

Regulator Type	Cut-in Voltage	Cut-out Reverse Current
01A-10505-C, C4	6.4-6.9 volts	0-8 amperes
5EH-10505-C	6.6-7.0 volts	0-8 amperes
51A-10505-A1	6.6-7.0 volts	0-8 amperes
51A-10505-A2, B2, C2, D2	6.0-6 3 volts (Cold).	0-8 amperes
51A-10505-H, J	6.6-7.0 volts	0-8 amperes
8A-10505-A	6.0-6.6 volts	0-8 amperes
8L-10505	6.0-6.6 volts	0-8 amperes
8M-10505-A	6.0-6.6 volts	0-8 amperes
FAC-10505-A,A1,A2	6 0-6 6 volts	0-8 amperes
FAD-10505-A	6.0-6 6 volts	0-8 amperes
FAE-10505-A	6.0-6.6 volts	0-8 amperes
FAJ-10505	6.0-6.6 volts	0-8 amperes

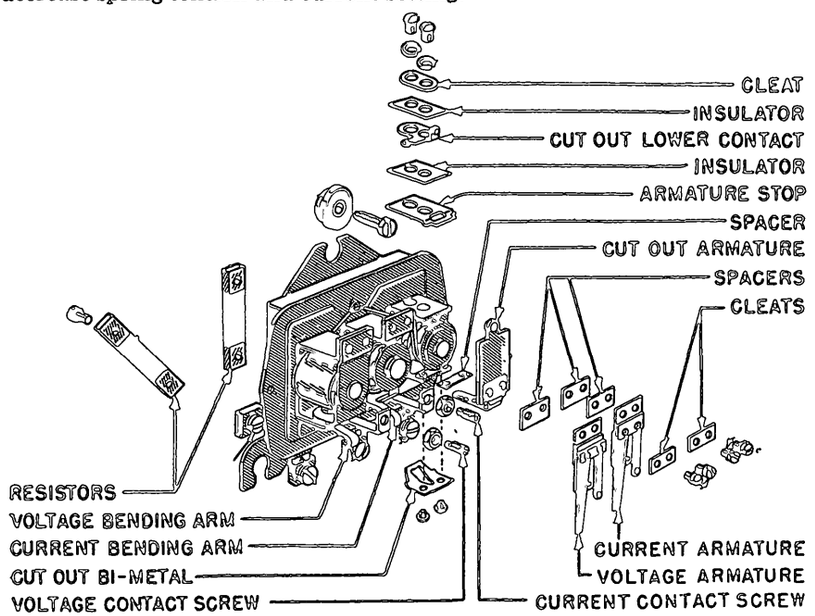
►*IDLE SPEED NOTE*—If higher than cut-in point, it will be necessary to back off throttle stopscrew and bring idling speed below cut-in point.

Voltage Regulator Setting—Check with the cover in place and at 70-80°F. with the regulator at normal operating temperature (after operating for 30 minutes or having been heated on the test bench so temperature stabilized). Connect ammeter in charging line at regulator "BAT" terminal (disconnect lead on this terminal, connect ammeter to this lead and to the terminal), connect voltmeter between regulator "ARM" terminal and ground. Run engine at 1500 RPM., adjust charging rate to 8-10 amperes (if less than 8 amperes, turn

CONTINUED N NEXT PAGE

FORD, LINCOLN, MERCURY REGULATORS (Cont.)

on lights or other load; if more than 12 amperes, cut in resistance of the test set). Note voltmeter reading with generator output of 8-10 amperes (CAUTION —cover must be in place when making this reading). To adjust, remove regulator cover, bend spring adjustment (bending arm—see illustration) upward to increase spring tension and voltage setting, or down to decrease spring tension and voltage setting. Re-install cover and repeat test.



▷*CAUTION*—Voltage will drop approx. 0.2 volt when steel cover installed and should be allowed for when adjusting (aluminum covers do not change setting).

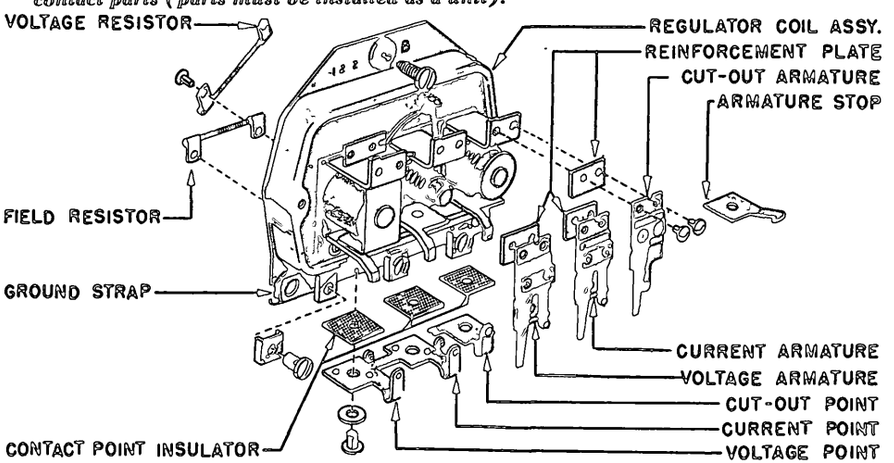
②—7.0-7.4 volts with regulator COLD.
③—With Ambient air temperature from 70 to 80°F.

Current Regulator Setting—After checking Voltage Regulator (above) re-install regulator cover if removed. Proceed as for voltage regulator check with engine running at 1500 RPM. (approx. 30 MPH.), use Battery-Starter Tester to increase load (or decrease resistance of carbon-pile regulator on Ford Test Set), note ammeter reading which should agree with current regulator setting below. To adjust, remove regulator cover, bend spring adjustment (bending arm—see illustration) upward to increase spring tension and current setting, or down to decrease spring tension and current setting.

REGULATOR CONTACT ASSY. (EARLY TYPE)

Current Regulator Setting

Regulator Type	Setting (Amperes)
01A-10505-C, C4	30-33
5EH-10505-C	38-42
51A-10505-A1	30-34
51A-10505-A2, B2, C2, D2	30-33
51A-10505-H, J	34-38
8A-10505-A	30-34
8L-10505	38-42
8M-10505-A	34-38
FAC-10505-A,A1,A2	34-38
FAD-10505-A	38-42
FAJ-10505	48-52



▷*CAUTION*—After tests completed, disconnect test meters, connect charging line to regulator "BAT" terminal. Make certain that jumper removed from generator "A" and "F" terminals.

REGULATOR SPECIFICATIONS

Cutout Relay Contact Gap—.010" with armature against stop.
Cutout Relay Air Gap—.014" between armature and core with contacts open.
Contact Gap and Air Gap Setting—Insert .014" feeler between armature and core. Then set contact gap to .010" using a feeler gauge, by lowering armature stop and raising the lower contact, tighten 2 lower contact screws.
▷*CAUTION*—Heel of armature must not touch relay frame.
Aligning Cutout Relay Contacts—Contacts must make and break squarely. If adjustment necessary, bend lower contact up or down, then check Air Gap and Contact Gap (may be disturbed by movement of lower contact).
Regulator Air Gap—.032-.035" between armature and core (contacts closed).
Setting Air Gap—Bend the spring adjustment (bending arm)—see illustration —to clear armature spring. Insert .035" gauge (round stock) between armature and core (*CAUTION*—On voltage regulator make certain gauge does not contact rivet on underside of armature). Press armature down, turn contact screw down to just touch armature contact, set contact screw with locknut. Realign contacts
Regulator Contact Spring Tension—5 ozs. minimum with contacts just opening.
Checking Contact Spring Tension—Use a spring scale to measure tension just as contacts open. Adjust upper contact screw after loosening locknut if pressure below limits listed above.
▷*Check Relay and Regulator Settings after completing above adjustments.*

CONTACT REPLACEMENT

CONTACT REPLACEMENT: *See illustrations for contact mounting details.*
Cutout Relay: *CAUTION*—Lower cutout contacts replaceable only on regulators where contact mounting secured by screws (if contact secured by rivets, regulator must be replaced if contacts damaged).
Voltage & Current Regulators: *See "Changes, Cautions, Corrections" for later design contact parts (parts must be installed as a unit).*

REGULATOR CONTACT ASSY. (LATER TYPE)

BARREL TYPE BENDIX

See Starter Drive listing on individual car model pages for type used.

DESCRIPTION: This drive retains Bendix inertia principle of engagement and free longitudinal movement to insure pinion mesh but has been redesigned so that all parts of drive mechanism except drive spring are located within the pinion barrel. The threaded sleeve is mounted loosely on an extension of the drive head (instead of directly on the starter shaft) and is retained by the stop nut which is screwed and staked in place on the outer end of the head. The pinion is integral with the barrel or drive sleeve and is mounted loosely on the starter shaft (not on threaded sleeve as in former types). Starter drive is through lugs on the control nut or driving ring on the screw shaft which engage slots in the end of the pinion barrel. Pinion barrel is held in place on control nut by a locking ring within the end of the barrel directly behind the driving lugs. A coil type anti-drift spring is mounted on the threaded sleeve ahead of the control nut and a meshing spring is located within the head of the barrel

BENDIX SPRINGS: Both Type "F" and "H" driving springs formed with special smaller diameter end coil designed to fit closely on shaft at ends. No spring clips used with these types. Springs may be identified by larger (3/8") spring eye. Spring eyes located on same side of coil (Type F), or 180° apart (Type H).

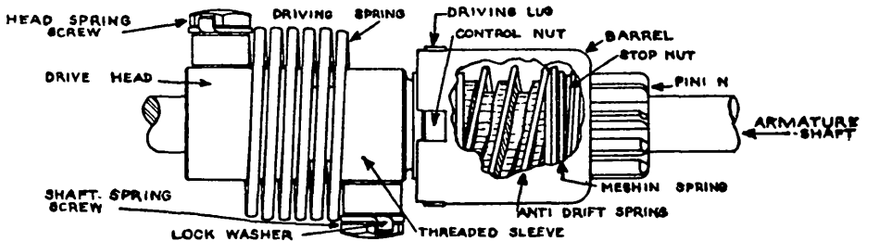
OPERATION: Pinion, barrel, and control nut operate as a unit and pinion is moved out into mesh with the flywheel as the control nut is threaded along the threaded sleeve. If the pinion teeth strike the ends of the flywheel teeth, the free longitudinal movement of the threaded sleeve on the drive head allows the pinion to turn slightly and mesh properly. This free movement important to insure correct meshing and prevent jammed pinion or damage to gear teeth.

SERVICING: No servicing required except cleaning and oiling of threaded sleeve and armature shaft under pinion when operation not satisfactory.

Armature Shaft:—Rotate pinion back to demeshed position, clean exposed portion of shaft with kerosene, lubricate lightly (Gredag 31¼ graphite grease).

Threaded Sleeve:—Rotate pinion forward to meshed position as far as possible, wipe threads clean with dry cloth or use kerosene sparingly (not gasoline). Do not wash entire drive in kerosene or grease installed under threaded sleeve at time of assembly will be removed (threaded sleeve cannot be removed to replace this lubricant). Lubricate threaded sleeve lightly with 10-W engine oil.

TROUBLE SHOOTING: If pinion jams or meshes improperly, check as follows:



(1) Armature shaft rough or burred, dirty or rusty under threaded sleeve (first type only). Remove Bendix, clean and smooth shaft, lubricate shaft lightly with graphite grease Gredag 31¼ before replacing drive.

(2) Armature shaft rough, burred or dirty under Bendix pinion (all types). Thread pinion back on threaded sleeve (demeshed position), smooth shaft with emery cloth or clean with kerosene (do not use gasoline), lubricate shaft lightly with Gredag 31¼ graphite grease.

(3) Armature Shaft Bent. Remove Bendix drive. Check shaft and straighten

(4) Drive spring screw at threaded sleeve end too long. See that spring does not project through sleeve and bind on drive head extension (on first type screw will bind on armature shaft).

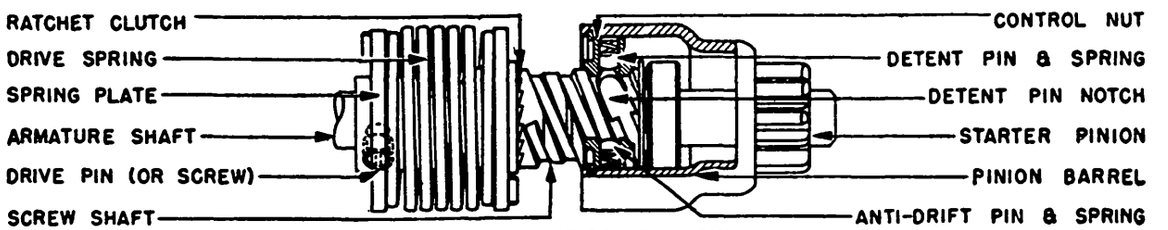
(5) Cocked or deformed drive spring. This will cause threaded sleeve to drag on armature shaft (first type) or on drive head extension (later types). Remove spring by taking out spring screws, examine spring, replace if necessary. Spring eye centers should be at right angles to spring axis (See Spring Note above). Use new lockwashers under spring screw heads when replacing screws and see that one lip of washer is turned down in spring eye gap and other lip turned up against screw head flat.

BARREL TYPE (SPRING SCREW TYPE) BENDIX DRIVE

BENDIX "FOLO-THRU" STARTER DRIVE

DESCRIPTION & OPERATION: The "Folo-Thru" Bendix Drive is similar to other Bendix Barrel-Anchor Plate types and operates in the same manner except for the Detent Pin action which prevents premature demeshing of the pinion from the flywheel ring gear as follows:

Detent Pin Operation—The detent pin consists of a spring-loaded plunger in the Control Nut which drops into notch in the screwshaft when the pinion is in the fully engaged position. The pin cannot be disengaged or the pinion moved manually from the engaged position and will only release when the pinion speed reaches 5800-7300 RPM. (at this point, centrifugal force moves the pin outward to free the pinion) and the pinion then is free to disengage from the flywheel ring gear. A ratchet clutch on the screwshaft (between the pinion and the drive spring) allows the pinion to overrun the starter armature shaft and prevents damage to the starter when the pinion is being driven by the engine. *NOTE*—An Anti-drift Spring (similar in appearance to the Detent Pin) is also located in the Control Nut. This anti-drift pin rides on the teeth of the screwshaft and prevents accidental engagement of the pinion due to vibration while the engine is running.



SERVICING: *Do not disassemble this drive* (furnished only as a complete unit due to calibration requirements of Detent and Anti-Drift Pin Springs). Service is limited to removal and installation of the drive or to cleaning when necessary (if drive fails to operate due to gummy deposit of oil or dirt).

Cleaning the Drive: Dip screwshaft and pinion assembly in clean kerosene or use brush to apply kerosene, run pinion back and forth on threads to remove all gum and grit, dry the drive with compressed air. No lubrication is recommended although a very light film of SAE 10W engine oil can be used on moving parts if desired. ***CAUTION—Too much oil on screwshaft will collect dust and produce a gummy condition which will interfere with drive operation.***

REMOVAL: To remove drive assembly from armature shaft, push spring plate toward drive pinion to expose the setscrew or pin mounting the drive on the armature shaft. Remove this screw or pin, slide drive off shaft. Do not disassemble the drive.

INSTALLATION: ***CAUTION—Drive cannot be moved manually from engaged to disengaged position, however drive can be installed on starter and starter installed on engine with drive in the engaged position.*** Slide drive assembly on armature shaft and align mounting screw hole in screwshaft with hole in armature shaft, compress spring plate and insert mounting screw or pin. Install starter on engine.

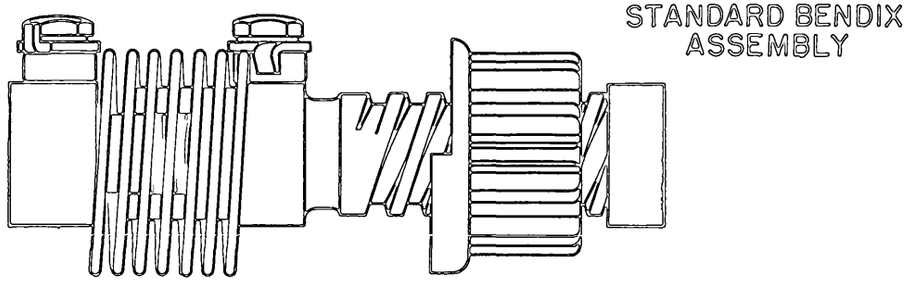
►*CAUTION*—If drive in "Engaged" position, make certain that pinion properly engaged in flywheel ring gear teeth and that starter seated solidly on its mounting flange before mounting screws are tightened. DO NOT FORCE STARTER INTO PLACE (will cause misalignment and binding of pinion teeth or drive).

BENDIX "FOL -THRU" STARTER DRIVE

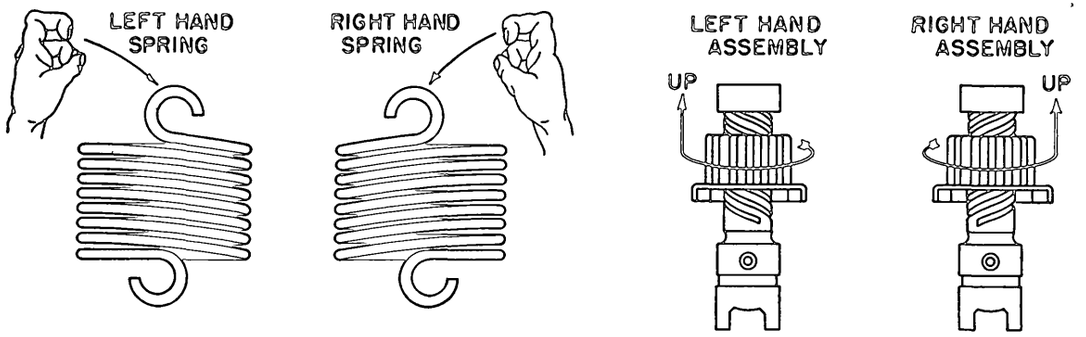
STANDARD BENDIX DRIVE

DESCRIPTION: The Standard Bendix Drive consists of a counterweighted pinion loosely threaded on a screw sleeve driven by a drive spring bolted to the starter shaft. The pinion teeth are chamfered on one side and specially rounded for easy meshing with the flywheel gear. Drives are furnished for right and left rotation.

OPERATION: When the starter shaft turns, it drives the screw sleeve (through the drive spring) and the pinion being counterweighted and loosely threaded on the screw sleeve, tends to remain stationary. This causes the pinion to move along the sleeve and engage the flywheel. In the event the teeth butt, the threading action causes the sleeve to be pushed backwards against the compression of the drive spring, the longitudinal movement permitting the pinion to turn slightly further and enter the flywheel.



ADJUSTMENTS: With the drive assembled on the starter shaft and holding the drive spring compressed by hand, the distance between the end of the drive and the starter end plate should not exceed 3/8". If clearance is more than 3/8" a washer should be installed on the shaft between the drive and the end plate to obtain a clearance of 5/16" to 3/8". With the drive spring free this clearance should be 1/16". More than 1/16" will allow the pinion to ride too far through the gear which will cause the counterweight on the pinion to strike the flywheel, eventually breaking it loose from the pinion.



REPAIR: If the pinion teeth are worn or damaged it will be necessary to replace the pinion and sleeve assembly as pinions are not furnished separately.

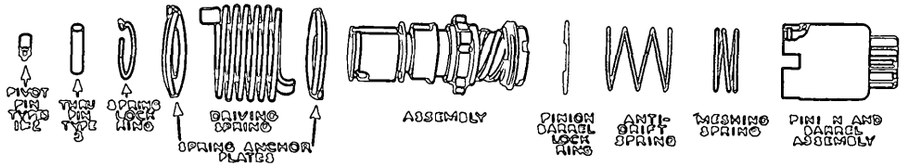
RIGHT & LEFT HAND PARTS IDENTIFICATION: See illustrations for drive and spring identification.

Spring—Hold spring upright with spring loops toward you. Crook index finger as shown in illustration to conform with direction of upper spring loop. If left index finger conforms with loop, spring is Left Hand type. If right index finger conforms with loop, spring is Right Hand type.

Screw Shaft "SA" Assembly—Hold assembly upright, grasping the end on which spring is installed. Turn pinion so that it moves in forward (upward) direction on shaft. If pinion turns to left and pinion teeth are chamfered on left hand corner, assembly is Left Hand type. If pinion turns to right and teeth are chamfered on right hand corner, it is Right Hand type.

BENDIX DRIVE ASSEMBLY & PARTS IDENTIFICATION

SPECIAL BARREL TYPE BENDIX (NASH & STUDEBAKER)



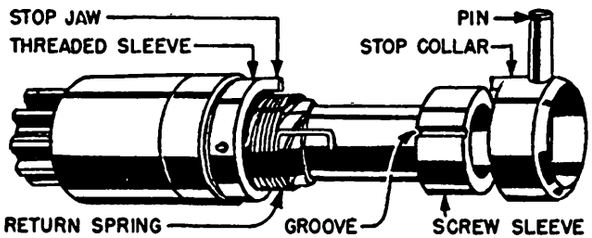
DESCRIPTION: Same as other Barrel Bendix Drives except that Drive Spring is anchored by two identical notched plates (instead of screws used on other types). Inner anchor plate retained by locking ring (Types 2 and 3 only) and anchor plates and drive spring can be taken off after locking ring removed.

REMOVAL & INSTALLATION: To remove drive from armature shaft, screw pinion and barrel assembly all the way back toward the drive spring, push head anchor plate in against drive spring compression to uncover pilot pin, remove pin, slide drive off shaft being careful not to lose woodruff key in shaft (Types 1 and 2). When installing drive, make certain that pilot hole in armature shaft is clean to permit full seating of pilot pin, install woodruff key in shaft, see that pilot pin tongue does not extend above the edge of the hole when installed and that the head anchor plate covers the top of the pin (this is important to prevent pin working out in service).

SERVICING: Disassembly. Remove locking ring within pinion barrel (drive spring end) by inserting screwdriver in lug recess in barrel nearest lock ring end and working ring out (be careful not to distort ring), remove pinion and barrel assembly from screw shaft. To remove anti-drift spring, pull spring back until end coil slips over stop nut shoulder (hook finger under spring 180° from end coil), remove spring taking care not to distort it.

Drive Spring & Anchor Plates (Types 2 and 3 only). Remove lock ring on screw shaft at outer end of anchor plate (use pliers and take care not to distort ring), slide head anchor plate and spring off. Do not remove shaft anchor plate (nearest barrel) unless necessary. If this anchor plate removed, install by cocking the fibre washer so that the edge projects through hole at point under spring slot in anchor plate, then feed it through hole in anchor plate carefully to avoid damage. When installing drive spring, see that dished faces of anchor plates face spring (see illustration), and that the anchor plate covers the top of the pilot pin. See that lock ring is properly seated in groove and spring opening is over the top of the pilot pin (important).

Drive Assembly. Check anti-drift spring clearance in pinion barrel (spring should fall into barrel freely, if either end binds, install new spring). To install spring hook end over stop nut and thread spring in until it strikes control nut, then push end over stop nut. Check by threading control nut half turn forward on screw sleeve and making certain that spring does not project beyond control nut or stop nut shoulder. See that meshing spring is in place in pinion barrel, install pinion barrel and lock ring. See that pinion and barrel assembly moves freely on screw sleeve. In fully demeshed position, pinion and barrel assembly should rethread itself (slight click will be evident) on all three screw sleeve threads with slight reverse rotation of barrel.



BARREL TYPE (ANCHOR PLATE TYPE) BENDIX DRIVE

DELCO-REMY AUTOMATIC DRIVE

DESCRIPTION: Delco Remy Automatic Drive operates on the principle of a screw shaft drive, as used on Bendix Drive. The pinion is spring loaded, and if tooth abutment occurs, continued rotation of the armature results in the pinion turning and meshing with the flywheel teeth. By this method cranking motor force is not applied against the face of the teeth until pinion is in cranking position. When pinion reaches cranking position, the spring-loaded detent plunger in the threaded sleeve drops into place and locks the pinion in this position. The starter armature drives the pinion through the drive spring in the threaded sleeve which absorbs the shock of engagement. When the engine starts to fire, the starter is driven at increased speed and at 4000 RPM. the centrifugal force lifts detent plunger out of engagement to unlock the pinion. The pinion moves out of mesh with the flywheel ring gear and in the "at rest" position the jaw on the pinion assembly comes up against the jaw on the stop collar.

INSTALLATION OR REPLACEMENT DRIVE: Furnished as a completely assembled unit ready for installation. Remove old drive by prying lock ring out of groove in stop collar and pushing pin out far enough to clear armature shaft (on first drives without this lock ring, pin is staked in place and must be driven out), then slide drive off shaft. Clean armature shaft thoroughly, coat shaft with film of 5W engine oil (if 5W not available use 10W plus 10% kerosene). Make certain that thrustwasher in place on shaft. Pry lock ring out of groove on new drive, slide pin out to clear shaft hole, install new drive on armature shaft, push pin through armature shaft hole (if pin tight, rotate shaft 180° and insert pin through opposite end of shaft hole), install lock ring. Rotate pinion into cranking position and check for proper operation of detent plunger (pinion should be locked in this position by plunger). Check and adjust endplay as follows:

Drive Endplay: .010-.035". To check endplay with pinion in cranking position (locked by detent plunger), pull pinion firmly back toward barrel until all endplay is taken up, measure clearance between end of pinion and face of thrustwasher with a feeler gauge. If clearance not .010-.035", remove drive and install service thrustwasher of correct thickness. Thrustwashers furnished as follows: No. 1914999 (.062" thick), No. 1917886 (.041" thick).

DELCO-REMY STARTER DRIVE

DISASSEMBLY: Pry lock ring out of groove in stop collar and push pin out far enough to clear armature shaft (on first drives without this lock ring, pin is staked in place and must be driven out), slide drive assembly off armature shaft. Pull pin out and remove stop collar. Slip end of return spring from notch in head of screw sleeve, thread the screw sleeve in a clockwise direction out of the pinion spring and collar assembly. Disengage the return spring from the hole in the threaded sleeve. This completes the disassembly.

REASSEMBLY: Install the short end of the return spring in the locating hole of the threaded sleeve. Align the milled groove in the threads of the screw sleeve with the detent plunger on the threaded sleeve, rotate screw sleeve in a countr-clockwise direction until it locks against the detent plunger, lift detent plunger, continue to rotate screw sleeve until it bottoms in the threaded sleeve. Rotate free end of return spring in direction to tighten spring until end lines up with groove in screw sleeve, engage spring end in groove, install stop collar on sleeve (will lock spring end in place) with stop jaw on collar in line with stop jaw on threaded sleeve, rotate threaded sleeve approximately ¼ turn clockwise to align hole in sleeve and hole in collar, insert pin through one side of collar and into screw sleeve hole (pin and lock ring will be finally installed when drive installed on starter).

Installation Note—See Installation of Replacement Drive above.

①—1955 Models with Std. Trans.

②—This switch used with Carter Car Starter. See separate article for data on Carter Car Starter.

③—With Automatic Transmission.

DESCRIPTION: Magnetic solenoid switches of conventional design mounted on the starter field frame and controlled by a pushbutton switch on the instrument panel. The feed wire for the switch solenoid is connected to the coil side of the ignition switch so that the starter is operative only with the ignition turned on. See car diagrams for wiring and connections of each installation.

OPERATION: Two springs are used in connection with solenoid coil to control the switch action. When the solenoid circuit is completed by pressing the pushbutton switch, the solenoid plunger is drawn into the coil against the tension of a light spring. After the main switch contacts close, the plunger compresses a second spring, insuring a positive connection at the switch contacts. When the pushbutton switch is released, breaking the sol noid circuit, this second spring quickly separates the main switch contacts, preventing arcing or burning of the contacts. The first spring then returns the solenoid plunger to the off position.

CHECKING & ADJUSTMENT: If switch does not operate satisfactorily, check performance specifications as given below. No adjustments are required in service.

PERFORMANCE SPECIFICATIONS:	**6 Volt Types**	**12 Volt Types**
Closing Voltage	3.0-4.0 volts	6.0-8.5 volts
Opening Voltage	0.5-1.25 volts	1.0-2.5 volts

►***PINION STOP & RETAINING RING WEAR & BREAKAGE (MCH-6106, MCH-6110, MCL-6110, MCL-6111 Starters with MCH-2070 Armature):*** On early starters noted above, failure of the starter may be caused by pinion stop and retaining ring moving on armature shaft Correct by installing new armature (with hardened shaft) and new retaining ring and pinion stop which have reduced clearances in shaft groove ***CAUTION***—"Pinion clearance when engaged" setting should be carefully adjusted to limits shown in ADJUSTMENTS below to prevent pounding of the stop when the pinion is engaged

DESCRIPTION & OPERATION Manually operated pinion shift and starting switch assembly with switch mounted on the starter field frame Shift lever is linked to starting pedal on toeboard and is operated by depressing the pedal First movement of the lever meshes the pinion with the flywheel ring gear and the switch is then closed by a lug on the lever (if pinion teeth butt against flywheel teeth, a spring permits further movement of the lever to close the switch, and the pinion is meshed by the spring as the armature starts to turn) An overrunning clutch in the starter drive prevents starter being driven at excessive speed when the engine begins to fire (pinion is demeshed by the return spring as soon as the pedal is released).

ADJUSTMENT: Check the following specifications and adjust as required·

Pinion Position when Disengaged: With starter at rest, the distance from the outer face of the pinion housing (face of starter mounting flange) to outer face of the pinion is shown in table below.

Pinion Position (Disengaged)

Starter Model	①Pinion Distance	Starter Model	①Pinion Distance
MAW (All Models)	1 11/32"	MCH (All Models)	1 317-1 467"
MAX (exc MAW-4009)	1 11/32"	MCL (All Models)	1 317-1 467"
MAX-4009 only	See Note	MZ (Exc MZ-4137, 4162)	1 11/32'
		MZ-4137 & 4162	25/32'

①—Variation of Plus 1/64" or Minus 5/32" is allowable.

MZ-4101 Note—With pinion at rest, distance from center of locating dowel hole to face of pinion should be 3½" with ⅛" clearance between pinion and flywheel. Pinion travel between at rest and fully meshed positions should be ½"
MAX-4009 Note—With pinion at rest, distance from center of locating dowel hole to outer face of pinion should be 2 11/32" plus 1/64" or minus 5/32"

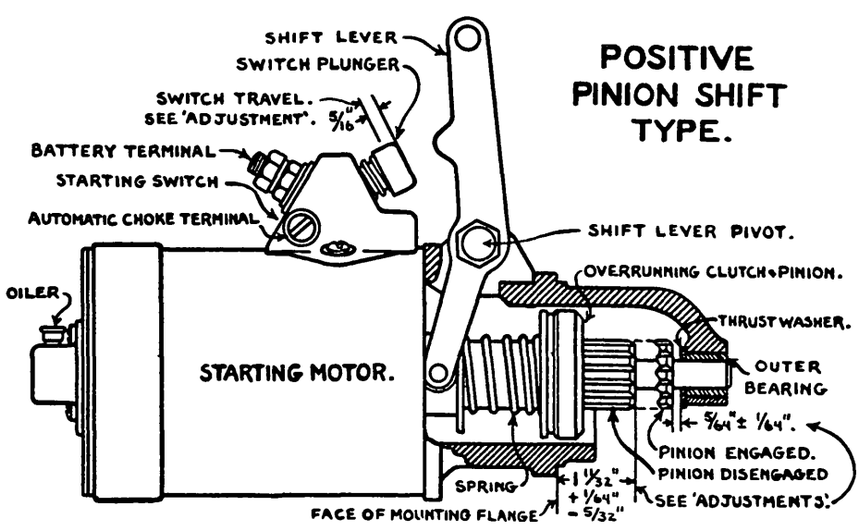
Pinion Clearance when Engaged: With shift lever at end of the travel, clearance between outer face of pinion and thrust washer next to outer pinion bearing is shown in table below Adjust by pressing down on spring on switch plunger and turning button on outer end of plunger in or out The button is locked by the end of the spring

Pinion Clearance (Engaged)

Starter Model	①Pinion Clearance	Starter Model	①Pinion Clearance
MAW (All Models)	5/64"	MCL-6110, F, T, 6111, T	3/32"
MAX (All Models)	5/64"	MCL-6112	5/64"
MCH-6103	5/64"	MCL-6126	3/32"
MCH-6106, F, T, 6110	3/32"	MZ (Exc MZ-4137, 4162)	5/64"
MCL-6102, 6103	5/64"	MZ-4137, 4162	37/64"

①—Variation of plus or minus 1/64" is allowable

Switch Travel The full stroke or travel of the switch plunger should be approximately 5/32" (All MAW & MAX Starters, All MZ Starters except MZ-4137 & 4162), 3/16" (MZ-4137 & 4162), 3/16" (All MCH & MCL Starters) See pinion clearance data above



MAW-4019 & 4019A Note—Tension required to move yoke lever into contact with starting switch button should be 9-15 lbs at hole 3 3/16" from yoke pin

Checking Switch Action: Switch action can be checked by slipping a special steel spacer (square stock 1" wide, ¾" thick, with ⅝" slot in the 1" face) on armature shaft between pinion and thrust washer at pinion housing outer bearing. With spacer in place, switch should close when pressure applied to outer end of pinion shift lever.

MCH-6106, F, T; 6110 Note—When checking switch action on these models, use spacer block ½" thick instead of regular ¾" thick block mentioned above
MCL-6110. F, T: 6111, T; 6126 Note—When checking switch action on these models, use spacer block ½" thick instead of regular ¾' thick block mentioned above

MZ-4101 Note—When checking switch action on this model, use spacer block ⅜" thick instead of regular ¾" thick block mentioned above.

Armature Endplay: The armature endplay should be .005" minimum, .030" maximum Adjust by inserting MU-54 thrust washer of correct thickness between the MAD-96 thrust washer and the commutator end plate These thrust washers furnished in following thicknesses MU-54 or MU-54F—1/32", MU-54A or MU-54G—1/64", MU-54B or MU-54J—3/64", MU-54L—1/16", MU-54K—5/64"

►**1946 PACKARD MAX-4052 STARTER CLUTCH REPLACEMENT:** When trouble encountered with the clutch on these starters, examine starter for yellow paint mark on pinion housing between frame and mounting face (mark indicates that latest type clutch installed) and INSTALL NEW CLUTCH on all starters not so paint marked. *CAUTION*—Install only latest type clutch, Part No. MAX-3075 **marked by yellow paint on pinion,** and use extreme care in adjusting the switch linkage so that correct synchronization of switch and pinion shaft linkage is secured. *See Adjustment data below.*

DESCRIPTION: This is a solenoid type combined starting switch and pinion shift mounted on the starter field frame. The solenoid plunger is connected to the pinion shift lever by an adjusting stud and link so that the pinion is engaged and the switch contacts closed when the solenoid is energized. The solenoid is controlled by a relay in the solenoid case which is operated by a pushbutton on the instrument panel or special controls as follows:

►**Packard Starting Switch Note**—Control switch is "Carter Car Starter" mounted on the carburetor and actuated by depressing the accelerator pedal. *See "Carter Car Starter" in this section for complete data on this unit.*

OPERATION: Feed wire for the starting pushbutton is normally connected to the ignition switch (or switch side of gasoline gauge) so that the starter can be operated only when the ignition is turned 'on'. The closing of the pushbutton contacts completes the solenoid relay circuit, energizing the relay and closing the relay contacts. This completes the solenoid circuit, allowing a current flow of approximately 65 amperes through the two (series and shunt) coils of the solenoid. The solenoid plunger is drawn into the solenoid coil, engaging the starter pinion with the flywheel and closing the main starting switch contacts. The series coil is short-circuited when the switch contacts close (being connected across the contacts), but a current of approximately 15 amperes continues to flow through the shunt coil which holds the plunger in so that the pinion remains in mesh and the switch contacts closed while the starter is cranking the engine. When the pushbutton is released, the solenoid relay circuit is broken, the relay contacts open, breaking the solenoid circuit, and interrupting the current flow through the shunt coil. The return spring on the shift lever then disengages the pinion from the flywheel and the starting switch contacts open.

An overrunning clutch is built into the starter pinion to prevent the starter being driven by the engine after the engine begins to fire and before the pushbutton is released. A spring between the shift lever collar on the armature shaft and the overrunning clutch housing is provided to assist in meshing the pinion.

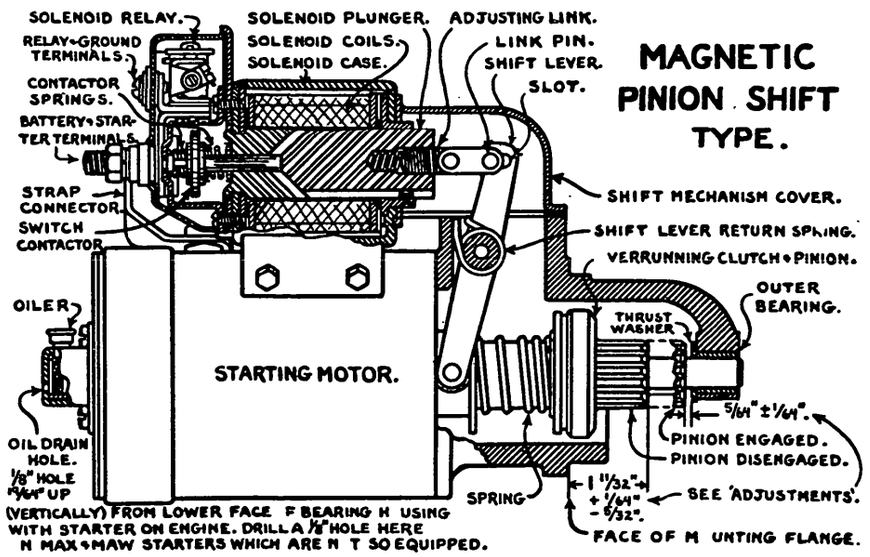
ADJUSTMENT: The position of the pinion when disengaged (at rest), and clearance of pinion when fully meshed in the operating position, should be checked and adjusted as follows:

Pinion Position when Disengaged:—Distance from mounting face of pinion housing (face of starter mounting flange) to outer face of pinion is shown in table below. Measure this distance with the pinion at rest and the starter not operating. Adjust by changing armature endplay (see Armature Endplay data below).

Pinion Position (Disengaged)

Starter Model	①Pinion Distance	Starter Model	①Pinion Distance
MAW (All Models)	1 11/32"	MAX-4052	15/16"
MAX (Except following)	1 11/32"	MCH (All Models)	1.317-1.467"
MAX-4008, 4036, 4037	1 3/8"	MCL (Except following)	1.317-1.467"
MAX-4041	15/16"	MCL-6114	0.913-1.063"
MAX-4044, 4051	19/32"	MCL-6123T	1.475-1.627"

①A variation of Plus 1/64" or Minus 5/32" is allowed.



Pinion Clearance when Engaged:—With the plunger bottomed in the core, the clearance between the outer face of pinion and the thrust washer next to the pinion bearing in the outer housing is shown in table below. To check this clearance, press in on the plunger by hand until it bottoms (do not press on shift lever or pinion) or disconnect strap connector to starter terminal so that starter will not spin and connect battery to solenoid relay terminal and ground on starter field frame. Current flow through shunt coil will hold plunger in while adjustment is being made. Take out pin connecting shift lever and plunger link, turn adjusting stud in or out of plunger until pin can just be inserted with pinion in correct position. Pin should be against solenoid end of slot in upper end of shift lever. The endplay in the linkage provided by the slot is necessary for correct operation. *DO NOT take up endplay by pressing on shift lever or pinion.*

Pinion Clearance (Engaged)

Starter Model	①Pinion Clearance	Starter Model	①Pinion Clearance
MAW (All Models)	5/64"	MCH-6105, 6113, 6113A	3/32"
MAX (All Models)	5/64"	MCL-6101	5/64"
MCH-6102	5/64"	MCL (Except 6101)	3/32"

①—Variation of plus or minus 1/64" is allowable.

CONTINUED ON NEXT PAGE

AUTO-LITE SOLENOID STARTER SWITCHES (WITH RELAY) Continu d

NOTE—When operating switch, it will be noted that switch contact is made first and that a further travel of approximately 3/16" is required to bottom the plunger in the core (this will bring outer end approximately even with solenoid housing).

Starter Armature Endplay—Armature endplay must be held within limits of .005-.030" (All models except as noted below). Adjust by installing thrust washers between the MAD-96 thrust washer and the commutator end plate. These thrust washers furnished in following thicknesses: MU-54 & MU-54F—1/32", MU-54A & MU-54G—1/64", MU-54B & MU-54J—3/64", MU-54L—1/16", MU-54K—5/64".

►**MAX-4035, 4041, 4052 Armature Endplay Note**—On these models, endplay should be 1/16" maximum. On all other "MAX" starters, endplay is standard .005-.030".

SOLENOID & RELAY SPECIFICATIONS: Check solenoid performance and adjust relay settings as follows:

SOLENOID PERFORMANCE (6 Volt Types)

Series SS-4100, 4200, 4700 Solenoids

	Both Coils	Shunt Coil Only
SS-4100 Series	34.0-38.0 amps. at 3 volts	14.0-16.0 amps. at 6 volts
SS-4200 Series	34.0-38.0 amps. at 3 volts	7.0-8.0 amps. at 3 volts
SS-4700 S ries	45.0-50.0 amps. at 3 volts	7.0-8.0 amps. at 3 volts

Series SSX-4100 Solenoids

	Pull-In Coil	Hold-In Coil
Series SSX-4100	31.5-36.0 amps. at 3.0 volts	8.8-10.1 amps. at 3.0 volts

Solenoid Rel y: Control relay is built-in the solenoid housing at the starting switch end (see illustration). Relay specifications and performance are as follows:

SOLENOID RELAY PERFORMANCE

Series SS-4100, 4200, 4700 Relays

C ntacts Close—3.5-4.5 volts. Adjust by changing position of armature upper stop (contact gap adjustment). Increase gap to increase operating voltage or decrease gap to decrease voltage.

Contacts Open—1.5-2.5 volts. Adjust by changing armature spring tension. Increase spring tension to increase operating voltage or decrease spring tension to decrease voltage.

Contact Gap—.025-.035". Adjusted by changing position of armature upper stop (see closing adjustment above).

Air Gap—.005-.007" with contacts closed. Adjusted by changing position of lower armature stop.

Coil Resistance—7.5-8.3 ohms at 77°F.

Series SSX-4100 Relays

Contacts Close—1.5-3.0 volts. Armature "seals" to core at 4.0 volts.

Contacts Open—0.5 volts minimum from "sealed" position.

CHECKING SWITCH ACTION: The switch action can be checked by slipping a special steel spacer (make up from bar stock 1" wide with 5/8" slot in this 1" face and of correct thickness for each starter as listed below) on the armature shaft between the pinion and the thrust washer at the pinion housing outer bearing. With spacer in place, switch plunger should bottom and switch contacts should close with normal voltages.

Spacer Thickness

Starter Model	Spacer Thickness	Starter Model	Spacer Thickness
MAW (All Models)	3/4"	MCL (Except following)	1/2"
MAX (All Models)	3/4"	MCL-6101, 6107	3/4"
MCH-6102	3/4"	MCL-6123T	3/8"
MCH-6105, 6113, 6113A	1/2"		

TROUBLE SHOOTING: Pinion fails to engage or disengage properly. Check for interference between shift yoke and collar at open end of yoke where curved section passes over rim on collar. Binding of yoke on collar at this point should be corrected by filing yoke at point where interference occurs. Check for binding of yoke shoes on mounting pins which causes shoes to turn and bind in collar. Correct by cleaning all dirt from between shoes and yoke, lubricate shoe pins and make certain that yoke shoes installed with curved side toward pinion end of starter clutch. Check for binding of yoke assembly on yoke fulcrum pin due to paint or dirt on pin. Clean yoke pin and yoke sleeve thoroughly, examine return spring on pin. If this does not correct trouble, replace yoke assembly.

Flywheel ring gear teeth damaged by pinion. May be caused by too early closing of starting switch contacts which will result in starter operating before pinion has been meshed with flywheel. Check pinion position (see specifications above). Switch contacts should close approximately 3/16" plunger travel before plunger bottoms in solenoid core.

►***PINION STOP & RETAINING RING WEAR & BREAKAGE (MCH-6105, MCL-6108, MCL-6109, MCL-6116, MCL-6117 Starters with MCH-2070 Armature):*** On early starters noted above, failure of the starter may be caused by pinion stop and retaining ring moving on armature shaft. Correct by installing new armature (with hardened shaft) and new retaining ring and pinion stop which have reduced clearances in shaft groove. ***CAUTION***—"Pinion clearance when engaged" setting should be carefully adjusted to limits shown in ADJUSTMENTS

DESCRIPTION: This combined starting switch and pinion shift solenoid is similar to earlier types except that no solenoid relay is used

OPERATION: Solenoid has two windings: (1) Series winding or "pull-in" coil, (2) Shunt winding or "hold-in" coil. Both windings are energized to engage the starter pinion with the flywheel and to close the main starting switch contacts. Series winding is short-circuited when the switch contacts close but shunt winding remains energized to hold contacts closed.

ADJUSTMENT: Pinion position when disengaged (at rest) and pinion clearance when engaged should be checked and adjusted as follows:

Pinion Position when Disengaged—Measure distance from face of mounting flange to outer face or edge of pinion in the "at rest" position with the armature end clearance taken up first in one direction and then in the opposite direction.

Pinion Position (Disengaged)

Starter Model	Pinion Position
MCH-6105, 6113, 6113A	1.317-1.467"
MCL-6109, 6116, 6117, 6121, 6121A	1.317-1.467"
MCL-6304	1 317-1 467"
MCL-6132	.834- 984"
MDF-6008	.834-.984"
MDB-6001, 6001A, 6301	1.317-1 467"

Pinion Clearance when Engaged—With the plunger bottomed in the core (see Note below) and with the armature endplay taken up at the commutator end, measure clearance between outer face or edge of pinion and pinion stop. If not correct, adjust by screwing the solenoid plunger or adjusting pin in or out as required after removing the pin linking the shift lever and the plunger link.

NOTE—Plunger can be bottomed in coil for above check by pressing in on plunger by hand (CAUTION —do not press on shift lever or pinion) or by disconnecting strap connector to starter terminal so that starter will not spin and then connecting battery to solenoid terminal and ground on starter field frame (coil will hold plunger in while adjustment being made).

Pinion Clearance (Engaged)

Starter Model	①Clearance
MCH-6105, 6113, 6113A	3/32"
MCL-6109, 6116, 6121, 6121A	3/32"
MCL-6132, 6304	3/32"
MDB-6001, 6001A, 6301	3/32"

①—Plus or minus 1/64".

Starter Armature Endplay—.005" minimum, .030" maximum. Adjust by installing MU-54 thrustwashers on armature shaft at commutator end plate (between the MCH-96 thrustwasher and the end plate).

PERFORMANCE: Current draw is as follows:

SOLENOID CURRENT DRAW

Series SSX-4001, 2, 3, 4 (6 Volt)

Pull-in Coil—31.5-36.0 amperes at 3.0 volts.
Hold-in Coil—8.8-10.1 amperes at 3.0 volts.

Series SAD-4101 (12 Volt)

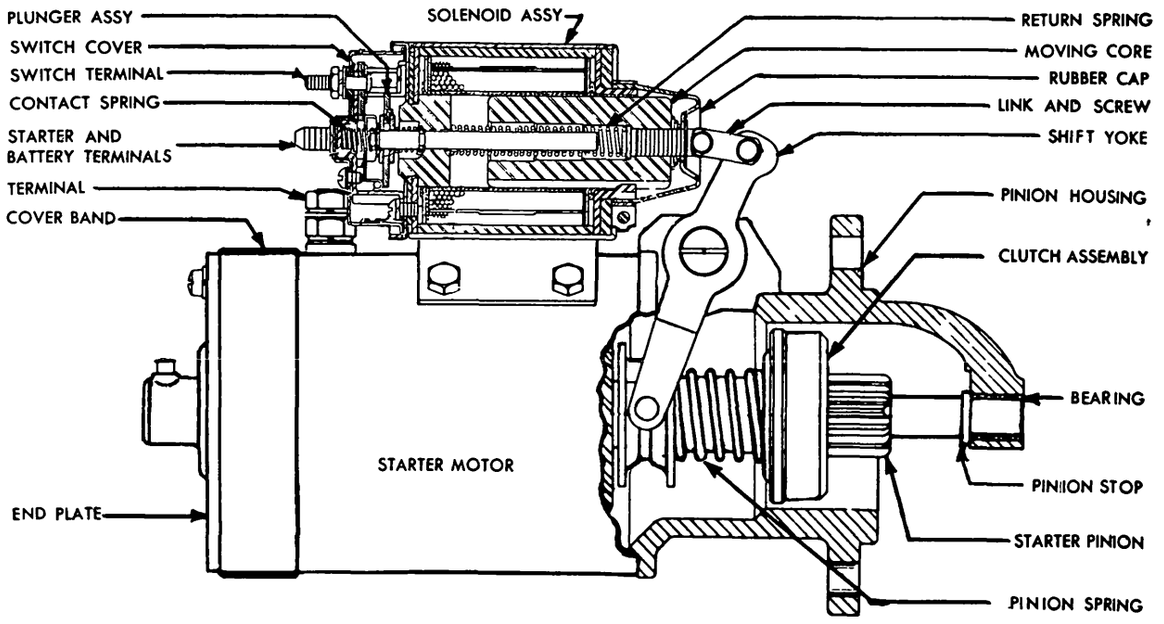
Pull-in-Coil—28 6-32 9 amperes at 6.0 volts.
Hold-in Coil—10 2-11 8 amperes at 6 0 volts

Series SSY-4002 (12 Volt)

Pull-in Coil—17.0-19.4 amperes at 6 0 volts.
Hold-in Coil—4 8-5.5 amperes at 6.0 volts.

CHECKING SWITCH ACTION: Action can be checked by slipping special steel spacer (flat stock 1" wide, ½" thick, with ⅝" slot in the 1" face) on armature shaft at the outer end of the pinion. With spacer in place, switch plunger should bottom and switch contacts should close with normal voltages.

CONTROL RELAY SPECIFICATIONS



Model HRW-4001, 4001A (6 Volt Types)

Contact Closing Voltage—1.5-3.0 volts. Armature seals to core at 4.0 volts maximum
Contact Opening Voltage—0.5 volts minimum.
Contact Gap—.020-.040". Adjust by bending armature stop up or down.
Armature Air Gap—.012-.020" with contacts closed. Adjust by raising or lowering stationary contact.

Model RAA-4001, 4001A (12 Volt Type)

Contact Closing Voltage (4001)—3.0-6 0 volts; **(4001A)** 6 0-8 0 volts. Armature seals to core at 8 0 volts maximum.
Contact Opening Voltage—1.0 volts min. (4001); 1.0-4 0 volts (4001A).

Contact Gap—.020-.040". Adjust by bending armature stop up or down.
Armature Air Gap—.012-.020" with contacts closed. Adjust by raising or lowering stationary contact.

AUTO-LITE SOLENOID STARTER SWITCH (NO RELAY)

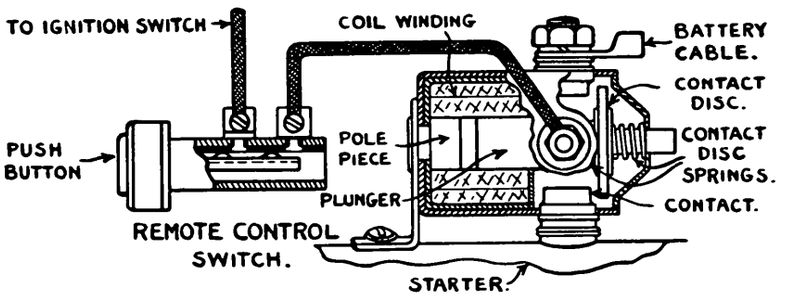
DELCO-REMY MAGNETIC STARTER SWITCHES

Car Model	Delco-Remy Switch No.
Rambler (1953-55) Hydra-Matic Cars	1465
Nash Statesman (1950-55) Hydra-Matic Cars	1465
Packard 8 & Super 8 (1947-50)	1452
Packard 200, 300 (1951)	1452
Packard 200, 250, 300 (1952-53)	1465

Packard Control Switch Note—Switch is Carter Car Starter mounted on the carburetor and operated by throttle valve shaft (accelerator pedal starting). Refer to Carter Car Starter article in this section for data.

DESCRIPTION: These switches are magnetic type mounted on the starter field frame. It is used in connection with a Bendix drive and does not include the pinion shifting mechanism of the previous models. It is operated by a 'remote control switch' or push-button starting switch connected to the ignition switch so that starter operative only when ignition turned on.

OPERATION: Switch has two windings (pull-in and hold-in coils) both connected to the switch terminal. Both coils are energized when the starting button circuit is closed so that a strong 'pull-in' action results. When the main switch contacts close, the pull-in coil is short-cricuited and the contact disc is held in by the hold-in coil only. Contact disc is returned to off position by the spring when the starting button is released.



PERFORMANCE DATA: Check current draw of switch using ammeter connected in lead to the switch winding terminal (figure given below is for both windings which is current draw before switch contacts close).

Switch No.	②Current & Voltage
1452	3 1-3 7 amperes at 4 volts
1465	5 7-7 0 amperes at 6 volts

②—At room temperature of 80°F.

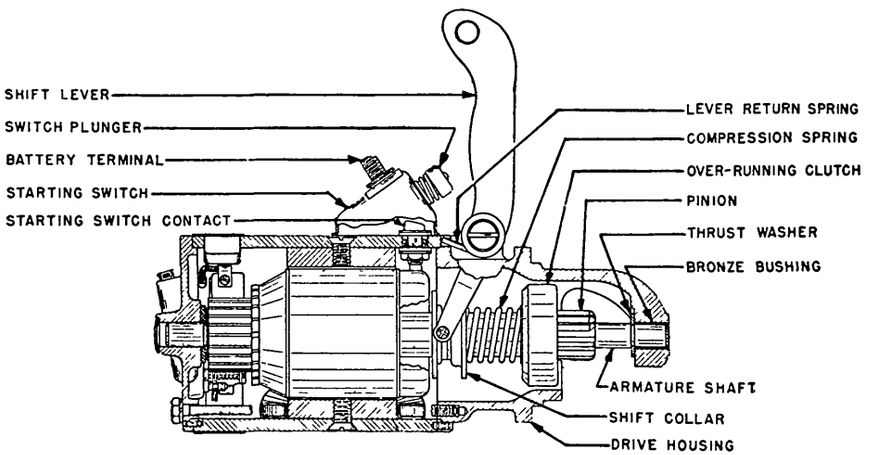
ADJUSTMENT: No adjustments provided on these switches.

NOTE—Switch can be operated by hand by pressing in on switch plunger on end of case after the small metal cap on the case has been removed

DELCO-REMY MAGNETIC STARTER SWITCH

DELCO-REMY MANUAL PINION SHIFT STARTER SWITCHES

Car Model	Delco-Remy Switch No.
Chevrolet, All Pass. Cars (1946-48)	820052
Chevrolet Trucks, 6 Cyl Exc. Fwd. Cont. & Hydra-Matic (1946-55)	820052
Oldsmobile 6 & 8, With Synchro-mesh Trans. (1946-48)	820052
Pontiac 6 & 8, All Models (1946-48)	820052



DESCRIPTION: Starters have a pinion assembly and shift lever similar to that used on Solenoid Pinion Shifts but the shift lever is connected through linkage to the starting pedal so that the pinion is positively engaged with the flywheel teeth when the starting pedal is depressed. The starting switch is mounted on the starter field frame and switch plunger is depressed by lug on shift lever to close switch contacts and operate starter after pinion has been meshed with the flywheel.

SERVICING: No service required and no adjustment provided. Switch contacts should not close until after pinion has been meshed (except when pinion teeth butt against flywheel teeth in which case compression of spring between shift collar and overrunning clutch on pinion sleeve will allow switch contacts to close and revolve pinion to meshing position). Return spring on shift lever must have sufficient tension to disengage pinion when pedal released.

Pinion Assembly & Spring (1946 & Later)— Pinion assembly used on these models may be identified by groove in pinion teeth approximately ⅛" from clutch shell. Compression spring must have tension of at least 34 lbs. when compressed to 1". To remove spring, press shift collar down on pinion ring. Spring and collar can be serviced but no attempt should be made to dismantle overrunning clutch mechanism. Clutch is packed with high melting point grease. Do not clean pinion assembly with solvents which may remove grease.

Shift Lever Return Spring—Return spring on shift lever should have tension of 9-12 lbs. (start of travel), 28-35 lbs. (end of travel). Weak spring may cause sluggish disengagement particularly in cold weather or if shaft is gummy.

Switch Test—Switch contacts are defective if voltage drop 0.5 volts or higher when checked with voltmeter at switch terminal with starter cranking engine.

②—Delco-Remy Vacuum Switch (Cars with Stromberg carburetor). Carter Car Starter is used on cars with Carter carburetor.

③—**Cars with Carter Carburetor**—Carter Car Starter.

Cars with Stromberg Carburetor—(1946-47) Delco-Remy No. 1990127 Vacuum Switch, (1948-50) Stromberg No. 385000 Starter Switch.

See data on each type unit in this section.

►**1946 BUICK STARTER PINION ENGAGEMENT & DISENGAGEMENT CORRECTION: If starter drive clutch pinion does not engage flywheel (on starters built before August 1, 1946)** replace Shift Lever, Part No. 1884808, with redesigned part of same number which may be identified by zinc-plated finish (original lever painted black) which will correct interference between shift lever and collar.

NOTE—Starters on which this correction has been made may be identified by spot of white paint on frame above name plate and by zinc-plated finish of lever. Starters built after Aug. 1, 1946 (Serials No. 6-H-1 up) have this new lever.

If Starter does not engage or cranks continuously (with new type shift lever described above)—Check for binding of solenoid contact disc and pushrod on terminal plate guide pin. Replace contact disc and pushrod assembly if guide hole in eccentric, straighten guide pin if it is bent.

DESCRIPTION:—Solenoid type combined starting switch and pinion shift (with control relay in solenoid case) mounted on the starter field frame with the solenoid plunger linked to the pinion shift lever.

OPERATION: When the pushbutton switch is closed, or accelerator pedal is depressed (vacuum switch type), with the ignition turned on, the solenoid relay circuit is completed, energizing the relay and closing the relay contacts. This completes the solenoid circuit. The solenoid plunger is drawn into the coil, meshing the starter pinion, and closing the starting switch contacts. When the engine begins to fire, the solenoid relay circuit is broken in one or more of the following ways:

(1) Operation of the vacuum switch. Caused by the vacuum built up in the intake manifold.

(2) By the rise in generator voltage. Where solenoid relay is grounded through generator main brushes or auxiliary contacts in cutout relay, the voltage built up by the generator opposes the current flow through the solenoid relay winding.

(3) By releasing the pushbutton switch or ignition key. On all car model installations where solenoid relay is grounded directly to starter field frame, the circuit will not be broken until the pushbutton is released.

(4) Through Neutral Safety Switch (automatic transmission cars).

When the solenoid relay circuit is broken, the relay contacts open, breaking the solenoid circuit. The starting pinion is demeshed by the shift return spring and the starting switch contacts are opened by the contact spring.

PERFORMANCE: Solenoid Switch. Solenoid should close (bottom in coil) against 70 lb. pull with ½" gap drawing 65-71 amperes at 5 volts. While closed, current should be 12-14 amperes (hold-in coil only).

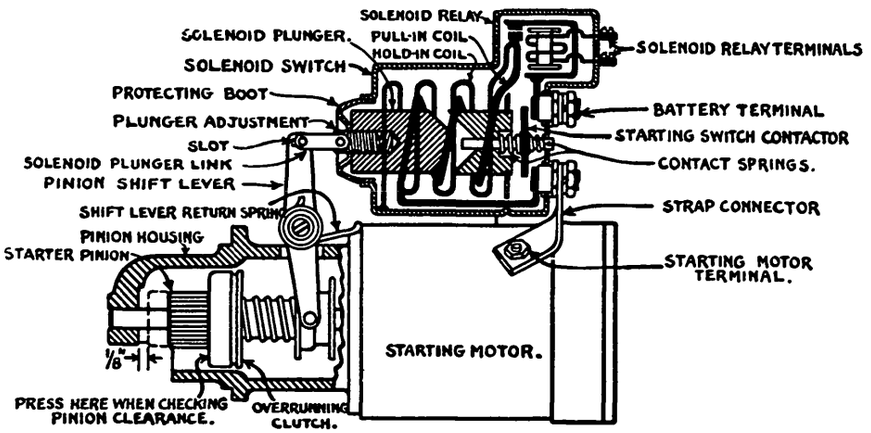
SOLENOID RELAY SPECIFICATIONS

Solenoid 1542, 1545, 1546, 1547, 1548

Contacts Close—1.9 volts max. **Contacts Open**—1.0-1.2 volts.
Contact Gap—.035". **Air Gap**—.012" (contacts closed).

Solenoid 1118019, 1118021, 1118102, 1118141

Contacts Close—3.0 volts max. **Contacts Open**—1.9 volts.
Contact Gap—.025". **Air Gap**—.015" (contacts closed).



CHECKING & ADJUSTMENT: Check Solenoid and Relay performance (above). Adjust solenoid plunger link for correct pinion clearance as follows:

Solenoid Setting—Clearance between end of pinion and inner face of starter housing should be 3/16" (see Cadillac Note below) with the solenoid plunger bottomed in core. Adjustment will be simplified if lead disconnected at terminal on starter field frame (so starter will not spin) and relay contacts closed so that plunger is drawn into coil core. Press back on pinion to take up backlash. In overrunning clutch, remove solenoid plunger link pin, adjust link (by turning link stud in plunger) until pin can just be inserted at forward end of shift lever slot

Cadillac 1940-49 Note—On these starters, pinion travel (from disengaged or at rest position to fully engaged position with solenoid plunger bottomed in core) should be 23/32" to 25/32".

SERVICING: Pinion Assembly & Spring. Compression spring tension should be at least 34 lbs. at 1". To remove spring, press shift collar down on pinion sleeve to compress spring until lock ring on end of sleeve is exposed, remove lock ring. Spring and collar can be serviced but no attempt should be made to dismantle overrunning clutch mechanism. Clutch is packed with high melting point grease and pinion assembly should not be cleaned by any method which may remove this lubricant.

Shift Lever Return Spring—Return spring on shift lever should have tension of 9-12 lbs. (start of travel), 28-35 lbs. (end of travel). Weak spring may cause sluggish disengagement particularly in cold weather or if shaft is gummy.

①—With separate Relay No. 1116855.
②—Hydra-Matic Drive Cars only.
③—With separate Relay No. 1116876
④—Early 1954.
⑤—Exc. Hydra-Matic Drive models.
⑥—With separate Relay No. 1116886.
⑦—With separate Relay No. 1116904.
⑧—Starter No. 1107640 also used.
⑨—Models with Hydra-Matic Drive.

DESCRIPTION: This solenoid type combined Starting Switch and Pinion Shift is similar to type used on other cars except that solenoid link is non-adjustable (pinion position adjustable by shifting solenoid assembly on starter) and no relay is incorporated in the solenoid assembly (separate relay used on some cars). 6 Volt and 12 volt units are similar except that special "Ignition Terminal" used on 12 volt units (see Ignition Terminal Note below).

▷*IGNITION TERMINAL NOTE (12 Volt Solenoids)*—This special terminal provides an ignition feed which bypasses the ignition coil resistor when the starter is cranking (terminal connected to contact finger in switch which is "live" while switch contacts are closed). See individual car wiring diagrams for ignition coil connections.

▷*CONTROL RELAY NOTE: (Buick & Chevrolet Corvette)*—SEPARATE control relay is used in the solenoid control circuit. Relay is not part of solenoid assembly. See CONTROL RELAY data below for specifications and adjustment data. See Individual car wiring diagrams for relay internal circuits and circuit connections.

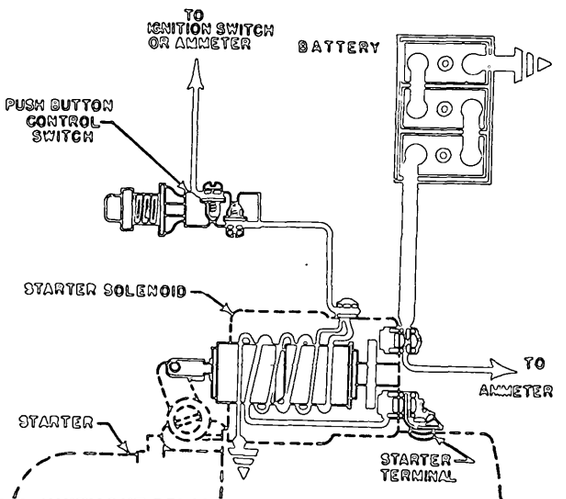
OPERATION: When the pushbutton is pressed, both solenoid windings are energized (pushbutton is special heavy-duty type designed to handle entire solenoid current). Solenoid plunger is drawn into coil, meshing starter pinion, and closing starting switch contacts (if teeth butt and prevent pinion meshing with flywheel, spring on shaft behind pinion is compressed and meshes the pinion as soon as starter armature shaft begins to rotate). Closing of the starter switch short-circuits the heavy solenoid winding (pull-in coil) and the lighter solenoid winding (hold-in coil) keeps the pinion in mesh until the pushbutton is released when the pinion is withdrawn by the return spring.

▷*CAUTION—See special Pinion Clearance Adjustment directions below.*

PERFORMANCE: Solenoid. Current draw below is measured from starter button terminal on solenoid to ground (see illustration). "Both-Coil" specification is with starting switch contacts open, "Hold-in Coil" specification with starting switch contacts closed and pull-in coil short-circuited. If solenoid does not test within limits shown, it should be replaced. *NOTE*—when checking solenoid current draw with solenoid mounted on starter, disconnect solenoid-to-starter connector and ground this solenoid terminal to the solenoid frame. Current draw measured at solenoid control terminal will then be the "Both Coil" draw. Remove the ground wire from the solenoid starter terminal and current will be the "Hold-in Coil" draw.

▷*CAUTION—Solenoid should be tested COLD (room temperature of 80°F.).*

SOLENOID CURRENT DRAW



All 6 Volt Types

Both Coils—85-90 amperes, 5 volts, at 80°F.
Hold-in Coil—14-16 amperes, 5 volts, at 80°F.

All 12 Volt Types

Both Coils—72-76 amperes at 10.0 volts.
Hold-in Coil—18-20 amperes at 10.0 volts.

CONTINUED ON NEXT PAGE

DELCO-REMY STARTER SOLENOID (WITHOUT RELAY)

DELCO-REMY SOLENOID STARTER SWITCHES (NO RELAY) Continu d

Starter Pinion Overrunning Clutch: Clutch should transmit 50-60 ft.lbs. torque in drive direction without slipping, and should allow pinion to turn freely in overrunning direction.

Shift Lever Return Spring: Check spring tension with spring scale hooked in hole in upper end of shift lever. Pull at start of travel should be 9-12 lbs. and at end of travel should be 28-35 lbs.

ADJUSTMENT: ***CAUTION—It is recommended that starter be removed from engine for adjustment (will provide easier access to solenoid mounting screws).***

Pinion Clearance: ***NOTE—Clearance differs for each type starter end thrust device (see identification below) and is the only adjustment required.***

Pinion Clearance—Should be measured from end of pinion to face of drive housing with pinion in operating position. When measuring this clearance, press lightly on outer face of clutch shell to take up all backlash in linkage but DO NOT compress the drive spring.

Pinion Clearance (when engaged)

Car Model	Thrust Type	Clearance
Buick (1951-52)	①	3/16" ± 1/32"
Buick (1953)	②	1/8" ± 1/32"
Buick (1954-55)	③	010-.050"

Pontiac (1955)	③	.010-.040"

①—Thrust washer on end of armature shaft within pinion housing. Measure clearance between pinion and housing.

②—Thrust plug located ¼" within drive end housing nose with a pin across the shaft hole directly behind the plug. No thrust washer is used. Measure clearance between pinion and housing

③—Thrust washer located within pinion housing and clearance should be measured from face of pinion to this washer.

Pinion Clearance Adjustment—Disconnect solenoid to starter strap to prevent motor operating, place a gauge (see Clearance Specifications above) between pinion and housing or between face of pinion and thrust washer as indicated in table above. Connect battery between switch terminal of solenoid and ground (solenoid base) and push plunger in by hand so that pinion is moved out against gauge (battery current will hold solenoid in this position while adjustment is being made). On models without adjustable plunger link, loosen solenoid mounting screws and shift solenoid on starter so that all play in lever and clutch linkage is taken up. Tighten mounting screws. On models with adjustable plunger link, loosen screw and adjust length of link as necessary to remove all play.

►***CAUTION—Do not compress spring on shaft behind overrunning clutch when making above adjustment.***

CONTROL RELAY (BUICK): ***CAUTION—Both 6 Volt and 12 Volt units used. All relays are checked and adjusted alike but specifications are different as listed below.***

RELAY SPECIFICATIONS

6 Volt No. 1116855

Contact Closing Voltage—1.5-2.1 volts. Armature should "seal" to core at not more than 0.1 volt above closing voltage.

Contact Opening Voltage—Not less than 0 35 volt.

Contact Gap—.025" (020-.030").

Air Gap— 011" minimum with contacts closed.

6 Volt No. 1116886

Contact Closing Voltage—2.2-3.0. Armature should "seal" to core at not more than .01 volt above closing voltage.

Contact Gap—.025".

Air Gap—.018".

12 Volt No. 1116876 & 1116904

Contact Closing Voltage—3.8-5 0 volts. Armature should "seal" to core at not more than 0.2 volts above closing voltage.

Contact Opening Voltage—Not less than 0.6 volt.

Contact Gap—.025" (.020-.030").

Air Gap—.011" minimum with contacts closed.

CHECKING & ADJUSTMENT

Checking Operation—Use rheostat (must have 10 ohm resistance and 2 ampere capacity) and accurate low reading voltmeter. Connect rheostat to relay terminals #1 and #4 (CAUTION—rheostat must be turned to provide full resistance), connect voltmeter to relay terminals #3 and #4. Make certain that ignition switch turned OFF. Slowly decrease resistance by turning rheostat and note voltmeter reading at instant relay contacts close and solenoid switch operates (can be checked by test lamp connected between relay terminal #2 and ground). Voltage reading at this point should agree with "Contact Closing Voltage" in specifications above. Continue to decrease resistance until slight "click" occurs indicating that armature has sealed to the core. Voltage reading at this point should be not more than 0.1 volt higher (6 Volt Relay), 0.2 volt higher (12 Volt Relay) than contact closing voltage. Quickly cut out all resistance to saturate relay magnet core fully, then quickly increase resistance and note voltage reading at instant relay contacts open (if test lamp used, light will go out at this point). Voltage reading at this point should agree with "Contact Opening Voltage" in specifications above.

Relay Adjustment

Contact Closing Voltage—Bend armature spring post **down** (to increase spring tension and closing voltage) or **up** (to decrease spring tension and closing voltage).

Sealing Voltage & Contact Opening Voltage—Adjust by varying air gap (see below) or by changing the closing voltage (CAUTION—closing voltage must be kept within specifications).

Contact Gap—Adjust by bending upper armature stop.

Air Gap—Adjust by bending lower contact support (check air gap by pressing armature down until contacts just touch, then measure between armature and core with feeler gauge).

CHECKING & INSPECTING SOLENOID: If performance not satisfactory, check as follows:

Voltage Drop (High Resistance Check)—Disconnect ammeter lead from battery cable terminal on solenoid, connect voltmeter from battery terminal to starter terminal on solenoid. Use Remote Control Switch connected to pushbutton terminal on solenoid to operate starter motor ***(CAUTION***—On 12 volt solenoids with ignition coil terminal, lead must be disconnected from this terminal to prevent engine firing and control switch must NOT be connected to this ignition terminal). Voltage reading with starter cranking must not exceed 0.1 volt (6 volt system). If reading greater, disassemble and inspect solenoid (see below).

Solenoid Inspection—Take out cover retaining screw and remove cover ***(CAUTION***—use care not to damage solenoid winding lead. Check solenoid plunger for free movement without binding and see that plunger has sufficient travel for firm contact between the copper contact washer and the starter switch contacts. Make certain that full contact is secured and that contact surfaces are not burned or corroded. ***NOTE***—Contacts can be replaced—see OVERHAUL below.

OVERHAUL: Solenoid Contact Replacement: With solenoid removed from starter, remove solenoid plunger from solenoid body. Take out cover retaining screw and remove cover. Remove nuts, lockwashers, flat washers, and insulating washers from each terminal stud. Remove two terminal stud support plate-to-solenoid housing screws, remove support plate, insulating plate, one terminal stud and starter switch stud. Remove outer spring retainer and spring from solenoid plunger contact ring. Compress the contact ring spring, remove retainer, insulating washer, and contact ring from plunger; remove plunger from solenoid body. Unsolder solenoid coil lead from remaining terminal stud.

Reassembly—Place new contact ring and insulating washer on plunger, compress spring and install retainer with open side up ***(CAUTION***—Three lugs on bottom of contact ring must index with slots in lower insulating washer). Install solenoid plunger assembly in solenoid body, carefully solder solenoid lead to new terminal stud. Place solenoid plunger spring and outer spring retainer in position over end of solenoid plunger. Place terminal support insulator plate and support plate over the terminal stud soldered to the coil lead ***(CAUTION***—Lugs in terminal support plate must fit in holes in insulator). Place starter switch lead stud up through terminal insulator plate, index lugs on stud with slots in insulator plate, snap stud into place. Insert remaining terminal stud up through insulator plate and support plate, install terminal support plate-to-solenoid housing screws (with lockwashers) and tighten screws securely. Install insulating washers, flat washers, lockwashers, and nuts on terminal studs and tighten nuts securely. Install cover and cover attaching screw. Test solenoid for proper operation, install on starter, adjust pinion clearance (see ADJUSTMENT).

DELCO-REMY VACUUM STARTER SWITCH (1940-47 BUICK)

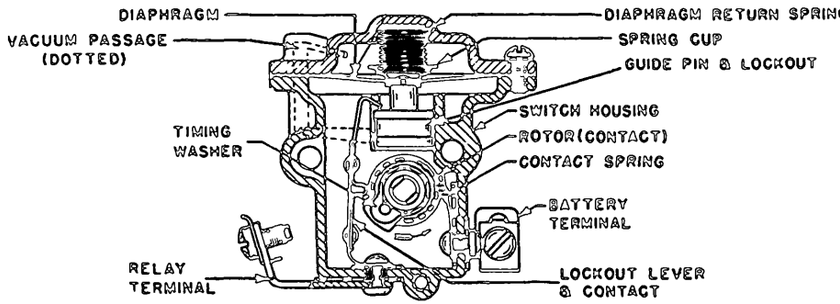
Delco-Remy No. Used On:

1990127—BUICK, ALL SERIES (1940 to 1947) ①

①—Front carburetor of Compound Carburetion installation.

NOTE: This switch used only on cars equipped with Stromberg carburetor. Switch is mounted on front carburetor of Compound Carburetion equipment.

DESCRIPTION: Vacuum switch is of the "direct operated type" with contact rotor mounted directly on end of throttle valve shaft within switch body (switch assembly mounted directly on carburetor casting at end of throttle shaft by two screws). Vacuum chamber is formed within top cover plate and is connected to the manifold below the throttle valve by a channel extending through the top cover, switch body, and carburetor casting. Diaphragm is clamped between switch body and top cover and consisted of a riveted assembly including spring cup (spring sits in cup and is positioned by recess in top cover) and combination guide pin and lockout plunger (which moves in guides formed in switch body). The internal circuit through the switch is completed from one contact spring through the contact rotor to the opposite contact spring (mounted on the lockout lever).



OPERATION: With the engine not running (no vacuum) and throttle valve closed, lockout will free lockout lever (diaphragm pressed down by return spring) but lockout lever and contact will be held away from contact plate on contact rotor by insulating knob on rotor. When the throttle is opened to start the engine, contact rotor turns with throttle valve shaft and as soon as insulating knob is turned away from the lockout lever, the contact spring on the lever contacts the rotor and completes the circuit through the switch. As soon as vacuum is developed in the manifold, diaphragm attempts to move upward but is prevented from doing so by hook on upper end of lockout lever which engages top of lockout plunger. When throttle is closed (to idle engine after it has started), insulating knob on contact rotor presses out on lockout lever and frees lockout plunger, diaphragm then moves up and lockout engages lockout lever so that the contact spring is held away from the contact rotor while the engine is running. When engine is stopped, the closing of the throttle valve lifts the lockout lever from the lockout (this Unlatch Action occurs 17-23° from closed throttle position) and diaphragm and lockout plunger drop down into position for a new start.

ADJUSTMENT: No adjustment ordinarily required. Switch "timed" for correct throttle position when contacts closed by timing washer assembled on face of contact rotor which positions rotor on throttle valve shaft. Timing can be checked, and new washers installed to change timing as follows:

Switch Timing Check:—See that carburetor throttle lever stopscrew set for correct 8 MPH. hot or slow idle speed. Take out screws and remove side cover plate on switch. Start engine, close throttle, then open throttle until clearance between throttle stopscrew and highest step of fast idle cam is ¼" (cam in fast idle position—engine must be cold), stop engine without disturbing throttle position. Place mirror so that switch guide pin and lockout visible from left side of car, close throttle slowly by lightly tapping on hand throttle lever until guide pin and lockout releases, then measure clearance between stopscrew and fast idle cam with cam in fast idle position. Clearance should be 3/64" minimum, 3/32" maximum. If less than 3/64" timing washer should be replaced by one having a higher number. If more than 3/32", timing washer should be replaced by one having lower number. See directions below.

Switch Action Check (On Car):—See that carburetor throttle lever stopscrew set for correct 8 MPH. hot or slow idle speed. Start engine, close throttle then open throttle until clearance between throttle stopscrew and highest step of fast idle cam is ¼" (cam in fast idle position—engine cold), stop engine. Tap throttle closed until clearance between stopscrew and cam is exactly 3/64" (use extreme care not to close throttle further, if clearance less than 3/64", repeat entire procedure). Start engine by opening throttle from this position. Repeat this test several times. Engine should start each time. If engine does not start more than once, timing washer should be replaced with one having a higher number. After making above test for minimum clearance between fast idle cam and stopscrew, check for maximum clearance as follows. Repeat test instructions given above except that clearance between fast idle cam and stopscrew should be set at not less than ⅛". Engine should not start from this position. If engine starts, timing washer should be replaced with one having a lower number and first test (for minimum clearance) should be repeated.

Timing Washers:—Washer has slot which engages flat on throttle shaft and lug which engages hole in contact rotor (rotor is free on shaft and is positioned by timing washer). Washer marked by number on side opposite rotor lug and furnished with lug in different positions for smaller or larger stopscrew-to-fast idle cam clearance (washer with higher number will increase clearance, lower number decrease clearance). Washer number indicates angular degrees of

DELCO-REMY VACUUM STARTER SWITCH (1940-47 BUICK)

throttle shaft rotation and washers are furnished in 3° steps. Select correct washer by means of tests given above and install washer as follows:

Timing Washer Installation. Take out screws in side cover on switch, remove cover and gasket. Remove nut on end of throttle valve shaft within switch, remove lockwasher and timing washer (if contact rotor removed, make certain that steel washer installed on shaft behind rotor). Install timing washer being careful to see that lug engages hole in contact rotor, install lockwasher and tighten nut, replace cover and gasket. Recheck switch timing.

CAUTION—Cover gasket is felt and is designed to provide necessary 'breathing' action required by diaphragm movement. This gasket must always be installed under side cover and no other type gasket should be used

SERVICING:—No servicing required. If top cover removed (for diaphragm replacement), make certain that return spring properly seated in cover recess and spring cup on diaphragm and that vacuum channel in top cover and switch body line up. When installing new parts, always check switch timing and install correct timing washer as directed above.

CAUTION:—Always connect wire with red cross tracers (hot lead) to terminal on front of switch to prevent lock-out lever being short-circuited if it should be bent back against housing during timing operation.

OTHER CARBURETORS

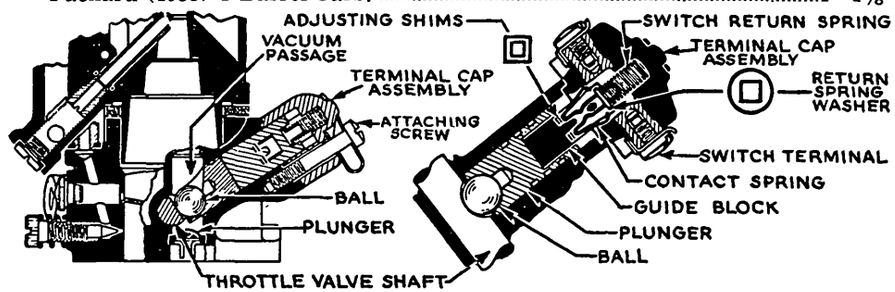
Buick 40, 50 (1954)①	Stromberg AAVB-267, Code 7-96
Buick 60, 70, M/100 (1954)	Stromberg 4-AUV, Code 7-98
Buick 40 (1955)	Stromberg AAVB-267, Code 7-102
Buick 50, 60, 70 (1955)	Rochester 4GC, No. 7006200

►**SERVICE CAUTION:** Car Starter is built in carburetor throttle body casting and must be removed when carburetor is disassembled for servicing (carburetor throttle valve shaft cannot be taken out until switch dismantled and switch ball taken out). CAUTION—Use care not to lose small square switch adjusting shims when switch disassembled.

DESCRIPTION & OPERATION: Switch is plunger type mounted on carburetor casting and operated by steel ball which engages switch plunger and flat on carburetor throttle valve shaft when engine is not running. Depressing accelerator pedal to open throttle forces switch plunger up until 'W' shaped contact spring on upper end completes circuit between two brass contact blocks in the switch cap. When the engine begins to fire, switch ball is drawn up out of engagement by manifold vacuum (ball blocks vacuum passage as long as engine is running) so that switch is inoperative. When engine stops, throttle must be closed momentarily to allow switch ball to drop down between throttle shaft and switch plunger.

ADJUSTMENT: Vacuum Switch Timing Check. Use special Carter Tool T109-155S (see Note) consisting of scale clamped on choke housing and indicator arm fastened on throttle lever. Connect test lamp in switch circuit to check switch closing. Rotate fast idle cam to hot or slow idle position, back off throttle lever stopscrew so that throttle valves are tightly closed. Loosen setscrew and set indicator arm opposite '0' on correct scale of the gauge. Open throttle lever and note gauge reading when switch closes (test lamp will light). Gauge reading should be between 30° and 45°. Adjust by adding (if throttle opening more that 45°), removing (if throttle opening less than 30°) square brass adjusting shims located on bakelite guide block under 'W' shaped contact spring (these shims have square hole which engages tongue on guide block, do not confuse these shims with round spring seat washer which seats on middle leg of contact spring).

►*CAUTION—Do not use less than one No. 153-11 (.018") Shim or more than three No. 153-11 (.018") Shims plus two No. 153-12 (.006") Shims.*



Carter Gauge T109-155S Note—Gauge has three separate dials marked "WCD & WDO', 'WA' and 'W1' and correct dial must be used in checking each carburetor model. Refer to Equipment List above for carburetor type used on each car.

Checking Switch Timing without gauge—If tool not available, timing can be checked on the car as follows:

1946 & Later (All Models)—Measure unloader arm travel (1954 & earlier cars), throttle arm travel (1955 cars) as follows: Back off throttle stopscrew, turn fast idle cam to slow or hot idle position, see that throttle valves are fully closed. On 1954 & earlier cars place a 6" scale against choke unloader arm and make a pencil mark on float bowl opposite edge of scale. On 1955 cars, hold scale against flat face of throttle lever lower arm which contacts the dashpot, so that scale rests on rocker arm cover. Make a pencil mark on rocker arm cover at front edge of scale. Turn ignition switch on (or use test lamp and battery connected to switch terminal to check switch closing), open throttle slowly while holding scale in position (as indicated above), until starter pinion just engages flywheel (or test lamp lights) indicating that switch contacts have closed. Make a second mark on float bowl (1954 & earlier), or rocker arm cover (1955), at same edge of scale. Measure distance between these marks which indicated unloader arm or throttle arm travel. See table below. See ADJUSTMENT data above for adjustable procedure. Reset engine idle speed.

Unloader or Throttle Arm Travel (for Switch Timing)

Car Model	Unloader or Throttle Arm Travel
Buick (1946-54) 2-Barrel Carb.	15/16 - 1 5/16"
Buick (1952-54) 4-Barrel Carb.	¾ - 1 1/16"
Buick (1955) 2-Barrel Carb.	29/32 - 1 7/16"
Buick (1955) 4-Barrel Carb.	9/16 - 15/16"
Packard (1953) 4-Barrel Carb.	1 - 1⅜"

CARTER CAR STARTER

REMOVAL & DISASSEMBLY: Disconnect and tape the leads on switch terminals (wire with red tracer on terminal nearest engine is 'hot' with ignition turned on). Remove switch terminal cap attaching screw, hold-down clip, switch cap, withdraw return spring, guide block and contact spring assembly, switch plunger and ball. Be careful not to lose spring seat washer (on contact spring) or adjusting shims (on guide block under contact spring).

Servicing. Clean switch ball, plunger, cylinder, carburetor vacuum chamber and inlet screen, throttle valve shaft flat with gasoline. Check 'W' contact spring and switch return spring. Replace these parts if dimensions incorrect. **'W' Contact Spring**—Distance across spring at widest part (across outer contact legs) should be 7/16" (plus 1/32", minus 0") with spring seat washer seated on middle leg of spring.

Return Spring—Free length of spring should be 11/16-¾" and pressure of 32 ozs. should be required to compress spring to length of 3/8".
